Before turning to the consideration of the actual business of a publisher, we should point out that most valuable experience can be obtained by engaging as traveller with a wholesale house. Of course, every publishing firm of any standing employs a number of travellers from whose ranks many of our most successful publishers have risen. We have preferred to mention the great wholesale houses first, as these are not confined to London, whereas, excepting a few notable firms in Edinburgh and Glasgow, there are practically no important publishing houses outside of London. The provincial youth has thus to turn his attention—in the first place, at least—to the wholesale distributors and the large booksellers; who very often do a small amount of original publishing.

London is essentially the Mecca of publishing, and the young man who is ambitious of becoming a publisher will do well if he can secure an engagement with a London publisher when he is about twenty years of age.

The Young Publisher's Progress. Assuming that he is determined to be no mere employee in a department, but has set his mind on a managerial post at least, we shall suppose him to have had, first of all, a reasonable knowledge of English literature [see LITERATURE], and if he gives evidence of any literary taste and judgment, he will not find it difficult, after he has spent some time in the Costing Department, where he will have become familiar with the cost of producing a book and the various qualities of material used, in getting into the Production Department, the scope of which varies greatly in accordance with the importance of the firm. Here the duties consist of keeping account of all accepted MSS., arranging with the printers for specimen pages, and estimating the size of books, deciding upon the style of title-pages, bindings, general get-up, and proof reading. It is, in a word, the department in which all the practical detail of production occurs, from which the MS. of a book is handed to the printer, and from which the first completed book is handed over to the manager. In the smaller firms this department is concerned also with drawing up the spring and autumn catalogues, but in the large houses that important part of a publisher's business usually falls to the lot of the Publicity Department.

It will be gathered from our qualifying references that it is very difficult to speak of the publishing trade in general terms. There are many publishers earning a good livelihood who employ no more than half-a-dozen assistants, and unite in themselves all the different departments we have mentioned. In fact, it is no bad plan for a young man to attach himself to one of these smaller publishers, as the variety of work which will fall to his share every day will result in his acquiring a very good knowledge of the trade more speedily than it could be acquired in one of the larger firms.

of course, very much the same as that of any other business, but the young man who has shown sufficient literary aptitude to be placed in the Production Department is fairly certain to be employed sooner or later in the reading of MSS., and in consultation with the manager preliminary to the acceptance of a work. The "literary adviser" used to be a somewhat mysterious person who read all the MSS. received, and supplied reports as to their literary qualities and the likelihood of their success. He was sometimes himself a distinguished novelist, who thus eked out some extra income by giving what was very frequently the most misleading advice. This old-fashioned type of adviser is disappearing. The successful publisher of to-day depends hardly at all upon the unsolicited MSS. he receives. They are read and reported on as of old, but his reader, if he himself does not do the work, is more likely to be some alert person with the real journalist's knowledge of what is calculated to interest the public, and it will be found that he or the publisher himself will be the first to think of most of the books they will publish. As a matter of fact, the ideal publisher, or literary adviser, is essentially an ideal editor. The editor of a successful magazine has a certain public, or perhaps several publics, in mind when he sits down to plan out his next number. In order to secure an attractive programme, he will ask a certain number of distinguished writers each to contribute a story of a certain kind and a given length. He will arrange so many articles to suit this section or that section of his readers, and he will ask certain writers to prepare them. He will then decide how many pages each is to occupy, including illustrations, and will carefully choose the artist who can best do the different kinds of pictures he requires. Hence, although he may receive 200 MSS. per week, he will seldom retain more than two, and nothing but the fear of missing a good article by an unknown writer induces him to wade through the MSS. Now, if for stories and articles we substitute novels and books of biography, travel, and general literature, the publisher is engaged in precisely the same work as the editor. This indicates that one may come to publishing through editing; but, of course, for such a one the SELF-EDUCATOR is hardly likely to be a guide.

"A Genius for Publishing." It is unnecessary here to dwell upon such technical details as the arrangement of a book, the various sizes of paper, types, illustrations, printing, and book-binding. All these matters are dealt with in other parts of the present course, and with them the beginner in book production must necessarily and speedily familiarise himself. In the little space that remains to us we must confine ourselves to the general aspects of publishing, and need we say that after every possible tittle of information touching the practical side of the business has been acquired, if the intending publisher is not gifted with the peculiar acumen that makes the successful editor and the prosperous publisher, he may have studied and prepared for the work in vain? There is some touch of genius in knowing just what is likely to meet the tastes of the many different sections of the public, and without this all the technical knowledge in the world will avail nothing. Every day of our life we see books being published which we know cannot possibly succeed. Sometimes this is the bad foolishness of the vain writer, who has paid some publisher to issue the work, but publishers who do this never rank high in the profession.

Risky Publishing and Safe. Not very well can we lay down any rule as to the amount of capital that is required to engage in publishing. Everything will depend upon one's personal requirements and how soon a return for one's money will be expected. This, however, can be said, that cheap publishing requires by far the largest amount of capital. That is to say, to deal largely in attractive editions of non-copyright books at cheap prices involves a much greater risk than the publishing of original works in general literature, in editions of, say, one thousand copies, at good prices, from six shillings upwards; and if the possibilities of the more expensive publishing are not quite so great, the money invested is far safer and likely to produce a substantial return. Novels, and fiction of all kinds, involve a much greater element of risk than works of biography and travel; but it is an axiom of the trade that educational and technical books are of all the most desirable to publish, as they supply a demand that can be easily gauged, and if at all well done, cannot easily fail to be profitable.

MAN AGAINST BACTERIA

**The Facts of Immunity. The Fates of Nations Decided by Bacteria.
Empires Founded on Immunity to Disease. Immunity from Moral Disease**

Group 23
BACTERIOLOGY
3

Continued from page 6544

By Dr. GERALD LEIGHTON

BEFORE proceeding to the next portion of our subject, it will be well to summarise briefly the important bacteriological facts bearing upon the causation of disease and production of immunity.

Bacteria produce their effects either by their own multiplication or by the manufacture of poisonous toxin. Some diseases, such as anthrax, are due mainly to the former process. These are termed septicæmias. Others are chiefly dangerous from the toxic action of the microbe—for example, tetanus or lockjaw. Hence, substances which prevent or cure microbic disease are either anti-bacterial or anti-toxic, according to the nature of the particular disease. Immunity is of two different types—natural or acquired. Natural immunity belongs to the individual in virtue of his being the person he is, a person of a given species, race, family, temperament, and idiosyncrasy. It is a product of evolution, and hence is found to show itself in various directions in different species and races. Because it is inborn, it can be, and is, transmitted by heredity; it cannot be transferred from one individual to another. Acquired immunity, on the other hand, comes to a person in one of two ways—either as the result of recovering from disease, or as the result of artificial inoculation. Because it is acquired, it cannot be, and is not, transmitted by heredity. But it can, by suitable methods, be transferred from one individual to another.

Disease Cured by Horse Serum.

The most perfect method of thus transmitting an acquired immunity is to be seen in the serum treatment of disease. This depends upon the fact that when a susceptible animal is artificially made to acquire immunity, the serum of that animal contains substances which are either anti-bacterial or anti-toxic. This serum can be readily withdrawn from the animal in question, can be preserved for a considerable length of time, while it retains its properties, and can thus be used at any moment when required as a curative agent. Such a serum, to be depended upon, must be taken from a highly immunised animal; it must have, in other words, a high anti-toxic value. By this is meant that a given quantity of that serum must be of such potency as will enable it to antagonise a large quantity of toxin in a patient. It is not sufficient that it merely be anti-toxic; it must be highly anti-toxic. The reason is obvious. It is impossible for the physician to estimate in a case, for example, of diphtheria, how much toxin is present in the body of his patient as the result of the action of the microbe of that disease. There may be little; there may be much. There may be little to-day, but sufficient to-morrow to kill the patient. In order that the anti-toxic serum may be reliable, it follows that the dose of that serum must contain sufficient anti-toxin to antagonise the largest quantity of toxin which is likely to be present in any case of diphtheria.

A serum of this high immunising power is obtained from the horse by rendering that animal immune, not merely from ordinary doses of diphtheria anti-toxin, but from doses which, under ordinary circumstances—that is, were the animal not immunised—would be much more than sufficient to cause a fatal result. The bacteriologist, whose business it is to prepare a serum has definite tests by which he is able to "standardise" his serum, which is therefore always of a known potency. Not only so, but he is able to increase or decrease the virulence of disease-producing microbes by various methods of cultivation, and so able to produce immunity from a more virulent microbe than the one which usually causes the disease itself.

The advantage of using a serum to confer acquired immunity is that its anti-toxic properties are available for instant service. It is a curative agent. The disadvantage of conferring an acquired immunity by a serum is that such an immunity lasts but a short time. The serum is a foreign substance, and, as such, tends to be eliminated from the system before very long. Meantime, however, it has done its work of healing. The advantage of acquiring immunity by recovery from disease is that such an acquired immunity lasts for a long period—perhaps years, perhaps a lifetime. The disadvantage of this process is that the patient has to make his own anti-toxic substance while suffering from the disease. It is therefore only of value as a preventive agent against future infection.

The Place of Bacteria in Evolution.

It is surely a wonderful thought that these microscopic bacteria contain within them the fate of nations; but such is indeed the case. It would be difficult to think of any one class of agency which has been such a potent factor in the past history of the evolution of mankind, and which is still in active operation to-day. We have seen in another part of this work [see BIOLOGY] that organic evolution means *adaptive change*, and that the most powerful factor in its production is natural selection of the fittest to survive. Any agency, therefore, which operates by eliminating huge numbers of individuals must be a most potent cause of racial evolution. In fact, the evolution of any nation is that of its immunities from the various deleterious influences to which it is subjected. Restricting ourselves for the moment to what we term the physical sphere, and in that sphere to the domain of disease, it is thus quite obvious that the evolution of a nation or a race will depend upon the evolution of immunity from various diseases, or else upon the evolution of the power of acquiring immunity. Take our own race as a case in point.

For very many generations the people in these isles have been subject to the infection of tuberculosis, or consumption. Now, the microbe of this disease, the tubercle bacillus, flourishes best in the environment of what we term "slums." In these "slums" are gathered together in dense crowds great numbers of our population. Nothing but a strong power of resistance—that is, immunity—could possibly prevent the utter extermination of people under such conditions, and, as a matter of fact, as we know, many do so perish. But why not all, or a great many more than do? Obviously, there has been evolved in our race an inborn power of resistance, an inborn immunity. How has it been evolved ? In the usual way, by natural selection of the fittest to survive. Who were the fittest in this particular case ? Those who possessed by nature already some power of resistance. The others, the less resistant, have been in process of elimination for generations. Thus is gradually being evolved in our race an inborn immunity from this particular disease. If we wish to see what happens in the absence of such evolution we have only to notice the effect of this disease upon a race previously unexposed to it. Its ravages are terrible.

Measles as a National Disaster. Take another case—that of measles. Here we have a disease to which every Englishman is still susceptible, but against which, all the same, there has been great racial evolution in a different direction. Measles in this country, apart from any complications, is considered a trifling complaint. We know from experience that nearly every case will end in recovery. But when measles is introduced amongst a race to which it was previously unknown, the Polynesians, for example, its effects are so severe that a large proportion will perish. Why ? Because the Englishman has undergone a process of evolution against measles of which the Polynesian has had no opportunity. But note the Englishman still gets measles. He has not evolved any immunity from infection. He is as susceptible as ever, apparently. What he has evolved is the capacity to recover—in other words, the power of acquiring immunity. How has this been accomplished ?

Obviously, again, it is a question of natural selection. Once more the unfit have gone to the wall. When measles first attacked us, those individuals only who had the power of recovery and of acquiring immunity survived. This was an inborn power capable of transmission by heredity to their descendants. In this way each succeeding generation became more and more capable of acquiring immunity from measles. And this would go on as long as measles was a selective agent.

Thus, in some infectious diseases which affect large numbers of people there is evolved by natural selection an inborn immunity from infection. In other diseases there is evolved the power of acquiring immunity from the effects of the disease. These two processes are perfectly distinct, but both proceed along similar lines of evolution and are the cause of the racial differences of susceptibility to disease which we see in the world to-day.

" Modern examples of ancient epidemics," as Dr. Archdall Reid says, " may be seen in isolated regions. In Pacific islands, for example, air-borne disease spreads like a flame. The whole community is stricken down. The sick are left untended and perish in multitudes. The fields, the entire business of the community, are neglected, and famine frequently follows. Under such conditions measles or whooping-cough—diseases which we in England are accustomed to regard as scarcely more than nuisances —may rise to the level of a great national disaster. Thus, in 1749, thirty thousand natives perished of measles on the banks of the Amazon. In 1829 half the population died in Astoria. In 1846 measles committed frightful ravages in the Hudson Bay Territory. More recently a quarter of the total inhabitants was swept away in the Fiji group."

Evolution against Consumption. "The progress of consumption was different. It was never truly epidemic. Owing to its low infectivity, to its lingering nature, to the fact that no immunity from it could be acquired, it did not spread suddenly when first introduced, but when once established its virulence did not abate within measurable time. In other words, it was endemic from the beginning. It made its home in the hovels of the early settlers on the land. In such situations—as in Polynesian villages—modern Englishmen do not take the disease. But their remote ancestors were more susceptible ; they could be infected by a smaller dose of bacilli. Gradually, as civilisation advanced, the conditions became more stringent ; men gathered into larger and denser communities, into hamlets and villages, in which they built houses ill-lighted and worse ventilated. With the rise of towns, and ultimately of great cities, the stringency of selection continually increased, and with it, step by step, the resisting power of the race. To-day Englishmen dwell under conditions as impossible to their remote ancestors as to the modern Red Indians. In fact, no race, especially in cold and temperate climates, is now able to achieve civilisation, to dwell in dense communities, unless it has previously undergone evolution against tuberculosis.

"So during the long sweep of the ages the microbic diseases strengthened their hold on the inhabitants of the eastern hemisphere, who, in turn, slowly evolved powers of resistance. In like manner antelopes grow swift and wild sheep active when persecuted by beasts of prey. Then, when the germs of disease were rife in every home and thick on the garments of every man, there occurred the greatest event in human history, the vastest tragedy. Columbus, sailing across an untracked ocean, discovered the western hemisphere. The long separation between the inhabitants of the East and the West ended. The diseases of the Old World burst with cataclysmal results on the New."

Bacteria as Empire Builders. Then, of course, what had already happened in the Old World had all to be undergone again in the New. Once more plague and pestilence held the field, with great epidemics, followed by famine. In the same way, when smallpox was taken to the West Indies in 1507, whole tribes were exterminated, and shortly afterwards the same fell disease depopulated San Domingo. Three-and-a-half million human beings perished from it in Mexico. Catlin, in 1841, wrote of the United States, that " thirty millions of white men are now scuffling for the goods and luxuries of life over the bones of twelve millions of red men, six millions of whom have fallen victims to smallpox." And so the white man spreads over the so-called uncivilised portion of the globe and inhabits the choicest places previously occupied by others, simply because it has been his lot to have evolved in the course of ages an immunity from some infections and a power of acquiring immunity from others. So the Spanish conquest of the West Indies was followed by the rapid disappearance of the natives, who acquired the diseases imported by every vessel. The striking lesson that bacteriology teaches the empire-builder is that any conquest, in order to be permanent, must be accompanied by extermination, for otherwise, in the course of time, the native will either absorb or expel the conquerors. Dr. Reid says " The Saxon conquest of England was permanent ; of the Norman conquest there remains scarcely a trace. The Huns and the Franks founded permanent empires in Europe : the Roman Empire and that of the Saracens in Spain soon tumbled into ruins. It is highly improbable, therefore, that the British will retain their hold on their Old World dependencies. A handful of aliens cannot for ever keep in subjugation large and increasing races that yearly become more intelligent and insistent in their demands for self-government. But no probable conjunction of circumstances can be thought of that will uproot the Anglo-Saxons from their wide possession in the New World. The wars of extermination are ceasing with the spread of civilisation. We have ransacked the world, and now know every important disease. Diseases cannot come to us as they came to our forefathers and to the Red Indians, like visitations from on high. All the diseases that are capable of travelling have nearly reached their limits; the rest we are able to check. Even in the unlikely event of a new disease arising it would affect other races equally. Canada and Australasia, like the United States, may separate from the parent stem, but the race will persist. If ever a New Zealander broods over the ruin of London he will be a New Zealander of British descent."

New Empires no longer Possible. Thus in plain fact is the natural history of man nothing more than the story of his evolution against bacterial diseases. It is a humbling thought but a true one that the conscious efforts of man have had but little influence upon his destiny in comparison with his unconscious struggle to evolve against the most minute of living creatures. The time for founding new empires has gone for ever. Only a few malarious districts remain. Other nations had their opportunity and threw it away by choosing the tropics for their empire instead of the temperate climes, as was the case with Spain and Portugal. "France lost her opportunity on the Heights of Abraham. Germany is more than a century too late in the start. Russia can conquer only hardy aliens, who will multiply under her rule and ultimately assert their supremacy." To Great Britain alone was it given early enough to evolve immunity from the most devastating of bacterial diseases, and the wisdom or good fortune to colonise those portions of the world where this advantage placed the land at her mercy.

In this brief survey of modern bacteriology we have seen the dawn of a revolution in the methods of medical treatment of disease, a revolution whose future results it is impossible to foresee. In the future of bacteriology lies the hope of the healing art. We have seen how bacteria have moulded the history of the world and particularly of our own race. It only remains to show that these same great principles are in operation in other spheres than those of bacteriology, and that the laws of immunity have a far wider application than has hitherto been supposed. The greatest discovery of all is made plain by the discovery of the laws of immunity in bacteriology—namely, the fact that these laws are operative also in the mental, moral, and religious life of man, as well as in his physical body.

THE HIGHEST AIM OF MAN, PHYSICAL AND MORAL

A great number of readers have now followed the present writer in the sections of this work dealing with the sciences of biology and bacteriology. In the former of these courses we studied the problem of organic evolution, and endeavoured to gain some clear idea as to how that evolution had come about. We watched the relentless principle of natural selection at work, selecting the fit in the struggle for existence and rejecting the unfit, the suppression of the individual for the good of the race. That is Nature's method of progress. Then in the course of bacteriology we have studied a special aspect of organic evolution, evolution against microbic disease, and realised something of what has taken place in past ages which makes it possible for modern civilisation to exist as we see it in our teeming cities. We have learnt that it is possible for a race to become immune from a disease, and for an individual to possess the power of acquiring immunity. More, we clearly see that, unless evolution produces individuals who are either immune, or can acquire immunity from disease, the nation composed of those individuals *must inevitably perish*.

Evolution Against Moral Disease. In what follows here the writer wishes to apply these same principles and laws to other phases of man's life, to show what, in his opinion, must constitute the scientific base of evolution in other spheres than those of disease—spheres to which, as far as he is aware, these laws have not been definitely applied. The view to be here stated is given with all humility; it will not appeal to all—no view can do that, because a hundred minds see the *same truth* from a hundred different aspects—but it is hoped that, as it has helped a few already, it may be of assistance to many more in showing that there is solid scientific ground for expecting certain definite results to follow equally definite lines of procedure in other parts of man's nature.

It will be taken for granted in what follows that the reader has made himself familiar with what is meant by "Immunity," and that he has clearly understood the two types of immunity described in BACTERIOLOGY under the names "Natural or Inborn Immunity" and "Acquired Immunity." It must also be clearly understood that we are not here attempting to construct an elaborate analogy. An analogy is a likeness between things in some respects when the things are otherwise entirely different. The attempt here is to apply the same *identical laws* to additional aspects of man's nature.

Wider Application of Laws of Immunity. If the laws of immunity mean anything, they convey the greatest truth in the world—namely, that by undergoing certain processes a man can become immune from certain agencies. This is the highest aim of man. Physically, mentally, morally, he who is immune from all that can work him evil is the perfect man. There can be no higher ideal for man than to become immune from all that will interfere with the perfect development of his physical, intellectual, and moral nature.

Therefore, we say advisedly that the laws which govern the production of immunity convey the greatest truth in the world. What is here advanced is the scientific application of those same laws of immunity in disease to other parts of man's nature. Disease is merely one phase of human life, and is not entirely physical. It has its mental and moral aspects. We therefore assume that these aspects are involved in the working out of immunity. It is contended that the mental and moral processes, as well as those of disease, can be explained, and their nature demonstrated, by the application of the well-known laws of immunity to that part of man's nature of which they are the outward expression. One cannot separate these from the rest of a man. They are just as much a part of him as is his bodily health. Just as the latter is first developed, and subsequently modified by various natural agencies, so we must believe that these mental and moral processes are similarly brought forth and modified. In a word, a man has been what he was, is what he now is, can be what he hopes to be, in virtue only of one great set of principles which we know as the laws of immunity.

We may now examine the facts of immunity in the non-physical world, just as we did in the course on BACTERIOLOGY in relation to disease. In the realm of moral disease the definition of the term would be as follows: Immunity is that condition of an individual in virtue of which he is able, either partially or absolutely, to resist temptation.

Immunity from Temptation. A close examination of the lives of men and women around us will soon make clear the fact that all have some power of resistance to the variety of moral infections—that is, temptations—by which they are surrounded, and to which they are continually exposed. If this were not so, all would be hopelessly immoral. The righteous and sober life would be impossible. Now, this capacity for resistance, which all possess more or less, is inborn, and, like that against disease, it varies immensely in different individuals. It also varies with the nature of the infection in the same individuals. The temptations of one man are not necessarily those of another, any more than are the weak points in his physical armour. Everyone knows that there are people who can, by virtue of this power of natural resistance, pass unscathed through certain moral infections which in others would inevitably produce moral death. Thus some are naturally sober, innately resistant to the special infection of alcohol. It is no credit to them, but it is something for which they should be profoundly thankful. Others are naturally honest; the temptation to steal simply does not touch them. On the other hand, there are individuals who are especially susceptible to one or other of what we term vices, in whom, that is to say, this natural power of resistance is lacking.

The next point to note is that this inborn immunity of the individual cannot be transferred from one to another. It is useless as a help to his fellow-man. It is only the man of like passions and susceptibilities as ourselves who, having become immune, can transfer his immunity to others. The person who has been vaccinated can provide vaccine lymph which can be used as a protection to others: but if he be insusceptible to vaccination by nature, he is useless for this purpose. So it is that some are born saints, so to speak, while others are born susceptible to moral infection.

In addition to this universal resistance, which all possess in varying degrees, we observe that after passing through some special temptations the individual has acquired an immunity from that special condition, an immunity which did not exist before passing through the experience in question. If the law operates here as it does in the case of disease, we should expect to find that this special immunity lasts in some cases for years, in others for a lifetime. So it is.

The Fallacy of "Sowing Wild Oats." The thought then occurs that since experience of temptations and sin (infection and disease) successfully overcome (recovery) may confer immunity, why not try and confer this immunity artificially by exposing individuals to the contagion? There are those who believe in the efficacy of this process, and who think it a good thing that "wild oats should be sown" in the hope of reaping immunity. But it must be remembered that those who are thus exposed to moral infection run the risk of moral death for themselves, and, for the time being, are centres of infection for others. As a simple matter of fact, experience teaches that large numbers who try the process die morally under its poisonous action. In the case of disease we saw that this deliberate exposure to infection on the chance of recovery with immunity has been made illegal. It is too dangerous, both for the individual and the community. Too many will perish. Only those of high natural resistance will survive. The process is effective in eliminating the unfit, and it is Nature's method, but it is too cruel. In the same way, and for the same reason, the moral and religious law steps in, and says to the individual "Thou shalt not!"

Finally there comes the tremendous claim made by the founders of all moral systems—the claim that they can confer upon mankind an artificial immunity from the moral infection of temptation and the moral disease of sin. The claim is not put in these words, but, translated into modern science, and expressed in terms of immunity, that is what it means. The modern physician is not content to trust to the chance of his patient's recovery to make him immune. The risk is too great. The moral teacher likewise sees the danger of such a process. The physician urges upon his patient not to wait until he be exposed to infection, but to protect himself beforehand by acquiring an artificial immunity. The moral teacher takes the same line, and offers a method of treatment which he claims will confer upon the person an acquired immunity for a time. True, the effect is temporary. All artificial immunity is so, more or less. But the supply is inexhaustible, the process safe, the result certain.

Immunity from Alcoholism. To make all this perfectly clear we may take one concrete example—that of alcohol. Some people have a marked degree of natural inborn immunity from the temptation or the effect of alcohol. They constitute the great majority of the sober members of the population. They are sober because they are immune. If any habitually sober man imagines that he is so because of his strong efforts to struggle against the temptation of alcohol every hour of his life, he deceives himself. It is not so. The sober man who is at the same time honest will admit, if he thinks, that to him alcohol is no temptation. He is immune. The present writer has asked hundreds of sober men why they were so, and every one, after consideration, has admitted the truth of the above statement. To most of us, therefore, it is no credit to be sober, but it should be a matter of great thankfulness that we are naturally immune.

Of those who are naturally susceptible or who acquire a taste for alcohol, a certain number in time become immune. But it is after such an experience as few would care to risk. It is a test under which most succumb, and is far too dangerous to be made a routine process. All moral and religious teachers have clearly recognised this, and they therefore offer a method of acquiring immunity which they claim to be safe, speedy, and certain. They claim that the power of the influence which they prescribe is so strong that it will protect not merely from one, but from all moral infection. In this one point they go beyond anything that science has yet discovered in the sphere of infection disease; but in every other detail the offer which they make appears to be perfectly scientific and practical. It is the method which we ourselves adopt in dealing with our fellow-men. It is the only method by which man can become immune from all deleterious influences, mental, moral, or physical.

GAS, OIL, AND PETROL ENGINES

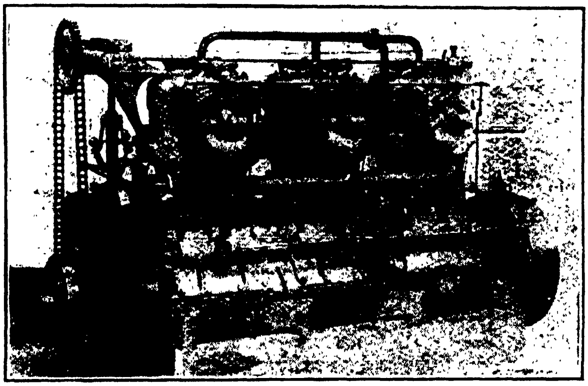
The Gas Engine. Cycles. Gases. Oil Engines. The Diesel. Petrol Motors. Thornycroft. Daimler

By JOSEPH G. HORNER

GAS, oil, and petrol engines are all classed as internal combustion engines, because the fuel is burned within the cylinder instead of in a boiler separate therefrom. Though the heat problems involved are similar to those of steam-engines, the practical working conditions are different in many details. In each case the effect of heat is expansion and pressure, but the pressure of the elastic fluid steam is not of so violent a character as that in the gas-engine. In the latter, an explosive mixture of gas with atmospheric air in certain definite proportions is made and ignited, and so exploded. The resulting heat is so intense that the cylinder would become rapidly overheated unless it were water-jacketed. This, of course, entails much loss of heat, and is exactly contrary to that which exists in steam-engine practice, in which the cylinder is jacketed to lessen escape of heat. Yet the heat efficiency of the gas-engine is greater than that of the steam-engine, because there is no loss consequent on the use of a steam-boiler, and the fuel is therefore used directly.

The term " gas " covers a wide range of product, from town's gas and producer-gas to blast-furnace waste and Mond gas. The only difference in the gas, and the oil and petrol engines, is that the first is all ready for use, and the two last have to be gasified.

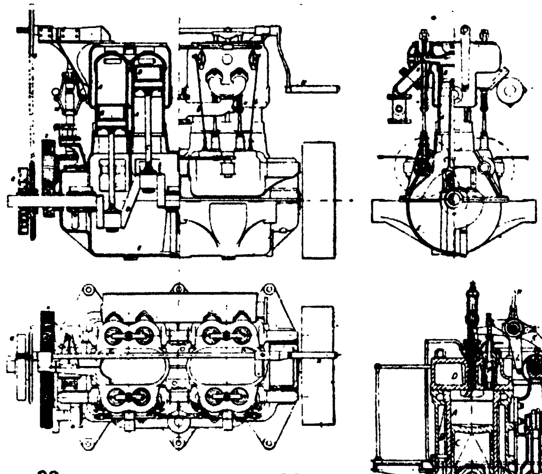
Cycles. A cycle means the entire series of operations involved in the utilisation of a given charge from the period of its introduction to discharge or exhaust. The Otto cycle is that which is now nearly always used. It includes the drawing in of the gas and air into the cylinder, following behind one stroke of the piston, the compression of the mixed charge during the return stroke, and firing at the termination of the in-stroke. It is burnt and exploded in the next forward stroke. There is thus only one actual working stroke in four in an Otto single-acting engine; but further economy is ensured by governing on the hit-and-miss principle. The governor opens or closes the gas valve, responsive to the load on the engine. Most large engines, however, are now often governed in another way, by varying the volume of the gas admitted. The amount of compression possible varies with different gases from about 4 atmospheres to 10, being dependent on the proportion of hydrogen present. The larger the proportion of hydrogen, the less compression is possible. Ignition is effected by an electric spark, or by a red-hot tube.



92. 78-B.H.P. PETROL ENGINE FOR MARINE USE
(John I. Thornycroft & Co., Ltd.)

Gases. The gases used vary much in calorific or heat-giving power. Town's gas alone was used in the early days of the gas-engine. It has a higher percentage of heat-giving power than any other; but its use has long been discarded for large engines in favour of gases lower in calorific power, but much cheaper. The calorific capacity of producer gas is only about one-fourth that of retort gas, that of Mond gas about the same, while that of blast-furnace gas is only about one-sixth. But the nitrogen in the latter takes the place of much of the air ordinarily required in retort gas, and hence the engine efficiency is higher than the calorific value of the gas alone would indicate. In the gas producers, fuel generally of a cheap and inferior kind is fed from a hopper to a brick-lined cylindrical vessel containing a grate. Air is fed by a fan, and carbonic oxide is formed, with nitrogen and other elements in various proportions, according as the method adopted is dry, or wet, or water-gas.

Blast-furnace Gas. Nothing has given so much impetus to the growth of the large gas-engine as the utilisation of blast-furnace gas. The first large engine of this kind exhibited was at the Paris Exhibition of 1900, being of about 600-h.p., which has been more than doubled since. As long as town gas or Dowson producer gas were the only sources available, engines of over 100-h.p. were rarely made. The space occupied by generating plant, and the cost, did not compare very favourably with the steam-boiler plant. In the development of these vast engines, the Cockerill Co., of Belgium, and some German firms led the way. The result is that these engines are now scarcely discernible from steam-engines in external appearance; they are double-acting, and the valves of the drop type resemble those of steam-engines. The hit-and-miss regulation is abandoned in favour of a governor-actuated cam, which regulates the amount of lift of the gas valve, besides which, an immense number of special details are included. At Oberhausen there are seven double-acting engines of this kind, four of which are 1,000-h.p. By designing engines tandem, with two, or four cylinders, the power is multiplied: so that there are engines of 2,000-h.p. and over at work, and there is no reason why from 5,000-h.p. to 6,000-h.p. should not be made if required. In the early days of blast-furnace gas-engines, much trouble arose from the presence of dust and of tar. The dust is now readily got rid of, but the tar still causes trouble, lodging in the cylinder and causing the valves and piston rings to stick in their seatings.



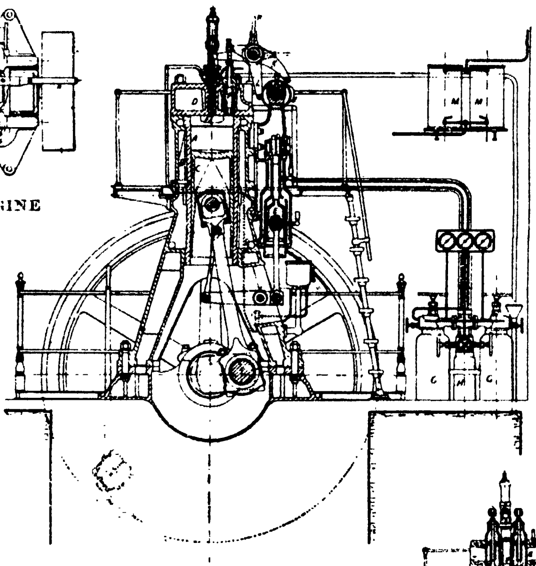
93. THORNYCROFT ENGINE

Oil-engines. These are gas-engines to which the fuel is supplied in the liquid form. Their value lies chiefly in isolated districts in which no power-gas is available. Ordinary petroleum is generally used. The oil is introduced in definite volume into a highly heated chamber—the vaporiser—along with a suitable supply of air. The mixture is then drawn into the working cylinder by the suction stroke. It is then compressed on the return or in-stroke, and ignited. The explosion gives the working stroke, and in the return stroke the products of combustion are exhausted, thus embodying the Otto cycle. The governor lessens the number of explosions when the engine is running light. In some engines the oil is sprayed and mixed with air before it is passed into the working cylinder to be compressed. In others the air is compressed in the vaporiser. The charge of oil and air when it enters the cylinder should have a temperature of from 170° F. to 300° F. About 1 lb. of oil is required per brake horse-power per hour. Petroleum suitable for engines should have a specific gravity of 0·8, and 150° F. its flash point. Cylinders are jacketed as in gas-engines. The thermal efficiency of oil-engines ranges between about 12 per cent. and 18 per cent., the latter being high. By thermal efficiency is meant the ratio of the actual work done by the engine at the brake (B.H.P.) in a given time to the total heat supplied per minute by the complete combustion of the oil required to do that work. Or,

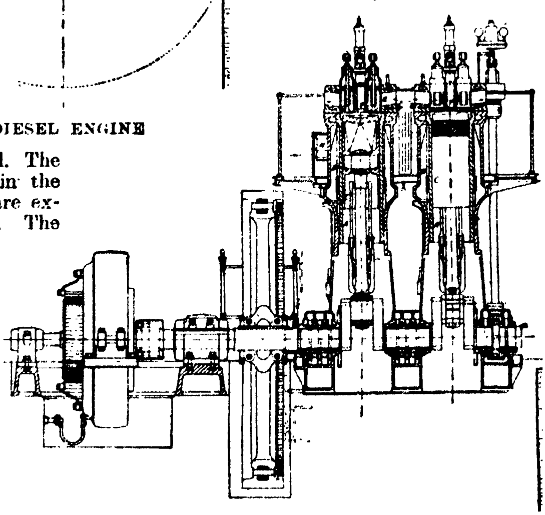
$$\text{Thermal efficiency} = \frac{\text{work done per minute}}{\text{heat supplied per B.H.P. per minute}}$$

One-horse power = 33,000 foot-pounds per minute, or 42·63 heat units. The heat unit is the quantity of heat required to raise the temperature of 1 lb. of water through 1° F., and is equivalent to 774 foot-pounds.

The Diesel Engine. This [**94** and **95**] is a remarkable type of oil-engine which has been developed rapidly of late years. The leading feature by which it is distinguished is the very high compression and temperature employed, from which various results follow. It operates upon the four-cycle principle. During the first stroke air alone is drawn into the cylinder at atmospheric pressure and temperature, and this charge of air only is compressed on the return stroke, to a pressure of about 32 to 35 atmospheres, or, say, 450 lb. to 500 lb. per square inch with a temperature of about 1,000° F. During the third or working stroke the oil fuel is gradually injected by means of an air jet at a pressure of about 800 lb. per square inch. The effect is to spray the oil very finely throughout the highly heated charge of air, with which it is ignited, in consequence of the high pressure present, no ignition apparatus being necessary. There is, therefore, no sudden explosion, such as that which occurs in the ordinary oil-engine, but a gradual combustion and gradual expansion without shock. The fourth stroke exhausts the products of combustion.

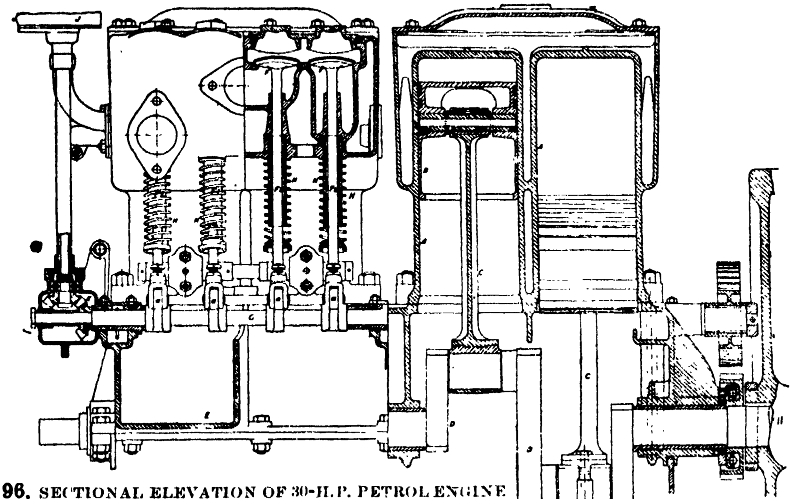


94. DIESEL ENGINE



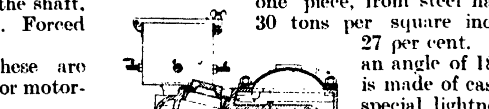
95. DIESEL ENGINE

In the illustrations [**94** and **95**], which is an engine by the Vereinigte Maschinenfabrik Augsburg und Maschinenbaugesellschaft Nürnberg A.G., Augsburg, the following are the principal parts of the engine:



96. SECTIONAL ELEVATION OF 30-H.P. PETROL ENGINE
(Daimler Motor Co., Ltd.)

The cylinder A is fitted with a water-jacket B; the piston C is of trunk form; the engine cover D is at the head of the cylinder, and is also water-jacketed; E is the air pump; N is the fuel feed pump. The compressed air is stored in the vessels G, G, H, one of G being a reserve. The fuel is received from the filtering tanks M, M, and brought into the fuel valve F above the cylinder by means of the pump N. The other valves are the starting valve P, the exhaust valve O, and the handle R the reversing lever is placed in the starting position F. After opening the valve on vessel G the motor starts running. If it has reached the speed required for igniting the fuel, the reversing lever is placed in working position, and then the engine works with fuel and may be loaded at once. The valves are all operated by cam plates on the shaft, J, K and L being the levers. Forced lubrication is adopted.

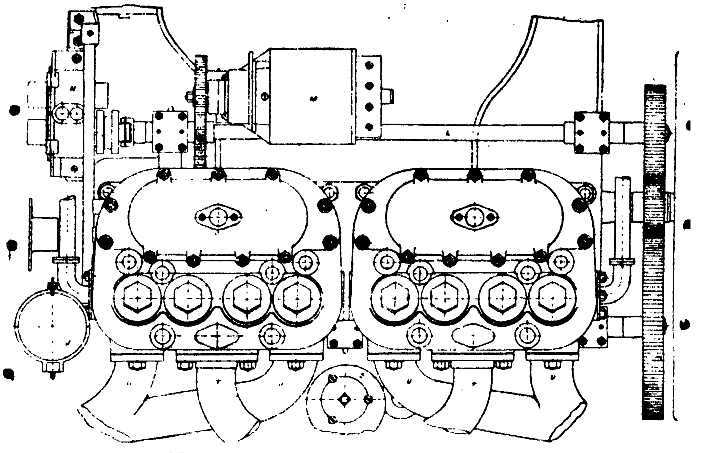


97. END SECTIONAL ELEVATION OF 30-H.P. ENGINE
(Daimler Motor Co., Ltd.)

Petrol Motors. These are special types of oil-engines for motor-cars, launches, and other purposes, in which petrol, vapour and air form the combustible mixture. They are made in four and two-stroke cycle types. The first-named is the same as that already explained. In the second the operations are as follows: The mixture of petrol vapour and air is first drawn into the crank chamber, or into a separate pump cylinder. It is compressed to about 5 lb. per square inch, and is introduced into the cylinder at about the period of the termination of the out-stroke. It is compressed by the in-stroke, and is ignited by an electric spark. The charge expands and drives the piston outwards, and the products of combustion escape through ports in the cylinder walls. The two-stroke design has the advantage of simplicity of construction, but consumes more fuel than the four-stroke cycle does. The heat generated is probably about 1,800° F., which renders water-jacketing or air cooling necessary.

Figure 98 illustrates one of the petrol engines by Messrs. John I. Thornycroft & Co., Ltd., of Chiswick, for marine use. Many details which are not shown here may be observed in the photograph [92], of an engine of similar type, but having six cylinders. The drawing shows a 6 in. by 8 in. cylinder engine. In this, A indicates the cylinders, water-jacketed; B the trunk pistons, with spring rings; C the connecting rods, which are steel stampings; D the crankshaft, machined from one piece, from steel having a tensile strength of 30 tons per square inch, with an elongation of 27 per cent. The crankpins are set at an angle of 180°. The crank casing E is made of cast iron, or aluminium when special lightness is required. It is completely enclosed, is fitted with doors, and the cylinders are registered into and bolted on it. Lubrication of this engine is of the splash system, but a pump and forced lubrication is often adopted.

In front of the photograph [92], and at the lower right-hand end the carburetter is seen, with the air inlet and throttle leading to the supply pipes to the cylinders. The carburetter consists of a body in which the incoming air, as it is sucked by the motor, rushes past a nozzle, from which the petrol is drawn out in a spray and, volatilising, passes thence through the throttle. In F is the inlet pipe to the cylinder, and G is the inlet valve. The exhaust valves are on the opposite side of the cylinders (compare with the plan view). The valve rods H are actuated from the cam shafts J, operating hard steel rollers on the tappet shafts. These cam shafts are driven from the crankshaft through the gears K, K, from the smaller gear L on the crankshaft, and open and close the valves once for each two revolutions of the flywheel. The valves B are lifted by the cams against the pressure of the springs seen encircling the rods, which springs



98. PLAN OF 30-H.P. PETROL ENGINE

close the valves after the full of the cam has passed. From one of the cam shafts the governor M is driven through bevel wheels. The method of its connection with the throttle, on which it acts directly, is seen in the photograph. The method of firing is by means of a low-tension magneto system. The permanent magnets are seen at the left-hand end of the photograph, just below and in front of the governor. The lower ends of the magnets carry two pole-pieces. Within these there is a fixed armature, and between them a soft iron shield or sleeve rotates. The sleeve has two slots cut in it at opposite sides, leaving two open spaces of about 90°. The armature is wound with insulated copper wire, and the lines of force that cut the armature coils vary from nothing to maximum, and maximum to nothing twice in a revolution. Four sparks are thus made per revolution. In another type the armature rotates instead of the shield. The sparking plugs are screwed into the cylinders at *a*, close to the inlet chamber, connected with the magneto by the wires *b*. A contact-breaker placed close to each plug is operated by a cam and a vertical rod. N is the starting handle connecting its shaft with the crankshaft by pitch chain passing over wheels O, P. Q is the free-wheel clutch. It is composed of a pair of ratchets which are carried on the casing round the clutch, and which in its turn is connected to the crankshaft of the engine. The starting chain wheel is attached to the ratchet wheel, which engages with the ratchets in one direction only. When it is desired to start the motor, the starting handle, and consequently the chain wheel, is turned, and drives the crankshaft by means of the ratchet wheel and ratchets. As soon as the engine fires the crankshaft outruns the chain wheel, and centrifugal action causes the ratchets to fly out of contact with the ratchet wheel. The starting handle thus becomes stationary, and the ratchets being out of contact with the wheel, there is no noise caused by their rubbing over the teeth.

A 30-h.p. Daimler motor, designed for a car (Daimler Motor Co., Ltd., Coventry), is shown in **96, 97** and **98**, lettered as follows: A indicates the cylinders, B the pistons, C the connecting rod, D the crankshaft, and E the base chamber. S indicates the vaporiser, T the vapour pipe leading to the induction ports of the cylinders, and U the pipe for carrying away the exhaust gases.

It will be observed that the cylinders are cast in pairs, and water-jacketed. The connecting rods are of H section, and the crank chamber is cast in aluminium. The induction and exhaust valves—which are interchangeable—are indicated at F1 and F2 respectively, and are actuated by the cam shaft G and tappet and roller *a*, the spring H pulling the valve down on to its seating as the cam projection passes the roller *a*. The cam shaft is driven by the usual half-speed wheels. On the side of the cylinders, opposite to and running parallel with the cam shaft, is the lay shaft L, which drives the magneto M and the gear pump N. It may be mentioned that the magneto is fitted as an alternative source for the supply of current to the sparking plugs, and is entirely independent of the ordinary high-tension circuit with induction coil and accumulators as depicted in **99**, which illustrates the method of wiring; also the plan of the distributor case J with the cover removed, showing the block O, which is in contact with and rotates between the brushes P, and thereby makes and breaks the low-tension or primary current. The distributor block O is so designed that the distribution of the secondary or high-tension current to the insulated plugs Q, and thence to the sparking plugs R, synchronises with the opening and closing of the primary or low-tension circuit. The distributor case, which, under normal conditions, is stationary, can, for the purpose of advancing and retarding the timing of the spark, be rotated on its own axis through the required angle. The vertical shaft, to which the distributor block is keyed, is driven by means of bevel gears, K, K, off the end of the cam shaft. Ball bearings are fitted at each end of the vertical shaft. The approximate weight of the above-described engine is 6 cwt.

TRIGONOMETRY

continued from page 6728

By HERBERT J. ALLPORT, M.A.

44. Case Two of Solution of Triangles. Given one side and two angles, say a, B, and C. Since the three angles of a triangle equal 180°, we have $A = 180° - B - C$.

Again, $\frac{\sin A}{a} = \frac{\sin B}{b}$, so that $b = \frac{a \cdot \sin B}{\sin A}$.

Similarly, $c = \frac{a \cdot \sin C}{\sin A}$.

These two equations give the values of b and c.

Adapting these formulæ to the use of logarithms, we have

$$\begin{aligned}\log b &= \log \frac{a \cdot \sin B}{\sin A}\\ &= \log a + \log \sin B - \log \sin A\\ &= \log a + (L \sin B - 10) - (L \sin A - 10)\end{aligned}$$

or, $\log b = \log a + L \sin B - L \sin A$.

Similarly,

$$\log c = \log a + L \sin C - L \sin A.$$

45. Case Three of Solution of Triangles. Given two sides and the included angle, say b, c, and A. We have $B + C = 180° - A$, which gives the value of $(B + C)$. Then, from Article **40**,

$$\tan \frac{B - C}{2} = \frac{b - c}{b + c} \cdot \cot \frac{A}{2}.$$

This gives the value of $\frac{B - C}{2}$, and therefore of $(B - C)$. Having obtained the values of $(B + C)$ and $(B - C)$, the values of B and C can be found.

Finally, since $\frac{a}{\sin A} = \frac{b}{\sin B}$, or $a = \frac{b \cdot \sin A}{\sin B}$, we obtain the value of a.

To arrange the method for logarithmic work we proceed thus:

$$\tan \frac{B - C}{2} = \frac{b - c}{b + c} \cdot \cot \frac{A}{2}.$$

$$\therefore \log \tan \frac{B - C}{2}$$

$$= \log (b - c) - \log (b + c) + \log \cot \frac{A}{2};$$

or, adding 10 to each side of the equation,

$$L \tan \frac{B - C}{2} = \log (b - c) - \log (b + c) + L \cot \frac{A}{2}.$$

And, as in Article **44**, from $a = \frac{b \cdot \sin A}{\sin B}$, we get

$$\log a = \log b + L \sin A - L \sin B.$$

46. Case Four of Solution of Triangles. Given two sides and the angle opposite one of them, say b, c, and B.

Since, $\frac{\sin C}{c} = \frac{\sin B}{b}$,

$$\therefore \sin C = \frac{c \cdot \sin B}{b}. \quad . \quad . \quad (1)$$

C can be found from this equation. Then, having found C,

$$A = 180° - B - C.$$

The value of a is found, as in the last article, from the formula $a = \frac{b \cdot \sin A}{\sin B}$.

47. The Ambiguous Case. In the case considered in Article **46**, the solution of equation (1) gives the value of the *sine* of C. Now, when C is an angle of a triangle, and the value of *sin* C is known, C itself may have *two* values, one of them being less than 90°, and the other being between 90° and 180°.

Hence, there *may* be *two* triangles in which b, c, and B have the given magnitudes. Whether this is so may be decided as follows:

1. If B (the given angle) is *greater than* 90°, C must be *less than* 90°, since any two angles of a triangle must be together less than two right angles. Therefore, when B is greater than 90°, there is only one triangle which satisfies the given conditions.

2. When B (the given angle) is less than 90°, four things have to be considered.

(i.) Is b less than $c \cdot \sin B$? If so, then, since $\sin C = \frac{c \cdot \sin B}{b}$, the value of sin C is greater than 1, which is impossible [Art. **15**]. In this case there is *no* triangle which satisfies the given conditions.

(ii.) b may be *equal* to $c \cdot \sin B$. We should then have $\sin C = 1$, and therefore $C = 90°$. In this case, then, there is only *one* triangle.

(iii.) If b is greater than $c \cdot \sin B$, but *less than* c, then B is less than C [GEOMETRY, *Prop.* 21], and therefore C may be acute or obtuse. Hence, C may have either of the values found from the equation $\sin C = \frac{c \cdot \sin B}{b}$, and there will then be *two* triangles satisfying the given conditions. This is the *ambiguous case* in the solution of triangles.

(iv.) If b is equal to or greater than c, then B is equal to or greater than C. Hence, C must be an acute angle, and therefore there is again only one triangle satisfying the given conditions.

48. We shall conclude with examples illustrating each case in the solution of triangles.

EXAMPLE 1. Given that $a = 40$, $b = 51$, $c = 43$,

$$\log 2 = \cdot 3010300, \ \log 3 = \cdot 4771213,$$
$$\log 67 = 1 \cdot 8260747.$$
$$L \tan 24° \, 44' \, 13'' = 9 \cdot 6634464, \text{ find A.}$$

Here, $a+b+c=40+51+43=134$.

$\therefore s=67,\ s-a=27,\ s-b=16,\ s-c=24$.

$$
\begin{aligned}
\therefore \mathrm{L}\tan\frac{A}{2}-10
&=\tfrac{1}{2}\{\log 16+\log 24-\log 67-\log 27\}\\
&=\tfrac{1}{2}\{\log 2^4+\log 3+\log 2^3-\log 67-\log 3^3\}\\
&=\tfrac{1}{2}\{4\log 2+\log 3+3\log 2-\log 67-3\log 3\}\\
&=\tfrac{1}{2}\{7\log 2-2\log 3-\log 67\}\\
&=\tfrac{1}{2}\{2\cdot 1072100-\cdot 9542426-1\cdot 8260747\}\\
&=\tfrac{1}{2}\{2\cdot 1072100-2\cdot 7803173\}\\
&=-\tfrac{1}{2}\{\cdot 6731073\}=-\cdot 3365536=1\cdot 6634464.
\end{aligned}
$$

$$
\begin{aligned}
\therefore \mathrm{L}\tan\frac{A}{2}&=9\cdot 6634464\\
&=\mathrm{L}\tan 24^\circ\,44'\,13''.
\end{aligned}
$$

$$\therefore A=2\times(24^\circ\,44'\,13'')=\underline{49^\circ\,28'\,26''}.$$

EXAMPLE 2. In the triangle ABC, the base AB is 1,000 ft. long, and the angles at A and B are 31° 20′ and 125° 19′ respectively. Find the length of AC.

We are given A, B, and c.

First, $C=180^\circ-31^\circ\,20'-125^\circ\,19'$
$=23^\circ\,21'$.

Again,

$$
\begin{aligned}
\log b&=\log c+\mathrm{L}\sin B-\mathrm{L}\sin C\\
&=\log 1000+\mathrm{L}\sin 125^\circ\,19'-\mathrm{L}\sin 23^\circ\,21'\\
&=\log 1000+\mathrm{L}\sin 54^\circ\,41'-\mathrm{L}\sin 23^\circ\,21'\\
&=3+9\cdot 9116739-9\cdot 5980754\\
&=3\cdot 3135985\\
&=\log 2058\cdot 725.
\end{aligned}
$$

Thus, $AC=\underline{2058\cdot 725\text{ ft.}}$

EXAMPLE 3. Two sides of a triangle being 2265·4 ft. and 1779 ft., and the included angle being 58° 17′, find the remaining angles of the triangle.

Suppose $b=2265\cdot 4$, $c=1779$, and $A=58^\circ\,17'$.

Then, $B+C=180^\circ-58^\circ\,17'=121^\circ\,43'$.

Again, $\mathrm{L}\tan\dfrac{B-C}{2}$

$$
\begin{aligned}
&=\log(b-c)-\log(b+c)+\mathrm{L}\cot\frac{A}{2}\\
&=\log 486\cdot 4-\log 4044\cdot 4+\mathrm{L}\cot 29^\circ\,8'\,30''\\
&=2\cdot 6869936-3\cdot 6068541+10\cdot 2537195\\
&=9\cdot 3338590\\
&=\mathrm{L}\tan 12^\circ\,10'\,21''.
\end{aligned}
$$

$$\therefore \frac{B-C}{2}=12^\circ\,10'\,21''$$

nd $(B-C)=24^\circ\,20'\,42''$.

But $(B+C)=121^\circ\,43'$.

$\therefore 2B=146^\circ\,3'\,42''$

nd $2C=97^\circ\,22'\,18''$.

Hence, $\left.\begin{aligned}B&=73^\circ\,1'\,51''\\ C&=48^\circ\,41'\,9''\end{aligned}\right\}\ \underline{\textit{Ans.}}$

EXAMPLE 4. The lengths of two sides of a riangle are 5374·5 ft. and 1586·6 ft.; the angle pposite to the shorter side is 15° 11′. Calculate the other angles of the triangle, or of the triangles, if there are two.

Suppose $b=1586\cdot 6$ ft., $c=5374\cdot 5$ ft., and $B=15^\circ\,11'$. Then,

$$
\begin{aligned}
\mathrm{L}\sin C&=\log c+\mathrm{L}\sin B-\log b\\
&=\log 5374\cdot 5+\mathrm{L}\sin 15^\circ\,11'-\log 1586\cdot 6\\
&=3\cdot 7303381+9\cdot 4181495-3\cdot 2004674\\
&=9\cdot 9480202\\
&=\mathrm{L}\sin 62^\circ\,31'\,23''.
\end{aligned}
$$

$\therefore C=62^\circ\,31'\,23''$,

or $180^\circ-62^\circ\,31'\,23''=117^\circ\,28'\,37''$.

And b is less than c, therefore both these values are admissible.

Thus there are two triangles.

(i.) $B=15^\circ\,11'$,	(ii.) $B=15^\circ\,11'$,
$C=62^\circ\,31'\,23''$,	$C=117^\circ\,28'\,37''$,
so that $A=102^\circ\,17'\,37''$.	$A=47^\circ\,20'\,23''$.

EXAMPLE 5.

Given that $C=52^\circ\,10'$, $b=643$ yd., $c=872$ yd., find the other angles.

$$
\begin{aligned}
\mathrm{L}\sin B&=\log b+\mathrm{L}\sin C-\log c\\
&=\log 643+\mathrm{L}\sin 52^\circ\,10'-\log 872\\
&=2\cdot 8082110+9\cdot 8975162-2\cdot 9405165\\
&=9\cdot 7652107\\
&=\mathrm{L}\sin 35^\circ\,37'\,7''.
\end{aligned}
$$

$\therefore B=35^\circ\,37'\,7''$,

or, $180^\circ-35^\circ\,37'\,7''=144^\circ\,22'\,53''$.

But b is less than c, therefore B must be less than C. Hence, the second value found for B is inadmissible.

Thus $B=35^\circ\,37'\,7''$, and

$A=180^\circ-35^\circ\,37'\,7''-52^\circ\,10'=92^\circ\,12'\,53''$.

The above examples, with the exception of Example 1, are worked direct from the Tables of Logarithms. As already mentioned, the method of finding the logarithm corresponding to a given number or trigonometrical ratio, or the number or angle corresponding to a given logarithm, is explained in the book of logarithms.

49. Text Books. For the student who wishes to go further into Mathematics the following textbooks can be recommended.

ALGEBRA.—"A Treatise on Algebra," by Charles Smith (7s. 6d. Macmillan & Co.); "Higher Algebra," by Hall and Knight. (7s. 6d. Macmillan & Co.)

GEOMETRY.—"A School Geometry." Hall and Stevens. (4s. 6d. Macmillan & Co.)

TRIGONOMETRY. — "Plane Trigonometry." Todhunter and Hogg. (5s. Macmillan & Co.)

CONIC SECTIONS —"Geometrical Conics," 6s., and "Conic Sections," 7s. 6d., both by Charles Smith. (Macmillan & Co.)

"Differential Calculus for Beginners." Joseph Edwards. (4s. 6d. Macmillan & Co.)

"Integral Calculus for Beginners." Joseph Edwards. (4s. 6d. Macmillan & Co.)

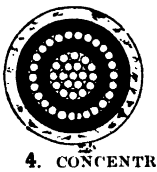
CABLE-MAKING AND LAYING

Concentric and Three-core Cables. Methods of Joining Cables. Systems of Cable Laying

Continued from page 6548

A CONCENTRIC cable [4] consists of a prime central conductor, an insulation covering, a second conductor outside the insulation, a second insulation on top of the second conductor, and a protective covering. The second conductor is in the form of a copper wire ring, which is concentric with the prime conductor. The insulation in this make of cable is usually of paper or jute. The reason for this is that the second conductor could not be well applied on a soft indiarubber insulation before vulcanisation, because it might cut through the plastic substance and cause a fault. Further, if the first insulation were vulcanised before the second conductor were added, the second insulation would have to be vulcanised, and while this was being done the first insulation would be vulcanised again. This would destroy all the good properties of the first covering, and cause it to crack when bent.

Making Concentric Cables. In the making of concentric cables, the first process is the making of the central stranded conductor by means of the stranding machine, as already mentioned. The conductor is taken from the stranding machine to the paper-lapping machine, where it receives a covering of several layers of strong manilla paper tape. This is applied by being spirally wrapped round the conductor much as though the tapes were wires being stranded round the core. Each layer of paper is wrapped on in reverse spiral, for the reason stated, with rubber strips. The paper-covered core is now placed in a hot-air chamber, heated to about 250°, to drive out all moisture. Since the paper will again absorb moisture from the atmosphere if left about, it is at once taken to the tanks containing a special hot resinous compound. The paper is thoroughly impregnated with this compound until it is practically waterproof. At the same time, the compound adds a little to the better insulation of the cable. From the tanks the cable is again taken to the stranding machine, where it receives its second conductor. This requires careful application, since, when it is on, the wires forming it must have a combined sectional area equal to that of the prime conductor, because both will have to carry the same amount of current with the same amount of resistance. If the sectional area differed, the smaller conductor would offer more resistance than the greater to the passage of the same amount of electricity. This would cause waste of current and more heat in the circuit, therefore both conductors should be of the same sectional area. The second insulation is now applied by the wrapping, drying, and impregnating processes as before.



4. CONCENTRIC CABLE—LEAD COVERED

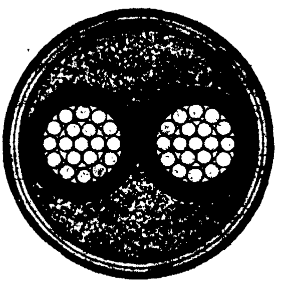
Lead Covering. With a moisture-absorbing material like paper a waterproof covering is necessary; therefore, as the cable comes out of the compound tanks for the second time it is taken to the hydraulic lead press to be encased with a lead sheathing. The method of applying this has been much discussed among cable-makers, some preferring to put on the lead at a high temperature with low pressure, and others at a lower temperature with high pressure.

In the former method, the lead is very liable to small air holes, or pores, and the thickness of the sheathing is not usually the same all the way round. In the second method, owing to the increased pressure, porosity is less likely to occur, and the thickness of the covering is more smoothly and evenly maintained; hence the high pressure process is now becoming general. At the hydraulic press the cable passes through the centre of a die, through which the lead is forced at the same time under very great pressure and at a temperature well below melting point. This gives the cable a closely-fitting protective sheathing against dampness and mechanical injury. With the lead covering on, the cable is ready for testing. In connection with these paper-insulated cables, the great difficulty is to prevent dampness getting to the insulation, because dampness not only conducts electricity, but also quickly rots the paper and causes a fault. When a fault occurs, there is no telling what may happen, so that it behoves makers to see that the cable is sound before it leaves the works.

Testing Lead-covered Cables. The testing of lead-covered cables is rather difficult to conduct in a satisfactory manner. The cable is first placed in water-tanks, and left there for about twenty-four hours, the ends being carefully kept out of the water, because they are not fully protected against dampness. When the test for insulation resistance is made, the ends are carefully prepared to prevent surface leakage by being coated over with an insulating compound. Both the waterproof and the insulation resistance tests are very similar to those for indiarubber insulated cables. It will be noticed that the concentric cable is not tested as soon as the insulation is applied, as the single cable was, and the reason for this will be readily understood when it is remembered that the chief idea right through the process of making the cable is to prevent dampness in the paper.

The unsatisfactory part of the testing when the lead covering is on is this: owing to the method of application, there is always the possibility of weak places occurring in the lead. These will withstand the tests when the cable is newly made and before it has been wound many times on a drum, but very soon after it comes to be wound and unwound in the process of laying, the weak places break down, and when next the electricity is sent through there is a fault shown. After the testing the cable is ready for use. Since lead soon decomposes when laid in the ground, this class of cable is usually laid in conduits. The concentric cable, having two conductors, may be used alone.

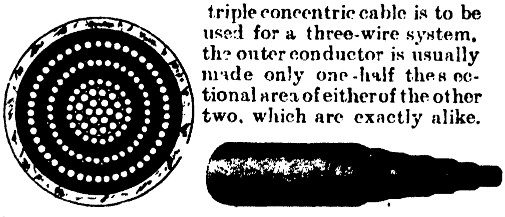
Twin Cable. This is called a twin cable [5] because it has two similar insulated conductors bound together under one protective covering. The two conductors are stranded separately at the machine, and each is separately insulated by indiarubber, bitumen, or paper.



5. TWIN CABLE—DOUBLE-STEEL TAPE ARMOURED

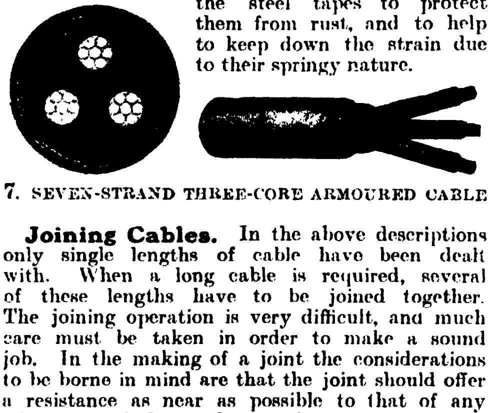
As the conductors are usually small in twin cables, they can generally receive their insulation, if of indiarubber, at the longitudinal machine. If bitumen or paper is used, the insulation is applied by the wrapping process. After receiving the insulation of indiarubber, the cables are tested in a manner similar to the single indiarubber cable. Up to the testing process the two conductors are treated as separate cables, but from this point they become as one. If they withstand the tests satisfactorily, they are placed side by side and closely packed round with broken jute, usually impregnated with resinous or tarry compounds. A stout jute braid is then applied round the packing to keep it tightly in its place, and to make a solid core around which a lead covering or wire armouring may be placed. Before the armouring is applied, the braided cable is passed through the serving tanks to receive its covering of compound, which acts as a preventive against dampness. The lead covering is also put on for this purpose, but it further acts as a mechanical protection.

Triple Concentric Cable. This [6] is so called on account of the three concentric conductors which are enclosed within its armouring. It consists of a central conductor, a first layer of insulation, a second conductor in the form of a ring, a second layer of insulation outside the ring, then a third conductor, again in the form of a ring of copper wire, and a third insulation. As the insulation is usually of paper, for the reasons stated for the concentric cable, the usual protective covering is the waterproof lead sheath applied by pressure. The stranding of the conductors, the wrapping of the insulation, and the pressing on of the lead are all done in the manner as described for the concentric cable. If the triple concentric cable is to be used for a three-wire system, the outer conductor is usually made only one-half the sectional area of either of the other two, which are exactly alike.



6. TRIPLE CONCENTRIC CABLE—LEAD COVERED

Three-core Cables. This cable [7], as the name implies, has three cores or conductors, each of which is separately stranded and insulated. All three are then bound together within one armouring. A sample of the three core cable before the writer is insulated with bitumen. To prepare this substance for insulation purposes, it must go through a thorough refining process. Much difficulty was at one time experienced in getting this material into such a condition that it was neither so brittle as to crack when bent nor so soft as to allow the heavy conductor to become decentralised when insulated with it. After the refining process the bitumen is compounded with chemicals, one of which is sulphur, and rolled into thin sheets. These are cut into narrow strips, which are wrapped spirally round the conductor, after a lapping of paper or indiarubber-covered cotton tape has been applied on the copper to prevent the sulphur in the bitumen from tarnishing it. The process of vulcanisation is the same as for indiarubber, and it is done for the purpose of adding strength and flexibility to the compound. Each conductor is generally of the same size, and insulated with the same thickness of material. When the insulation is vulcanised, the three cores are placed together and tightly packed round with jute soaked in oily or bituminous compound. A strong braid surrounds the packing, and on the outside of this the armouring is placed. This may take the form of galvanised iron wires, steel tapes, or lead sheathing. If steel tapes are used, they are applied by the steel taping machine and laid on in two spiral layers. The second layer is wound over the joints of the first, so that there is no joint showing right through the steel covering. Steel tapes are an excellent form of mechanical protection, as they are flexible and will withstand a lot of rough treatment without injuring anything underneath them. A covering of strong braid is usually placed over the steel tapes to protect them from rust, and to help to keep down the strain due to their springy nature.



7. SEVEN-STRAND THREE-CORE ARMOURED CABLE

Joining Cables. In the above descriptions only single lengths of cable have been dealt with. When a long cable is required, several of these lengths have to be joined together. The joining operation is very difficult, and much care must be taken in order to make a sound job. In the making of a joint the considerations to be borne in mind are that the joint should offer a resistance as near as possible to that of any other part of the conductor, the insulation about the joint should be as sound as any other portion of the cable, and the joint should be strong enough to withstand a certain amount of rough usage which it is sure to receive when being laid. The method of making the joint varies somewhat with the style of cable being joined. A common way of fastening together two lengths of small size cable (say, nineteen strand) is by what is known as the *married joint* [8]. To make this the conductors are stripped of their insulation for a short distance from the ends about to be joined. The bare conductors are then bound round with a few turns of thin copper binding wire at the place where the insulation ends. This is to keep the strands in place while the outer wires are bent back so as to disclose the central strands of seven wires. These are soldered up solid for some distance and then filed into a long bevel so that when placed together there will be a fairly large surface of each in contact with the other. The two ends are then held together while they are tightly bound with binding wire. The joint is then soldered over and filed down smooth. The wires should be thoroughly cleaned before joining so that the solder will run well on them. The outer wires, which have been bent back, are now cut off at suitable lengths, alternate ones of each conductor being cut long and short. These are then butted together so that a long wire from one side butts against a short one of the other, and molten solder is poured over the joints, after binding wire has been wrapped over them. Figure **8** shows this joint.

The solder is filed down to smoothness so that there will be no sharp projections which might pierce the insulation. The reason for cutting off the outer wires in alternate long and short lengths is to avoid the overlapping of the wires and to make the finished joint as nearly as possible the same thickness as any other portion of the conductor. If the conductor is a very small one (say, of only seven wires), it is usually joined by one joint in a similar manner to the central strand as described above.

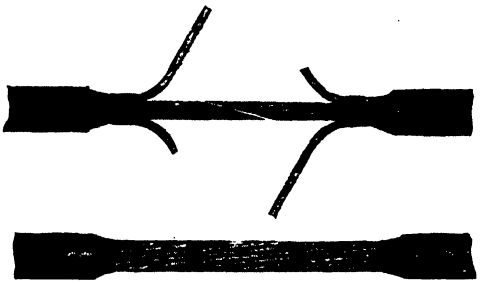
The Telescopic Joint. Another simple way of joining small cables is by the telescope joint as shown in **9.** To make this the conductors are stripped of their insulation for a short distance and then bound with wire as before. The outer wires of one conductor are then cut off at the binding, and the inner strand of the other is cut off at its binding. The outside wires, B, now remaining are laid up in position again so that they form a hollow cylinder into which the projecting central strand, A, of the first conductor, after being soldered up solid, is inserted. The end of the hollow cylinder touches the binding at which the outer wires were cut off. The whole joint is tightly bound with wire, and then soldered over and filed down smooth, after which it is ready for insulating.

In the concentric cable the inner conductor is joined by the single or married joint, according to size, and then insulated, the outer wires, or the second conductor, having been turned back out of the way. A sleeve of clean copper is usually placed over the joint on the outside of the first insulation, and on the top of this sleeve the second conductor is married, bound, and soldered as mentioned before. In joining concentric cables great care must be used so that the first insulation shall not be damaged in any way during the process of joining the second conductor. The second insulation is applied and then the protective covering.

Joint Boxes. Large cables are usually joined in specially made joint boxes filled up solid with compound to make them watertight and to improve the insulation.

When joint boxes are not used the insulation of the joints in cables is a very difficult matter, as will be readily understood when it is stated that these are the places in which the conductor will offer most resistance and consequently generate most heat. Further, the insulation will have to be tightly and soundly applied without any of its properties being impaired in any way. There are two ways of re-insulating the joints in indiarubber-covered cables; one by means of pure indiarubber, and the other by vulcanising indiarubber. The pure indiarubber joint is made by stripping back the tapes and braids so that they will be clear of the part to be reinsulated. When the indiarubber is thick enough the surface which has been exposed during the making of the copper joint should be trimmed down to the conductor in a long bevel.

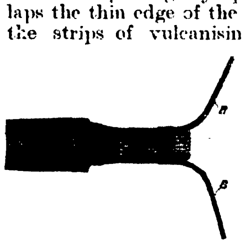
This will expose a new, clean surface, to which the pure indiarubber strip about to be applied will stick better. If the copper joint is clean and smooth, the pure indiarubber strip is wrapped tightly and evenly round it, and over the bevelled surfaces, until a thickness equal to, or slightly greater than, that of the old covering is obtained. Strong tapes are then soaked in compound and tightly wrapped over the strip, and for a short distance over the original braiding. The whole joint is then painted over with resinous, water-resisting compound. When the indiarubber insulation is not thick enough to be bevelled down, the new rubber may be lapped for about an inch or so over the old, which ought first to be well scraped and cleaned to remove all grease and dirt. This kind of reinsulation of joints answers all practical purposes in indoor low-pressure circuits where little moisture penetrates and little heat is generated.



8. MARRIED JOINT

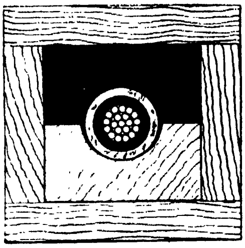
Joining Cables Out of Doors. The making of a vulcanised indiarubber joint out of doors requires special apparatus, since it is practically impossible to carry about with one a steam generating plant and vulcanising pans. The molten sulphur bath is probably the most satisfactory portable vulcaniser for outside work. The bath may consist of a strong, cylindrical box, made in halves, and flanged so that they may be bolted together to enclose the joint. The upper half contains a hole through which the molten sulphur is poured, and through which a thermometer is placed so that the temperature of the sulphur can be read. The bottom half contains a tap, through which the sulphur is run out after the process is over. When the box is screwed up with the joint inside, the openings through which the cable passes are packed with common rubber to protect the insulation from the heated flanges.

The preparation of the joint for the insulation is similar to that described above. When the bevelled edges have been cleaned, a lapping of pure indiarubber strip is tightly applied so that it just overlaps the thin edge of the bevel. On the top of this the strips of vulcanising indiarubber are firmly wrapped until the insulation about the joint is the same diameter as any other portion of the cable. The tightness and evenness of wrapping are essential to prevent small air spaces being left between the layers of insulation. A spiral wrapping of indiarubber-covered tape is placed over the vulcanising



9. TELESCOPE JOINT

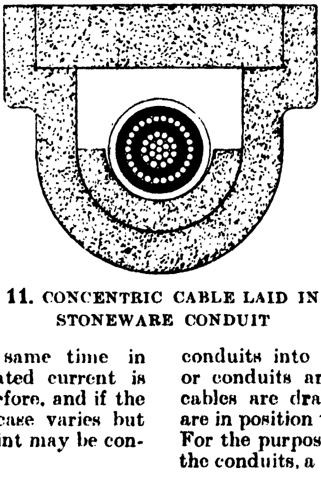
rubber, and in order to keep the insulation in shape, and under pressure, a piece of sheeting is tightly rolled over the tape so as to form a longitudinal seam. On this a spiral wrapping of strong unprepared tape is applied. The sheeting and unprepared tape merely act as a mould while the joint is being vulcanised. As soon as the process is over both are removed. The sulphur is melted over the fire used for heating the soldering irons, and is poured through the top hole in the box. The temperature is maintained by placing spirit lamps under the box. It is advisable to heat the box first so that the temperature of the sulphur will not be greatly diminished when it comes into contact with the metal. After the sulphur has been kept at the proper temperature for the requisite time, it is run out, the box is unbolted, and the joint allowed to cool. The operation is over. A rough test for the degree of vulcanisation may be made by pressing the indiarubber, when cool, with the thumbnail. If this leaves no mark, the rubber may be considered to be correctly cured. If a mark is left the indiarubber is probably under-vulcanised, and if the substance feels hard and solid so that the nail makes no impression, over-vulcanisation has probably occurred. The vulcanised joint is protected by strong tapes and braid, which overlap for a short distance the original braid on the cable. Joints in bitumen-insulated cables are made in a similar manner to those described above, but the paper cables are more commonly joined in special joint boxes, which are watertight and take the place of lead covering.



10. SOLID SYSTEM OF CABLE LAYING

Testing Joints. When the joints are completed, they should be tested to see that their insulation resistance is not much different from that of an equal length of continuous cable. There are several ways of testing joints, but a simple and effective one is known as the accumulation method. The joint to be tested is placed in water contained in a trough which is thoroughly insulated by being raised from the ground on blocks of insulating material.

The trough should be tested before proceeding with any other tests. The length of cable containing the joint is connected to one pole of a battery, the other pole of which is connected, through a condenser, to the water by a wire, which is not allowed to touch the cable. The current passing through the insulation of the joint escapes through the water and along the wire to the condenser. This is then disconnected from the trough and connected to a galvanometer, through which the condensed or accumulated current passes, and gives a deflection. The joined length of cable is removed and a continuous piece substituted; the condenser is again connected with the trough and again collects the current passing through the resistance of the cable under test. The battery is kept on for the same time in both cases. The second accumulated current is sent through the galvanometer as before, and if the deflection obtained in the second case varies but slightly from that of the first, the joint may be considered satisfactory.



11. CONCENTRIC CABLE LAID IN STONEWARE CONDUIT

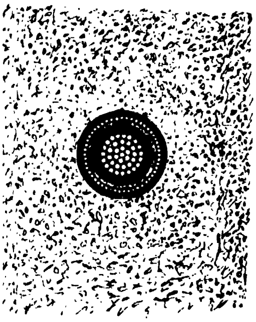
The trough may be tested by passing a current through an electrometer until a steady deflection it obtained. The battery is removed and the electrometer connected to the trough. A decrease in the deflection of the instrument takes place, but if this decrease is only very slight, the trough is sufficiently well insulated for testing purposes.

Cable Laying. When the joints are tested and found sound the finished cable is ready for laying. The question of whether the cable should be laid underground or overhead is soon decided. In England the only method allowed in any of the large towns is the underground system, although under certain circumstances, especially for the transmission of electricity over long distances, the overhead lines may have decided advantages. Overhead wires are chiefly confined to outlying mining districts. There are many in South Wales. The several ways of laying cables underground may be grouped into two classes: (1) the "built-in," or "solid" system and (2) the "drawn-in" system. Figure **10** shows a lead-covered cable laid on the solid system, and **11** shows a cable laid in a conduit in the "drawn-in" system.

Access to built-in cables, when once they are laid, can be made only by opening up the ground, whereas in the drawn-in system, the cables, lying as they do in conduits, may be easily withdrawn into the nearest surface box for inspection. Greater mechanical protection is required in the "solid" method than in the "drawn-in." This is because the cables in the solid system are sometimes laid in the ground direct [**12**]. The armouring may consist of steel tapes, or iron wires, or the cables may be laid in troughs of wood or iron, filled up solid with compound. Sometimes broad tiles are placed just above the cables to give warning to workmen when opening the ground that the cable is at hand. Precautions are then taken that the pick or spade is not sent through the cable's insulation. In these troughs a good plan is to lay the cables on small bridges of wood, as shown in **10**, before filling up with the compound or asphalt.

Whichever of these plans is adopted, the cables must be laid while the ground is open, and this is a great inconvenience to traffic if the laying happens to be in a very busy thoroughfare. Further, the road authorities allow only a certain length of trench to be open at one time, and this is often a hindrance to rapid laying. When a length of trench is prepared, the drum containing the cable is mounted on a trolley and wheeled along the side of the trench so that it pays off the cable, which is laid in place in the trough. Hot compound is then poured over it. The trench is filled up, and the surface repaved.

Drawn-in System of Laying. In the "drawn-in" system it is not necessary to go to the expense of strongly armouring the cables because they are provided with mechanical protection by the conduits into which they are drawn. The pipes or conduits are placed in the ground before the cables are drawn into them, and when once they are in position the ground need not again be opened. For the purpose of drawing the hauling line through the conduits, a wire is threaded through each section of them, as they are laid, and it is fastened in the surface boxes. When the conduits are laid, the drum containing the cable is conveniently placed on an axle near the mouth of a surface box, and the end of the cable is connected, by a smooth, strong, fastening, to the hauling line, which is then drawn through the conduits by the wire left for that purpose. The rope is then used for drawing in the cable. The length of cable which may be drawn in at one hauling depends partly upon the weight of the cable but chiefly upon the straightness of the conduits about to be entered. In town work the lengths are usually short on account of the numerous sharp bends encountered. When a bend is reached, a length of cable, sufficient to reach to the next surface box, is drawn through and laid on the ground in long loops. The hauling rope is drawn on as before, and then the loops of cable gradually disappear into the conduits. The reason for raising the length of cable to the surface at the bend is to avoid the friction and extreme tension which would arise from the cable being drawn round a sharp corner. Even in straight lengths of conduit the friction is very great, and to reduce this as far as possible a coating of whiting is often applied, as a lubricant, to the cable. Sometimes a chain is drawn through the pipes to clear away any obstacles which might increase the friction or tension on the cable that follows. If the conduits are smooth to begin with, and these precautions are taken against friction, the possibility of damage to the cable during the drawing-in is reduced to a minimum.



12. WIRE-ARMOURED CABLE LAID DIRECT IN THE GROUND

Conduits. The cost of conduits is a considerable item. When large-sized cables are laid, a separate way is usually provided for each one, although smaller sizes may be drawn in in pairs. This question of cost has led many people to turn their attention to the manufacture of cheaper kinds of pipes which can be readily joined together. Brick culverts are rarely used now because they take up much space underground, they occupy a long time in building, and are very costly. Earthenware conduits, with two or three cable-ways, can be laid much more quickly and cheaply, and they are now manufactured in a special way so that the joints can be easily made. The disadvantage of earthenware pipes is that they are very liable to fracture, and on account of this other kinds are sometimes substituted.

Bituminous concrete conduits are often used because they are fairly cheap. They are made in blocks with two or more passages, and are joined together by inserting short mandrels in each passage of two blocks while hot bituminous compound is poured into the joint and allowed to cool. When the mandrels are withdrawn the compound has formed a joint between the two blocks, and the mandrils have kept clear the passages through which the cables will be drawn. Cast-iron pipes are extensively used in connection with Post Office cables, as they have been found to be the most satisfactory.

Considerations in Laying. In deciding at any place whether the cables shall be laid by the "solid" or "drawn-in" systems, considerations are given chiefly to the cost of the cables and conduits. If the "built-in" cables are laid in iron troughs filled up solid with compound and the "drawn-in" system has cast-iron pipes for conduits, then the cheaper method is probably the latter, as in this the cables are not usually so strongly armoured as in the former. After the cost the convenience of access in the "drawn-in" system strongly recommends this method, although it has several disadvantages. The conduits are always liable to infiltrations of water and gases, and if the insulation is not perfectly waterproof, a fault may easily occur. Further, wherever gas collects there is always the possibility of an explosion. The conduits are usually connected with the drain pipes so that the water may run out almost as quickly as it enters. In the solid system there are no spaces in which gas may collect, and the insulation is usually waterproof, therefore the small amount of water which may penetrate the compound around it may be ignored.

Uses of Different Insulations. The different kinds of insulations mentioned have their respective advantages and disadvantages for special classes of work. For a material to be a good insulator it should be moisture-resisting, because moisture is a conductor, and lowers the effectiveness of the insulation; it must be strong and tough, so that it can withstand the rough usage it receives in laying without splitting or tearing, and it should be flexible so that it can be easily wound on drums or bent round sharp corners under ground. Further, it is desirable that it should withstand a fairly high temperature without being injured permanently, as heat is generated by the passage of the current along the conductor, and it should be practically unaffected by the acids and gases it is likely to meet when laid in the earth. In high-pressure circuits the insulation must be a very homogeneous mass, because it has to offer great resistance to disruptive discharge. When an installation is found with all or most of these properties, the best cable is that in which the cost, bulk, and weight are least. Good quality of indiarubber, properly applied, possesses almost all these qualities: therefore, from a purely technical point of view it is undoubtedly the best insulator known. Its one great disadvantage is that it is expensive.

Bitumen compound is a fairly good insulator for low-pressure work, but as it cannot withstand much heat without softening, it is unsuitable for heavy current work, where a large amount of heat is generated. Its resistance, thickness for thickness, is not quite so good as indiarubber, but it has the advantage of being cheap. Gutta-percha has a comparatively low melting point, and is therefore confined chiefly to insulation of submarine cables, and underground telephone and telegraph wires, which work only at low pressure. The advantages of gutta-percha for these insulations are that it is thoroughly waterproof and lasting. Paper insulations are suitable for either high or low pressure circuits as they will withstand a fair amount of heat without serious injury. Their disadvantages are that the paper readily absorbs moisture and therefore always requires a lead or other variety of waterproof covering, which adds to the expense. The paper itself is inexpensive.

ELECTRIC CABLES *concluded*

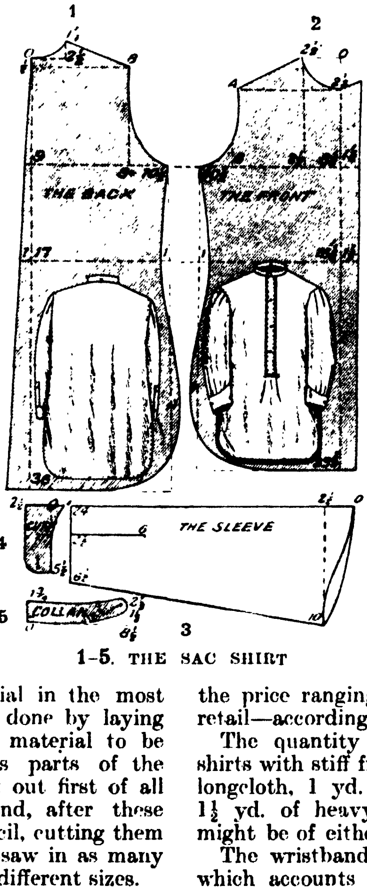
SHIRT AND COLLAR MAKING

The Making and Dressing of all Kinds and Makes of Shirts. Drafting, Cutting and Finishing. Collar Making. Popular Styles

By W. D. F. VINCENT

FORTY or fifty years ago shirtmaking was one of the cottage industries of England. The general practice then was for the large firms who supplied the shopkeepers engaged in the drapery and outfitting trades to send round to the women of the villages and small towns of the country districts the cut-out parts in a range of sizes, paying at the rate of so much per dozen for the ordinary work of making up. Specially good needlewomen, who could work neat buttonholes and do the other parts of the work exceptionally well. found this a good means of adding to the domestic income.

The general adoption of the sewing machine, and its introduction to the factory system of working, brought about a change in this class of work. It ceased to be a home industry in the sense of home-workers being employed to supply the wholesale merchant with his requirements. Big shirt factories were established in several districts, Devonshire and Belfast being the leading centres, the latter doubtless by reason of its being the seat of the Irish linen trade. London also has become an important centre for the manufacture of linen shirts and what may be called kindred articles, such as collars, cuffs, and the now almost abandoned shirt-front or "dickie."



1-5. THE SAC SHIRT

Whether, however, the goods are made at home or in the factory, the principle of production is practically the same.

Cutting Out the Material. In the factory the first thing is to cut out the material in the most economical manner. This is done by laying out a number of folds of the material to be used, and placing the various parts of the pattern, which are usually cut out first of all in tin or stout cardboard, and, after these have been marked round in pencil, cutting them out with a hand knife or band-saw in as many thicknesses as required for the different sizes.

For domestic or individual work, of course, a different plan is adopted, but it is equally important to arrange the pattern so as to use as small a quantity of material as possible.

The various parts of the shirt having been cut, the body part from calico, and front, cuffs and collar from linen, the supplementary parts have next to be attended to, such as the underlining for the cuffs, which is usually a fabric composed of a mixture of linen and cotton, and the backing for the fronts. The quality of a shirt is generally made to depend upon the fineness of the linen employed in making the front and cuffs, which is reckoned according to the number of threads to the inch, as counted through a magnifying glass specially made for the purpose.

The various parts of the different kinds of shirts will be seen by reference to the diagrams, and these are put together by the ordinary methods of sewing, the main object being to fit the body without causing discomfort at any part.

The buttonholes should be very neatly worked, and a sewing machine for working buttonholes is largely used in all shirt and collar factories. This machine, by means of a kind of cross-stitching, does the sewing before the hole is cut, this being done by a chisel, or similar tool, after the shirt or collar has been finished and dressed—that is, starched and ironed.

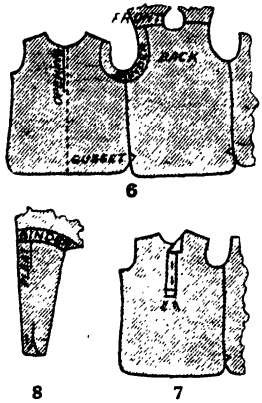
Great care should be exercised in seeing that the buttonholes harmonise as regards position, that the hole in the back of the collar be exactly in the centre, and that those of the cuffs are properly balanced.

Material for Shirts. The material used for making shirts is a calico, in the trade termed longcloth, varying from 34 in. to 37 in. in width, the price ranging from 5½d. to 10d. per yard—retail—according to quality required.

The quantity of material required for two shirts with stiff fronts and wrists would be 6 yd. longcloth, 1 yd. Irish linen for frontings, and 1½ yd. of heavy interlining. The interlining might be of either linen or cotton.

The wristbands are usually made fourfold—which accounts for the extra length of interlining—to resist the greater wear on them generally. Cottons Nos. 40 to 45, 6-cord, would be suitable for bodymaking; but for fronts, wristbands and buttonholes, 60, 6-cord, would be best. For needles, Singers' ½ would be found suitable.

The material for flannel day shirts varies from 3 yd. to 3½ yd. These are, of course, easier to make, owing to there being no stiff fronts or wristbands to be inserted. The cloth is folded in the same way as for dress shirts, but instead of cutting away a piece for the insertion of the stiff front, a piece of cloth about two inches wide is stitched down the centre, so as to form a broad plait when buttoned over. Then slope out the neck according to the size required. The neckbands of these shirts are generally made of drab or grey sateen.



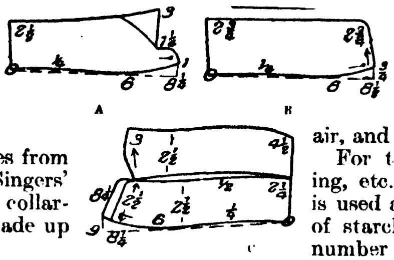
6–8. FITTING THE SHIRT TOGETHER

The wristbands are cut so as to fit just round the wrist about 2½ in. or 3 in. deep. Pearl buttons are used for fronts and wristbands. Owing to the greater strength required of these shirts for day work generally, the same should be made up with 6-cord cotton, 45 to 50.

Linen Collars. The quantity of material required varies according to the shape of collar. The cloth used for fronting is generally Irish linen, which dresses up so much better than cotton, and imparts a higher finish to the collar when dressed, and wears longer.

The collar can be lined with either a heavy cotton or linen interlining; but the latter would be more durable, and would be found cheaper in the end.

The material for collars varies from 34 in. to 36 in. in width. Singers' 0 needles are suitable for collar-making. Collars should be made up in 6-cord, 60 to 80, cotton.



9. COLLAR DRAFTING
A. The "Wing" B. The "Stand" C. The "Double"

Diagram 9 gives reduced models of some of the most popular styles of collars, which only need to be reproduced by the ordinary inchtape to give a good model.

The variations in size can be easily made by adding to or taking from the back.

"Dressing." A new shirt should first be placed in cold water for the purpose of taking out the dress or priming of the cloth of which it is made, and afterwards taken out and washed as household linen, being thoroughly well dried in the open air before starching. While the shirt is drying lump-borax should be dissolved in the proportion of 4 oz. to 6 oz. in one pint of boiling water to half a dozen shirts. The starch (which should always be good rice starch) should then be prepared. Take 1 lb. of starch, add a little blue, which gives the shirt a whiter appearance when dressed, mix the starch in a little cold water, then add water in which the borax has been dissolved, which, however, should first be allowed to cool. The shirt being thoroughly dry, first take hold of the wristbands, and well soak and rub in the starch that has been prepared, and then deal with the front in the same way. The wristbands should next be rolled to front tightly, and the shirt allowed to remain three or four hours if possible; it could be ironed immediately if required, but in this case it would need to be first rolled in a dry cloth, or rubbed down with a dry cloth to take off the surface starch and superfluous moisture. If the starch appears a little thick when rubbing, add a little water to reduce it.

Ironing. First set, or lay out flat, the yoke of the shirt, then neck band, and afterwards the body, seam to seam.

Iron the body of shirt first, then "set" the cuffs and iron the sleeves. When this is done, prepare the front. Place a board (which should be covered with a piece of ironing flannel) between back and front of shirt, and then set for ironing. Next take an oval iron, or polisher, well heat it, and then take a piece of rag upon which a piece of beeswax has been placed, and rub the iron lightly with this—which will cause the iron to run smoothly over the starched front and wrists—but before using, wipe again with a clean duster, to remove any particle of beeswax that might be sticking to the iron. Then, with the heel of the polisher rub briskly, using the point or nose of the iron around neck band. When ironed, fold, and press with flat iron, well air, and the shirt is ready for use.

For the washing, drying, starching, etc., of collar, the same process is used as for shirts, but the quantity of starch required depends upon the number of articles to be dressed.

White shirts are made up in many varieties of fronts and cuffs. Thus the dress shirt has a front 14 in. or 15 in. deep, and about 11 in. wide, with one stud-hole in the centre about 5 in. or 6 in. down from the collar.

The ordinary, or everyday, shirt has a front ranging from 11 in. to 13½ in. long, and 8 in. to 9 in. wide, with two or three buttonholes up the front.

Short-fronted shirts are also made for those who wear high buttoning vests, and the newest style of these are V-shaped, which gives much more comfort than the old round pattern.

Many shirts are now made up with soft fronts, or in other words without the insertion of any kind of front, and it is to this class that the flannel shirt belongs.

Cuffs are usually placed at the wrists, but many are now made with detachable cuffs. Occasionally, shirts are made up with collars attached, but this is the exception.

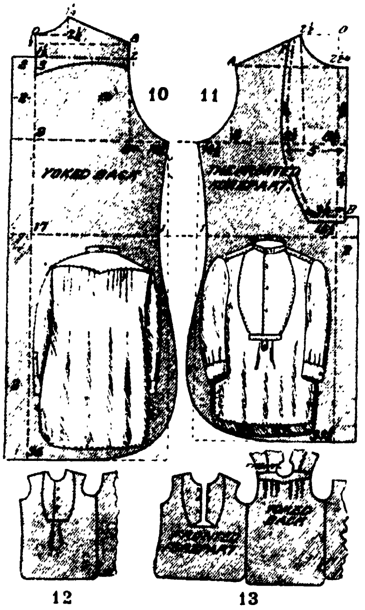
The fastening can either be arranged up the the front or the back, but the latter plan is preferred. A slit is made about 12 in. deep, and a facing seamed on and the band arranged accordingly.

Football shirts are made up in all kinds of patterns, according to the club selection. The illustration [19] shows the harlequin design, but this is one of scores, including many varieties of stripes, bands, stars, and other designs. They are usually finished at the neck with a turnover collar, and a patch pocket on the breast.

The night shirt is made longer and fuller than the day shirt, but generally speaking is of the same design [14]. It is finished at the neck with a turnover collar and a breast pocket. Occasionally the bottom of the back is cut ten or twelve inches longer, turned up to form a kind of pocket for the feet.

An excellent book on cutting and making all kinds of shirts is published by the John Williamson Co., Ltd., Gerrard Street, W., from whose pages we have reproduced the following system of cutting the two principal styles.

Taking the Pattern. We first proceed to describe the system, and in order to make it as simple as possible we have selected a style of shirt which is very free of complications, and will describe the cutting of this by divisions of the breast measure system for which the ordinary measures of length and width, the same as for a coat, will suffice.



10-13. YOKED AND FRONTED SHIRT

The Back [1]. Draw line O 36 and mark off as follows: O to ½, ½ in. O to 9, one-sixth breast plus 3 in. O to 17 the natural waist length. O to 36 the full length desired plus the seams. O to 2½ one-sixth neck.

From these points square lines across at right angles.

2½ to 1¼ one-twelfth neck, and curve back neck. 1¼ to 8 the width of shoulder, as taken on customer, plus two seams. Square down from 8 to 8*. 9 to 10½ one-fourth breast plus 1½ to 2½ in. Square down from 10½, and hollow on line 17 1 in. and add on 1 in. of spring over the seat.

Mark out from 17 1 in., and draw line from O through 1.

The Front [2]. Draw line O 33½. O to 2½ one-sixth neck. O to 8½ one-sixth breast plus 2½ in. O to 16½ natural waist length less ½ in., or by making the distance from 8½ to 16½ the same as 9–17 of the back. 16½ to 33½ 2 in. less than 17 to 36 of the back. Square lines from O, 2½, 8½, 16½, and 33½. O to 2½ one-sixth of the neck. 2½ to A the same as 1¼ to 8. 8½ to 8 one-fourth breast less 1in. 8½ to 10½ one-fourth breast plus 1½ in. to 2½ in. Hollow waist 1 in. Give 1 in. of spring under the hips. Add on 1½ to 2 in. for button-stand and front pleats.

The Sleeve and Cuff [3 and 4]. Draw line O 24. O to 2½, 2½ in. to 3½ in., the smaller quantity for easy-fitting sleeve. O to 24 the length of sleeve less cuff and shoulder-width, due provision being made for seams. 2½ to 10 half scye plus 1 in. to 1½ in. 24 to 6½ one-sixth breast plus ½ in. Cut as in the underpart, about 2 in. or 2½ in. from the crease.

For the cuff [4] draw lines O 2½, O 5½. O to 5½ half size of cuff desired, plus 1 in. O to 2½ depth of cuff desired plus ½ in. Add on point at 1 or shape to taste.

The cuff may be varied considerably, and this is but one style of many.

The Collar [5]. Draw line O 8½. O to 8½ half neck plus 1 in. 8½ to 1½, 1½ in. Draft collar 1¾ deep at back and 1 in. deep at front.

The Finished Article. In the accompanying diagrams we give a few suggestions on making-up. Diagram 6 shows the back joined to the front at the shoulders and the side; about 2 in. from the bottom of the side seam a gusset is put. The opening is cut down the front about ¾ in. to the right of the centre and about 13 in. deep. This is then turned in, and forms the button-stand, whilst the other side is turned in to form a pleat, and the underpart turned over to meet it, the holes being worked in this as shown in 7.

In 8 we show the sleeve made up; the fulness at the top may either be put in the form of pleats or gathers, which also applies to the cuff; the slit of the sleeve should be faced so as to take buttons if necessary. Binders are often put on round the armhole in order to strengthen it at that part. These are shown in 6 and 8.

Yoked and Fronted Shirts. The vast majority of shirts are now made up with yokes and inserted front. This plan is now adopted not only for white and coloured linen shirts, but also for flannels, so that this is by far the most popular style of shirt at the present time. These two features do not necessarily go together; the yoked back may be used with the plain forepart [2], or the fronted forepart may be used with the sac back [1].

The Yoke Back [10]. Draw line O 36. O to ½, ½ in. O to 3, 3 in. more or less to taste. O to 9 one-sixth breast plus 3 in. O to 17 natural waist length. O to 36 full length of back plus two seams. Square lines at right angles to these points. O to 2½ one-sixth neck. 2½ to 1¼ one-twelfth neck, and curve back neck. 1¼ to 8 the width of shoulder plus two seams (½ in.). Square down from 8 to 8*. 9 to 10½ one-fourth breast plus 1½ in. to 2½ in. Square down from 10½. Hollow inside this line 1 in. at waist, and add 1 in. of spring over the seat. Shape bottom of yoke to taste. In the diagram it is pointed in the centre, which is 3 in. down from O. The depth at the scye is 2 in. Let back overlap this at the shallowest part at least ½ in., as shown by dot and dash line.

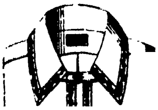
THE FOREPART [11]. Draw line O 33½. O to 2½ * one-sixth neck. O to 8½ one-sixth breast plus 2½ in. 8½ to 16½ the same as the back from 9 to 17. 8½ to 33½ about 2 in. less than 9 to 36 of the back. 8½ to 2½, and O to 2½, each one-sixth of the neck.

Square across from 2½* to A, and make 2½ to A the same width as 1¼ to 8 of the back.

8½ to 8 one-fourth breast less 1 in. 8½ to 10½ one-fourth breast plus 1½ in. to 2½ in. Square down from 10½.

Hollow side seam at waist 1 in., and give about 1 in. of spring over the hips.

THE FRONT. The shape of the front varies considerably, but the more general size is that indicated on this diagram.

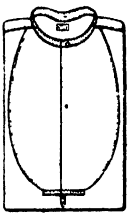


14. NIGHT SHIRT

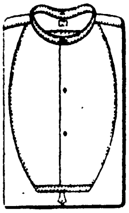
The depth extends to within 1 in. or 1½ in. of waist line, 16½.

The width of the front at the bottom is 3¼ in., including the ¾ in. buttonstand added beyond the centre line.

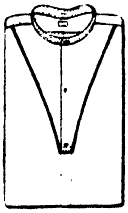
The width across the widest part of the breast just below the depth of scye line is 5 in., including the ¾ in. buttonstand. From this point it is continued up to the shoulder seam, where it is made 1 in. wide.



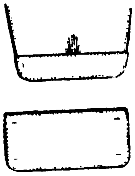
15. DRESS SHIRT



16. MORNING SHIRT



17. FRONTED SHIRT



18. DETACHABLE CUFFS

To provide for seams where the front is joined at the breast, allow ¾ in. at both side and bottom.

From B downwards allow 2 in. for pleat at bottom of the front.

19. FOOTBALL SHIRT

The sleeve, cuff, and collar are as described on **3**, **4**, and **5**, though in the illustration we show a plain round cuff; that, however, is a variation easily introduced.

Important Details. The yoke is intended to be double.

The extra width of the back is either gathered or pleated in to the yoke just above the blades on either side of the point, leaving about 1½ in. plain on either side of the point. This is shown in **13**, as well as the joining of the forepart to the yoke.

In **13** we also illustrate the front sewn to the forepart down the sides, from which it will be seen there is extra width on the forepart below to be gathered or pleated in. This is generally done by a box-pleat, and the bottom of front is either finished with a strap, or the front is left long enough to overlap the necessary amount.

On the figure in **11** we illustrate the strapping method, and in **12** the plain method.

These fronts are either made double, or of more thicknesses.

When working-men's shirts are made up from Oxford shirting in this way, the lining of the front is of unbleached calico.

When flannel shirts are made up in this way, the inner front may either be of the same flannel or a thinner one.

The number of holes put in the fronts is usually three, though for dress shirts this number is sometimes reduced to one.

For white linen or cambric shirts the fronts are made up with four thicknesses, to take the starch, and in this case the cuffs follow suit.

A tab is often put on the bottom of the front to fasten it to the top button of the trousers.

All the seams are turned in and stitched or felled, and are never left raw. This necessitates the provision of rather wider seams than the usual ¼ in., so that they ought not to be less than ⅜ in. or ½ in. The bottom side seams are left open about 3 in. or 4 in. up, and the top of the slit finished with a gusset.

The other diagrams on this page not already referred to [**15–18**] serve to illustrate the various styles when made up, and are explained in the descriptions given underneath.

COMPANY FORMATION

The Company Promoter and His Duties. Articles of Association. Directors. Working a Limited Company

By D. N. DUNLOP

THE fundamental principle underlying all joint-stock enterprise is financial co-operation, which legislation endeavours to place on a sound basis of equity. The very freedom of the system of British Company Law, as set forth in the Act of 1862, constitutes its gravest danger. Abuse of this freedom by unscrupulous promoters and directors led to further measures for the protection of the public in the shape of the amended Companies Act of 1900, without seriously curtailing the freedom. This Act provides that all the information likely to influence would-be investors no less than the absolutely essential facts, should be registered and made public, thus insuring that companies should not be launched without due guarantee of soundness, or without giving the investing public a chance of judging of the merits of the enterprise. The Act secures, in addition, a more intimate control on the part of shareholders, and protects creditors of the company by enforcing a public registry of all mortgages and charges created by the company.

British company law is now, in its amended form, as perfect as criticism and experience can make it, while refraining from exercising a cramping or stifling influence on commercial and industrial enterprise. Against the individual losses and mischief imputed to joint-stock companies in the past must be set the immense benefits which the stimulus of the co-operative principle, combined with limited liability, has conferred upon British trade. Joint-stock companies are divided into three classes:

(A) Companies with unlimited liability;

(B) Companies whose liability is limited by shares;

(C) Companies whose liability is limited by guarantee.

Class A is now practically extinct. B is the normal type and by far the most important.

The Promoter. What are the legal position, the responsibilities, and the risks of the business man who becomes a company promoter? The most frequent cause of disaster to the amateur promoter is ignorance or misapprehension of his fiduciary relation to the company he promotes, as understood in the doctrine of equity. The duties, responsibilities, and obligations of a promoter which constitute his fiduciary relation to the company are various and great. The promoter, or promoters, of a company have in their hands, as Lord Cairns puts it, the creation and moulding of a company. They have the power of defining how, when, and in what shape and under what supervision it shall come into being and begin operations as a trading company. The promoter prepares and settles the memorandum and articles of association of the company, furnishes it with directors and fixes the minimum subscription on which the directors may go to allotment. In one word, his will controls the future destiny of the unborn corporation. It stands to reason that, under these circumstances, equity demands that the promoter should not abuse his trust by taking advantage of his own power and the company's defencelessness to despoil it or involve it in difficulties.

The Stumbling Block. The practical meaning of the warning here conveyed is briefly this. It is assumed, as a matter of course, that a promoter does not undertake to promote a company for nothing. He may have some property he wishes to dispose of to the company when formed, such as a business, a mine, a concession, a patent, etc., or he may be induced to give his services for a consideration in cash or shares. The point at issue is this: he may make any condition he thinks fit, arrange for the disposal of his own property, or of property in which he is interested, on terms advantageous to himself, but he is compelled to make full disclosure of his interest and position in regard to one or other of these profits. The penalty in case of failure thus to disclose his interest is that he is not by law allowed to retain such profit. If he dispose of a business to the company, the accounts must be audited and the value of the undertaking strictly estimated on an equitable basis. If he sells a property such as a mine, *he is bound to disclose the profit he is making by the transaction*, for he stands in the position of trustee to the company he is promoting. The company must enter into a contract with him with its eyes open.

The position of the promoter is, therefore, that the company has in equity the right to all profit or remuneration obtained by the promoter as its trustee unless it has waived that right after being put in full possession of all the facts—that is, of the nature and amount of the interest. The Act further demands [Sec. 10 (1)] that any such moneys and interest shall be specified in the prospectus, so that the company—that is, the shareholders—may duly take this into consideration before investing their money in the concern. It is the duty of the directors to see that this disclosure is duly made in the prospectus, for once they are appointed, the liability is shared by them. A vendor to any company about to be formed should, therefore, avoid any share in the promotion of the company, unless he be prepared to take upon himself the obligations of a promoter and to make full disclosure of his interest.

The Duties of a Promoter. The duties of a promoter, when forming a company, are as follow:

(1) To prepare a draft of the preliminary agreement in case of property or enterprise to be acquired by the company.

(2) To prepare the memorandum and articles of association of the company and to get six other persons of full age to subscribe them (they need not subscribe more than one share each).

(3) To pay duty on the company's capital and the registration fees.

(4) To select and appoint a board of directors to act.

(5) To file their consent to act with the registrar.

(6) To present the memorandum and articles for registration, together with a statutory declaration.

(7) To prepare the prospectus according to statute (Sec. 10 (1)], being careful to include the thirteen particulars of disclosure required by law.

(8) To have the prospectus signed by all mentioned therein as directors.

(9) To file the prospectus with the registrar.

(10) To advertise the prospectus.

The Directors' Preparations for Business. The company is now promoted and the shares have been publicly offered for subscription; as soon as the minimum subscription, specified in the prospectus, or failing this, the whole of the nominal capital, has been subscribed, the directors take the following steps before the company is ready to begin business as a trading company:

(1) Proceed to the allotment of shares.

(2) File a return of the allotment with the registrar.

(3) File a statutory declaration for the commencement of business according to Section 6 of the Act and obtain from the registrar a certificate entitling the company to begin business.

Management of the New Company. Further immediate steps in the management of the newly registered company include the following:

(1) Prepare preliminary report for presentation and discussion at the first statutory meeting of shareholders (Sec. 12), which must be held not more than three months after the date of the certificate authorising the company to begin business.

(2) File this report and obtain a certificate for it from the registrar.

(3) Circulate the report, sending a copy to each shareholder at his address in the register, *seven clear days* before the day appointed for the statutory meeting.

(4) Hold the statutory meeting (Sec. 12).

(5) Register mortgages and charges and endorse on every debenture or debenture stock a copy of the registrar's certificate of registration (Secs. 14 to 18).

(6) Preserve and file copies of instruments of mortgage or charge for inspection at the registered office of the company.

(7) Keep a list of directors at the registered office of the company and send returns to the registrar.

(8) Make out an annual summary and list of members.

The above is the correct statutory order of procedure in the formation of a company. We shall now examine some of the essential points a little more closely.

The Memorandum and Articles of Association. The memorandum of association is the basis or charter of the company's constitution, and as such is a public document registered with the articles of association at Somerset House. Five important points are required by law to be set out in the memorandum, as follows:

(1) The name of the proposed company, with the addition of the word *Limited* as the last word in such name.

(2) The part of the United Kingdom, whether England, Scotland or Ireland, in which the registered office of the company is to be situated.

(3) The objects for which the proposed company is to be established.

(4) A declaration that the liability of the members is limited.

(5) The amount of capital with which the company propose to be registered, divided into shares of a certain fixed amount.

The Objects Clause. No. 3 is the most important of the clauses. Once the objects are specified, the company is bound down to these and cannot undertake anything beyond these. By the definition of these objects, as stated in the memorandum, the sphere of the company's activities is strictly limited. The State, having incorporated the company for a special purpose, in respect of which shareholders invest their money, will not authorise the money being applied to any other enterprise, held to be ultra vires or in excess of their statutory powers, even by full consent of the shareholders. Hence, certain powers, such as borrowing powers, power to accept bills of exchange and other negotiable instruments, power to sell and dispose of the company's undertaking without a winding-up, or to promote another company, power to pay preliminary expenses and the amount of the minimum subscription on which the directors will proceed to allotment, should all be inserted in the memorandum. In addition, it should be distinctly stated of what kind of shares the capital is to consist, whether there be preference shares, and if so, what privilege and rights they carry, and whether the preferential dividend be cumulative or not.

The memorandum and articles of association must be duly signed by seven persons of full age and not standing under any legal disability. Each signature must be duly witnessed. The memorandum need not necessarily be printed, but the articles are required to be printed; both must be stamped with a 10s. deed stamp and with the fee stamp, and must be registered by the Registrar of Joint Stock Companies at Somerset House.

The Board of Directors. There are several important points in connection with the position of a director in a joint-stock company which should not be lost sight of.

The company, being a legal abstraction of a co-operative aggregate, cannot do anything of itself or act except through agents, known variously as directors, managers, council or board. The law regards them all as directors, if they are the accredited representatives or agents of the company. The directors are chosen by the promoter, who is generally anxious to secure an attractive board, which will form a guarantee and induce the public to subscribe. Great abuses have arisen out of this inducement held out to the public: names of weight have been prematurely advertised as directors, sometimes on the faith of a half promise, sometimes as a decoy which has proved only too successful, the public discovering too late that the very man whose name formed a guarantee of success had refused to act as director.

The new Act of 1900 (Sec. 2) has effectually prevented this abuse by requiring that the consent in writing to act as director must be filed before the articles nominating him as director can be registered or the prospectus issued.

The director is further required to subscribe the memorandum of association for his qualification shares, or to sign and file with the registrar a contract in writing to take from the company and pay for his qualification shares (if any). The first of these courses is to be recommended, as the second presents serious difficulties owing to the fact that a contract cannot be made with a company which has no legal existence; and if it be made with the promoters, the company, not being a party to the contract, would have no locus standi to enforce it. The director must take his qualification shares *from the company* and within two months of his appointment, or else vacate the office.

If a director be not legally appointed in accordance with these requirements of the Act and yet exercises the functions of a director, he is liable to a penalty of £5 a day.

A director is criminally liable for any fraud, misstatement, false statement, failure to disclose or to comply with the statutory conditions of which he was cognisant, or of which it was his duty to be cognisant, but he is not liable for the frauds of his co-directors, if he be himself deceived by them; or for mere errors of judgment. Directors are, in short, expected to fulfil their duties as agents faithfully, honestly, and diligently. When guilty of a breach of trust, the company has the remedy of bringing an action against the director for misfeasance; if the company is being wound up, a misfeasance summons may be taken out by the official receiver or by a creditor, compelling the director to repay misapplied moneys or to make compensation for loss.

Going to Allotment. In the past, winding-up orders were frequently due to the undue precipitation of the directors in proceeding to allotment before a sufficient subscription had been raised. By Section 4 of the Act of 1900, legislation seeks to obviate this danger, by requiring that allotment shall be made only when the amount fixed by the memorandum or articles of association as the minimum subscription has been subscribed, or, if no amount has been fixed, then the whole amount of the share capital. Both these amounts are to be reckoned exclusively of any amount payable otherwise than in cash. Other sub-sections fix the amount of the shares payable on application at not less than 5 per cent. of the nominal amount of the share. The time limit allowed the company for raising the minimum subscription is 40 days after the issue of the prospectus, on the expiration of which, if the directors may not proceed to allotment, they must forthwith repay all money received from applicants for shares. Repayment *without interest* must take place within 48 days after the issue of the prospectus: after that period, repayment is burdened with interest at 5 per cent.

Although directors may not proceed to allotment before the minimum subscription has been raised, they may give a provisional acceptance of a subscriber's application, subject to the statutory conditions as to allotment, provided they notify him to that effect.

Beginning Business. A point of the utmost importance to persons dealing with a company in the early stages of its existence is the question of contracts. No contracts entered into with a company before the certificate entitling it to begin business has been granted is binding on the company; it is only provisional—that is, contingent on the grant of the certificate. But on the day the certificate is granted, *the contract becomes* binding, says the Act [4 (Sec. 3)]. The contracting party cannot, however, withdraw from his agreement with the company, pending fulfilment of this condition, unless the prospectus contain any false or fraudulent statement material to the contract, in which case he is entitled to rescind his agreement.

Mortgages and Charges to be Registered. There are four classes of mortgages and charges which are required by the Act to be registered [Sec. 14 (1)]:

(*a*) A mortgage or charge for the purpose of securing any issue of debentures (including debenture stock);

(*b*) A mortgage or charge on uncalled capital of the company;

(*c*) A mortgage or charge created or evidenced by an instrument which, if executed by an individual, would require registration as a bill of sale:

(*d*) A floating charge on the undertaking or property of the company.

All these classes of mortgages and charges must be registered by the Registrar of Joint Stock Companies at Somerset House. The points to be entered on the register are:

(1) The date of the creation of the mortgage or charge.

(2) The amount secured thereby.

(3) Brief particulars of the property mortgaged or charged.

(4) The names of the mortgagees or persons entitled to the charge.

In the case of debentures it is sufficient to register:

(1) The total amount secured by the whole series.

(2) The date of the resolutions creating the series and of the covering deed (if any) by which the security is created or defined.

(3) A general description of the property charged.

(4) The names of the trustees (if any) for the debenture-holders.

These provisions form the investor's safeguard, for, as mentioned above, every debenture stock must be indorsed with a copy of the registrar's certificate of mortgages and charges. But as the Act does not cover any but these four classes of charges, it will be seen that there are risks outside this certificate which must be either inquired into or covered by insurance.

Inspection of Registers. The register at Somerset House is open to inspection by *any person* on payment of a fee not exceeding 1s. The company's own register is, on the other hand, accessible only to members or creditors.

The company is compelled to keep on record a copy of every instrument creating the mortgages and charges which come within the section of the Act, and to allow any member or creditor to inspect the same on payment of a fee not exceeding 1s. It is well to note that the right to inspect also covers the right to copy, and that a shareholder can depute his right to inspect to his solicitor.

Every shareholder has a right to transfer his shares, subject to the regulations of the company, who may require that all transfers receive the approval of the board of directors before registration. This regulation is often included in the memorandum or articles in order to protect the company against insolvent or undesirable shareholders. The directors' right to veto, however, applies only to cases in which the objection is to the transferee and not to the purpose for which the transfer is effected.

LIFE AFLOAT

Climbing the Ladder of Promotion on Board Ship. The Mercantile Marine. Examinations for Ship Officers. The Routine of the Ship

By J. P. LORD

THERE is one point about the merchant service which is especially attractive to the youth who desires to go to sea—namely, that birth and influence are not necessary to attain command, fitness being the only requisite.

Staff of a Steamship. The staff of a large steam vessel is divided into three main sections, at the head of which stands the captain. First, there is the executive, or deck staff, consisting of the captain himself, and at least two mates, but usually three or more, as officers. Petty officers are the boatswain and his mate, the carpenter, quartermasters, the sailmaker, and gunner. Then comes the crew, divided into A.B.'s, or able seamen, ordinary seamen, and boys. Next comes the purser's staff, consisting of purser, clerks as officers, stewards as petty officers, and assistant stewards, cooks, cabin stewards, and cabin boys, as crew. Lastly, there is the engine-room staff, commanded by the chief engineer, with second, third, and fourth, and possibly more, engineers as his assistants, especially where a refrigerating plant is installed. Greasers, donkeyman, firemen, and trimmers, form the complement of the crew.

The first division is the most important, and as it is the only one in which command can be obtained, or in which the highest posts are open to the penniless youth with no influence of any kind, we shall consider it first.

We shall premise that the would-be sailor is between fourteen and sixteen years of age. He wishes one day to be a captain, and wants to know how to attain his ambition. There are two recognised methods of becoming an officer in the mercantile marine. The first is to work one's way up from the bottom; the second, or more aristocratic method, is by apprenticeship. Working one's way up is known as "coming through the hawse holes"; but, provided that the officer who has attained rank in this fashion is skilful, smart, and gentlemanly, he will not find that stand in his way. Some of our best captains have been "before the mast," as being a common sailor is called. We shall take this method first, detailing the duties of the various members of the crew and petty officers.

Joining a Ship. The youngster who desires to join a ship should apply to the shipping master at any of our large ports from which sailing ships set out, for though a modified qualification can be obtained by joining a steamer, still, that qualification is of little use in later life. A ship having been found for the boy, he will have to sign on the articles in that capacity, appearing at the shipping office for that purpose. His pay will be merely nominal, ranging from 6d. a month to possible 4s. On board, he will have to make himself generally useful, being at the beck and call of everyone in his department. He will learn to go aloft, to splice and make knots, and to clean brasswork. From his elders he will pick up a considerable amount of knowledge, and after he has been a few voyages, or possibly only one, if he is about seventeen, he will be given a discharge as an ordinary seaman. At the end of each voyage, when the crews are paid off at the shipping office, each member receives a discharge paper, stating the length of the voyage, the conduct of the individual, and his capacity. These he must preserve, as he must show them when he seeks another ship.

Ordinary Seaman. As an ordinary seaman, the young sailor will be expected to be capable of taking his part in the working of the ship, but he will not be expected to steer, nor will he generally be entrusted with repairing the more important portions of the rigging. He will have to take his turn at the "look-out" during his watch. Here we may say that the crew of a ship is divided into two watches, the "starboard" and "port," and each is on duty for four hours at a time, beginning at 4 a.m., except during the dog watches, which are only of two hours'duration—namely, from 4 p.m. to 6 p.m., and 6 p.m. to 8 p.m. The object of the dog watches is to ensure a change for the men, those who have two night watches one day having only one the next. The ordinary seaman has to help to stow cargo, under the direction of the mate, unless he is occupied in hauling on the ropes of the derricks, a task at which he is generally employed. If he shows himself smart, he may be allowed to take a hand at the wheel in fair weather, or may be put to assist an A.B. in heavy weather, and thus he learns how to steer. When he can do this, and has shown himself smart aloft, he will get his discharge as A.B., or *able-bodied seaman.*

The "A.B." To get thus far usually takes a youngster four years, and he does not then remain in the forecastle, where the men are berthed. If he is desirous of being an officer, the Board of Trade requires only that an applicant for examination for second mate shall be able to show discharges for four full years at sea on an ocean-going vessel. If, however, he has not put in his full time the A.B. must ship in that capacity, when his pay will be between £2 and £3 a month. As A.B. the sailor is expected to be accomplished in all the ordinary knots and splices, to be able to steer accurately, to heave the log (under supervision), and to know the marking of the hand lead-line, and to be able to give the correct depth of water when using it, to manage a small boat, and to do any work aloft or on deck which may be required of him. The A.B.'s are the seniors in the forecastle, and a certain proportion of them are distributed in each watch.

Petty Officers. The carpenter and sailmaker are artisans who have learnt their trade ashore, as well as having had practical training at sea, when, as A.B.'s, or even ordinary seamen, they have been attached as mates to carpenters and sailmakers. They look after the up-keep of the fabric of the ship, and the repairing and making of the sails. Besides this, the carpenter takes soundings of the wells in the ship at regular intervals, and reports to the officer of the watch how much water there is in the bottom of the vessel, for very few ships are absolutely dry. In times of emergency, he has to be able to perform the ordinary duties of a sailor, and go aloft to make or take in sail.

The boatswain and his mate act as sergeants over the two watches, directing work to be done rather than doing it themselves. However, when an officer is supervising, they have to take their share of the labour. They are always experienced men, and when really good, are of more real service to the captain than some of his junior officers.

Quartermasters and Gunners. Quartermasters and gunners, when native crews are carried, are usually to be found only on board large steamers. The former are in charge of the wheel, two being attached to each watch, and taking turns at the helm. They act as general messengers for the officer of the watch, see that the lights are properly burning, and that the look-out is on the alert. They strike the bell every half hour, assist in heaving the log, or take readings from the patent log, make signals with flags, and attend to the rockets and fire signals. The gunners are practically only cargo officers. They take charge of the hatches, seeing that the cargo is put in properly, and generally assist the officers on duty. They look after the ship's armoury, and keep all the bright work clean. When there are many boats attached to the steamer, some of them are in charge of the gunners. When the cargo is in the hatches, the gunners have to send to the clerks and purser accurate lists of what is in the hatches to which they have been appointed. They make themselves useful, standing by and passing the word, and so forth, and have their proper stations at boat and fire drill. On boats manned by natives, the gunners are selected for their knowledge of the language and are often themselves half-castes. While speaking of lascar crews, we may mention that the quartermasters, where native, are called *seacunnies*; the boatswain is the *serang*; his mates, the *burra* and *chota tindals*; and the carpenter is the *mistri*.

The cook and cook's mate, with the steward, are the only members of the purser's staff carried on sailing ships which do not carry passengers. The steward is usually the captain's private servant, who looks after the stores and their issue. He is rarely a sailor. The cook and cook's mate are both supposed to be sailors, and are liable on board smaller vessels to be called on to go aloft and assist in the working of the ship at any time. The Board of Trade accepts service as a ship's cook as proof of practical sea training, and four years' service as such entitles a man to go up for examination as an officer, though, naturally, this privilege is seldom exercised.

Becoming an Officer. Having put in his time at sea, and got his rating of able seaman, the young man is qualified to go up for his examination as second mate, the first step to responsibility. But to do so, he will require to have studied hard during his spare time at sea. This is essential as far as seamanship is concerned, but for navigation he need not be so particular, for much of the work can be learned ashore in one of the many excellent nautical schools, a short sojourn at one of which is now becoming more necessary. Before dealing, however, with the examinations requisite to enable the youngster to assume the blue and gold of an officer we must describe the more general method of becoming an officer—namely, by apprenticeship. Many of the large firms of shipowners accept apprentices on their sailing ships, receiving premiums which vary from £20 to £150. The apprentices are either berthed aft, close to the captain's cabin, or have a house to themselves on the quarterdeck. They have to do the ordinary work of sailors, under the supervision of the officers and with the assistance of several qualified sailors. To them is generally entrusted the management of the sail on the mizzen mast. They are expected to watch the officers taking sights and calculating the ship's position, and after a time are also permitted to take sights for themselves with a sextant. They take their meals by themselves and not with the men or officers, unless on special occasions the captain extends hospitality to them. In good ships they are very carefully watched, and the difficulty of their work is graduated, so that before their time is up they are usually good practical sailors. Knotting and splicing is taught to them by the A.B.'s or boatswain, and the captain or first mate frequently teaches them the elements of navigation. At the end of their apprenticeship they are entitled to go up for the Board of Trade examination. In some ships the smartest apprentice is often given honorary rank as third officer, and thus he learns how to give orders as well as to obey. To shorten the apprenticeship, those who can afford it can be sent to the Worcester or the Conway, two excellent training ships for the mercantile marine, where, prior to going to sea, the boy is taught a certain amount of navigation and seamanship, and enters his new profession with a fair theoretical and practical knowledge of his calling. Two years on either of these vessels counts as one year at sea for purposes of qualification.

First Examination. Whether the candidate has acquired his knowledge before the mast or has been an apprentice he must now pass the examination for second mate, the lowest qualification recognised by the Board of Trade. The examination is held at various large ports throughout the world, but "tickets," as certificates are called, obtained from London are held in the highest esteem by sailors, though all are equally good from the shipowner's point of view. Tickets are of three classes: *Full* tickets, those permitting the aspirant to command any class of vessel (for these, at least a year of the apprenticeship must have been passed in a square-rigged vessel); *fore and aft* tickets, which permit the holder to hold office in the vessels of the schooner type or in steamers; and *steam* tickets, which grant permission to be an officer only on steamships. The last two are not to be recommended. Every sailor should strive to obtain the full ticket. So many fully qualified men are to be obtained that few shipowners care to employ men with lower tickets, always with the exception of the small coasting trade.

The subjects of the examination, which is fairly exacting, are seamanship, embracing the management of all sails and rigging; the standing and running rigging of ships; the bending, unbending, setting, taking in and furling of sails; the management of a ship under canvas, especially in sudden squalls; the rule of the road at sea, and what course to steer to avoid a collision; the lights carried by ships and steamers of every description, and their fog and sound signals; signals of distress, for pilot, and the penalties for misusing them; marking and use of lead-line; sending masts and yards up or down; management of boats in rough weather; dunnaging and stowing cargo. Failure in this part of the examination necessitates going to sea again for six months.

In navigation the second mate must show an efficient knowledge of principles, understand all terms, and be able to find the ship's position by ordinary methods, those of Sumner and latitude by altitude of Polar Star excepted. He must know how to estimate the error of a compass or a sextant, and correct the same as far as possible, or to make tables of the errors for future calculation.

He must know how to enter in the log the "Day's Work," and how to use the same for navigation, and find position by dead reckoning as well as by observation. Parallel sailing and Mercator's sailing must be learnt. Amplitude, tides, azimuths, chronometer, longitude by azimuth and chronometer combined, and the use of true and magnetic charts all find a place in the examination, which, as will be seen, is fairly comprehensive. The simple mathematics is confined to the correct use of logarithms, and a small acquaintance with trigonometry, though not a subject of examination, is almost essential. In addition to this examination the candidate will have to pass the Board of Trade sight test, to ensure that he is not colour blind.

Second Mate's Duties. The newly fledged second mate will now have his choice of entering the service of some steamship company or of remaining in a sailing ship. If he goes in the latter he will probably be rated as second mate, and will have to share the watches with the mate and captain. He will be in charge of the deck at fixed times, and when he goes on duty he will receive from his predecessor the orders which have been given by the captain, and will also see that they are written down in the log before the officer relieved goes off duty. He will have to see the holds properly loaded with cargo. He will have a portion of the rigging under his charge and will have to overhaul it at intervals and report thereon. At stated times he will have to work out the ship's position and generally assist in the navigation of the vessel. For the first time he will be in real authority.

Duties of Third and Fourth Mates. On a steamer, however, the newly-made mate will not have much chance of obtaining a post as second mate right away, except on small tramp vessels. He will probably have to sail for some considerable time as third officer, and even as fourth or fifth. The fourth and lower officers in large vessels are not usually in charge of a watch, but are employed in looking after cargo, baggage, mails, passengers, the fabric of the ship and so forth; they are attached to senior officers and work under their directions. The third officer—for on steamers the word *mate* is forgotten—is, however, in charge of a watch, the captain keeping no watch. The third officer's watch is generally from 8 till 12, morning and evening, during which time he has in all things to behave as if in command of the vessel, save when running into danger, or if there be a sudden change of the weather, when he sends a report to the captain. He must never leave the bridge during his watch. He will also be in charge of a hatch, and, like all hatch officers, will have to see the cargo properly stowed in the holds, subsequently writing up a list of what is in his hold, and its destination, which he will forward to the purser or clerk, together with his gangway book, in which a fair copy of this is entered. Twice a day he will have to take sights and determine the ship's position, sending in his report to the captain. All officers above the third have also to do this. He will relieve the bridge for meals, unless a fourth officer is carried, getting his own meals later. He will have to take the readings of the patent log, or send a quartermaster to do so, at intervals during his watch, and enter the same in the log book. Everything that happens during his watch will also have to be written in the log. In his relations with passengers he must not be too familiar, or he will probably be dismissed when his ship returns, the companies rightly holding that their responsible officers should not form too strong friendships with passengers lest the safety of the ship suffer. At the same time he must, when required, take a part in the festivities of the ship and generally be agreeable and courteous.

Second Mate on Steamers. After serving a time as third, the young officer may be promoted to second officer on his steamer, when he will find that his responsibilities are increased. In large vessels the second officer is usually looked upon as the navigating officer, and the captain relies a good deal upon his subordinate's calculations. Indeed, the early morning sights are very frequently entrusted solely to the second officer, much to that worthy's disgust, for as his watches are those between 12 and 4 it is a little hard on him to have to be on deck shortly after eight again, when he has had only a very short sleep. However, the increased dignity and increased pay compensate him to a great extent. In many mail steamers the second officer is in charge of the mails and is responsible for them. He has to see the bags on board, see them stowed in the mail-room, and keep the key himself. On other vessels he keeps the key of the baggage-room, and superintends the periodical baggage days. Besides this he has his hatch to look after, though custom generally gives him the hatch which is least difficult to work.

First Mate. The next examination which the officer has to take is that for first mate, or simply mate. He has to take the same subjects as the second mate, but is expected to show a further knowledge of seamanship. He must know what to do in the event of his vessel being disabled, and be thoroughly capable of executing temporary repairs of all sorts, and of rigging jury masts. He must know how to shift large spars, and manage heavy weights, even in a sea way. He must understand how to load a ship so as not to strain her, how to ventilate his holds and how to stow explosives. In the event of wreck he must be able to make the best provision for the saving of life. He must be able to dock and undock his vessel and must have a practical acquaintance with the forms to be observed in the event of his having to take a ship into port after an accident. In other words, he must show himself perfectly capable of taking entire charge of the vessel in the event of the death or disablement of the master.

Duties of a Mate. His actual duties at sea depend a good deal on the class of vessel. On sailing ships he is responsible to the captain for the proper maintenance of the spars and rigging, and for the general upkeep of the ship's fabric. On liners and steamships he is in charge of the deck, sees to the painting and repairing of the ship, indents for stores and has them issued under his supervision for keeping the vessel spick and span. He is expected to take charge of a table in the saloon at meals and to make himself agreeable to the passengers. He it is who instructs the crew in boat and fire musters, and with the assistance of the purser apportions the passengers to the various boats. He is the captain's right-hand man, and, as a rule, orders from the commander pass through the *chief officer*, as the first mate is generally called.

Examination for Master. After serving with a chief mate's certificate for twelve months at sea, even though employed only as a second mate, the officer is entitled to present himself for the master's examination. This embraces all the subjects which he had to take for his mate's ticket, but the examination is much harder. If he wishes to graduate in the Honour school, the candidate can offer himself for the extra master's certificate, which is the most searching examination under the Board of Trade.

As captain, or master of a ship the sailor will have obtained the height of his ambition, but he will have to pay heavily for it in responsibility, for the commander is held to be responsible for everything that takes place on board his vessel unless he can prove clearly that he was in no way implicated. He is absolute king on board his ship and his word is law, but he will find that great tact is required if he is to rule his kingdom without friction, and at the same time with the necessary firmness. Sailors have small respect for a weak captain.

Where the captain has no clerk or purser to assist him he will have to prepare the papers and documents which will be described under the category of the purser's duties. He is also expected to have some acquaintance with marine engines, if he be in charge of a steamer.

In his relations with the owners of the vessel the captain will have to exercise great judgment. If he is too servile he will not be respected, and his life will be a burden to him. On the other hand he must remember that the owners are his employers, and unless he has very good cause to do so he should not thwart their wishes. But, above everything, he must remember that his first duty is to his ship and to the lives and cargo entrusted to him, and the owners must take a second place when the two interests clash.

The Purser's Department. Under the purser in large vessels is an army of stewards, clerks, cooks, and cabin servants, for all of whom he is answerable to the captain. Promotion in this department is not so sure as in the executive staff, influence having a good deal to do with appointments to the higher posts.

The purser himself is always a man of education, and in some of the larger vessels may be a member of one of the universities. He is the representative of the owners on board, and his duties are very varied. First and foremost he is in charge of all the ship's papers and either makes them out himself, or sees that they are properly prepared by his assistant or his clerk. Where there is no purser the captain sees to them.

First comes the *official log*, in which is entered records of all births, deaths, marriages, convictions of crew, punishments, fines, forfeitures, illnesses of crew, character and conduct of each member of it, collisions and accidents to the vessel, change of masters and so forth. The draught of water when the ship proceeds to sea must always be recorded in the official log. Penalty for not obeying these rules varies from £5 to £30, the latter being the punishment for making an entry of an event which occurred on a voyage after the ship has entered port and been moored for more than a day. All entries must be signed by the captain and the chief officer, or some other member of the crew.

Ship Articles. The articles contain a list of every member of the crew and also the conditions of their service and their wages, etc. They are made out at the shipping office, but on the voyage the captain can add to the number, and then must make an entry, and show it to the nearest consul when he gets to port.

The *ship's register* must be on board, but the purser does not generally keep that for it has to be posted up on passenger ships in a place where everyone can see it. Before sailing for foreign ports a *bill of health* must be obtained from the port of departure, and this must be endorsed by the consul of the port of destination.

A number of manifests will have to be prepared for the various ports to which the ship is bound. Sometimes these are provided from the shore office, but very frequently the purser and his clerks have to prepare them. They are lists showing the particulars of the vessel herself, and a complete list of all the cargo contained in the holds, with marks, numbers, and consignees and shippers. One manifest, giving the entire contents of the ship is known as the *general manifest*, and from this a series of particular manifests have to be prepared for each port to show what cargo is to be discharged there. Copies of the particular manifest, with at least one of the general manifest, all signed by the captain, have to be delivered to the customs authorities at the various ports. In many ports lists of the ship's effects and stores have to be delivered and these are made out by the purser.

Bills of lading, which are receipts for the goods taken on board, are signed by the captain or the purser. They must correspond with the total of cargo by the officers' gangway books in which the officers in charge of the hatches enter every package that is received.

Passenger Lists. On passenger vessels, one or more passenger lists have to be prepared for each port unless all passengers are entered in the *content*, a document enumerating everything on board the ship, and all crew and passengers. Besides these papers the purser has to see that the following documents are obtained: The return list, or E.N.G., which is a list of all members of the crew who have failed to join and the names of substitutes engaged. The A.A. which is proof that the officers have the proper certificates, and the B.B. which is a sworn declaration that the last crew was properly paid. The *last light bill* gives the date up to which all light dues have been paid. The *cocket card* is a customs clearance, and the *jerking note* is a paper stating that the ship has been searched for unentered goods, and bearing a list of bonded goods on board. The *victualling bill* is a list of stores for use on the voyage, and is endorsed by the customs officials. The *port clearance* authorises the vessel to proceed to sea, and the *quarantine certificate* permits her to enter another port.

Besides preserving these papers, and having copies made by the clerks, or making them himself, the purser has to keep a register of all stores in the vessel, and of the quantities issued daily and consumed as well as of all purchases which he may make for the use of his ship. He checks the steward's wine bills, and sees that passengers accounts are properly made out and delivered weekly. He supervises the daily menus for the two saloons, and satisfies himself that the victuals served out to the crew are in good condition and are at least of the amount per man stipulated for in the articles. He makes out a list of all valuables entrusted to his care, and shows it to the captain for verification. He makes out the wages bill at the end of the voyage and enters thereon any advances that may have been made to officers or men on the journey, and at the close of the voyage he attends at the shipping office with the captain or chief officer and personally sees the crew paid off and signed off the articles. He is also expected to see that every member of the crew receives a proper discharge, and in the event of the captain not attending the shipping office he must take the discharges to that official to be endorsed with the character of each recipient.

Arranging Freights. On the voyage, should additional freight offer at a port where the owners of the vessel have no agent, the purser arranges terms of freight if authorised to do so; if not, the captain does this. All the passengers' amusements are under the control of the purser, who is expected to be a good all-round entertainer and to be a friend to all on board.

This is only a general outline of the purser's duties, for each company of steamship owners has its own traditions, to which the purser must adhere rigidly. In some, for instance, all the chief officer's stores, paints, and so forth, are under the purser's control, and he has to see to them being served out when necessary, while in other companies the purser has nothing to do with deck stores.

The assistant purser and the clerks work under the direction of the purser, and have no accurately defined duties. But when only a clerk is carried that individual has to do all the purser's duties with the exception of those which relate to victualling, those being entrusted to the chief steward.

The Steward's Staff. The steward, whether under a purser or not, keeps a record of all stores under his charge, and of the amounts issued to him or by him. This should be made up each day. He gives the cooks what is required for the daily meals, and sees that the same are properly cooked. He is responsible for the cleanliness of the saloons and cabins, and manages the lower servants. In fact, he is butler and housekeeper in one. To become a steward, the aspirant must enter as a cabin boy or under steward, and learn the household work of the ship, trusting to his own energy to gain him promotion. In most of the large companies it is now requisite for the would-be steward to show his capacity for waiting at table in a sea way before being engaged.

The prospects of stewards vary. In large companies the position of head steward is a very lucrative one, and one of great honour, while on a tramp the steward is only the captain's servant. It is impossible to lay down even an approximate scale of pay in the domestic department, for everything depends on the ship and the company it belongs to. Taken altogether, however, sea-going servants are much better paid than their colleagues ashore, and the life is full of charm.

Ships' cooks are of two classes. On liners they must be thoroughly trained chefs, capable of catering for a first-class restaurant. They have usually served an apprenticeship ashore before going to sea as an assistant cook, and then perfected themselves in the management of the floating kitchen. On tramp steamers and sailing ships the cook is an individual who has taught himself, and the dinners he serves up bear testimony to this species of training. Shipowners of to-day are at last beginning to recognise that a trained cook is less wasteful than the self-taught servant, and a movement is in progress for the bettering of this class of servant. The youth who wishes to sail as a cook will do well to obtain some good lessons ashore before he offers himself for a post, and his chances of promotion and regular work will be greatly increased thereby. Cabin stewards and waiters are really sea-going housemaids and parlourmaids.

The Engineer's Department. In this department the line is rigidly drawn between the officers and the crew, just as happens on deck. In olden days the executive officers of the steamer used to look down on the engineers, but better feeling has now sprung up, and the engineers are held to be engineer officers, and are treated as gentlemen. The training of a marine engineer is discussed on page 6366.

Greasers are the labourers of the engine-room. They act entirely under the orders of the engineer of the watch. They are expected to have had some experience ashore in engine-rooms before they ship as greasers. Their duties are varied. They have to keep the engines properly lubricated, to assist in repairs of every kind, and generally to assist in the hundred and one odd jobs which crop up in the engine-room. They have no future before them.

The firemen spend their watches in the stokehold, feeding the giant furnaces which heat the boilers. They are labourers pure and simple, though some experience is necessary before they are able to get the best value out of the coal they are using. They begin as ordinary stokers, and can eventually rise to be a leading fireman, when they will have subordinate charge of one watch of stokers. Under the foreman stoker, or leading fireman, are several trimmers, whose duty it is to enter the coal bunkers and see that the coal is properly fed down to the coal ports in the stokehold, so that the firemen can get at it to shovel it into the furnaces. When not so employed they are engaged in working the ash hoist, clearing out the waste cinders, and throwing them overboard. The coal-trimmer is the lowest servant on a steamer, and his work is both unpleasant and insanitary, the coal-dust often causing fatal lesions to the lungs.

General Ship's Routine. At regular intervals during a voyage on every vessel the crew are piped to fire stations. The exact position of every member has been apportioned by the chief officer and on the pipe going, each man, save the officer of the watch, the engineer on duty, the quartermaster, and greaser, and the principal stokers, have to run to the places assigned to them. The hoses are fitted, pumps manned, or steam pumps started, and everything made ready for suppressing an outbreak. This is practised until each member can perform his duty without the least hesitation or confusion. Similarly, boat stations are practised until each officer and man knows just where he has to take his place in a boat, and what part he has to play in the general work of saving life in case of need. Muster of all hands takes place on Sunday morning, as a rule, when the captain, chief officer, chief engineer, and purser inspect the ship's crew, and also visit the various portions of the ship to see that all is clean and in good order. On weekdays, in well-regulated vessels, the three heads of departments—chief officer, engineer, and purser—inspect the ship and report all clean and well found.

Concluding this section, we may say that the sea offers an honourable and fascinating calling to healthy men. The prospects, especially in the deck department, are good; the life is full of change and is healthy, and, taken all round, sailors are capital fellows, and make firm and loyal friends. No large fortunes can be made at sea, but the sailor can lay by enough for his old age, and he is always well fed and housed.

GREEK–LATIN & GREEK ROOTS

Being the Conclusion of the Course in Greek, Together with a List of Latin and Greek Root Words and their Derivatives

GREEK

Continued from page 6672

By G. K. Hibbert, M.A.

PROSE COMPOSITION

THE student has now arrived at a point when he should devote considerable time to turning passages of English prose into Greek. While a rough working knowledge of a language can be attained without doing much composition, it is only by means of considerable attention given to composition that an accurate knowledge can be acquired.

The student is earnestly recommended to procure Sidgwick's "First Greek Writer" (3s. 6d.), and when he has worked through this, to proceed to Sidgwick's "Greek Prose Composition" (5s.). Both these books are published by Rivingtons, and can generally be picked up at a second-hand book-shop. Each contains an English-Greek vocabulary, but if the student should feel the need of an English-Greek dictionary, there is a good one by Yonge, published at 8s. 6d. by Longmans.

It is, however, advisable to rely more on the Greek-English dictionary than on the English-Greek, for the former shows us the *usage* of the Greek word, and gives us the different shades of meaning. If in turning English into Greek we cannot think of the Greek for a certain English word, we can generally think of some synonym, or recast the whole phrase so as to bring it into a form that we can translate into Greek. For example, instead of "in a state of felicity," we could say "being happy," *εὐτυχὴς ὢν*; instead of "he rejected this overture," we could say "he did not wish to do this," *οὐκ ἤθελε ταῦτα πράττειν*, and so on.

In a preceding part of this course [page 5808] we gave the fable of the frogs asking for a king; let us now render into Greek John Milton's reflections thereon:

THE FABLE OF THE FROGS: ITS MORAL

"Nor are you happier in the relating or the moralizing your fable. 'The frogs' (being once a free nation, saith the fable) 'petitioned Jupiter for a king: he tumbled among them a log: they found it insensible; they petitioned then for a king that should be active: he sent them a crane' (a stork, saith the fable), 'which straight fell to pecking them up.' This you apply to the reproof of them who desire change: whereas indeed the true moral shows rather the folly of those who being free seek a king; which for the most part either as a log lies heavy on his subjects, without doing aught worthy of his dignity and the charge to maintain him, or as a stork is ever pecking them up and devouring them."

Before attempting to turn this into Greek we should do well to re-write it in English that is simpler and more adaptable to the Greek idiom, somewhat as follows:

"You appear neither to tell nor to understand the myth aright. For the frogs (having become free, says the story of old) asked Zeus for a king: therefore he threw down a log, which to them indeed seemed something senseless, so that they asked for an active king. Therefore he sent a crane, or which the myth says a stork, and he immediately ate them up. And this you reproach to those desiring change; but rather it wishes to tell the folly of those being free and desiring a king, who for the most part either oppresses his subjects as a log, not doing anything in accordance with his dignity and the expense of his keep, or, as a stork, always seizes them and eats them up."

GREEK VERSION OF THE ABOVE

τὸν γὰρ μῦθον οὔτε ὀρθῶς λέγειν οὔτε συνίεναι φαίνεσθε. οἱ γὰρ βάτραχοι (λέγει τὸ πρὶν, ἐλεύθεροι γενόμενοι) τὸν Δία βασιλέα ᾐτήσαντο· ξύλον οὖν κατέβαλεν, ὃ αὐτοῖς ἀναίσθητον δή τι ἔδοξεν, ὥστε βασιλέα αἰτεῖσθαι καρτερόν. γέρανον οὖν ἔπεμψεν (ἢ ὃν ὁ μῦθος λέγει πελαργόν), ὁ δὲ εὐθὺς κατήσθιεν αὐτούς. καὶ ταῦτα τοῖς μεταβολῆς ἐπιθυμοῦσιν (dative plural of present participle of *ἐπιθυμέω*, governs genitive) *ὀνειδίζετε. ἀλλὰ μᾶλλον βούλεται μωρίαν λέγειν τὴν τῶν ἐλευθέρων ὄντων* (present participle of *εἰμί*) *καὶ βασιλέως ἐπιθυμούντων, ὅσπερ ἐπὶ τὸ πολὺ ἢ ὡς ξύλον βαρύνει τοὺς ὑπηκόους οὔτι πρὸς τὸ ἀξίωμα καὶ τὴν τῆς τροφῆς δαπάνην ποιῶν, ἢ ὡς πελαργὸς ἀεὶ καταλαμβάνει αὐτοὺς καὶ κατεσθίει.*

NOTE. As an exercise, the above might be translated back again into English after the lapse of a few days from the first reading.

General Concluding Remarks. Greek differs from English, French, German, and most modern tongues, in its greater simplicity of expression. It puts things in a direct and concrete form without artificiality and allusiveness. Thus: 1. Where we think of a man as a person, a complex set of attributes, the Greeks would either think of him as a body, a visible and palpable object, or they would denote him by some obvious part of his body—*e.g.*, head, face, or breast, as *ὦ φίλτατον κάρα*, O dearest head.

2. Where we talk of an abstraction, they talk of a thing. Thus the Greeks constantly use the neuter adjective with the article in place of an abstract noun—*e.g.*, *τὸ καλόν*, honour; *τὸ ὠφέλιμον*, utility. So a complex abstract idea is

expressed as two ideas—*e.g.*, προαίρεσις καὶ πολίτεια, political principles; πρᾶξις. καὶ συμμαχία, negotiations for alliance.

3. The Greeks possessed a great love of moderation and of the due mean, as opposed to anything strained or extravagant (*cf.* their use of εἰ instead of ὅτι after θαυμάζω, αἰσχύνομαι, κ.τ.λ.). They did not borrow from other tongues when a native word would do. In this respect no cultivated tongue is so pure as Greek, which in classical times had only 2½ per cent. of loan words, compared with 14 per cent. in Latin. Greek is also sparing of the use of metaphors; hence expressions like "They cast about," "Night drew on," "He became a laughing stock," "On the field of battle," "Silence reigned," must be translated into Greek without the metaphor—thus: ἐσκόπουν, νὺξ ἐπῆλθε, γελοῖος ἐγένετο, μαχόμενος, ἐν ἡσυχίᾳ ἦν.

As to Syntax, we may note that:

1. Greek is the richest of all languages in particles—according to Aristotle the one nicety that no barbarian could master! Every sentence unless beginning a treatise, or because of vividness, is joined to a previous one by a connective particle, while in English the sequence of thought is left to be gathered from the arrangement of the clauses.

2. The Greek verb system is far richer than Latin, and can express many more shades of meaning. It has preserved many forms of the original verb of the parent speech—*e.g.*, the dual, the middle, and the aorist as distinct from the perfect. Very interesting is the Greek use of the aorist. In the indicative mood it does generally denote *past* time, but in all other moods the aorist has no connotation of "past." In these other moods the aorist regards the act as a single occurrence, not considering it as protracted, while the present regards the act as extended in time. Examples: νοσῆσαι, to fall sick; νοσεῖν, to be sick. πεῖσαι, to prevail; πείθειν, to urge. εὐτυχῆσαι, to get a stroke of luck; εὐτυχεῖν, to enjoy continued good luck.

In the indicative, the aorist is constantly used where we should use the pluperfect. In fact, the pluperfect is seldom used in Greek, while the aorist can hardly be used too frequently.

We may here note an idiomatic use of the present tense, an idiom which is found also in French, to denote that the act or practice described extends from the past up to the present time—as: πάλαι προσδοκῶ, I have been waiting a long time; τρία ἤδη ἔτη νοσῶ, I have been ill these three years.

3. Greek prefers a personal to an impersonal construction. Thus, for "It is right for me to do it," they say δίκαιός εἰμι ποιεῖν, I am right to do it; also δίκαιός ἐστιν ἀπολωλέναι, It is right that he should be hung; φανερός εἰμι ποιῶν, It is plain that I am doing it. So from μέλει μοι, it is a care to me, comes μέλω, I care for; from δοκεῖ μοι, it seems to me, comes δοκῶ, I think, *or*, I think it best; from δεῖ, it lacks, comes δέω, I lack, and so on (*cf.* "I am well" for "it is well with me," and "if you please" for "if it please you").

The Order of Words

In English the order of speech is as a rule the same as the order of thought; only occasionally is it changed to emphasise some particular word (*e.g.*, "He saved others, Himself he cannot save"). In Greek, which is a highly inflexional language, the termination of the word generally shows whether it is subject or object, and so the order is much freer, and depends much more on emphasis than on the order of thought. The emphatic word is put first or last in the sentence. In Latin, as in modern German, the verb is mostly considered the emphatic word, and is put at the end; but this is not so in Greek. The order of words in Greek is far more natural than in Latin, being almost as natural as in English; above everything the Greeks avoided artificiality. In English, when any two words are opposed to other two words, the same order is kept in both clauses, but in Greek the order of the second clause is usually reversed—*e.g.*, τὰς πρῴρας μὲν ἔξω, εἴσω δὲ τὰς πρύμνας (Thuc. II, 83). This is called *Chiasmus.*

For the sake of clearness the Attic orators often put the relative clause before that which contains the antecedent; this is done very frequently by Demosthenes—*e.g.*, περὶ ἃ ἑκάτεροι σπουδάζετε, ταῦτ' ἄμεινον ἑκατέροις ἔχει, Each of you is superior in the points in which you respectively take most interest; ἃ δὲ νῦν ἀποκρινάμενοι τὰ δέοντ' ἂν εἴητ' ἐψηφισμένοι, ταῦτ' ἤδη λέξω, I will tell you now what you should answer so as to arrive at the proper decision.

Greek is *par excellence* the language of *naturalness* and of *clearness;* if we read it, it cannot fail to clarify our thinking; if we write it, it will both simplify and dignify our style.

KEY TO TRANSLATION, page 6672

κώνωψ πρὸς λέοντα ἦλθε καὶ ἔλεγεν· 'Οὔτε φοβοῦμαί σε, οὔτε ἰσχυρότερός μου εἶ· τίς γάρ σοί ἐστιν ἡ δύναμις; ξύεις τοῖς ὄνυξι καὶ δάκνεις τοῖς ὀδοῦσι; τοῦτο καὶ γυνὴ τῷ ἀνδρὶ μαχομένη ποιεῖ. ἐγὼ δὲ πολύ εἰμί σου ἰσχυρότερος, καὶ εἰ θέλεις, ἔλθωμεν καὶ εἰς πόλεμον.' καὶ ὁ κώνωψ ἔδακνε τὰ τοῦ λέοντος ἄτριχα πρόσωπα περὶ τὰς ῥῖνας. ὁ δὲ λέων τοῖς ἰδίοις ὄνυξιν ἔξυεν ἑαυτόν, ἕως οὗ ἠγανάκτησεν· οὕτως ὁ κώνωψ ἐνίκησε τὸν λέοντα καὶ ἀπῆλθεν. ἔπεσε (from πίπτω) δὲ εἰς τὸν ἀράχνης δεσμὸν καὶ ἀπωδύρετο (from ἀποδύρομαι), ὅτι ἐνίκησε λέοντα, ἰσχυρότατον θῆρα, ἀλλ' ἀπώλετο (from ἀπόλλυμι) ὑπὸ εὐτελοῦς ζῴου, τῆς ἀράχνης.

As practice in translation, the student might after a lapse of a few days write out the above in English.

NOTE. For the treatment of accents the student is referred to Rutherford's or Goodwin's Greek Grammar (Macmillan).

TABLE OF ROOT WORDS IN LATIN AND GREEK

With their Derivatives in English, French, Italian and Spanish.

By G. K. Hibbert, M.A.

In English, French, Italian and Spanish, a great many words derived from the same Latin or Greek root-word undergo changes more or less consistent in all four languages. Consequently, as a general rule, when we know the English word derived from the Latin or Greek, we can construct the corresponding word in French, Italian or Spanish. Below are set forth the most common rules in this connection. These should be carefully noted, as in the list which we are giving only the *exceptions* to these rules will be noted. That is to say, only when a word of Greek or Latin origin undergoes an irregular change in any of the other languages will that word be given. This will save the needless repetition of numerous words which the student, with these rules before him, can form for himself.

It should be mentioned that German is not included in this list because German is largely Teutonic in its structure, and not (like French, Italian and Spanish) of Classical or Romance origin.

The following scheme gives the principal rules for the respective languages, the English word being taken as the basis in each case.

Nouns

A. Greek Derivatives

English Ending	*French*	*Italian*	*Spanish*
y (agony)	ie (agonie)	ia (agonia)	ia (agonia)
e (parable)	e (parable)	a (parabola)	a (parabola)
a (asthma)	e (asthme)	a (asma)	a (asma)
t, l, m, and most consonants	add **e**	add **o**	add **o**
ics (mechanics)	ique (mécanique)	ica (meccanica)	ica (mecanica)
ch (monarch)	que (monarque)	ca (monarca)	ca (monarca)
is (crisis)	e (crise)	i (crisi)	is (crisis)

B. Latin Derivatives

English Ending	*French*	*Italian*	*Spanish*
tor, sor, or, our, er (doctor, emperor)	eur (docteur, empereur)	ore (dottore, imperatore)	or (doctor, emperador)
ary (lapidary)	aire (lapidaire)	ario (lapidario)	ario (lapidario)
ate (legate)	at (légat)	ato (legato)	ado (legado)
age (voyage)	age (voyage)	ggio (viaggio)	aje (viaje)
ty (vanity)	té (vanité)	ta (vanita)	dad (vanidad)
ion (action)	ion (action)	ione (azione)	ion (accion)
ain (mountain)	agne (montagne)	agna (montagna)	aña (montaña)

Adjectives

A. Greek Derivatives

English Ending	*French*	*Italian*	*Spanish*
ic (cosmetic)	ique (cosmétique)	ico (cosmetico)	ico (cosmético)
ac (maniac)	aque (maniaque)	aco (maniaco)	aco (maniaco)
an (cosmopolitan)	e (cosmopolite)	a (cosmopolita)	a (cosmopolita)

B. Latin Derivatives

English Ending	*French*	*Italian*	*Spanish*
al (general)	al (général)	ale (generale)	al (general)
ain (certain)	ain (certain)	o (certo)	o (cierto)
ar (singular)	ier (singulier)	are (singolare)	ar (singular)
ary, arious (gregarious, necessary)	aire (grégaire, nécessaire)	ario (gregario, necessario)	ario (gregario, necesario)
ian (Christian	ien (Chrétien)	iano (Cristiano)	iano (Cristiano)
ine (feminine)	in (féminin)	ino (feminino)	ino (femenino)
ic (public)	ique (publique)	ico (pubblico)	ico (publico)
ous, ose (copious, verbose)	eux (copieux, verbeux)	oso (copioso, verboso)	oso (copioso, verboso)
acious (loquacious)	ace (loquace)	ace (loquace)	az (loquaz)
ive (captive)	if (captif)	ivo (cattivo)	ivo (cautivo)
estrial estrian (terrestrial, equestrian)	estre (terrestre, equestre)	estre (terrestre, equestre)	estre (terrestre, ecuestre)

Verbs

A. Greek Derivatives

English Ending	*French*	*Italian*	*Spanish*
ise, ize (baptize)	iser (baptiser)	are (battezare)	ar (bautizar)

B. Latin Derivatives

English Ending	*French*	*Italian*	*Spanish*
fy (edify)	fier (édifier)	ficare (edificare)	ficar (edificar)
ish (nourish)	ir (nourrir)	ire (nutrire)	ir (nutrir)
—	er (demander)	are (demandare)	ar (demandar)
—	re (croire)	ere (credere)	er (creer)
—	ir (vêtir)	ire (vestire)	ir (vestir)

There are, of course, many changes at the beginning or in the middle of words as they pass from one language to another, but these cannot be noted here in full. A study of the following list will make the majority of these changes clear.

Latin

(NOTE. *F* = French; *I* = Italian; *S* = Spanish.)

ACER, *sharp ;* ACUO, *I sharpen :* acid, acrid, acrimonious, acute, acumen, acerbity, vinegar (sour wine). *F* âcre, aigu, aigre. *I* acre. *S* agudo.

ÆDES, *house :* edify, edifice (facio = I make).

ÆQUUS, *level :* equal, equity, equator, equivalent, equinox, adequate. *F* égal, équateur. *I* uguale, equinozio. *S* igual, ecuador, equinoccio.

ÆSTIMO, *I value :* estimate, esteem, aim. *I* stima (= esteem, noun).

ÆVUM, *age :* coeval, primeval.

AGER, *field :* agriculture, agrarian. *I* agrimensore (land-surveyor). *S* agrimensor.

Ago, *I drive, I do:* act, agent, agile, agitate, exigent, cogent, cogitate, litigation. *F* agir (to act). *I* atto (an act). *S* accion.

Albus, *white*: album, albumen, Albion, albino. *F* aube (alb). *I* albeggiante (whitish). *S* albar.

Alius, *other;* Alter (*the other of two*)*:* alias, alibi, alien, alter, alternate, "alter ego," altruism. *F* autre. *I* altrui, altrove, altramente. *S* otro.

Altus, *high, deep:* alto, altitude, exalt. *F* altier (haughty). *I* alto, altura, altero. *S* alto, altivo.

Ambulo, *I walk:* amble, perambulator, somnambulist, ambulance. *I* ambio. *S* amblar.

Amo, *I love:* amour, amorous, amateur, amatory, amicable, inimical, amiable, amenity. *F* aimer. *I* amore. *S* amor, amigo.

Ango, *I choke:* anger, anguish, anxiety, angina pectoris. *F* angoisse. *I* angore, ansieta. *S* ansia.

Anima, *breath:* animal, animate. Animus, *mind:* animadvert, magnanimous, unanimous.

Annus, *year*: annual, annuity, anniversary, millennium, perennial, biennial, centenary, solemn. *F* année. *I* anno, perenne. *S* año.

Aperio, *I open:* April, aperture, aperient. *F* Avril, apéritif. *I* Aprile, apritivo, apriporta (door-opener). *S* Abril, abertura.

Aqua, *water:* aquarium, aquatic, aqueduct. *F* eau, aquarelle (painting in water-colours). *I* acqua, acquidotto. *S* agua.

Ardeo, *I burn:* ardent, arson, ardour.

Artus, *a joint:* article (a little joint), articulate. *I* articolo. *S* articulo.

Audeo, *I dare:* audacious. *S* audaz.

Audio, *I hear:* audience, audible, audit. *F* auditoire, audition. *I* udire. *S* oir.

Augeo, *I increase:* augment, auction, author, authority. *F* auteur, octroi. *I* aumentare, autore.

Auris, *ear:* aurist, auricular. *F* oreille. *I* orecchio. *S* oreja.

Aurum, *gold:* auriferous, aureole, oriole, oriel. *F* or. *I* oro. *S* oro.

Avis, *bird:* aviary, auspicious (auspice = avispicium, drawing an omen from watching birds).

Barba, *beard:* barb, barber, barbel. *F* barbon (grey-beard, dotard). *I* barbone.

Bellum, *war:* duel (original form of *bellum* was *duellum*), bellicose, belligerent, rebel, revel. *F* belliqueux. *I* ribelle. *S* belico.

Bene, *well:* benefit, benign, benediction, benevolence.

Bis, *twice:* biscuit, bi-sect, bi-furcate, biceps, binoclo, binomial, combine. *F* bis (encore!).

Bonus, *good:* bon-bon, bonny, bonus. *F* bien, bon. *I* bene, buono. *S* bien, bueno.

Brevis, *short*: brief, brevity, breviary, semibreve, brevet, *F* bref. *I* and *S* breve.

Cado, *I fall*: cadaverous, cadence, cascade, chance, case, casual, casuistry, ac-cident, oc-cident, oc-casion. *F* cas. *I* and *S* caso. *S* caer (to fall).

Cædo, *I cut, I kill*: homicide, suicide, incision, concise, circumcision.

Cælum, *heaven, sky*: celestial, ceiling. *F* ciel. *I* and *S* cielo.

Candeo, *I shine*: candid (= white), candidate (at Rome applicants for office dressed in white), candle, in-cendiary. F chandelle, incendie (fire). *I* and *S* candela, incendio.

Cano, *I sing*: chant, incantation, recant, canticle, cantata, canto. *F* chanter. *I* cantare.

Capio, *I take*: captive, caitiff, capable, capacity, accept, receptive, receive, conceit, capstan. *F* recevoir, cabestan. *I* cattivo, ricevere. *S* cautivo, recibir.

Caput, *head:* capital, cape, capitulate, captain, chief, chapter. *F* capitaine, chef, chapitre. *I* capitano, capo, capitolo. *S* capitan, cabeza, capitulo.

Caro (gen. *carnis*), *flesh:* carnage, carnal, carnation, incarnation, carnival, carnivorous. *F* chair. *I* and *S* carne.

Causa, *cause:* cause, excuse, accuse, recusant.

Cedo, *I go, I yield:* cede, cession, recede, abscess, success. *F* céder. *I* cedere.

Centum, *a hundred*: cent, century, centipede. *F* cent, centime. *I* cento, centinaio. *S* ciento.

Cerno, *I distinguish:* discern, concern, discreet, secret (from the supine *cretum*). *I* segreto.

Charta, *paper:* chart, charter, card, carte, cartoon, cartridge. *F* carte. *I* and *S* carta.

Civis, *citizen:* civic, civil, city. *F* cité, citoyen. *I* citta. *S* ciudad.

Clamo, *I shout:* clamour, claim, proclaim, reclaim. *I* chiamare, clamare (to call).

Clarus, *bright:* clear, claret, clarion, clarify. *F* clair. *I* chiaro.

Claudo, *I shut:* clause, close, closet, cloister, include, conclude, preclude. *F* clos, cloître. *I* chiuso, chiostro. *S* claustro.

Colo, *I till:* cult, culture, cultivate, colony. *I* and *S* culto (worship).

Contra, *against:* country, counter, counterfeit, countermand, contrast, contrary, contradict.

Coquo, *I boil:* cook, concoct, decoction. *I* cuoco. *S* cocinero.

Cor, *heart:* cordial, concord, record. *F* cœur. *I* cuore. *S* corazon.

Corpus, *body:* corporation, corps, corpse, corpulent, incorporate, corporal. *I* corpo. *S* cuerpo.

Credo, *I believe:* creed, credit, incredible. *F* croire, croyance. *I* credo, credenza. *S* creer.

Cresco, *I grow* (supine, *cretum*)*:* crescent, increase, concrete, recruit. *F* croître, croissant. *S* crecer.

Crux, *cross:* crucial, crucible, crucifix, crusade, *F* croix, croisade. *I* croce, crociata. *S* cruz.

Cura, *care:* cure, curate, curator, curious, sinecure, procure, proctor (= procurator), secure, sure. *S* cuidado.

Curro, *I run:* cursive, cursory, current, corridor, curriculum, course, discourse, concourse, concur, recur, incur. *F* courir. *I* correre. *S* correr.

Debeo, *I owe:* debit, debt, due, duty, debenture. *F* devoir, dette. *I* dovere, debito. *S* deber.

Decem, *ten:* December, decimal, decimate. *F* dix. *I* dieci. *S* diez.

Dens, *tooth:* dent, dentist, trident. *S* diente.

Deus, Divus, *god:* deity, deify, divine, divinity. *F* dieu. *I* dio. *S* dios.

Dico, *I say:* diction, dictate, predict, contradict. *F* dire. *I* dire. *S* decir.

Dies, *day:* diary, diurnal, quotidian, adjourn, journal, journey. *F* jour. *I* giorno. *S* dia.

Dignus, *worthy:* deign, dignity, disdain, condign. *I* degno.

Do, Dono, *I give, I put:* donation, con-done, pardon, date, add (ad-do), e-dit. *F* donner. *I* dare.

Doceo, *I teach:* docile, document, doctor, doctrine. *I* dottore.

Dominus, *lord:* dominate, domain, dame (= domina), domino, dominie. *F* dimanche (= dies dominica, the Lord's Day). *I* domenica. *S* duenna.

Domus, *home:* domicile, domestic, dome.

Dormio, *I sleep:* dormant, dormouse, dormitory.

Duco, *I lead:* duke, duct, educate, conduce, reduction. *F* duc, conduire. *I* duca, condurre. *S* duque, conducir.

Dulcis, *sweet:* dulcet, dulcimer. *F* doux. *I* dolce. *S* dulce.

Duo, *two*: duet, dual, dubious, doubt. *F* deux. *I* due. *S* dos.

Emo, *I buy*, Sumo, I *take*, (sub-emo)*:* redeem, exempt, ransom, consumption, presume, assume.

Eo, Itum, *I go:* exit, exeunt, transit, trance, issue, itinerate, obituary, initial, perish. **Comes** = companion, one who goes with: count, concomitant.

Equus, *horse:* equine, equestrian.

Faber, *workman:* fabric, fabricate, forge. *I* fabbro (forger).

Facio, *I make:* fact, feat, faction, face, superficial, defeat, infect, comfit, confectioner, fortify, deify, efficient. *F* faire, fait. *I* fare, fatto. *S* hacer, hecho.

Fallo, *I deceive:* false, infallible, falter, fail, fall, fault. *F* faillir, faux. *S* faltar.

Fero, *I bear* (supine *latum*): fertile, suffer, transfer, translate, legislate, dilate, confer, vociferous. *I* trasferire.

Ferveo, *I boil:* fervent, ferment, effervesce. *S* hervir.

Fido, *I trust:* fidelity, fiduciary, confide, perfidy, defy. *F* foi (faith). *I* fede. *S* fe.

Fingo, *I shape:* fiction, feign, figure. *F* feindre. *I* finzione. *S* ficcion.

Finio, *I end:* fine, final, finish, finite, infinite, define, infinitive.

Fiscus, *purse, treasury:* fiscal, confiscate.

Flagro, *I burn:* flagrant, conflagration, flame, inflammation. *I* fiamma. S flama.

Flo, *I blow:* flatulent, inflate. *F* enfler. *I* enfiare.

Flos, *flower:* florid, florist, flourish, flour, efflorescence. *F* fleur. *I* fiore. *S* flor.

Fluo, *I flow:* fluid, flux, fluctuate, fluent, affluent, confluence, influence, influx.

Fœdus, *a treaty* (akin to fides, *faith*): federal, federation, confederate.

Folium, *leaf:* foil, foliage, folio, trefoil. *F* feuille. *I* foglia. *S* hoja.

For, Fans, Fatum, *I speak:* fame, infamous, fate, fatal, infant, confess, nefarious.

Fortis, *strong:* fort, fortress, forte, fortify, fortitude, comfort. *S* fuerte.

Frango, *I break:* fragment, fracture, fraction, fragile, frail, infraction, refraction, infringe.

Frater, *brother:* friar, fraternity, fraternal, fratricide. *F* frère. *I* fratello, fra.

Frons, *brow:* front, frown, affront, confront, frontage, frontier, frontispiece.

Fruor, *I enjoy:* fruit, fruition, frugal, usufruct. *I* frutto. *S* fruto.

Fugio, *I flee:* fugitive, fugue, refuge, subterfuge. *F* fuir. *I* fuggire. *S* huir.

Fundo, *I pour:* funnel, foundry, confound, confuse, refund, refuse, fuse, futile, fountain, font.

Fundus, *bottom:* fund, fundamental, foundation. *F* fond. *I* and *S* fondo.

Fungor, *I perform:* function, perfunctory.

Gelo, *I freeze:* gelid, gelatine, galantine, jelly, congeal. *F* gelée. Also **Glacies**, *ice:* glacier, glacé, glass. *I* ghiaccio (ice). *S* hielo.

Gero, *I bear:* gerund, gesture, gesticulate, jest, suggest, digest, vice-gerent, belligerent, register.

Gradior, *I step:* grade, graduate, gradual, digress, transgress, egress, aggression, degrade, degree.

Gravis, *heavy:* grave, gravid, gravity, grief.

Grex, *flock*: gregarious, egregious, congregation. *I* gregge.

Gusto, *I taste:* gusto, disgust. *F* goût. *I* and *S* gusto.

Habeo, *I have*: habit, have, exhibit, inhibit, prohibit. *F* avoir. *I* avere. *S* haber. Also a frequentative form, **Habito**, *I dwell:* inhabit, habitation, haunt, cohabit.

Hæreo, *I stick*: adhesive, hesitate, cohere.

Homo, *man:* homicide, human, humane, humanity. *F* homme. *I* uomo. *S* hombre.

Horreo, *I bristle:* horrid, horror, horrible, abhor.

Hospes, *guest:* hospital, hospice, hospitable, host, hostel, hotel. *I* ospedale. *S* huesped.

Hostis, *enemy:* host, hostile. *S* hueste.

Humeo, *I am moist:* humid, humour.

Humus, *ground:* humble, humiliate, exhume. *I* umile. *S* humilde.

Idem, *same:* identity, identify, identical.

Ira, *anger:* ire, irascible, irate.

Jacio, *I throw:* ejaculate, object, reject, adjective, conjecture, projectile, jet, jetsam. *F* jeter. *I* gettare. *S* echar.

Judex, *judge:* judicial, adjudicate, prejudice. *F* juge. *I* giudice. *S* juez.

Jungo, *I join:* juncture, junction, joint, conjunction, injunction. *F* joindre. *I* giungere. *S* juntar.

Juro, *I swear:* jury, conjure, adjure, perjury. *I* giuri. *S* jurado.

Jus, *law:* just, jurisdiction, jurisprudence, injure. *I* giusto.

Juvo, *I help:* adjutant, jury (mast).

Labor, *I glide:* lapse, collapse, relapse.

Lædo, *I hurt:* lesion, elide, collide, lèse-majestie.

Lapis, *stone:* lapidary, lapis lazuli, dilapidate.

Lavo, *I wash:* lave, lavatory, lotion, lava, lavender, lavish, laundry. *F* laver. *I* lavare.

Lego, *I gather, I choose, I read:* neglect, collect, elect, intelligent, lecture, lesson, college, legion, legend, legible. *F* lire. *I* leggere. *S* leer.

Lego, *I depute:* legacy, legatee, legation, relegate. *F* legs.

Leo, *lion:* leonine, leopard, Leonard, Leander.

Levo, *I lift:* levity, levy, Levant, elevator, levée, lever, relieve, alleviate, legerdemain.

Lex, *law:* legal, legitimate, legislate, privilege. *F* loi. *I* legge. *S* ley.

Ligo, *I bind:* religion, obligation, league, ligature, ligament, colligate. *F* lier. *I* legare.

Linquo, *I leave:* delinquent, relinquish, relict, derelict.

Litera, *letter:* literal, literary, literature, illiterate. *F* lettre. *I* lettera. *S* letra.

Locus, *place:* local, locate, locomotive, locum tenens. *F* lieu. *I* luogo. *S* lugar.

Loquor, *I speak:* eloquent, colloquy, loquacious, elocution, magniloquent, soliloquy.

Luceo, *I shine:* lucid, elucidate, lucent, lunar, lunatic, luminary, illumine. *F* luire. *I* lucere.

Ludo, *I play:* elude, prelude, delude, collusion, illusion, ludicrous.

Magnus, *great:* main, magnate, magnify, magnitude, majesty, major, mayor, magistrate, master. *F* maire, maître *I* and *S* maestro.

Malus, *bad:* malady, malaise, mal-de-mer, malaria, malefactor, malevolent, maltreat, malice, malignant, malinger.

Maneo, *I remain:* mansion, manse, manor, menial, remain, remnant, permanent. *F* maison.

Manus, *hand*: manual, manufacture, manuscript, manicure, manifest, manipulate, manœuvre, emancipate, maintain. *F* main. *I* and *S* mano.

Mater, *mother:* maternal, matricide, matriculate, matrimony, matron. *F* mère. *I* and *S* madre.

Medeor, *I heal:* medicine, medicate, remedy. *F* médecin (doctor). *I* medico.

Medius, *middle:* median, mean, medium, meridian, medieval, mediocre, Mediterranean, immediate. *F* moyen, milieu. *I* mezzo.

Memor, *mindful:* memoir, memorable, memory, commemorate, remember.

Metior, Mensus, *I measure:* mensuration, commensurate, immense. *I* misurare. *S* medir.

Miles, *soldier:* military, militia, militant, militate. *S* militar.

Mille, *thousand:* mile, millennium, million, millimetre. *F* and *S* mil. *I* mille.

Minuo, *I lessen:* minus, minor, minim, minimise, diminish, minute, minister, minstrel, minuet, minutiæ. *F* moins, menu. *I* minore. *S* ménos.

Miror, *I wonder at, I admire:* mirror, mirage, miracle, admire, marvel.

Mitto, *I send, I put:* mission, missile, missive, admit, permit, remiss, omit, promise, demise. *F* mettre. *I* mettere.

Moneo, *I warn:* monitor, monster, monument, demonstrate, remonstrance, admonish, summon.

Mons, *mountain:* mount, mound, surmount, amount, promontory. *F* montagne. *I* montagna. *S* monte.

Morior, *I die:* moribund, mortal, mortuary, mortgage, mortify, mortmain. *F* mourir. *I* morire.

Moveo, *I move:* motion, motor, mobile, mob, moment, motive, emotion, promote, mutiny. *F* mouvoir. *I* muovere.

Multus, *many:* multiply, multitude, multifarious. *I* molto. *S* mucho.

Muto, *I change:* mutation, mutable, permutation, commute, mutual.

Nascor, *I am born:* nascent, renaissance, native, nature, nation, natal, Noel, cognate. *F* naître, née. *I* nascere. *S* nacer.

Nauta, *sailor:* Navis, *ship:* nautical, nautilus, navy, navigate, navvy. *F* navire. *I* and *S* nave.

Nego, *I deny* (nec, *not:* aio, *I affirm*): negative, negation, renegade, runagate.

Nepos, *grandson:* nephew, nepotism. *F* neveu. *I* nipote.

Noceo, *I hurt:* noxious, nocuous, noise, innocent, obnoxious. *F* nuire. *I* nuocere.

Nomen, *name:* Nosco, *I know:* Nobilis, *known, noble:* noun, nominate, nomenclature, nominal, binomial, ignominy, gnostic, note, notion, notice. *F* nom, con-naître. *I* nome, conoscere. *S* nombre.

Novus, *new:* novel, novelty, novice, innovation, renovate, nuncio, announce. *F* neuf, nouveau. *I* nuovo. *S* nuevo.

Nubo, *I marry* (lit. *I veil myself*, connected with nubes = cloud): nuptial, connubial. *F* noces. *I* nozze. *S* nucias.

Octo, *eight:* octogenarian, octave, October. *F* huit. *I* otto. *S* ocho.

Oculus, *eye:* oculist, binocular, ocular. *F* œil, aveugle. *I* occhio. *S* ojo.

Omnis, *all:* omnivorous, omnipotent, omniscient, omnibus, "omnium-gatherum." *I* ognuno.

Optimus, *best:* optimist, optimates, "Senior Op." (at Cambridge). *I* ottimo.

Opto, *I choose:* option, adopt, co-opt, optative.

Opus, *work:* opera, operate, co-operative. *F* œuvre. *S* obra.

Orbis, *circle:* orb, orbit, exorbitant.

Ordo, *rank:* ordinary, order, ordain, ordinance.

Orior, *I rise:* orient, origin, abortion.

Oro, *I speak, I pray:* oral, oracle, orison, oration, peroration, inexorable, adore.

Ovum, *egg:* oval, ovary, oviparous, ova, ovule. *F* œuf. *I* uovo. *S* huevo.

Pando, *I spread:* pace, pass, passenger, expand, expanse, compass. *F* pas. *I* passo. *S* paso.

Pango, *I fix:* pagan (from pagus = district), peasant, page, pageant, compact, impact, impinge. *F* païen, pays, paysan. *I* paese (country). *S* pais.

Par, *equal:* peer, pair, umpire, compare, compeer, parisyllabic. *F* pair, pareil. *I* pari.

Pareo, *I come forth:* appear, apparent, apparition.

Pario, *I bring forth:* parent, parturition, oviparous, viviparous, viper, repertory.

Paro, *I make ready:* pare, parry, prepare, repair.

Pars, *part:* parse, partial, participate, particular, particle, participle, partisan, partition, party, repartee, impart, portion.

Pasco, *I feed:* pastor, pasture, repast. *F* paître.

Pater, *father:* paternal, patron, parricide, patriarch, patrimony, patriot, expatriate. *F* père. *I* and *S* padre.

Patior, *I suffer:* patience, passion, passive.

Pello, *I drive:* push, pulse, compel, impel, repel, impulsive, repulsive. *F* pousser.

Pendeo, *I hang, I weigh:* pensive, pension, pendant, pendulum, suspense, depend, compensate, recompense, perpendicular, pound, ponder, poise.

Pes, *foot:* pedal, pedestrian, pedestal, biped, impede, expedite, expedient. *F* pied. *I* piede. *S* pié.

Peto, *I seek:* petition, petulant, compete, appetite, repeat.

Placeo, *I please:* plea, placid, placable, pleasant, complacent. *F* plaire. *I* piacere.

Plaudo, *I clap, I praise:* plaudit, plausible, applaud, explode.

Pleo, *I fill:* plenary, plenipotentiary, plenty, replenish, replete, complete, supply, supplement, complement. *F* plein. *I* pieno. *S* lleno.

Plico, *I fold:* ply, pliable, pliant, plight, apply, duplicate, double, duplicity, complicate, complex, supplicate. *F* plier. *I* piegare. *S* plegar.

Plus, *more:* plural, pluperfect, surplus.

Pono, *I place:* post, position, positive, posture, deponent, deposit, composition, supposition, impost, compound, postpone.

Populus, *people:* population, popular, public, publish. *F* peuple. *S* pueblo.

Porto, *I carry:* porter (= one who carries; but porter = doorkeeper, is from porta = door), port (= demeanour), portfolio, export, important.

Possum (potis-sum), *I am able:* possible, posse, potent, potentate, impotent.

Poto, *I drink:* potation, potable, potion, poison. *I* potare.

Prehendo, *I grasp:* prehensile, apprehend, comprehensive, comprise, prison, prize (= reward). *F* prendre.

Premo, *I press:* express, oppress, impress, print.

Pretium, *value:* price, precious, prize (= valuation, estimate). *F* prix. *I* prezzo. *S* precio.

Primus, *first:* prim, prime, primate, premier, primeval, primrose, primitive, prince, principal, principle. *F* premier. *I* primo.

Pungo, *I prick:* puncture, pungent, point, pounce, expunge, punctilious, punctual, punctuate.

Puto, *I cut, I think:* putative, amputate, compute, count, reputation, deputy.

Quæro, *I seek:* query, quest, question, require, exquisite, inquisition. *S* cuestion.

Quatio, *I shake* (in compounds cutio, cussum): quash, discuss, concussion, percussion.

Quot, *how many:* quote, quotient, quota, quotidian. *S* cociente.

Rapio, *I snatch:* rapacious, rape, rapid, rapine, rapt, rapture, ravage, ravish, ravenous, ravine. *F* ravir. *I* rapire.

Rego, *I make straight, I rule:* regent, regal, royal, regnant, reign, regicide, regiment, regular, rector, rectify, direct, correct. *F* roi (king). *I* re. *S* rey.

Rogo, *I ask:* rogation, derogatory, arrogate, abrogate, interrogative, prorogue

Rumpo, *I break:* rupture, eruption, corrupt, disruption, bankrupt, abrupt, interrupt. *F* rompre. *I* rompere.

Sal, *salt:* salad, saline, salary, sausage. *F* sel. *I* sale. *S* sal.

SALIO, *I leap:* salient, sally, salmon, assail, assault, insult, exult, result. *F* saillir. *I* saltare

SALUS, *health:* salute, salutary, salubrious, salvation, salvage, saviour, safe, save, sage (the plant). *F* sauf (= safe). *I* salvo.

SAPIO, *I taste:* savour, sapient, sage (= wise), insipid. *I* sapere. *S* sapido (= high-flavoured).

SCIO, *I know:* science, omniscient, conscious.

SCRIBO, *I write:* scrip, script, scripture, scribe, describe, conscription, postscript, scribble, scrivener. *F* écrire, escritoire. *I* scrivere. *S* escribir.

SECO, *I cut:* section, sect, dissect, bisect, segment, insect, intersect.

SEDEO, *I sit:* sediment, sedentary, session, possess, sedate, sedulous, preside, *F* as-seoir.

SENEX, *old man:* senile, senior, sir, sire, senate. *F* sieur. *I* signore. *S* señor.

SENTIO, *I feel:* sense, sentient, sentence, sentiment, assent, consent, scent.

SEQUOR, *I follow:* sequence, sequel, sequestrate, consequence, consecutive, persecute, second, sue, suit, pursuit. *F* suivre, suite. *I* seguire. *S* seguir.

SERO, *I join:* series, serial, sermon, insert, desert, exert, assert.

SERVIO, *I serve:* serf, servile, servant, sergeant, dessert, deserve.

SIMILIS, *like:* SIMUL, *at the same time:* similar, simile, simulate, simultaneous, assimilate, semblance, resemble. *F* sembler.

SOLVO, *I loosen, I pay:* solve, solvent, soluble, solution, dissolute, absolute, resolve.

SONO, *I sound:* sonorous, sonata, sonnet, resonant, consonant, unison, person, parson. *F* sonner.

SPECIO, *I look:* spy, species, specious, special, spice, specimen, specify, spectacle, spectre, speculate, aspect, respect, conspicuous, perspective, suspicion, prospectus, despise. *F* épier. *I* specchiare. *S* espiar.

SPIRO, *I breathe:* spirit, spirant, aspirate, conspire, inspiration, respirator, perspire.

SPONDEO, *I pledge:* sponsor, spouse, responsible, despond. *F* épouse. *S* esposa.

STERNO, *I lay down:* strata, street, strath, stray, strew, prostrate, consternation.

STO, *I stand:* stable, stage, stamina, stanza, state, station, statue, extant, distant, constant, substance, obstacle, destination. *F* état. *S* estado.

STRINGO, *I draw tight:* string, stringent, strict, strait, strain, constraint, restrain, distrain, distress, district, boa-constrictor. *F* étroit. *I* stretto. *S* estrecho.

STRUO, *I pile up:* structure, construct, destroy, construe, instruction. *F* construire. *I* costruire.

SUPER, *above:* superior, superintend, supreme, sum, summit, surface, surfeit, survive. *F* sur. *I* sopra. *S* sobre.

SURGO, *I rise:* surge, source, resurrection, resource, insurrection, insurgent.

TANGO, *I touch:* tangent, tangible, tact, contact, contagious, contiguous, attain, intact, integral, integrity. *F* atteindre. *I* tatto, contatto.

TEGO, *I cover:* tile, detective, protect, integument. *I* tegola (tile). *L* tectum (= roof). *S* teja.

TEMPUS, *time:* tense, temporal, contemporary, extemporary. *F* temps. *I* tempo. *S* tiempo.

TENDO, *I stretch:* tend, tense (= tight), tension, tentacle, tent, tentative, contend, intent, intend, intense, tempt, taunt, "tenter-hooks."

TENEO, *I hold:* tenable, tenacious, tenant, tenement, tenet, tenor, tenure, maintain, retain, retinue, continent, content, continuous. *F* tenir.

TERO, *I rub:* trite, triturate, tribulation, contrite, contrition, attrition. *I* tritico (corn).

TERRA, *earth:* terra-cotta, terrace, terrestrial, terrier, territory, inter, Medi-terranean, tureen. *S* tierra.

TEXO, *I weave:* text, texture, textile, context, pretext, tissue. *F* tisser. *I* tessere. *S* tejer.

TORQUEO, *I twist:* torch, torment, torsion, tort, tortoise, tortuous, torture, contortion, retort. *F* tort (wrong). *I* torto. *S* torcer (to twist.)

TRAHO, *I draw:* trace, tract, trail, train, trait, treat, tare and "tret," attract, retreat, portrait.

TRES, *three:* trefoil, triangle, trident, trinity, trio, trivet, trivial. *F* trois. *I* tre. *S* tres.

TURBA, *crowd:* turbid, turbine, turbulent, perturbation, disturb.

UNDA, *wave:* undulate, Undine, abound, abundant, redound, inundate. *F* onde. *I* and *S* onda.

UNUS, *one:* unit, unique, union, unicorn, uniform, universe, university, triune. *F* un. *I* uno.

VALEO, *I am strong:* valid, invalid, valerian, valiant, valour, value, avail, prevalent, convalescent. *F* valoir. *I* valetudine (health).

VEHO, *I carry:* vex, veil, vein, vehicle, convey, convex, inveigh, invective, reveal. *F* voile, voiture (carriage). *I* vettura.

VENIO, *I come:* venture, adventure, convene, convent, convention, supervene, prevent, revenue, avenue, convenient, covenant. *F* venir.

VERTO, *I turn:* versatile, verse, vertebra, vortex, vertex, vertigo, convert, perverse, aversion, inversion, reversion, obverse, adverse, advertise, conversant, divorce.

VERUS, *true:* very, verily, verity, verify, verdict, veracity, aver. *F* vrai. *I* vero. *S* verdad (truth).

VIA, *road:* viaduct, devious, voyage, impervious, trivial, obvious, previous, obviate. *F* voie. *I* and *S* via.

VIDEO, *I see:* viz. (short for "videlicet"), view, visage, vision, visible, visit, vista, provide, providence, prudence, revise, survey, envy, invidious, evident. *F* voir. *S* ver.

VINCO, *I conquer:* victor vanquish, convict, convince, evince, eviction, province (?). *F* vaincre. *S* vencer.

VIVO, *I live:* vivid vivacious, vivisect, victuals, vital, revive, survival, convivial, viper (= vivipara, producing young alive). *F* vivre. *S* vivir.

VOCO, *I call:* vocal, voice, vouch, vociferous, vocation, vocative, vocabulary, vowel, invoke, convocation. *F* invoquer.

VOLVO, *I roll:* voluble, volume, revolve, convolution, involve, devolution.

VOVEO, *I vow:* votive, votary, vote, devote, devout. *F* vouer. *I* votare.

In the process of anglicising a Greek word the following changes should be noted:

Greek υ (*u*) becomes English *y*, as συντάξις, *suntaxis* (syntax).

Greek αι (*ai*) becomes English *æ*, as αἴσθησις, *aisthēsis* (æsthetic).

Greek οι (*oi*) becomes English *œ*, as οἶκος, *oikos* (œcumenical).

Greek γγ (*gg*), or γκ (*gk*), or γχ (*gch*), or γξ (*gx*) becomes English *ng*, *nk*, *nx*, as ἄγγελος, *aggelos*, (angel); ἄγκυρα, *agkura*, *ancura* (anchor).

[For the letters of the Greek alphabet and their English equivalents, see page 5374.]

AĒR (ἀήρ), *air:* aeronaut, aerolite. *F* aeronaute, aerolithe. *I* aeronauta, aerolito.

AGŌ (ἄγω), *I lead:* *E* pedagogue, synagogue, demagogue, strategy (stratos = army). *I* pedagogo, sinagoga, strategia. *S* estrategia.

AGŌN (ἀγών), *struggle :* agony, antagonist, protagonist, "Samson Agonistes" (Samson the struggler *or* wrestler). *F* agonie. *I* and *S* agonia.

AKROS (ἄκρος), *top, point :* acrobat (batos = walker, goer), acropolis, acrostic (stichos = a line). *I* acrobato, acrostico.

ALLOS (ἄλλος), *other :* allopathic, allotropy.

ANGELOS (ἄγγελος), *messenger :* angel, evangel. *F* ange, évangile. *I* angelo, evangelio.

ANTHRŌPOS (ἄνθρωπος), *man :* philanthropic, misanthrope, anthropology. *I* filantropico, misantropo, antropologia.

ARCHĒ (ἀρχή), *beginning, rule :* anarchy, archæology, archaic, monarch, archbishop, architect. *F* archevêque. *I* monarca, arcivescovo, architetto. *S* arzobispo, arquitecto.

ASTĒR (ἀστήρ), *star :* aster, asterisk, astronomy, astrology. *F* astérisque, astérie. *I* and *S* asterisco.

AUTOS (αὐτός), *self :* automobile, autobiography, autocar, autonomy, autocrat, authentic.

BALLŌ (βάλλω), *I throw :* parable, parabola, emblem, hyperbole, sym-bol, embolism. *I* iperbola, simbolo.

BAPTŌ (βάπτω), *I dip :* baptism, baptize. *F* baptême, baptiser. *I* battesimo, battezzare. *S* bautisme, bautizar.

BAROS (βάρος), *weight :* baritone, barometer, baroscope, isobar (isos = equal). *F* baromètre.

BIBLOS (βιβλός), *paper, book :* Bible, bibliography, bibliophile. *F* bibliothèque (library). *I* Bibbia, biblioteca (library).

BIOS (βίος), *life :* biology, biography, bioscope, microbe, amphibious. *F* amphibie. *I* and *S* anfibio.

CHOROS (χορός), *dance :* chorus, choir, chorister. *F* chœur, choriste. *I* and *S* coro, corista.

CHRONOS (χρόνος), *time :* chronology, chronometer, anachronism, chronic, chronicle. *I* cronologia, cronico, cronica.

CHRIŌ (χρίω). *I anoint :* Christ, Christian. *F* chrétien. *I* and *S* Cristo, cristiano.

CHRUSOS (χρυσός), *gold :* chrysalis, chrysoprase, chrysanthemum, chrysolite. *F* chrysalide. *I* crisalide.

DĒMOS (δῆμος), *people :* democracy, demos, demotic. *F* démocratie. *I* democrazia.

DOGMA (δόγμα), *opinion ;* DOXA (δόξα), *opinion, glory* : both from DOKEŌ (δοκέω), *I think :* dogma, orthodoxy, heterodoxy, doxology. *I* domma, ortodossia, eterodossia, dossologia.

DUNAMIS (δύναμις), *power :* dynamite, dynamics, dynasty.

ĒLEKTRON (ἤλεκτρον), *amber :* electricity (because first observed in amber). *I* elettricita. *S* electricidad.

ERGON (ἔργον), *work :* energy, erg, metallurgy.

EU (εὖ), *well :* eucalyptus (*lit.* well-covered), euphemism, eucharist, euphony, eulogy, evangel. *F* eucharistic, évangile. *I* eucaristia, eufonia.

GASTĒR (γαστήρ), *stomach :* gastric, gastritis, gastronomy.

GĒ (γῆ), *earth :* geography, geology, apogee, giant (*lit.* earth-born). *F* géant. *I* and *S* gigante.

GENOS (γένος) *race, birth :* genealogy, oxygen, hydrogen (GENNAŌ, γεννάω, *I produce*), Genesis. *F* Genèse. *I* ossigeno, idrogeno, Genesi.

GIGNŌSKŌ (γιγνώσκω), *I know :* diagnosis, gnostic, a-gnostic, physiognomy (*cf.*, *L* cognosco).

GRAPHŌ (γράφω), *I write :* grammar, graphic, paragraph, telegram, epigram, graphite, graphoscope, cinematograph (*kinema* = movement). *F* grammaire. *I* grammatica. *S* gramatica.

HĒLIOS (ἥλιος), *sun :* heliotrope, heliograph, helium.

HEMI (ἡμι-), *half :* hemisphere, hemistich (*L* semi-). *I* emisfero.

HEPTA (ἑπτά), *seven :* heptarchy, heptagon. *I* ettarchia, ettagono. *S* heptarquia.

HETEROS (ἕτερος), *other :* heterodox, heteroclite, heterogeneous. *F* hétérogène. *I* eterogene.

HEX (ἕξ), *six :* hexameter, hexagon. *L* sex. *I* esagono. *S* exagono.

HIEROS (ἱερός), *sacred :* hieroglyphic, hierarchy. *I* geroglifo, gerarchia. *S* geroglifico, gerarquia.

HIPPOS (ἵππος), *horse :* hippodrome, hippopotamus (river-horse), Phil-ip (short for Philippos, *lover of horses*). *I* Filippo. *S* Felipe.

HOMOS (ὁμός), *same :* homogeneous, homologous. *F* homogène, homologue. *I* omogeneo, omologo.

HŌRA (ὥρα), *hour :* horology, horoscope. *F* horloge. *cf.* *L* hora. *I* orologio *S* reloj.

HUDŌR (ὕδωρ), *water :* hydrogen, hydrophobia, hydrostatics, hydraulic, dropsy. *F* hydropisie (dropsy). *I* idropisia (dropsy), idrofobia.

IDEIN (ἰδεῖν), *to see :* idea, idol, idyl, kaleidoscope. *F* idée, idole, idylle. *I* idea, idolo, idilio.

IDIOS (ἴδιος), *one's own,* or *peculiar :* idiot, idiom, idio-syncrasy (*idiot* originally meant *a private citizen*). *I* and *S* idiota, idioma.

KOSMOS (κόσμος), *order,* and so *the world* as opposed to chaos : cosmetic, cosmopolitan, microcosm.

KRINŌ (κρίνω), *I judge :* crisis, critic, hypocrite, hypercritical. *F* crise. *I* crisi *or* crise, ipocrita.

KRUPTŌ (κρύπτω), *I hide :* crypt, cryptogram, apo-crypha. *I* apocrifi.

KUKLOS, (κύκλος) *circle :* cycle, cyclometer, encyclopædia.

LAMBANŌ (λαμβάνω), *I take :* syl-lable, dilemma, epi-lepsy. *F* syllabe. *I* sillaba, epilessia.

LEGŌ (λέγω), *I say, I choose :* lexicon, dialect, eclectic. *F* lexique. *I* lessico, dialetto. Also LOGOS (λόγος), *word :* logic, apology, geology, dialogue, syllogism, logarithm, tautology (tauto = the same).

LITHOS (λίθος), *stone :* lithography, monolith, lithia.

LUŌ (λύω), *I loosen :* para-lysis (palsy), analysis.

METRON (μέτρον), *measure :* metre, barometer, thermometer, metronome.

MĒTĒR (μήτηρ), *mother :* metropolis.

MIKROS (μικρός), *small :* microscope, microcosm, microbe (*lit.* small life): opposed to MAKROS, *large, e.g.*, macrocosm.

MISEŌ (μισέω), *I hate :* misanthrope, misogynist.

MONOS (μόνος), *alone, only :* monarch, monocle, monotony, monastery, minster, monotheism, monopoly [POLEŌ: I sell], monk. *F* moine (monk). *I* monaco (monk). *S* monje.

NAUS (ναῦς), *ship :* nautical, nautilus, nausea, aero-naut (nautes = a sailor).

NEKROS (νεκρός), *dead :* necropolis (a city of the dead, a cemetery), necromancy.

NOMOS (νόμος), *law :* astronomy, gastronomy, economy, Deuteronomy.

ONOMA (ὄνομα), *name :* syn-onymous, patronymic, onomatopœic, anonymous, pseudonym.

OPSIS (ὄψις), *sight :* optic, synopsis. *I* ottica.

ORTHOS (ὀρθός), *straight, right :* orthodox, orthography.

OXUS (ὀξύς), *sharp :* oxygen, oxytone, paroxysm. *I* ossigeno, parossismo.

PAIS (παῖς), *boy :* pedagogue ; PAIDEIA, *instruction :* encyclopædia.

PAN (πᾶν), *all :* panto-mime, pantheist, panegyric, panacea, pandemonium, panorama. (*Panic* takes its name from the god Pan, who used to inspire terror.)

PATHOS (πάθος), *suffering :* pathos, pathetic, sympathy, apathy.

PENTE (πέντε), *five :* pentagon, pentateuch (teuchos = book), pentameter, pentecost (*fiftieth*). *F* pentecôte.

PEPŌ (πέπω), *I digest :* pepsine, peptonise, dys-peptic, "Peps."

PHAINŌ (φαίνω), *I show :* phenomenon, sycophant ("fig-shower"), phantasm, phantom, phase, emphasis. *F* fantaisie, fantôme. *I* enfasi (emphasis).

PHARMAKON (φάρμακον), *drug :* pharmacy, pharmaceutical, pharmacopœia. *I* farmaco (remedy).

PHĒMI (φημί), *I say :* blasphemy, blame, prophesy, aphasia (loss of speech). *I* bestemmia, biasimo.

PHERŌ (φέρω), *I bear :* phos-phorus (*lit.* light-bearer), metaphor (*cf.*, *L* fero = *I bear*).

PHILOS (φίλος), *fond of :* philosophy (sophia = wisdom), philanthropy, Philadelphia, Philip, philtre, biblio-phile.

PHŌNĒ (φωνή), *voice :* phonetic, telephone, phonograph, microphone, anthem (= anti, *against*, phonē, *voice*). *I* and *S* antifona.

PHŌS (φώς), *light :* phosphorus, photography, photophobia (dread of light).

PHRAZŌ (φράζω), *I speak :* phrase, paraphrase, periphrasis, phraseology. *I* and *S* frase.

PHRĒN (φρήν), *mind :* phrenology, frenzy, frantic. *F* frénésie, frénétique. *I* frenesia, frenetico.

PHTHIŌ (φθίω), *I waste away :* phthisis. *I* tisi *or* tisichezza (consumption). *S* tisis.

PHUSIS (φύσις), *nature :* (from PHUŌ, φύω, *I beget*) : physics, metaphysics, physiology, physician, physiognomy.

PLANAŌ (πλανάω), *I cause to wander :* planet, aero-plane. *I* pianeta.

PNEUMA (πνεῦμα), *air, wind :* pneumatic, pneumonia. Greek for (Holy) *Spirit*. *S* neumatico.

POIEŌ (ποιέω), *I make :* poet, poem, poesy, pharmacopœia, onomatopœic.

POLIS (πόλις), *city :* policy, politics, metropolis, acropolis, cosmopolitan, police, Neapolis (Naples), Napoleon. *I* polizza (policy), polizia (police).

POLUS (πολύς), *many :* polyanthus, polygamy, polygon, polytechnic, polytheism, polypus.

POUS (πούς), *foot :* podagra (gout), tripod, trapeze, antipodes. *F* podagre.

PRESBUS (πρέσβυς), *old man :* presbyter, priest, Presbyterian. *F* prêtre. *I* prete. *S* presbitero.

PRŌTOS (πρῶτος), *first :* protagonist, protein, "protose," protocol, protoplasm, prototype.

PSALLŌ (ψάλλω), *I play the lyre :* psalm, psalter. *F* psaume, psautier. *I* and *S* salmo, salmista.

PSEUDĒS (ψευδής), *false :* all words beginning with *pseudo*, as pseudonym, pseudo Christian.

PSUCHĒ (ψυχή), *soul :* psychology, psychic (connected with PSYCHEŌ, *I breathe*). *I* psicologia. *S* psicologia.

PTŌMA (πτῶμα), *a fall*, (from PIPTO, *I fall*) : ptomaine, ptosis, sym-ptom. *I* sintomo.

PUR (πῦρ), *fire :* pyramid, pyre, pyrites, pyrotechnics, empyrean. *F* empyrée.

RHĒGNUMI (ῥήγνυμι), *I break :* cataract, hæmorrhage. *I* cateratte. *S* catarata.

RHEŌ (ῥέω), *I flow :* rheum, rheumatism, catarrh, rhythm. *I* and *S* ritmo.

SCHOLĒ (σχολή), *leisure :* school, scholar. F école, écolier. *I* scuola, scolare. *S* escuela.

SKOPEŌ (σκοπέω), *I look, I view :* scope, bioscope, microscope, telescope, episcopal, bishop, sceptic. *F* évêque. *I* vescovo (bishop). *S* obispo.

STASIS (στάσις), *standing* (from HISTEMI, ἵστημι, *I make to stand*) : ecstasy, apostasy, system, statics. *I* estasi.

STELLŌ (στέλλω), *I send :* epistle, apostle. *F* épître, apôtre. *I* epistola, apostolo.

STEREOS (στερεός), *solid :* stereoscope, stereotype.

STREPHŌ (στρέφω), *I turn :* catastrophe, apostrophe, strophe, antistrophe.

TAPHOS (τάφος), *tomb :* epitaph, cenotaph.

TAXIS (τάξις), *arrangement* (from TASSO, τάσσω, *I arrange*) : taxidermist, syntax. *I* sintassi.

TEINŌ (τείνω), *I stretch :* tone, tonic, monotony, baritone, hypotenuse, protasis.

TĒLE (τῆλε), *afar :* telephone, telegraph, telepathy, telescope.

TEMNŌ (τέμνω), *I cut :* a-tom, epi-tome, tome, anatomy.

THEOS (θεός), *god :* theology, theosophy, theism, theocracy, apotheosis, enthusiasm(?) (*cf.*, *L* deus). *I* and *S* teologia.

THERMOS (θερμός), *heat :* thermometer, thermal, isotherm.

TITHĒMI (τίθημι), *I place :* thesis, hypothesis, antithesis, synthesis, theme, epithet, anathema, apothecary, hypothecate (THĒKĒ, θήκη = box).

TOPOS (τόπος), *place :* topic, topical, topographer.

TREPŌ (τρέπω), *I turn :* tropic, trophy. *I* and *S* trofeo.

ZAŌ (ζάω), *I live :* ZŌON (ζῶον), *animal :* zoology, zoo, zodiac.

LANGUAGES *concluded*

GAS MANUFACTURE

Illuminating and Fuel Gases. The Processes Followed and the Appliances Used in their Manufacture, Purification, and Distribution

WHEN Van Helmont, in the sixteenth century, invented the word *gas* he applied it to an occult principle which he supposed to pervade all matter. Modern chemistry applies the word to matter in an aeriform condition at ordinary temperatures. In a popular sense the word gas is used to describe the inflammable gaseous matter which is obtained by distilling coal, and it is better defined by adding words indicating the source as "coal-gas." The various gases have been dealt with in the section devoted to Chemistry, from which it has been gathered that many elements are in the gaseous condition. Illuminating and heating gas is a mixture of two or more elemental gases, such as hydrogen, nitrogen, oxygen, carbon monoxide, methane, and ethylene. Some gases are combustible, and are obviously of most use for illuminating and heating purposes, but certain non-combustible gases are unavoidably present as diluents which have no heating value.

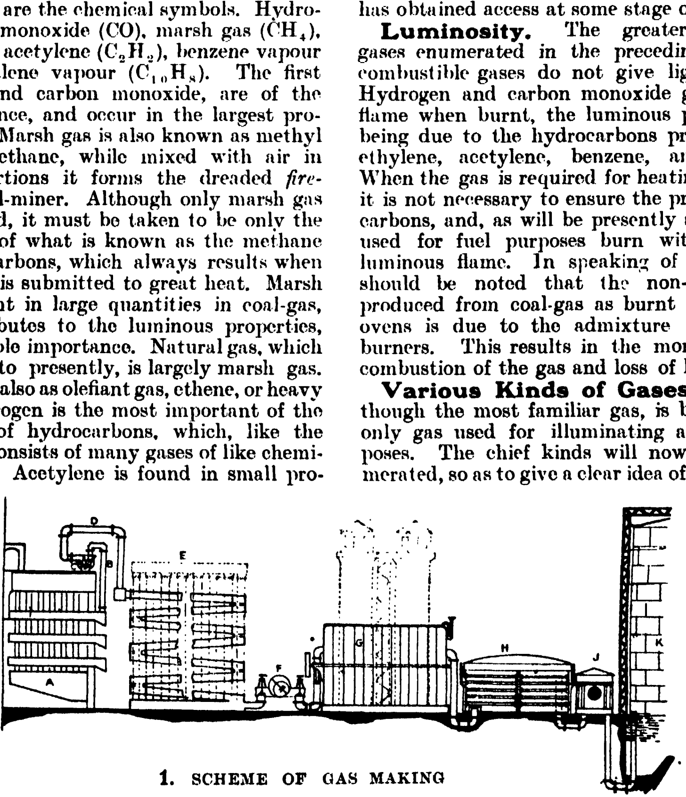
The chief gases which are present in either illuminating or heating gas are the following, which for convenience are divided into two classes.

Combustible Gases. The letters which follow the names are the chemical symbols. Hydrogen (H), carbon monoxide (CO), marsh gas (CH_4), ethylene (C_2H_4), acetylene (C_2H_2), benzene vapour (C_6H_6), naphthalene vapour ($C_{10}H_8$). The first two, hydrogen and carbon monoxide, are of the greatest importance, and occur in the largest proportions in gas. Marsh gas is also known as methyl hydride and methane, while mixed with air in explosive proportions it forms the dreaded *fire-damp* of the coal-miner. Although only marsh gas is here mentioned, it must be taken to be only the most important of what is known as the methane series of hydrocarbons, which always results when a body like coal is submitted to great heat. Marsh gas is not present in large quantities in coal-gas, but as it contributes to the luminous properties, it is of considerable importance. Natural gas, which will be referred to presently, is largely marsh gas. Ethylene, known also as olefiant gas, ethene, or heavy carburetted hydrogen is the most important of the ethylene series of hydrocarbons, which, like the methane series, consists of many gases of like chemical constitution. Acetylene is found in small proportions in coal-gas but larger quantities are made from calcium carbide, and so easily and cheaply, that this gas is burnt alone as an illuminating gas. The method of preparation will be separately dealt with. Benzene and naphthalene, it will be noticed, are referred to as *vapours*, because substances which are not gaseous at ordinary temperatures are not spoken of as gases. Benzene is a liquid and naphthalene a solid when isolated from gas, but they exist in gas in a dissolved state. They are important constituents, as they play a considerable part in the luminosity of gas. Naphthalene is apt to deposit from gas in very cold weather, and is the substance which chokes up the gaspipes in winter, causing much trouble by diminishing the supply.

Incombustible Gases. These, as has been explained, are diluents in gas, and are accidentally present, owing to the manner of preparation. The chief diluents are nitrogen, carbon dioxide, oxygen, and water vapour. Of these, nitrogen is present in the greatest proportion. It is an inert gas, and is the chief constituent of the atmosphere, but not the most important. Carbon dioxide is the gas used in aerating table waters. Most of this gas is taken out of coal-gas by a chemical process, but it is never entirely eliminated. Oxygen is known as a supporter of combustion—that is, gas needs oxygen (from the air) before it will burn. The oxygen found in coal-gas in small quantities comes from air that has obtained access at some stage of the process.

Luminosity. The greater part of the gases enumerated in the preceding paragraph on combustible gases do not give light when burnt. Hydrogen and carbon monoxide give only a blue flame when burnt, the luminous properties of gas being due to the hydrocarbons present—methane, ethylene, acetylene, benzene, and naphthalene. When the gas is required for heating purposes only it is not necessary to ensure the presence of hydrocarbons, and, as will be presently shown, the gases used for fuel purposes burn with a blue, non-luminous flame. In speaking of a blue flame, it should be noted that the non-luminous flame produced from coal-gas as burnt in domestic gas-ovens is due to the admixture of air near the burners. This results in the more nearly perfect combustion of the gas and loss of luminosity.

Various Kinds of Gases. Coal-gas, although the most familiar gas, is by no means the only gas used for illuminating and heating purposes. The chief kinds will now be briefly enumerated, so as to give a clear idea of what the various gases are, especially as some of the gases have several names. Each gas will be dealt with in its turn in succeeding parts of this article. *Coal-gas* is obtained by strongly heating coal in a closed fire-clay retort, but similarly *wood-gas* and *peat-gas*

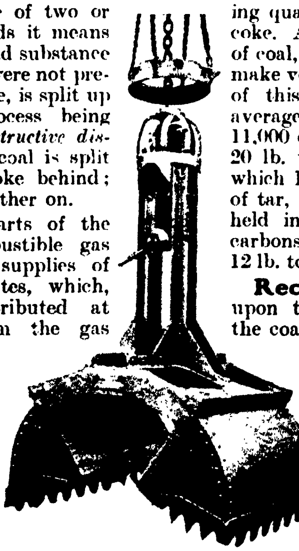


1. SCHEME OF GAS MAKING

A. Furnace with retorts B. Ascension pipe C. Foul main D. Pipe leading to condenser E. Condensers (dotted lines showing vertical form) F. Exhauster G. Washer (dotted lines at back showing the tower form of washer) H. Purifier J. Station meter K. Gasholder *gas* are made by heating wood and peat. *Natural gas* is found in various parts of the earth, and has merely to be collected and distributed through pipes to the house or factory. *Oil-gas* is made by decomposing petroleum or shale oil by heat, *oxy-oil gas* being a variety obtained by mixing oil-gas and oxygen. *Water-gas* is made by passing steam over red-hot coke, the water vapour being split up into its elemental constituents. This gas is also known as *blue gas*. When mixed with hydrocarbon vapours, so as to make it burn with a luminous flame, water-gas is known as *carburetted water-gas*. Then there is the important class of gases known as *producer-gas*, *generator-gas*, *Siemens gas*, *Dowson gas*, *gaz pauvre* (*poor gas*), or *mixed gas*. These being often a mixture of water-gas and coal-gas, as in the Dowson gas, are often referred to as *semi-water gas* or *steam-enriched gas*. *Mond gas* is produced for fuel purposes by the combustion of small coal or slack, and the gases evolved from the blast furnaces or coke ovens of iron and steel foundries are known as *blast-furnace gas* or *coke-oven gas*, according to the source.

When producer gas is used in a suction producer—an apparatus making fuel gas for direct consumption in a gas-engine—the term *suction gas* is sometimes used. *Methane hydrogen gas* is a gas made from steam and tar, being thus really a variety of carburetted water-gas. *Air-gas* or *gazolene gas* is simply air mixed with hydrocarbon vapour, the hydrocarbon used being gasolene or some similar light distillate of paraffin.

Distilling. As the word *distil* has been used, and will be used again in this article, it is well that its meaning should be understood. Distilling, as applied, for instance, to the preparation of alcohol, implies that by means of heat one liquid is separated from a mixture of two or more liquids. In the case of solids it means the splitting-up of a complex solid substance by heat into other matters which were not previously present. Coal, for instance, is split up or decomposed by heat, the process being more correctly referred to as *destructive distillation*. Roughly speaking, the coal is split up, giving off gas, and leaving coke behind; but this will be fully explained further on.



2. HONE'S PATENT GRAB
(Thames Ironworks Co., Ltd.)

Natural Gas. In many parts of the world Nature supplies a combustible gas ready made. There are large supplies of natural gas in the United States, which, when collected, have been distributed at Pittsburg, a hundred miles from the gas well, at 5d. per 1,000 cubic ft. Unfortunately, the supplies of natural gas give out in time, with the consequence that industries which have flourished because of the supply of cheap natural gas have declined and caused ruin to towns in the United States which depended on the maintenance of manufacturing industries. A supply was discovered at Heathfield, in Sussex, in 1897, by the London, Brighton, and South Coast Railway Company, in searching for an underground water supply, and this has since been utilised for fuel and lighting purposes. Natural gas generally smells of paraffin, and consists chiefly of methane, with small quantities of other hydrocarbons, oxygen, hydrogen, and carbon monoxide. The proportion of methane in the Heathfield supply is less than is found in many natural gases from American sources, but the amount of higher hydrocarbons is greater, with the result that the English gas is more luminous.

Coal-gas. Coal is placed in long fireclay tubes known as *retorts*. The retorts are closed at both ends, but near one end there is a pipe through which the gaseous products are conveyed. The retorts are subjected to great heat by a furnace underneath, and give off crude gas. The gas is then cooled or condensed, when tar separates, the gas passing on to scrubbers or washers to be deprived of the last portions of tar and the ammonia which the gas contains. From the scrubbers the gas passes to purifiers to remove the remaining gaseous impurities, such as carbon dioxide, carbon bisulphide, sulphuretted hydrogen, and cyanogen, and is then placed in the gasholders, from which it is distributed through the gas mains and pipes to the place where it is used. The process may be followed by referring to the diagram [1].

Varieties of Coal. The gasmaker recognises two kinds of coal—cannel, candle, or parrot coal, and common or gas coal. Cannel coal gives a gas containing a large proportion of ethylene, the constituent which contributes most to the luminosity of the gas. Common or gas coal may be divided into caking and non-caking coal. Caking coal softens when heated, and after the volatile constituents have been expelled, yields a coke which is of cellular structure, but which does not show the original shape of the coal. The non-caking coal retains the form of the coal in the coke, and does not soften before giving up its gaseous constituents. Anthracite coal finds a special use in the production of fuel gas. It should be especially noted that not only does the gasmaker have to judge coal by the gas yield, but he has to take into account the illuminating quality of the gas and the texture of the coke. As to the yield of products from a ton of coal, it will be seen that it is not possible to make very definite statements. For the purpose of this paper it may be taken that the average products comprise 10,000 cubic ft. to 11,000 cubic ft. of gas, holding in suspension 20 lb. to 24 lb. of hydrocarbon vapours, of which 16 lb. to 18 lb. are benzene, and 120 lb. of tar, of which 25 lb. to 30 lb. are carbon held in suspension, 2 lb. to 3 lb. are hydrocarbons similar to the vapours in the gas, and 12 lb. to 14 lb. are naphthalene.

Receiving the Coal. It depends upon the site of the gasworks as to how the coals are taken in. If the coal arrives by water it is, in modern works, taken from the ships or barges by self-acting grabs, such as Hone's patent grab [2], and delivered to elevating and conveying plant to the stores or retort houses. If the coal arrives by railway, mechanical appliances are employed for emptying the waggons, which, by means of an inclined railway, have been taken up to an elevated position. Where conveyors are used the larger lumps of coal will need breaking before being handled by the elevator buckets, there being two kinds of breakers—the roller and jaw types. If needed, the coal can be automatically weighed at this stage.

Retort Houses. The plan of the building in which the coal is going to be distilled depends upon the particular system that is to be employed. The building is constructed of steel framework and brick, the circular girder roof being largely adopted for double-bench retort houses. The working floor level is known as the *stage*, and below the level is the furnace and also the arrangements for conveying away the coke that comes from the retorts.

Retorts. Coal is distilled in fireclay retorts, which, in Great Britain, are machine made. The retorts are of two lengths, and are known as *singles* or *doubles*. The single retorts are from 8 ft. to 10 ft. long, and of D-shaped section, the height being 12 in. to 16 in. Double retorts are 20 ft. long, and are really two retorts set back to back, with a lid on each end. In the case of single retorts, one end only is fitted with a mouthpiece, the other end being built up. The end of the retort has fitted on it an iron socket to receive the lower end of the ascension pipe, or upright pipe which leads the gas from the retort, and a lid or mouthpiece. The type known as Morton's self-sealing mouthpiece is much used, but Candler's and Balfour's are varieties which more readily permit of the renewal of the wearing parts. The retorts are set in beds of from three to twelve, and are, from their position, known as bottoms, middles and tops. The collection of retorts, as seen in **3**, is called a *bench*.

3. WEST'S COMBINED CHARGING AND DRAWING MACHINE

(West's Gas Improvement Co., Ltd.)

The Furnaces. These retorts are supported on fireclay walls 2ft. apart, which act as flues for the heat of the furnace. Originally, the retorts were heated direct by coke, but Sir William Siemens' regenerate furnace, or some similar type, is generally used at the present time. In this kind of furnace, highly-heated gas is made to impinge on the outer surface of the retorts, the heating value being increased in some types by the injection of steam, which forms a proportion of water-gas. This type of furnace will be referred to when we deal with producer-gas.

Charging and Drawing. Single retorts have a capacity of from $1\frac{1}{4}$ cwt. to 3 cwt. of coal, double retorts taking a correspondingly larger charge. The charging of the retorts is done by one of four methods: (1) hand shovelling; (2) the use of a long scoop; (3) by machinery; or (4) by gravity. The last-named method will be dealt with in our consideration of inclined retorts. By whichever of the three methods employed, the object in view is to spread the coal evenly on the floor of the retort. The shovel method is obviously the slowest, and necessitates much loss of heat. It is also terrible work for the stoker. When a scoop carrying the whole charge is employed, the time taken to charge a retort is under a minute. The scoop of coal is introduced into the retort and then turned over and withdrawn.

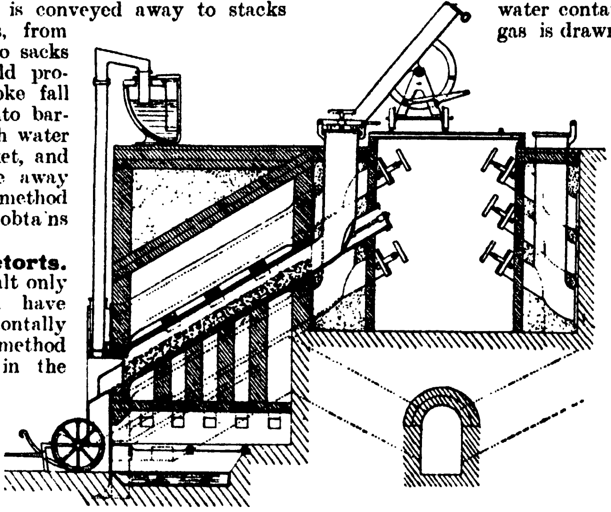
Charging Machinery. Much saving of labour results when machinery is employed for charging retorts, especially where power is used to drive the machines. West's manual charging machine is a simple type from which the well-known West's machines were evolved. The modern types of West's charging machines are driven by compressed air and run on rails on the stage in front of the retort bench. The retorts on one level are charged at the same time, after which the machine is adjusted for other levels. A scoop carrying the charge of coal is introduced into the retort, reversed, but each retort takes two scoopfuls. The first time the scoop enters the retort it turns over on the right, and the second time on the left side. The four levers for controlling the various actions of the machine are placed within easy reach of the stoker.

The Arrol-Foulis Machine. Another well-known type of charging machine is the one devised by Sir William Arrol and Mr. William Foulis. It is worked by hydraulic power at a pressure of 400 lb. per square inch. In this machine a hydraulic ram pushes charges of coal into the retort, five or six strokes being needed to charge a 10 ft. retort with $3\frac{1}{2}$ cwt. of coal.

Other Charging Machines. For small works the rapid charging machine of Messrs. Biggs, Wall & Co. is much used. There are two, one worked by manual labour and the other by power in the form of a small gas-engine. In Ruscoe's charging machine the charge is put into the retort in one operation by means of two scoops side by side, these being overturned in opposite directions. The newest types of charging machine, such as the De Brouwer and the turbine machine, are driven by electricity; in the latter machine the coal is shot into the retort by centrifugal force.

Drawing Machines. Sometimes combined in the same machine as the charging machine is a device for raking out the coke when it has been exhausted of its gas, or this may be a separate drawing machine [**3**]. The makers whose names have been mentioned in connection with charging machines also manufacture the drawing machines.

These consist essentially of a rake which is introduced into the retort and pulls out the glowing coke. Water-cooling devices are employed to cool the rake-rod. The coke is allowed to fall down a space beneath the stage, being directed by means of an iron screen or *fender* placed in front of the drawing machine, and is taken away by *conveyors*, consisting of grids, or plates, running on chains. While on its journey the coke meets a stream of water, which quenches it, and it is conveyed away to stacks or storage hoppers, from which it is filled into sacks or waggons. The old process is to let the coke fall from the retort into barrows, quench it with water from a hose or bucket, and then wheel the coke away to the yard. This method is costly, but still obtains in small gasworks.



4. INCLINED RETORTS

Inclined Retorts. So far, we have dealt only with retorts which have been placed horizontally in the setting. This method is being replaced in the newer gasworks by an improvement which consists in setting the retorts at an angle [**4**]. The method is due to André Coze, of Rheims, who patented the improvement in 1885. The retorts are set at an angle of 29° to 34°, and are fed at the uppermost end by travelling shoots, thus saving time and expense of hand or machine stoking. The coal storage tanks are placed above the level of the shoots leading to the retort, and by means of levers, measured quantities of coal are let fall into the retorts. The lower end of the retort is fitted with the usual self-sealing lid from which the ascension pipe rises. When the coal enters the retort it is met at the lower end by a check-plate, against which it forms itself into a regular layer along the bottom of the retort. When the distillation is finished the lids on the lower ends or drawing stage are opened, and the coke falls out automatically, or with slight assistance. The latest development is to employ retorts set vertically, the claim being that a superior yield of gas and better quality of coke are obtained.

Effect of Temperature. The retorts are heated to a temperature of from 1,800°F. to 2,000°F., that being the end temperature, four or six hours after charging the retort, when the coke is ready for drawing. The effect of heating coal at the higher temperature is partly to decompose some of the tar and increase the quantity of ammonia in the crude gas. The impurities, carbonic acid, cyanogen, and the sulphur compounds are also increased. Put in another way, this means that the higher temperature produces a larger yield of gas, but the illuminating effect of the gas is lower. It takes from 15 tons to 20 tons of coke to distil 100 tons of coal, the lower amount being required in the regenerative furnaces; but as little as 10 tons of coke are needed in some of the modern generator furnaces.

The Hydraulic Main. It will be remembered that each mouthpiece of the retorts is fitted with an ascension pipe, an upright pipe which conveys the gas from the retort to what is called the *hydraulic main.* The ascension pipes are about 5 in. in diameter, and rise some distance above the retort bench; they join a descending pipe by means of a short bridge of horizontal pipe, the dip pipe leading to the hydraulic main. This pipe dips about 1 in. below the water in the main. The hydraulic main is usually square, or with a rounded bottom, and is built up in sections. The liquid it contains is tar and water containing ammonia. The gas is drawn through this main by pumping engines or exhausters [**5**], to be referred to presently. The purpose of the liquid is to condense much of the tar and like matters carried over by the hot gas, and prevent the gas returning to the retort when it is opened for charging. All the retorts in one retort house are connected with the same hydraulic main. The pipe which conducts the gas and liquid from the hydraulic main is known as the *foul main.* This is connected with the *tar well*, the tar and aqueous part separating in time, while the gas goes on to a series of cooling pipes known as the *condenser.*

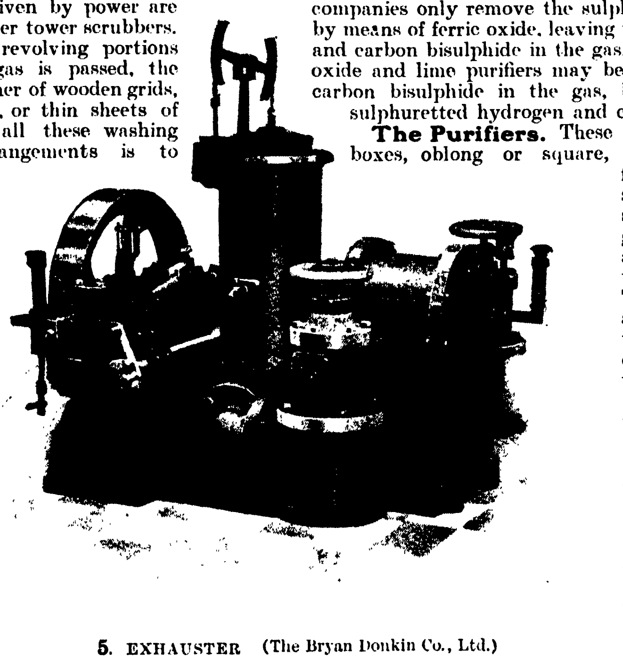
Composition of Crude Gas. This is a convenient place to refer to the composition of the crude gas as it comes from the retorts. The combustible gases contained in the crude gas are hydrogen (42 per cent. to 53 per cent.), methane (32 per cent. to 39 per cent.), carbon monoxide (3 per cent. to 10 per cent.), gaseous hydrocarbons (2·5 per cent. to 4·5 per cent.). The impurities which it is desirable to remove as far as possible are small percentages of carbon dioxide, nitrogen, sulphuretted hydrogen, ammonia, cyanogen, and carbon bisulphide. The nitrogen is not removed by any of the subsequent purification processes.

The Condenser. The gas, after it leaves the hydraulic main, passes through a series of vertical or horizontal cast-iron pipes, so arranged that the gas has to traverse the whole length of the pipes. During its passage in this condensing apparatus the gas is cooled and reduced in volume, and there is separated more tar and aqueous matter, which are led off to the tar-well before referred to by a syphon arrangement. Climatic conditions in England render air-cooled condensers efficient, although in hot weather it is necessary to spray the outside of the tubes with water. The condensing pipes are from 6 in. to 12 in. in diameter, and there are from nine to twelve rows of pipes placed above each other (in the modern horizontal condensers). Other kinds of condensers are cooled by water, the principle being that the gas passes up a tower within which are vertical pipes with water circulating therein. Clapham's "Eclipse" condenser has sometimes as much as a mile and a half of tube in one condenser.

The Exhauster. The gas passes from the condenser to the exhausters [5]. These are cylindrical pumps, the purpose of which is to draw the crude gas away from the retorts, and, when the gas has passed through the exhausters, to force it onwards through the washing and purifying apparatus. The exhausters generally used are Beale's, invented in 1848, and improved in 1866 and 1871. Since then E. B. Donkin has patented a further advance in this type of rotary exhauster by which the internal drum is made to do duty as a piston. The exhausters are driven by a steam-engine, the rate being carefully regulated so as to maintain the vacuum in the hydraulic main at a constant pressure.

Scrubbers and Washers. From the exhausters the gas passes to the scrubbers or washers, where it is deprived of its ammonia and a part of the carbonic dioxide, sulphuretted hydrogen, and cyanogen. There are different types of scrubbers, the principle of all being that the gas is finely broken up and brought into contact with a stream of water passing the opposite way to the gas. The tower form of scrubber consists of a tall tower filled with coke or wooden grids, a stream of water falling from the top of the tower through the coke. The gas enters at the bottom, and has to make its way up through the wet coke, losing on its way the ammonia it contains. The towers are run in series, the first one containing gas liquor, and the last one clean water. As the liquors become saturated they are passed to a plant for recovering the ammonia. Washer scrubbers driven by power are now replacing the older tower scrubbers. These have central revolving portions through which the gas is passed, the interior consisting either of wooden grids, brushes, wooden balls, or thin sheets of metal. The aim in all these washing and scrubbing arrangements is to saturate the liquors fully, using as little water as possible, because it is a needless expense to have to recover ammonia from weak solutions.

Tar Extractors. Means are adopted at various stages of the process of condensing and washing to lead off the tar, but a miniature scrubbing apparatus placed before the scrubbers proper, with the idea of preventing clogging of the scrubber, is known as a *tar-extractor.*



5. EXHAUSTER (The Bryan Donkin Co., Ltd.)

Chemical Purification. As the gas leaves the scrubbers it still contains sulphuretted hydrogen (1 per cent. to 2 per cent.), carbonic acid (1 per cent. to 3 per cent.), and small quantities of carbon bisulphide, and other sulphur compounds. The removal of these impurities is a chemical process.

It is provided by the Gasworks Clauses Act of 1847, that gas shall not give evidence of the presence of sulphuretted hydrogen when tested with lead-paper. This and other sulphur compounds are objectionable in gas, because the products of combustion which they yield (sulphur dioxide) are of an injurious character, both when breathed and because of their action on the contents of a room. Carbon dioxide diminishes the luminosity of the gas, and, as has been explained earlier in this article, it is not a combustible gas. The obligations of the various gas companies in regard to the removal of impurities are not identical. In some cases the carbon dioxide need not be removed, but as it diminishes the luminosity of the gas it is to the gas company's interests to see that it is removed entirely or diminished very considerably.

Scheme of Purification. To remove carbon dioxide the gas is passed over lime, the sulphuretted hydrogen is removed by ferric oxide or Weldon mud, and the carbon bisulphide by sulphided lime. The order of removal differs, as also does the number of purifiers which are devoted to chemical purification. This, as has been explained, is because of the differences in the legal requirements of the gas undertakings. If a complete scheme be adopted, it will require eight purifiers, the first two being lime vessels, the next two ferric oxide containers, two more for sulphided lime, and the last two in the nature of check vessels (often containing Weldon mud), to remove the last traces of sulphuretted hydrogen. Another scheme, known as the *all-lime* system, requires four purifiers containing lime and a check-box of ferric oxide. Other gas companies only remove the sulphuretted hydrogen by means of ferric oxide, leaving the carbon dioxide and carbon bisulphide in the gas, and, again, ferric oxide and lime purifiers may be used, leaving the carbon bisulphide in the gas, but removing the sulphuretted hydrogen and carbon dioxide.

The Purifiers. These are large cast-iron boxes, oblong or square, each vessel being from 30 ft. to 40 ft. square. Inside, a series of wooden grids is arranged, and carries the purifying material. These shelves are arranged so that the gas passes over as much of the purifier as possible—that is, the journey taken by the gas from its entrance to its exit is as long as possible. The lid of the purifier has a flange, which dips into a channel or U-section round the top of the purifier containing water, thus acting as a seal or lute to prevent the escape of the gas. Dry seal covers are used in modern works. The lid is brought into contact with strips of indiarubber, and fastened down with swing bolts. The number of tiers of grids varies according to the material and depth of the purifier: the latter is generally 5 ft. The set of purifiers is arranged with valves and exit pipes so that the order of the purifiers can be changed or put out of action to permit of recharging. It is usual to have more purifiers than are required for use, so that the process is efficiently carried out. When it is found that a purifier is not working properly, it is put out of action and a fresh purifier is used in its place.

Lime Purifiers. Lime, when freshly slaked, is one of the best substances known for absorbing carbon dioxide, the substance formed being a carbonate. The lime purifiers have generally four tiers of grids, upon which the lime is placed about 4 in. deep. The lime is carried alongside the purifier in wheelbarrows, and arranged by a workman with a shovel. The removal is effected by means of an outlet provided at the bottom, or the spent lime is shovelled into sacks and lifted out. The lime, as it is obtained from the earth, is burnt and slaked by watering it. A cubic yard of good burnt lime requires about 135 gal. of water to slake it, yielding 2¼ yd. of slaked lime. It takes 5·7 cubic yd. of slaked lime to purify 1,000,000 cubic ft. of gas from carbon dioxide, this being the quantity needed in practice: in theory, it is less. In addition to taking out the carbon dioxide the lime also takes out a portion of the sulphur (8 gr. to 10 gr. from 100 cubic ft. of gas), as carbon bisulphide, as well as some of the sulphuretted hydrogen and cyanogen.

Oxide Purifiers. The purifiers which serve for the removal of sulphuretted hydrogen are filled either with hydrated ferric oxide or a mixture of the oxide and Weldon mud (chiefly manganese dioxide). The ferric oxide that is used is natural bog ore (known also as *iron sponge*, or *iron mass*), which occurs in extensive deposits in the North of Ireland and Holland. This bog ore contains about 30 per cent. of ferric oxide, the rest of the substance being moisture and vegetable fibre, both of which are useful in dividing it, so that the sulphuretted hydrogen has a better chance of being absorbed. About 6 yd. of bog ore will be needed in practice to purify 1,000,000 cubic ft. of gas from sulphuretted hydrogen. The bog ore, which is reddish-brown, turns black when it has absorbed sulphuretted hydrogen, the ferric oxide being converted into ferric sulphide.

Revivification. The ferric sulphide which is obtained by passing sulphuretted hydrogen over ferric oxide is a very unstable body. It has the curious property, when exposed to the air, of absorbing oxygen and returning to its original state as ferric oxide, the sulphide being left as free sulphur, mixed with the ferric oxide. This property is made use of for restoring the ferric oxide to efficiency when it has become saturated with sulphuretted hydrogen, the process being known as *revivification*. The material can be revivified as many as fourteen times, after which the free sulphur it contains (about 50 per cent.) so dilutes the compound as to render it useless. This sulphur is either recovered at the gasworks or the sulphur-laden oxide is sold to makers of sulphuric acid. The revivification is attended by changes of colour which enable the workman to tell how the change is progressing. Sometimes the absorption of oxygen is so rapid that the mass takes fire, so it has to be carefully watched, and not spread out in layers of less than 12 in. deep. The oxide is taken out of the purifiers for revivification, and spread on a concrete floor, being turned over every few days until the oxidation is complete. A process of revivification in the purifiers is practised at some works, gas mixed with air or oxygen being passed through. This obviously saves a lot of handling of the oxide, but is not so easily managed, and the ferric oxide in the purifier has a tendency to become caked when it does not readily absorb sulphuretted hydrogen.

Weldon Mud. The use of Weldon mud in place of bog ore was proposed by Messrs. Hood and Salamon in 1888. Weldon mud is a by-product in the manufacture of chlorine, and a nuisance to the alkali-maker. Hood and Salamon, by a process of decantation, washed out most of the calcic chloride contained in the mud, leaving a mixture of hydrated oxides of lime and manganese. The mass is allowed to dry until it is in a moist, crumbly condition, when it is ready for use in the purifier. The manganese oxide becomes manganese sulphide by the absorption of sulphuretted hydrogen, changing its colour from yellowish-brown to pink. When saturated with sulphuretted hydrogen, the Weldon mud is revivified in like manner to bog ore. It is claimed to be superior to bog ore, because of the greater activity of Weldon mud.

Carbon Bisulphide. There still remains a very objectionable impurity in the gas—carbon bisulphide. The process of removal is to pass the gas over lime that has been saturated with sulphuretted hydrogen. This is prepared by passing gas free from carbon dioxide, but still containing sulphuretted hydrogen, through a lime purifier, forming sulphides of lime. This acts upon the carbon bisulphide in the gas, and forms probably calcium thiocarbonate. Before passing the gas through the sulphide purifiers it contained from 30 gr. to 40 gr. of carbon bisulphide per 100 cubic ft. of gas, but this is reduced by passage through the purifiers to as low as 6 gr. of sulphur compounds. In London the maximum of sulphur that is allowed in the gas is from 17 gr. to 22 gr. per 100 cubic ft., according to the season. As a matter of fact, the quantity present is much below the maximum—some 10 gr. to 12 gr. A purifier of about 28 ft. by 36 ft., charged with six 10-in. tiers of lime, will take up about 5 tons of sulphuretted hydrogen, and will absorb, when in action, at least 3 tons of carbon bisulphide. Two such vessels should suffice for a year's working on a daily output of about 3,000,000 cubic ft. of gas.

Cyanogen. The cyanogen compounds which are present in the gas, chiefly combined with ammonia, are taken out by several stages of the purification processes. The water in the scrubbers absorbs some, the lime another portion, and the ferric oxide the remainder. When absorbed by lime, it is difficult to recover the cyanogen in a paying form, but it is easier to obtain it when it has been absorbed by ferric oxide. For this reason, when cyanogen recovery is practised, lime purifiers must not be placed before oxide purifiers. Special processes are being worked for the recovery of cyanogen compounds, these latter being absorbed by certain reagents, such as ferrous sulphate, contained in a vessel placed in front of the scrubbers.

Candle-power. The quality of gas supplied by gas companies is judged by its illuminating power. This is fixed in London as 16-candle power—that is, one light from gas consumed at the rate of 5 cubic ft. per hour shall be equal in intensity to one light produced by sixteen standard sperm candles. These candles are defined by the Metropolis Gas Act, 1860, as being six to the pound, and burning 120 grains of spermaceti per hour. The gas is burned in a standard burner known as the London Argand No 1, and the light judged by a Bunsen photometer. The gas supply of London is subjected to frequent periodical examination as regards illuminating power, there being twenty testing stations in charge of the London County Council. In 1902 the sperm candles were replaced by a new standard lamp designed by Mr. Vernon

Harcourt, in which pentane (a petroleum distillate) is burnt. Every detail of the lamp is standardised, so that a light of the same intensity is always obtainable, the light being equivalent to the standard candle previously employed. Very precise directions are issued in a publication entitled "Notification of the Gas Referees," which is obtainable from the Government stationers. When gas was made from cannel coal there was no difficulty in supplying coal showing 27-candle power; such gas was used in the Government offices up to about 1876. There was a lower power gas supplied, made from bituminous coal, which tested at 16-candle power, that being the statutory illuminating power at present. As gas is more used for heating, and with mantles, and as it is easier and cheaper to make gas of a lower candle-power, there is a movement on foot among gas companies to obtain consent to supply 14-candle power gas.

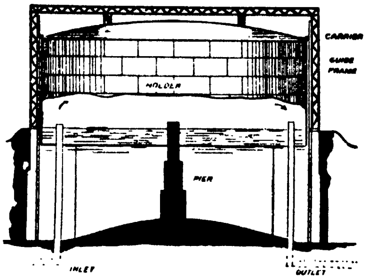
Gas Enrichment. To bring the illuminating power of gas up to standard, it was formerly the practice to employ a certain proportion of cannel gas. The increasing dearness of cannel has led to the devising of other means of enriching gas. The cheapest enricher is benzene, which is volatilised in a special apparatus; toluene, xylene, and naphthalene are better enrichers, but they are not so volatile. The albo-carbon method of increasing the illuminating power of gas at the burner involves the use of naphthalene, which is vapourised by the heat of the gas that is burning. As it is now usual to mix water-gas with coal-gas, the former is carburetted — that is, enriched with benzene or carburine before being added to the coal-gas, and is made the means of adjusting the candle power to standard in the finished gas as supplied to the public. This matter will be referred to again when we consider water-gas.

Gas Testing. To test for *sulphuretted hydrogen*, a strip of lead acetate paper is exposed to the action of a stream of gas for three minutes, when any discoloration that results is evidence of the presence of sulphuretted hydrogen. The lead acetate paper is made by wetting white filter paper with a solution of 60 grains of lead acetate in 1 oz. of water. *Ammonia* is tested for by passing 10 cubic ft. of the gas over glass beads moistened with a known quantity of sulphuric acid of known strength. Any loss of acidity due to the action of the ammonia is tested by another solution of ammonia of known strength. If a complete analysis of the gas is to be made it is conducted in the following order. (1) *Carbon dioxide* and sulphuretted hydrogen, by shaking with caustic soda solution; (2) *oxygen*, by an alkaline solution of pyrogallol; (3) unsaturated *hydrocarbons*, by absorption with a solution of bromine in potassium bromide; (4) *carbon monoxide*, by an acid solution of cuprous chloride; (5) *saturated hydrocarbons*, by partial absorption by paraffin oil, and exploding and analysing the resulting carbon dioxide; (6) *nitrogen*, by mixing a fresh volume of the gas with oxygen, exploding and removing the carbon dioxide and excess of oxygen, when the residue is nitrogen; (7) *hydrogen*, by difference.

By-products. The coke which is yielded from the distillation of coal is employed as a heating agent for the furnace or generator yielding the heat by which the distillation is effected. There is, however, a large excess which is sold as a fuel. If the use of coke as a fuel were more general the smoke problems in large towns would be solved; special grates, however, are required for burning coke effectually. From the gas liquor ammonium sulphate is obtained; it is used as a manure, but large quantities of pure anhydrous ammonia are now required for use in refrigerators. Cyanogen is recovered from the spent oxide of the purifiers. The tar which collects in the tar-well is distilled, and yields a great variety of liquids, which are the starting-point of many aniline dyes and synthetic medicines. Bricks are made from the clinker, and spent lime of the lime from the purifiers; it will be remembered also that iron oxide saturated with sulphur is used for making sulphuric acid. Tar is also used as a paint for outside fences, and when cheap it is economical as a fuel or for enriching gas, as in the Dinsmore process.

Station Meters. When gas leaves the purifiers it is measured by large *station meters*. Gas is measured like any liquid, by alternately filling and emptying an enclosed space of known capacity. The capacity of the space multiplied by the sum of the fillings and emptyings is the volume measured, which is transmitted to a dial. Upon the accuracy or otherwise of the meter depends the record of the yield of gas from the coal employed. The station meter is of the variety known as a *wet meter*, and is of exactly the same construction as the meter supplied for domestic use, but capable of registering very large quantities of gas.

The Gasholder. The gas is finally passed into the large gasholders [6], or gasometers, as they are often incorrectly called. The gasholder is a hollow vessel inverted in a tank of water and maintained in equilibrium by an outer framework or cables. The concrete base upon which the gasholder rests is best made of a mixture of old retorts and Portland cement, and the inner surface of the excavation or tank is coated with cement concrete. The gasholder is made of plates of iron riveted together. The different storeys of the gasholder are known as lifts, and slide or telescope within each other, being made gas-tight by water-seals. Gasholders are now made of enormous size, as the larger the holder the cheaper the storage cost. The largest gasholder in the world is at East Greenwich. This is a six-lift holder, and has a capacity of over 12,000,000 cubic ft. of gas. It costs approximately £5 per 1,000 ft. of storage. Spiral gasholders have lifts which ascend and descend with a spiral action. Gasholders equal to at least a day's maximum supply must be provided.



8. GASHOLDER

Gas-governor. The gas is now ready for delivery to the public, but, as the demands vary with the time of day and season of the year, an arrangement known as a *pressure governor* is employed to maintain constant pressure on the main. The regulator acts automatically, and is constructed on the principle of a gasholder, in that the rising and falling of a miniature gasholder opens or shuts a throttle valve admitting gas to the main. In large works an exhauster is also required to send the gas through the mains, but in many cases the down pressure of the gasholder is the force which drives the gas through the distributing mains.

Wood-gas. Murdock, to whom we owe the introduction of coal-gas into everyday use, told the Royal Society in 1808 that he had also experimented with wood and peat as a source of gas. The gas which is given off on destructively distilling wood is of good illuminating power if care is taken to employ sufficient heat to decompose the liquid oils which distil over. At high temperatures these yield gaseous hydrocarbons, which contribute in a great measure to the illuminating power. The process of manufacturing wood-gas is practised only in those countries where wood is plentiful and coal expensive. Riche's gas plant is used, the retorts being of cast iron. The gas consists of hydrogen, carbon monoxide with marsh-gas and ethylene, the carbon monoxide being in larger proportion than in coal-gas, some of it being due to the decomposition of the water which is contained in all wood. Sawdust and cork are sometimes distilled for gas, and several methods have been proposed for the preparation of peat-gas. These gases can be carburetted to increase their illuminating powers.

Air-gas. What is known as *air-gas* consists of air carburetted with the vapours of highly volatile hydrocarbons, such as gasoline, carburine, and benzene. The hydrocarbon needs to be very volatile, and of constant and uniform composition. Some small installations in places where gas is not available, and acetylene too expensive, have been successful. At Llanberis School a plant has been satisfactorily working for some time. It consists essentially of three parts: (1) A large, shallow cylindrical copper tank holding 250 gallons, buried some 30 ft. or more from the building, and filled with gasoline through a pipe and closed airtight by a screw tap. Two other pipes, an inlet and outlet, are fitted into the top of the tank, and pass underground to the cellar of the building. (2) In the cellar a pump, worked by a weight on pulleys, forces air through the inlet pipe on to the surface of the gasoline in the tank. Evaporation is rapid—gasoline boiling at from 35° C. to 70° C.—and the mixture of vapour and air is driven through the outlet pipe into (3) an automatic mixer, by which a definite and known quantity of air can be added, so that the proper proportion for burning may be constantly maintained. The apparatus is simple, and requires very little attention. The weight has to be wound up once a week, and the mixer adjusted by moving a small wheel along a rod, about once every two or three months, and the tank filled about every twelve or eighteen months. The frequency of the recurrence of these operations depends on the size of the plant relative to the demands upon it. Some of the air-gas plants require heat to evaporate the hydrocarbon, this increasing in a measure the risks of explosion.

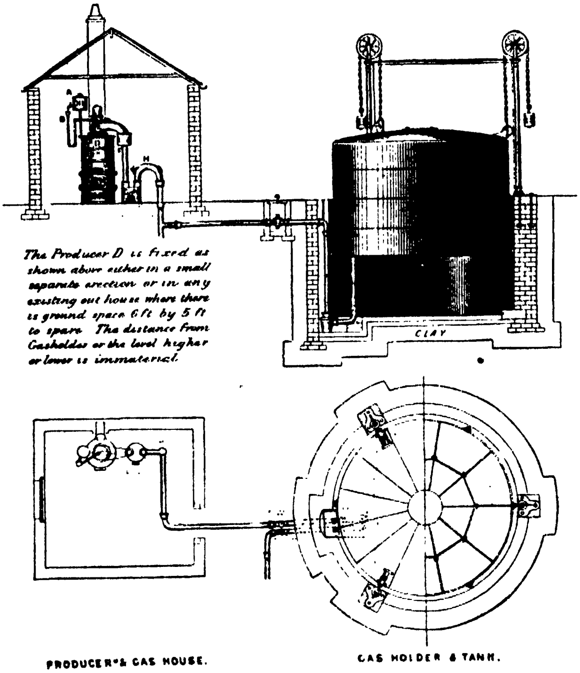
Ether-gas. A similar air-gas can be made with ether, but in this case the air is passed through a box containing a fibrous substance which has been saturated with ether. On dilution with air, ether loses its luminous flame; but any desired degree of luminosity can be imparted by carburetting with benzene. The cost of ether air-gas enriched with benzene is about twice that of oil-gas, its chief advantage being the ease with which a small plant can be installed to meet any temporary requirement. In the ether saturators sometimes employed in optical lanterns oxygen is passed through a metal box filled with ether-saturated cotton-wool.

Oil-gas When oil is subjected to destructive distillation it is broken up—"cracked" is the technical term—and a gas possessing high luminosity and heating power is obtained. The earliest process was invented by John Taylor in 1815, and shortly afterwards a method of compressing the gas was devised so that it could be readily transported. On account of the last-named fact, the gas was also known as *portable gas.* To chemists this early manufacture possesses an unusual interest, as it was from the liquid condensed in the cylinders of portable gas that Faraday first prepared benzene, this discovery laying the foundation of the aniline colour industry, which has now attained so much importance. The use of oil-gas, however, almost died out on account of the competition of the cheaper coal-gas, and it was not till 1870 that oil-gas was revived as a specially convenient method of illuminating railway carriages, buoys, and lightships.

Pintsch's Apparatus. There are several processes of manufacture. The Pintsch system is one in use by many railway companies, the following being a description of the process as used by the Great Northern Railway at Holloway. The plant was designed to make 60,000 cubic ft. of gas per day. The 10 in. D-retorts in which the oil is cracked are made of 1 in. metal, and are 6 ft. in length; they are worked in pairs, and are kept as nearly as possible at a cherry-red heat. Each pair will make from 300 cubic ft. to 400 cubic ft. of gas per hour, and 600,000 cubic ft. to 700,000 cubic ft. of gas before they require renewal. Immediately before the gas enters the hydraulic main a ¾ in. iron pipe, provided with a stop-cock, is tapped in so that the colour of the gas may be seen, this being the practical test applied to ascertain the quality of the gas, and whether the proper quantity of oil is being admitted. Another test for regulating the supply of oil is to drop a small quantity of the tar from the gas main upon a sheet of white paper; if too much oil is being admitted to the retort, a greasy ring will be found round the spot of tar; but if the right quantity is being used, no greasy ring will appear. The furnaces consume 160 lb. to 180 lb. of coke for every 1,000 cubic ft. of gas produced. The oil used is a once-refined shale oil; it runs to the retorts from a galvanised iron cistern of 50 gallons capacity through a 1 in. iron pipe, at the end of which is fixed a gun-metal micrometer cock for regulating the supply. From this supply pipe the oil flows into a small funnel attached to a ¾ in. syphon pipe, 12 in. deep, connected with the retort; it then falls on a loose tray, preferably of steel, and is instantly converted into a dense brown vapour. The gas issuing from the retorts passes to the hydraulic main, then through air condensers, washers and purifiers into the meters and gasholders. The purifiers contain a mixture of two parts of slaked lime to one part of sawdust placed on wicker trays, and are recharged every week. The cylindrical steel storeholders are 17 ft. 6 in. in length, and 4 ft. 3 in. in diameter; they are tested by hydraulic power to 300 lb. per square inch, and are provided with a pressure gauge registering up to 200 lb. per square inch. The gas is forced into the storeholders through a 1 in. extra strong lead pipe by compressing engines. Each holder is provided with a cock at the bottom for drawing off the condensed hydrocarbon, of which about a gallon is obtained from every 1,000 cubic ft. of compressed gas. Each gallon of oil yields 80 cubic ft. to 85 cubic ft. of gas. The oil is run in at about 12 gallons per hour. Other systems are the Keith, Pope, and

Peebles processes. The object aimed at in the last-named—Young, of Peebles—is to produce an oil-gas specially adapted for carburetting water-gas and enriching coal-gas.

Mansfield's Apparatus. A form of oil-gas plant much used for private installations is that made by Mansfield & Sons, Ltd., Liverpool. The illustration [7] shows a sectional elevation of the complete plant, the details of the gas producer being shown in the smaller figure [8]. The producer has a retort suspended in a cast-iron casing, lined with fireclay fittings. The top of the retort is made gas-tight by a lead joint. When the retort is hot enough to make gas, the lead melts, the bonnet sinks into it, thus making an automatic joint. The retort is heated by a coal or wood fire, and a strong red heat as seen through a sight plug is maintained throughout the gas-making process. Oil is stored in a suitable tank in any part of the building. From this tank a pipe is led to the oil syphon of the producer. A small cock attached to the end of the pipe regulates the flow of oil which is permitted to run in a fine stream into the funnel of the oil syphon. Through this it passes into the retort, and is converted into gas. The gas rises into the bonnet, and passes down the standpipe into the hydraulic main, through which it passes into the gasholder. The materials from which oil-gas can be made include creosote, palm-oil, castor-oil, coconut-oil, Rangoon-oil, kerosene, fish-oil, tallow, and unrefined fat.



The Producer D is fixed as shown above either in a small separate erection or in any existing out house where there is ground space 6 ft by 5 ft to spare. The distance from Gasholder or the level higher or lower is immaterial.

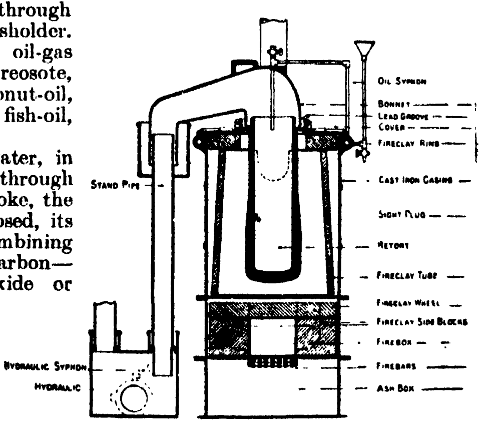
7. MANSFIELD'S OIL-GAS PLANT
(Mansfield & Sons, Ltd., Liverpool)

Water-gas. When water, in the form of steam, is passed through a mass of incandescent coke, the water molecule is decomposed, its constituent elements combining with the coke—a form of carbon—to make carbon monoxide or carbon dioxide and hydrogen. If the temperature of the coke is at about 500° C., carbon dioxide and hydrogen are formed, but at 1,000° C. the products are carbon monoxide and hydrogen. The mixture of gases thus obtained is known as *water-gas.* In discussing the various combustible and non-combustible constituents of gas, it was pointed out that carbon monoxide is combustible, but that carbon dioxide is non-combustible, and thus of no value as an illuminating or heating gas. The object will be, therefore, to produce carbon monoxide in preference to carbon dioxide if the usual properties of a gas are desired. There are, however, cases in which the carbon dioxide is preferable, as will presently be explained. The reaction in making water-gas takes place in two stages—the first, in which the water molecule is decomposed, absorbs heat in course of the change; and the second, when the carbon monoxide is being formed, is a reaction where heat is given out. The process is, on this account, an intermittent one. Air is blown in a blast over glowing coke till the mass becomes intensely hot, the gas being given off at this stage being known as *producer* or *generator gas.* When the coke is hot, steam is blown in in place of the air, water-gas being produced. The reaction rapidly cools the coke, so that it becomes necessary to stop the injection of steam and again blow the coke to incandescence by turning on the air blast. The producer or generator gas is passed into a second vessel filled with firebricks, which it raises to a white heat, and it is into this second vessel or *superheater* that the steam is passed before it goes into the fuel in the generator. Thus water-gas is made for about four minutes, and the heating-up occupies about ten minutes. This question of producer gas will be dealt with later.

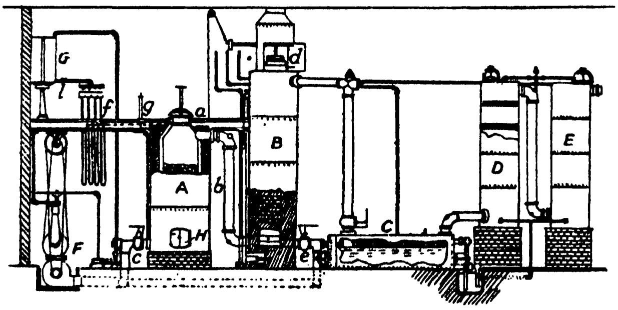


8. DETAILS OF THE GAS PRODUCER

Carburetted Water-gas. It will be remembered that both hydrogen and carbon monoxide give *blue* or non-luminous flames, and to make the gas give a luminous flame it is *carburetted* in a way similar to the enriching process referred to in the article on coal-gas. This carburetting is effected by the hot process in an additional chamber, in which oil is decomposed and the vapours mixed with the water-gas in a manner which will be best understood by reference to our remarks on oil-gas. The enriching may also be carried out in the cold process by allowing the gas to pass into a vessel containing carburine, a mixture of gasoline and benzene, which vessel is surrounded by hot water to promote evaporation. This, again, will be readily grasped when the section of this article on air-gas is read. Carburetted water-gas is much used in the United States, where gas-coal is comparatively dear, and hence cannot advantageously be used for preparing coal-gas. In this country the large gas companies are in the habit of mixing about 10 per cent. of carburetted water-gas with the coal-gas as a convenient method of raising the candle-power of the latter to the standard candle-power. Water-gas is more poisonous than coal-gas, as it consists mainly of carbon monoxide and hydrogen, the former a very poisonous gas. Moreover, as water-gas is inodorous, it is not so easy to detect leakage. This objection can be got over by giving the gas a strong smell by passing over naphthalene or impregnating with isocyanides or organic sulphides. The objection does not arise in cases where the carburetted water-gas is mixed with coal-gas, but the poisonous properties of carbon monoxide is a reason why the proportion of water-gas should not be unduly increased. If it were not that the public want a gas to give a luminous flame always it could very well be made luminous at the burner by means of an incandescent mantle.

Advantages of Carburetted Water-gas. After referring to the disadvantages of water-gas, it is only just to state the advantages. These are that the gas can be made of high illuminating power; economy in wages, since fewer workers are required than for the manufacture of coal-gas: the small cost of the installation; small area occupied by the plant: the utilisation of coke; freedom of the gas from ammonia and small amount of sulphur compounds to be removed. There is no need to remove the small amount of carbon dioxide, and the apparatus can be got ready for working in less than four hours, which is a convenience in case of a suddenly increased demand for gas. In coal-gas works it is economical to use the red-hot coke as it is drawn from the retorts.

Lowe's Water-gas Process. Having stated the chief points in the manufacture of water-gas, a few details of some of the processes actually employed may be given. In the Tessié du Motay process the water-gas is made from anthracite (in place of coke) and steam, then purified by passing through a lime-box, and finally carburetted by the cold process, the resulting mixture of water-gas and naphtha, or carburine vapour, being led through specially arranged retorts to ensure decomposition of the hydrocarbon, and finally stored. Lowe's process will be best understood by reference to **9**. In this the decomposition of the naphtha is carried out simultaneously with the production of the water-gas—that is, it is carburetted by the hot process. A is the generator, filled with anthracite through the manhole *a*. A fan, F, sends a current of air into the generator through the valve *c*; the gases escaping through the pipe *b* into the superheater B, filled with stacked firebricks; when the gases contain enough carbon monoxide to burn, air is also blown in at the base of the superheater through the valve *e*, the products of combustion escaping into the open at the top through *d*. When the requisite temperature is attained, *c*, *d*, and *e* are closed, and the fan nearly stopped, a very gentle current being still maintained through small orifices in *c* and *e*, purposely arranged to prevent back-rush of water-gas into the air main, which otherwise might cause an explosion. Steam is then turned on at the base of the generator, and a stream of naphtha at the top supplied from the tank by means of a series of distributing tubes. The mixture of hydrogen, carbon monoxide, and a little carbon dioxide formed in the generator, vaporises the naphtha, and the mixed gases act on one another in the superheater, ultimately producing an illuminating gas of high quality, when the steam and naphtha supplies are properly proportioned. The gas is washed in the purifier C, and the two towers, D and E, and stored. The steaming operation is continued for twenty minutes, when the steam is shut off, more anthracite filled in through the manhole, and the cycle of operations begun again. Every few hours (six to twelve) the doors, H, at the base of the generator are opened and the anthracite residue raked out. As will be seen, the product is a mixture of oil and water-gases. All sorts of variations of this process are in use. In one the superheater is filled with lumps of lime to free the gas from carbon dioxide. The Granger plant is arranged so that the naphtha is forced in under pressure, thus facilitating its gasification, and in the Hanlon and Leadley process bituminous coal is used in place of anthracite. Humphrey's apparatus consists of two generators, two carburettors, and two superheaters. The generators are connected by means of a flue, and each of them is also in connection with a carburettor and a superheater, the object being to enable the process to be alternately worked from the left and right.



9. LOWE'S WATER-GAS PLANT

The Dellwik-Fleischer System. In the water-gas processes just described, the fuel is raised to incandescence by blowing air through so deep a bed of fuel that the chief products are carbon monoxide and nitrogen (from the air). One pound of carbon develops only 2,400 heat-units when burnt to carbon monoxide, but 8,080 when burnt to carbon dioxide, for the reason explained in the opening remarks about the water-gas reaction. Carl Dellwik has devised a process by which the products of the "blow" are carbon dioxide and nitrogen, and thus the additional heat-units are made available in raising the temperature of the bed of fuel in place of passing into the producer gas. The result is that twice as much water-gas is obtained, the extra heat reduces the "blow" period, and allows the "run" (steam admission period) to be prolonged. The flow of steam to the fuel is regulated so that even at the end of the run there is no excess of steam to oxidise the carbon monoxide to dioxide. A ton of good coke yields 70,000 cubic ft. of water-gas in place of 34,400 by the older process. Under the older processes the cost of 1,000 cubic ft. of water-gas is from 4d.

to 6d.; by a large Dellwik-Fleischer installation the cost is below 3d. The gas produced by the Dellwik process has been successfully utilised at Cleethorpes for mixing with coal-gas by passing it into the retorts during carbonisation. Dr. Fleischer improved the original Dellwik process, hence his name becomes to be associated.

Methane Hydrogen Gas. This is the name of a process which has been successfully adopted at Sligo and Truro. The generator is filled with coke, and then blown up to incandescence, the waste gas escaping part of the way up the generator to the stack pipe, so that the fuel above is dried and heated before it comes down into the hot zone, and also serves to filter out the finely divided carbon produced during the "run." When the requisite temperature has been attained the valves are altered, and steam and tar are injected into the body of incandescent fuel. The tar is decomposed into carbon and gaseous products—containing methane—the steam combining with the coke and separated carbon to produce water-gas. A further quantity of steam injected at the bottom of the generator serves to produce ordinary water-gas, which passes away and mixes with the other gases. This gas is mixed with ordinary coal-gas in the foul main, where it takes up a considerable quantity of illuminants from the hot tar. Methane hydrogen is claimed to take up benzene better than ordinary water-gas in the carburetting process. Such a carburetted methane-hydrogen gas costs 8·92d. per 1,000 cubic ft. at Truro.

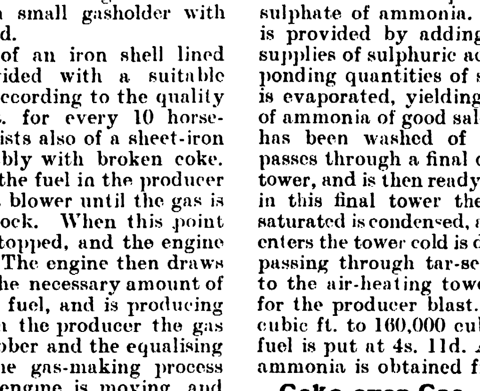
Producer-gas. This term is applied to the gas obtained in the producer or generator of the water-gas apparatus. It will be remembered that air was passed into the generator filled with coke, a gas was produced which was used to heat the second chamber, into which steam was driven and decomposed into water-gas. This may be taken as an instance of the utilisation of producer-gas; but it finds many employments in metallurgical operations, boiler firing, gas-engines, and in glass and pottery manufacture. It is also known as *Siemens' gas,* because producer-gas was economically made in a regenerative furnace of the Siemens' type. The producer-gas is made in numerous different furnaces. In some the gas is enriched by being used for distilling coal; and, again, if steam and air are injected, a mixture of producer-gas and water-gas is obtained—the so-called *semi-water-gas* or *Dowson gas.* The amount of steam that can be used is limited—from the reasons which we have dealt with in the paragraph on water-gas—and is arranged so that the heat generated by the air equals the heat absorbed by the steam. Producer-gas contains a large proportion of nitrogen from the air that is injected, and as nitrogen is a non-combustible gas, producer-gas is comparatively poor in heating properties; its flame also is non-luminous. The French call the gas *gaz pauvre*, or *poor gas.* Although the gas is poor, it can be produced in large quantities, and very cheaply. On this account producer-gas can be used freely, and still be an economical source of power. Carbon dioxide is also found in producer-gas, but the object is to make carbon monoxide in preference, as only the latter is combustible. Some average analyses will be given later in comparing the composition of several gases. In many producers anthracite is used in place of coal, as the tar produced with bituminous coal entails purification plant, the gas having a clogging action when used in gas-engines if it contains tar.

Types of Producers. The Bischof producer of 1839 is the basis of most types that have since been invented. The Siemens' gas producer was brought out in 1861. These early types of producers had open ashpits, with draught produced as in ordinary furnaces, and much heat was lost. Succeeding types are provided with closed hearths, and are produced with numberless variations in the arrangement of the parts. Prof. A. H. Sexton divides closed producers into the following five groups: (1) bar bottom; (2) solid bottom; (3) water bottom; (4) automatic; (5) blast furnace. The Dowson producer, one of the best known of the bar bottom type, was patented in 1878 (No. 3997) and 1881 (No. 2859). The air and steam were admitted through the bars. The clinker from the fuel accumulates on the bars of the furnace, and needs stoking to remove it. The Wilson producer of 1876 (No. 3949) is an example of the solid-bottom producer. The fuel rests on the solid bottom of the generator upon a layer of clinker. The clinker is drawn off near the bottom, and air blown in just above the layer of clinker, which is always left in the producer. The clinkers are removed every twenty-four hours through narrow side doors, bars being put across to support the fuel during the operation. Solid-bottom producers are thus intermittent, but this is got over by arranging a water-seal as in the water-bottom producers. The ashes fall into water, and no gas escapes. The heat of the ashes vaporises some of the water, which passes into the producer. The Duff producer (patent 15646, of 1901), the Smith and Wincott producer (patent 12895, of 1901), and the Wilson water-bottom producer are representative examples of this type. In the automatic producers the ashes are continuously removed by mechanical means. The Wilson automatic producer does this by a constantly revolving screw, which slowly pushes out the ashes. Space will not permit of details being given of the numerous producers that have been patented, and which fall under one or other of the above types. The chief improvements consist in means of removing the tar from the gas; heating the air and steam before use; special methods of charging; special arrangements for supplying the air and steam; varieties in grates; producers raising own steam; arrangements for breaking up clinker or fuel; supplying the air and steam at the top and drawing off the gas lower down; feeding at the bottom.

Suction Gas-producers. The constantly increasing use of gas-engines has ensured the evolution of the gas producers along economic lines. The types hitherto dealt with have needed air and steam forcing into the producer, with the consequence that the gas was under slight pressure, from which fact the type has been distinguished as *pressure gas-producers.* From these a new type requiring neither steam-jet nor air-blower has been evolved, the air being drawn into the producer by a suction pump attached to the gas-engine, being known as *suction gas-producers.* With the older type of pressure producers a boiler was needed to generate steam, and a gasholder in which to store the gas for use; while with the suction type the gas is taken direct to the combustion chamber of the engine. The boiler is supplanted by an *evaporator* or *vaporiser*, which in small plants is built frequently on the top of the producer in the form of a water jacket, and in large plants close to the producer in the form of a tubular evaporator. This evaporator is generating the steam required by utilising the waste heat of the producer and of the gas, which is of considerable advantage, as compared with the old system, the firing of a separate boiler being dispensed with. The advantage of a suction gas-producer are automatic generation of the gas by the engine; highest and best utilisation of fuel; no boiler or gasholder required; can be erected without danger in any convenient place; easy to start and to run; no soot, smoke or odour; no explosion possible; and small floor space required. The origin of the type is the Benier producer, which was patented 1894, and has been specially developed on the Continent. A complete suction gas-producer plant consists of a blower which, up to 150-h.p., is driven by hand; a producer, an evaporator, an overflow water-pot, a scrubber, and a small equalising tank or *expansion box*. In plants above 75-h.p. a sawdust scrubber is advantageously inserted behind the wet scrubber, and in plants where two or more engines are fed from the same producer a small gasholder with automatic regulation is used.

The producer consists of an iron shell lined with firebrick and provided with a suitable hopper. The grate area, according to the quality of fuel, is 0·8 to 1 sq. ft. for every 10 horsepower. The scrubber consists also of a sheet-iron shell, and is filled preferably with broken coke. Before starting the engine the fuel in the producer is heated up by means of a blower until the gas is burning well at the test-cock. When this point is reached the blower is stopped, and the engine started in the usual way. The engine then draws by its own sucking action the necessary amount of air and steam through the fuel, and is producing its own power-gas. From the producer the gas is drawn through the scrubber and the equalising tank to the engine. The gas-making process continues so long as the engine is moving, and stops when the engine stops. Anthracite, charcoal, or coke can be used in suction gas-producers.

Mond Gas. Dr. Ludwig Mond, in studying the question of obtaining a cheap fuel gas, has evolved a method in which slack coal is used, and the ammonia produced by the combustion is recovered. The gas is really a producer-gas, but is, on account of the novel method of production, generally distinguished as Mond gas. The gas is being produced on an enormous scale, and is distributed by means of pipes in a large district in Lancashire. The following is a brief description of the plant used, which will be made clearer by referring to the illustration [10]. The producer is provided with a water-seal, and is constructed so as to allow the ash, which is the only residue, to descend into the water, from which it is easily removed without interfering in any way with the working of the producer. The process of combustion is carried out at a comparatively low temperature, with the twofold object of preventing the formation of clinkers in the producer and of providing against the destruction of ammonia. This is accomplished by introducing into the producer a blast of hot air and steam. The quantity of steam required when it is desired to recover the ammonia from the gas is equal to 2½ tons per ton of fuel gasified, but of this about 1 ton is automatically recovered and used over and over again. After leaving the producer the gas is passed through a regenerator arranged so that part of the heat or gas and steam entering it is transferred to the blast of air and steam on its way from the air-heating tower to the producer, the gas being consequently cooled to a corresponding temperature. The gas then passes to a mechanical washer, which further reduces the temperature and removes all soot and dust. The next step is the recovery of the ammonia, and the gas is for this purpose passed through an acid tower, where the ammonia is completely absorbed by a dilute solution of sulphuric acid. The solution circulates through the acid tower again and again until it contains from 36 per cent. to 38 per cent. of sulphate of ammonia. Continuity of the process is provided by adding from time to time fresh supplies of sulphuric acid and withdrawing corresponding quantities of sulphate liquor. The latter is evaporated, yielding at once a solid sulphate of ammonia of good saleable quality. After the gas has been washed of its ammonia products, it passes through a final cooling and cleaning water-tower, and is then ready for use. As the gas is cooled in this final tower the steam with which it was saturated is condensed, and the cleaning water which enters the tower cold is delivered hot; and this, after passing through tar-separators, is again pumped to the air-heating tower to heat the air required for the producer blast. The final cost* of 140,000 cubic ft. to 160,000 cubic ft. of gas from a ton of fuel is put at 4s. 11d. About 90 lb. of sulphate of ammonia is obtained from each ton of coal.



10. MOND'S GAS-PLANT

Coke-oven Gas. In the manufacture of coal gas, as we have seen, the gas is the main product, and the coke, although used for several other purposes, is the by-product. The iron smelter requires a coke that is compact, heavy and even, and to produce such a coke special furnaces are used, known as *coke-ovens*. Here the coke is the main product, and the gas given off is the by-product. The gas is, as a rule, completely neglected and lost because there are many iron makers who believe that the recovery of the products of the coke-oven is not consistent with the manufacture of the kind of coke which is most suitable for the blast furnace. As some 13,000,000 tons of coal is coked in the United Kingdom in beehive ovens for the manufacture of pig iron, it will be apparent that the loss is tremendous. Many recovery or by-product coke-ovens have been invented, the principle being that the gas is drawn away from the ovens and means employed to remove the tar and ammonia. The resulting gas can be used for heating the coke-ovens or for other industrial purposes, such as in gas-engines. In large installations of by-product coke-ovens two kinds of gas are separately collected; the richer gas coming off during the first part of the process can be used as an illuminant, the second portion of the coking yielding fuel gas. The other by-products, tar and ammonia, are recovered by similar methods to those used in purifying coal gas, and described a little further back.

Blast-furnace Gas. The blast furnace used for smelting iron ore generates a large quantity of inflammable gas known as *waste gas.* The last name expresses the universal practice of iron makers up to a few years back, when efforts were directed to utilising this wasted form of fuel. The gas, owing to the velocity with which it passes from the furnace, is laden with dust; but this is neglected when the gas is employed for heating the blast, or as fuel under boilers. When required for use in gas-engines, the gas must be cleaned, or it soon blocks up the valves of the explosion chamber. Properly cleaned furnace gas is an ideal gas for gas-engines, as, when mixed with air and compressed, it is found to be a slow but very reliable explosive. A portion of the gas is used for driving the gas-engine which produces the blast, but much surplus gas remains for other economic purposes.

Composition of Gas. The following typical analyses of illuminating and fuel gas are interesting as showing the relative composition. The figures (percentages) were given by Mr. Willard L. Case in a communication to the New York section of the Society of Chemical Industry in 1905:

COMPOSITION OF ILLUMINATING AND FUEL GASES.

—	Natural gas.	Coal-gas.	Oil-gas.	Water-gas.	Carburetted water-gas.	Producer-gas from			Coke-oven gas.	Blast-furnace gas.
						Anthracite.	Bituminous coal.	Coke.		
Hydrogen	3 0	46·0	32·0	48·0	40·0	20·0	10·0	10·0	50·0	1·0
Methane	92·0	40·0	48·0	2 0	25·0	—	3·0	—	36·6	—
Ethylene	3·0	5·0	16·5	—	8·5	—	0·5	—	4·0	—
Carbon monoxide ..	—	6·0	—	38·0	19·0	25·0	23·0	20·0	6·0	27·5
Carbon dioxide ..	—	0·5	—	6·0	3·0	5·0	5·0	4·5	1·5	11·5
Nitrogen	2·0	2·0	3·0	5·5	4·0	49·5	58·0	56·0	2·0	60 0
Oxygen	—	0·5	0·5	0·5	0·5	0·5	0·5	0·5	0·5	—

Acetylene. At the beginning of the consideration of illuminating gas, acetylene was mentioned as both a combustible and luminous gas present in small quantities in coal-gas. Acetylene has, within recent years, been prepared for use by itself as an illuminant, this having been rendered possible by the discovery of a cheap method of producing it.

Action of Water on Carbides. When water is brought into contact with calcium carbide, acetylene is produced in accordance with the following chemical reaction:

$$CaC_2 + 2H_2O = Ca(OH)_2 + C_2H_2$$

calcium carbide + water = calcium hydrate + acetylene. The production of the gas is so easily and simply effected that it is no wonder that the use of acetylene soon became popular in places where coal-gas or carburetted water-gas were unattainable. Besides calcium carbide there are other carbides prepared in the electric furnace, but none of them have assumed the importance of calcium carbide. Lithium carbide, barium carbide, strontium carbide, potassium carbide, and sodium carbide, all give off acetylene when brought into contact with water, but aluminium carbide gives off methane and manganese carbide, a mixture of methane and hydrogen. Attempts have been made to take advantage of the last-named carbide by mixing manganese dioxide with the ingredients for making calcium carbide, but, so far, the production of mixed carbides has not been successful.

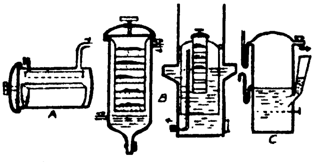
Storage. On account of this action of water on calcium carbide it is necessary that it be stored from moisture—large quantities in strong iron drums, and small quantities in hermetically sealed tins. This property also accounts for the fact that the storage of calcium carbide is regulated by the Petroleum Act, except when quantities of 28 lb. in 1 lb. packages are stored.

Properties of Acetylene. The light yielded by acetylene more nearly approaches sunlight in light rays, but it has more blue or violet rays (chemical rays). The illuminating power of acetylene as compared with coal-gas varies with the type of burner employed. In a suitable burner, 5 cubic ft. of acetylene per hour will give 240-candle power, while the same quantity of coal-gas gives 16-candle power. Acetylene is, however, generally burnt in small burners using from ½ cubic ft. to 1 cubic ft. per hour, when the illuminating power is from six to ten times as great as that of coal-gas. There is less heat developed by combustion of acetylene for given yield of light than most other illuminants. The distinctive smell of commercial acetylene makes it easy to detect leaks. The limits of explosibility of acetylene mixed with air are 3·1 per cent. to 24·1 per cent., which is a slightly wider range than other combustible gases of commerce. The effects of an explosion would probably be no greater than with ordinary gas. Compressed acetylene is dangerous, and its manufacture, importation, or storage at greater pressure than 100 in. of water is illegal in the United Kingdom. Acetylene is, however, allowed to be compressed along with oil-gas, as the mixture has been demonstrated to be safe. The exemption extends also to acetylene compressed into porous material, both with or without acetone. The last-named liquid has the power of absorbing 250 volumes of acetylene at a pressure of 10 atmospheres, the liquid being known as *dissolved acetylene.*

Impurities in Acetylene. It is the impurities in acetylene which give the gas its unpleasant smell, hence every care needs to be exercised to use only pure ingredients in making calcium carbide. Phosphorus compounds in the lime used become calcium phosphide, which, when moistened with water, yields phosphine; this gives not only an unpleasant odour but also a white haze of ammonium phosphate in the air when burnt in a closed room. The highest proportion of phosphine ever met with has been 2·3 per cent. Sulphur compounds are seldom present, but sulphuretted hydrogen may be detected in cases where the gas has been improperly generated or where aluminium sulphide is present in the carbide. Crude acetylene always contains ammonia, which arises from the aluminium or calcium nitrite in the carbide. It is an objectionable impurity, as it corrodes the brass fittings, and, producing pyrol at the burners, stops them up. Traces of hydrogen silicide, oxygen, nitrogen (or air), hydrogen, carbon monoxide, and methane, have also been found in varying small amounts.

Purification of Acetylene. The substances which have been proposed as chemical purifiers for acetylene are (1) ordinary ferric hydroxide, as used for coal-gas; (2) heratol, a solution of chromic acid in acetic or sulphuric acid absorbed in kieselguhr; (3) acagine, a mixture of bleaching powder, with 15 per cent. of lead chromate; (4) puratylene, a mixture of bleaching powder with calcium chloride and calcium hydroxide; and (5) frankoline, a solution of copper and iron chloride absorbed by kieselguhr. These materials have been subjected to an examination and tested for efficiency by Keppeler, and were, as a result, placed in the following order: Ferric acid is practically useless, but one kilo of the other four materials purifies the following quantities (in litres) of acetylene; heratol, 5,000; frankoline, 9,000; puratylene, 10,000; acagine, 13,000. In practice, these numbers may be increased from 10 per cent. to 20 per cent.

Types of Generators. There have been up to the present time some hundreds of different apparatus [11] constructed for the purpose of generating acetylene from calcium carbide. These have been classified by Professor V. B. Lewes into the following three classes, into one or other of which all the generators at present on the market fall.



11 TYPES OF ACETYLENE GENERATORS

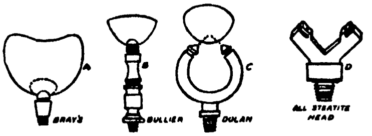
1. Those in which water is by various devices allowed to drip or flow in a thin stream on to a mass of carbide, the evolution of the gas being regulated by the stopping of the water-feed.
2. Those in which water in volume is allowed to rise in contact with the carbide, the evolution of the gas being regulated by the water being driven back from the carbide by the increase of pressure in the generating chamber.
3. Those in which the carbide is dropped or plunged into an excess of water.

These types are again subdivided into (*a*) *automatic* and (*b*) *non-automatic*.

By automatic generators are meant those which have a storage capacity for gas less than the total volume which the charge of carbide is capable of generating, and which depend upon some special contrivance for stopping contact between the water and carbide. Non-automatic generators are those in which a holder of sufficient capacity is provided to receive the whole of the gas made from the largest charge of carbide which the apparatus is capable of taking.

Choosing a Generator. The factors to consider in choosing a generator are those which guided the Departmental Committee appointed to advise the Explosives Inspectors in 1900. The Committee consider that in selecting an acetylene generator regard should be had to the following desiderata: (1) simplicity of action and design; (2) strength of construction; (3) high efficiency, as indicated by the yield of gas per lb. of carbide; (4) low pressure in generator; and (5) facility of removal of the residue.

Acetylene Burners. One of the chief difficulties in the burning of acetylene is the quantity of smoke which is produced, which causes endless trouble by growths of carbon which form at the tips of the burners. Burners using 0·75 cubic ft. to 1 cubic ft. of acetylene per hour are the largest that can be used without unpleasant effects. The acetylene is mixed with air at the burner in the most successful type, an air intake being arranged at the tip of the burner. The Naphey is a popular kind. In this, two small jets of acetylene meet to form a flat flame, with very little tendency to produce smoke or become choked. Other types are shown in 12.



12. TYPES OF ACETYLENE BURNERS

Installation Hints. As there are many points of difference between the fittings used for coal-gas and acetylene, the requirements are briefly indicated separately. The generator and holder should be in a well-ventilated place outside the house, the place being capable of being warmed with hot-water pipes in case of severe weather. The holder should be of such a size as to contain sufficient gas to last the whole evening or the longest period the burners will be alight. As regards the size of the pipes used for supplying acetylene, it must be remembered that a given size pipe will supply three times as many burners with acetylene as with coal-gas. For fifteen burners ½ in. pipe is used; for sixty burners, ¾ in. Iron barrel piping should be used, and joints screwed together without paint or packing. Taps require to be of best quality brass, as cheap fittings are soon corroded. In starting an installation, care must be taken that all the air is out of the pipes. It is best to take samples of gas from each burner in a test tube, and test with a match before applying a light to the burner for the first time. The pressure at which the gas is supplied should not be more than 2½ in.

Yield and Cost of Acetylene. One pound of calcium carbide will yield 5 cubic ft. of acetylene; in practice it is usual to reckon the quantity as 4 cubic ft. Acetylene is reckoned to cost £2 per 1,000 cubic ft. in the holder, and if it is distributed on a commercial scale, the cost of distribution will double this. Coal-gas costs 1s. 2d. per 1,000 cubic ft. in the holder, this being doubled by the expense of distribution and profit. It will thus be seen that acetylene cannot displace coal-gas where the latter is obtainable.

Acetylene Lamps. Many kinds of portable acetylene lamps have been devised, but the great difficulty in the case of table lamps has been to ensure freedom from smell. It will be obvious that similar conditions and principles apply in constructing table lamps as are indicated in the case of generators. It is usual to arrange a filter of silicate wool before the acetylene is passed into the burner, so as to guard against mechanical impurities being taken into the flame. Acetylene cycle lamps are much in use on account of the brilliant illumination obtained. Such lamps are more expensive to maintain than oil lamps, and the greater light obtained is not always a recommendation. Acetylene motor lamps are a development of the cycle lamps.

Gas Meters. To measure the quantity of gas used by a consumer, gas is passed through a meter which mechanically records the volume of the gas. The meter is fixed within 2 ft. 6 in. of the main cock. The gas is measured in cubic feet, for which, curiously enough, no standard existed till the passing of the Sale of Gas Act 1859. This Act fixed the standard cubic foot as the space occupied by 62·321 lb. avoirdupois of distilled water, weighed in air at 62° F., and at normal atmospheric pressure. Meters are tested for accuracy by passing through them a measured volume of gas from a small gasholder. The following are the capacities of a few ordinary size meters :

	Size of inlet and outlet pipe. in.	c. ft.	c. ft.
10 light	1		60
20	1¼		120
30	1¼		180
51		2½	300
100		5	600
250		12½	1,500
1,000		50	6,000

Wet Meters. There are two types of meters in use, the wet meter and the dry meter. The former is constructed on the model of the station meter, and consists of three essential parts : (1) a hollow drum or wheel rotating in water ; through this drum the gas passes, and as the drum rotates it actuates the dial index, recording automatically the gas passed ; (2) a compensating arrangement for keeping the chamber in which the drum revolves at a constant level ; and (3) the index, which shows the amount of gas passed. The measuring wheel is of inflexible material, but the water in the meter is liable to freeze in cold weather. For this reason the meter requires to be protected from changes of temperature, and as an additional precaution, glycerine is added to the water to lower the freezing-point. Salt, magnesium chloride and calcium chloride are sometimes used in place of glycerine, but corrosion of the interior of the meter often results.

Dry Meters. This type of meter works on the principle of an ordinary bellows. Gas enters and leaves compartments having flexible leather sides, alternately through valves which open and shut at the proper moment. One of the best-known makers of dry meters thus describes his make of dry meter :

> It consists of a cylinder divided by a plate in the centre, into two separate cylindrical compartments, which are closed at the opposite ends by metal discs ; these metal discs serve the purpose of pistons, and they are kept in their places by a kind of universal joint adapted to each ; the space through which the discs move, and, consequently, the means of measurement, is governed by metal arms and rods, which space, when once adjusted, cannot vary. To avoid the friction attending a piston working in a cylinder, a band of leather is attached, which acts as a hinge, and folds with the motion of the disc ; this band is not instrumental in the measuring, so that, if it were to expand or contract, the registering of the meter would not be affected, inasmuch as it would only decrease or increase the capacity of the hinge, the disc being still at liberty to move through the required space ; the leather is also distributed in such a manner, being curved, and bending only in one direction,that it prevents any creases or wrinkles forming, and renders it therefore much more durable. The arrangement of the valves and arms are somewhat different to that of the steam engine, although somewhat similar in principle.

Most dry meters are composed of two chambers ; but there may be three or more, without difference of principle. The chambers fill and discharge alternately or in succession, and the action of the valves is accurately registered in the mechanism that regulates the dials of the index. A common error is the supposition that the leather enclosing the space between the discs actuates the gas ; but the whole of the work is performed by the latter, which are really pistons receding to let the gas fill the chamber and advancing to drive it out. Though delicately adjusted, the mechanical action is really very simple.

How to Read the Meter. There is no mystery about the dial of a gas meter. It is perhaps because some people have never considered the subject that they think it difficult to read a gas meter. It is as simple as telling the time by a clock. There are three or more dials in the little compartment at the top of the meter. One of these indicates, perhaps, 2 cubic ft., an arrow usually being placed to indicate the direction of the hands. When a large quantity of gas is being burnt the little hand in the unit dial is kept busy, and the consumer can get a good idea of the cost per hour of, say, a cooking stove. The other dials register hundreds, thousands, ten thousands, and million cubic feet, the hands moving on the dial just as on the smaller dial, but naturally much slower. At a given date—say, the beginning of a month—the quantity is noted, and at the end of the month the index is again read off, the difference between the two amounts being the quantity consumed during the month. In the case of illuminating devices used at public rejoicings, the gas is generally taken direct from the main and a charge made of so much per jet per hour, with a minimum charge of 50s.

Prepayment Meters. These meters, which are actuated by a coin, are also known as slot meters. They were invented in 1887, and are of various kinds—Brownhill's, Price's, Cutler's, Braddock's, Cowan's, Glover's, and Parkinson's—adapted for taking either pennies, sixpences, shillings, florins or half-crowns. The slot meter is extremely popular with people of moderate means, who can thus use a cheap illuminant without running into debt.

Slot-meter Mechanism. At the front of the meter is the slot. Within is a delicate balancing arrangement which works on the valve of the meter. This balance is connected with the index, and as soon as the drum cylinder has revolved the allotted number of times, the balance is disturbed, and the coin drops down, and the supply ceases. As meters are made to give out quantities of gas for a sixpence, a shilling, a florin, or half a crown, it is easy to see that the weight of the coin, except as a means of starting the action, has nothing to do with measuring the gas.

Gas-fitting. From the meter, pipes convey the gas to the various parts of the house. The supply pipes are best of wrought iron, but composition pipes are much used. The latter are more liable to damage, and many cases of leakage have been caused by nails having been driven into the softer piping. The liability to compression and consequent constriction in the supply of gas is another fault often found with composition pipes. Cheap piping is to be avoided, as soundness is a very necessary quality in gaspipes. All lines of piping should be laid with a gradient, so that condensed moisture can drip or drain back into the risers. Drip pipes should be provided where necessary. Piping should be exposed as much as possible to facilitate future examination, and where the pipes are laid beneath floors, the boards should be screwed and not nailed down. In searching for leaks in pipes, a light should not be used, but the suspected parts painted with a strong soap solution; bubbles will show themselves if the least trace of gas is escaping. The work of the gasfitter has been described on pages 5797 to 5799.

GARDENING

6

Continued from page 6678

BUSINESS SIDE OF GARDENING

Economical Gardening. The Oldest Profession on Earth. Nurserymen and Seedsmen. The Market Gardener and his Opportunities. Profits and Losses

By H. H. HAVART

WHETHER a garden be large or small, its economical management depends so much on soil, situation, and other circumstances, that no hard and fast rule can be laid down to apply equally in all cases. Particularly does this apply to suburban gardens. There are some, notably in the western suburbs of London, attached to houses built on the site of market gardens, the soil in which is naturally good, and where but little in the way of manure is needed every year.

The Cost and Economy of the Small Garden. The initial cost of forming such a small garden, too, depends greatly on the condition in which the builder of the house has left it, or, if the house is not a new one, on the horticultural tastes of the previous tenant. Assuming that the ground is not in a very rough state, the following figures will serve as a guide to the initial outlay necessary:

	£	s.	d.
Jobbing gardener, two days weeding, digging, and preparing ground at 5s. per day	0	10	0
Spade, rake, etc.	0	8	0
Lawn mower	0	14	6
Loam, leaf mould, potting soil, for improving	0	12	6
Manure	0	6	0
Small collection of vegetable seeds ..	0	2	6
Small collection of bulbs .	0	5	0
Small collection of hardy annuals and perennials	0	5	0
Fruit and rose trees and shrubs (say) ..	1	0	0
	£4	3	6

This figure does not, of course, represent the annual expense, which may, in subsequent years, be limited to practically the 12s. 6d. comprising the seed and bulb items, as fruit and rose-trees rarely require renewing. The item for manure, too, is one which need not recur often. In fact, in many cases, a tradesman who supplies the household with goods will be only too glad to give a load or so of horse manure, if asked for it.

A greenhouse, with its accompanying heating apparatus, and a frame constitute a serious item. An efficient greenhouse for a small garden would be one (say, 9 ft. by 6 ft.) costing about £4, and the necessary heating apparatus another £3. A handy-sized frame, 8 ft. by 6 ft., costs £2 15s. The prices given are those for the simplest form of house and frame, and may be taken as being the lowest at which an effective greenhouse can be established.

Economy in Vegetables and Fruit. The most economical thing that can be grown in any small garden is undoubtedly the scarlet-runner bean. A shillingsworth of these, sown at intervals of a fortnight throughout the spring, will yield sufficient for the needs of a small family throughout the summer, and on into the autumn—that is, assuming that they take their turn with other vegetables. It is waste of time to try and grow such vegetables as cauliflowers and cabbages in a town garden. Radishes, lettuce, and mustard-and-cress are most economical vegetables for town garden culture, and, at a rough computation, a shillingsworth of crop may be expected for every pennyworth of seed sown, provided ordinary care is used in thinning out and other details.

Pears thrive in town gardens much more readily than apples, while crops of cherries and plums are usually spoiled by the attacks of birds. Of the bush fruits, the gooseberry is most likely to yield a profitable crop under such conditions. Strawberries are not to be thought of except as a hobby, as they take up a large amount of ground for a yield which is small in comparison. The ground they would occupy is best covered with small saladings.

Economy in the flower garden is to be effected by its help in furnishing flowers for indoor decoration, and for "buttonhole" purposes. In planting a small garden for economy, it is not at all necessary to put the things in formal rows, as if planting for market purposes. Those flowers which yield large supplies of bloom for cutting purposes should be interspersed with such things as geraniums, calceolaria, lobelia, and the like, which, though not so adapted for filling vases, lend bright colour to the garden generally: hence, when occasion arises to cut the flowers in the garden with a free hand, the presence of the things just mentioned will conceal the bareness which their absence would only serve to accentuate.

Economical Management of a Large Garden. The economical management of a garden depends almost entirely on the selection of a head gardener, and in this connection it often happens that the best horticulturist is not the man most suited to control a staff economically, and get the maximum amount of produce out of the ground at the minimum expenditure of money.

A young gardener who hopes to rise as high as possible in his profession should be careful not to lose sight of the commercial side of it. The days when an owner of a country seat simply gave orders for a garden beautiful, without counting the cost, are over. Certainly, owners of gardens take much more personal interest in them than hitherto, but the commercial spirit of the age has entered into gardening as deeply as into many another hobby, and, although it seems sordid to say so, the head gardener who can make the biggest show of bloom at the cheapest rate is the man who will get on.

Economy in labour is one of the most important items in the management of a large garden, and here the individual who calls himself a "head working" gardener will be out of place. In an establishment of any pretentions, where the number of hands employed in the gardens may be anything from twelve to forty, it is a false economy on the part of the head, as a rule, to do any of the manual work himself. It must not be forgotten that, in the majority of gardens, a large section of the staff will be composed of boys and young men, with little or no sense of life's responsibilities, and that the temptation to idle away their time when no watchful eye is upon them is one too great to be resisted. Instead of actually doing things himself, therefore, the head gardener should spend a large portion of his time in seeing that others do them as he would wish. It is a false economy to employ young and comparatively inexperienced men as foremen. Next to the head himself the well-doing of the garden is in the hands of these men, and, though it may look well on paper to show a few pounds saving at the end of a year in this part of the wages list by employing low-priced hands, it is of very little use when there is a much bigger item on the other side of the balance-sheet for plants and other things which have been spoiled by careless handling.

Seed-saving. An important item in the management of a large garden is that of seed-saving. Seed of all flowers and vegetables that do well in a garden should be saved every year, and be stored away for sowing the following season. Careful attention to this branch of the garden work will effect a saving of many pounds on the annual seed bill, and the work of picking them over in order to separate the good from the bad is an operation which may readily be carried out during the winter days when there is not so much to be done out of doors, or at any time when inclement weather causes a cessation of operations outside. It is not economy to be constantly introducing novelties into a garden. Changes must, of course, be made from year to year, but thousands of pounds are wasted annually in this country in the purchase of seeds, plants, and bulbs which are boomed as being something new.

It is not too much to say that an economy of 25 per cent. can be effected in the cost of fuel for the hothouses where care is used. Sufficient fuel must, of course, be used to maintain the houses at an adequate temperature, and anything more than that is not only waste as far as the consumption of fuel is concerned, but is not in any way conducive to the welfare of the inhabitants of the greenhouses. It should not be forgotten that coal-dust, damped with a little water, and banked up in the boilers overnight, will preserve an equable temperature in a house till morning, without further attention. This is a far more economical plan than the general one of stoking up overnight with a mixture of coal and coke, which invariably has the effect of raising the house many degrees above its proper temperature during the early hours of the night, and letting it down dangerously by the time the darkest and coldest hour of all arrives—the one preceding dawn.

A watchful eye must be kept on what is erroneously called the rubbish heap. It is a common practice to throw away bulbs that have been forced, plants which have been pulled up in the process of thinning out beds, and other such things. All forced bulbs may be used again in a spot in the reserve garden to furnish a supply of bloom for cutting, and if there is no room for surplus bedding plants, or thinned-out vegetables, they may readily be exchanged or got rid of in other ways.

How to Label. Proper labelling of plants is a far more important factor in the economical management of a garden than is generally imagined. Except in the case of plants which are so generally grown that they cannot fail to be recognised by the merest tyro, it is well to have everything labelled inconspicuously, but at the same time clearly. This is particularly important in gardens where collections of the different species of a genus are made, as, although many of them are very similar in appearance, they require different treatment from each other. In the event of a mistake, therefore, it is easy to see that a lot of valuable plants may be lost through not being labelled at all, or labelled indistinctly. It may be well to state here that the writing on a label should always be commenced at the top end—that is to say, at the part of the label furthest from the point which sticks into the ground. The reason for this is that if the rain and decay tend to make the label illegible, the upper part of it is, in the ordinary course of events, sure to be clearer than that which is close to the ground. If this upper part, therefore, bears the first part of the name of a plant, it is usually easy to guess at the remainder; but if the writing of the label has been started at the lower part, in all probability the last few letters of it only will be legible, and confusion easily follows.

The Need for Tidiness. It need perhaps hardly be said that tidiness and economy go hand in hand in gardening. All such operations as weeding, rolling, mowing, the clipping of hedges, and the hundred and one operations which go to make the garden neat and pleasing to the eye, should be attended to promptly and frequently. It is easy for a lad to remove young weeds, for example, in a very short time when they first make their appearance, but if they are allowed to remain undisturbed for a few days, it is astonishing with what rapidity they will grow, and with what corresponding difficulty and expenditure of labour their removal will be attended. That well-known business maxim, "Do it now," cannot be too rigidly observed in connection with the gardening operations just alluded to if a true economy of time and labour is to be effected. On the other hand, it is well not to be too precipitate with the autumn and winter planting operations, and the carrying out of such schemes as summer bedding. The vagaries of the weather have to be considered here, and too much promptness in the work may allow a nip of frost to destroy everything, and hence, instead of an economy being effected, a further expense for new plants is incurred.

How to Become a Gardener. Although the oldest profession on earth, gardening is one which is most poorly paid, and the lad who is setting out with the determination to make a fortune should think very deeply before he decides to embrace horticulture as the means to that end. This remark applies more particularly to private gardens. There are plenty of instances on record of nurserymen who have accumulated large fortunes, and, although the market gardener is always pleading poverty, one very rarely sees members of his profession included in the official list of Receiving Orders in Bankruptcy; but in both these businesses there is, of course, a large element of risk. To qualify as a gardener it is necessary to start young. The orthodox way is to secure a berth in some large local private garden or nursery as a boy, at a wage which rarely exceeds 5s. per week. If a lad shows any aptitude the head gardener will be only too glad to push him on, and, in a couple of years time or so, his money will be raised to 7s. or 8s. a week, in addition to living accomodation in the "bothy." This "bothy" is usually a small cottage in which the young unmarried gardeners in a private establishment live together, and take it in turns to act the part of housekeeper. If the "improver," as the embryo gardener is called at this stage, lives at home instead of in the "bothy," he is usually paid a shilling or two more per week. As he grows older and gains more experience he develops into a "journeyman." There is no doubt that at this time he gains the bulk of his experience, and if he wishes to learn his profession thoroughly he will do well to change his situation occasionally, and become acquainted with gardens in various parts of the country.

It must be distinctly understood here that the writer does not wish to advise lads and young men to throw up good situations, and go wandering about the face of the land in and out of work every few weeks. If a gardener is in a situation which seems likely to be a permanent one, and the prospects of promotion are good, he will, of course, stay there if he is sensible. At the same time, experience gained in only one garden cannot be so varied or valuable as that obtained in two or three, where soil, aspect, climate, and dozens of other conditions vary.

Getting to the Top. By the time he is four or five and twenty years of age, the "journeyman" usually considers he has sufficient experience to dub himself a "foreman," and in this capacity he has charge of one part of the garden, under the immediate supervision of the head gardener. The number of foremen employed in a garden varies, but in a place of any pretensions there is usually one for the kitchen garden, one for the flower garden, and a third for the glasshouses and conservatories. His wages are now about £1 per week, and his share in the "bothy;" or 24s. a week, roughly, if he lives outside. The final step from foreman to head gardener usually happens automatically, when the horticulturist is lured into matrimony. He finds that a foreman's wage is not sufficient to support two, and therefore he endeavours to better himself by applying for a situation as head gardener. When he has succeeded in obtaining this he has risen as high as he can ever hope to do in his profession. His emoluments now consist of a salary of 30s. a week, with a cottage to live in rent free, and the privilege of having sufficient of his employer's coal, fruit, and vegetables, for the consumption of himself and family. There are very few gardeners indeed in the United Kingdom who, though they may have charge of places in which thirty or forty men and boys are at work, receive a higher wage than that just mentioned, an income which, in cash and kind, rarely exceeds £150 a year.

Growing for Exhibition. Growing for exhibition at flower-shows is another of the gardener's methods of increasing his income, if his employer does not object. There is hardly a village in the United Kingdom that does not hold its annual flower-show, and many gardeners exhibit at every show within a reasonable radius. The prizes are not large, certainly, ranging as they do from a shilling to a sovereign, but they amount to a considerable aggregate with a consistent exhibitor. The majority of employers are very willing for their gardeners to compete at these flower-shows, and willingly buy exhibition varieties of different plants to facilitate their chance of winning, thinking, as they rightly do, that success at flower-shows is a proof of the skill of their gardener, and an incentive to spur him on to further efforts. At the same time, however, it must be remembered that too much showing is a bad thing. A head gardener who is constantly exhibiting is apt to devote too much attention to his "show" plants, to the detriment of the garden work generally; while his constant absence at the shows themselves, brought about by the necessity of staging and removing his exhibits, is likely to make things get slack in the garden all round. Exhibiting, therefore, should only be done in moderation.

How to Succeed as a Nurseryman and Seedsman. The difference between a florist and a nurseryman and a seedsman is a simple one. The florist is not a producer, but is generally merely an agent for the disposal of goods grown by other people. The nurseryman and seedsman, on the other hand, sells plants and seeds which are the result of his own cultivation and skill. It must not be imagined, however, that nurserymen sell nothing but what they have raised themselves, as large quantities of seeds and bulbs are imported annually, chiefly from Germany, France, and Holland, to enable them to fill orders which they could not execute from stock of their own raising [see also SEEDSMEN, page 4995].

Roughly speaking, nurserymen and seedsmen may be divided into three classes. At least 70 per cent. of them do the bulk of their trade in penny and twopenny packets of seeds, and cheap bedding plants. About 20 per cent. of the remainder have a better class of trade, an important feature of which is the laying out and keeping in order of suburban gardens by contract. The remaining 10 per cent. or thereabouts represent the élite of the trade, who, as a rule, supply only seeds of the finest quality, grown by themselves, and the latest novelties, for which they can command high prices.

How to Start. At the present time, undoubtedly the best situation for a nurseryman and seedsman who contemplates starting in business is in the outer suburbs of London or one of the other great cities. In such a situation he will be able to grow plants and produce seeds, free from the taint of city smoke, though, at the same time, they will be hardy enough to withstand the rigours of town life. A large portion of his trade will be purely local, although the postal department of a nurseryman's trade is one which ought never to be neglected. Naturally, the greater portion of the stock of a seedsman who caters for the million will have to be purchased by him from the wholesale houses in bulk, and made up and retailed in small quantities. Much of the success of the retailer will depend on the quality of the seed he thus dispenses. If he is careful to deal with wholesale firms of high standing, whose names are a guarantee of the goods they supply, our young nurseryman is, at all events, sure of giving satisfaction to his customers.

A certain amount of seed of such things as calceolaria, petunia, lobelia, and other popular plants should be sown very early in the year in heat, with a twofold purpose in view. Some of the plants so raised will be required in the late days of spring and early summer, either for selling to chance customers, or for the purpose of fulfilling any contracts to keep gardens and window-boxes in order which the nurseryman may have been fortunate enough to secure. Keeping gardens in order by contract is a very profitable branch of a nurseryman's business, and a good trade may often be done in this direction by a local canvass of likely houses during the months of April and May.

Mail Order Business. If this branch of his industry should at first not come up to his expectations, there is another channel through which the nurseryman can dispose of any plants he may have on hand. This is by means of advertisements in the horticultural journals, bearing always in mind the fact that the nurseryman should draw up his advertisement with a view to disposing of what he will have ready for sale in a fortnight or three weeks' time. Most horticultural journals go to press at least a week in advance, and the consequence is that plants, which may be ready for disposal at the moment of drawing up the advertisement, will be past their best time for transplanting when the announcement is made public, and orders begin to come in. Intelligent anticipation will do much to assist in this branch of the business, but if, as sometimes happens, an unexpected storm or a late nip of frost injures or destroys the plants upon which hopes of profit have been built, the best plan is to return the money for orders which cannot be filled from the nurseryman's own stock.

The Bulb Trade. The large majority of bulbs sold in this country every autumn are of Dutch origin, though within recent years it is pleasing to know that in the Lincolnshire Fen district, and in some parts of Ireland, bulb culture has met with no uncertain measure of success. Comparatively little wholesale trade is done, however, as most of the growers supply the public direct. In the days to come, however, there is but little doubt that the English and Irish bulbs will oust the Dutch bulbs from the market, especially as far as the better and choicer sorts are concerned. In the meantime, it is well to deal only with Dutch firms who will guarantee their bulbs as being true to name. A nurseryman should never hesitate about stocking bulbs liberally, as he has two chances of selling them. Those which are not got rid of by the end of November, when all bulb planting should cease, should be potted up and hurried on in a slight heat, when they will readily sell in the very early spring for decorative purposes, as the garden, and often the greenhouse, are comparatively bare of flowers at this time of the year unless they have been well looked after.

It should not be forgotten that one of the most profitable branches of a nurseryman's business is the " buttonhole " trade. To cope with this branch as far as possible, special efforts with winter-flowering carnations and roses in pots should be made, as these two flowers are in the greatest demand. If sufficient cannot be grown on the premises, without undue encroachment on valuable space, supplies may easily be augmented by French and Channel Islands flowers, which arrive at Covent Garden Market and other great centres of distribution in large quantities during many months of the year.

The Market Garden. The market gardener is not troubled much by winding paths and pretty effects. Concerning that part of his ground which is destined for open-air culture, the great aim of the market gardener, after such ground has been dug and prepared, is to maintain a proper rotation of crops, especially as far as vegetables are concerned. To this end the same vegetable will be grown on the same piece of land only once in every fourth year, so that the different chemical elements in the soil may adjust themselves and preserve the ground from becoming impoverished, at the same time effecting a large saving in the bill for animal and artificial manures.

There are a few points of especial importance if one wishes to succeed as a market gardener. It is well, to some extent, to specialise. A man stands a far better chance of success if he goes in for growing just a few things ; say, for the sake of argument, grapes, tomatoes, and the choicer stone fruits on a large scale, than he does if he potters about with little patches of half a hundred different things which have cost him far more, in proportion, to bring to perfection, for which he will have a difficulty in finding a market. Salesmen do not care to handle small parcels of goods of which the carriage practically swallows up the profits.

The Opportunities of Extra-season Crops. Another point which the market grower should watch is not to devote all his attention to " main crop " things, but pay attention to early and late sorts. For instance, who has not lamented the shortness of the strawberry season ? To the man in the street it is heralded by the appearance of choice fruits at two or three shillings for a small basketful. In a fortnight's time there is such a glut of the berries that really excellent fruit may be purchased at fourpence or sixpence a pound, and then all is over, and what cannot be eaten has to be destroyed or rushed round to the jam factories.

If many of these growers had devoted their attention to earlier and later sorts, there would have been a longer and steadier demand at better average prices, and less risk of the fruit spoiling without finding a purchaser. There is no difficulty about this. At the headquarters of the strawberry world, close to Bedford, it is quite possible to have strawberries any day in the year, and though an all-the-year-round strawberry trade is not to be recommended, it would be quite easy to lengthen profitably the present season.

Raising New Varieties. The raising of new sorts of fruits and vegetables can be made a source of profit to the market grower. Potatoes, for example, lose their character in the course of a dozen or twenty years and give way to disease, while tomatoes, strawberries, and many florists' flowers, such as roses, chrysanthemums, and carnations also deteriorate in quality and need to be replaced by good new sorts. It is a fact that a couple of seasons ago the now world-famed Eldorado potato changed hands at the rate of £22,400 a ton, while another variety, Northern Star, was for a brief period sold at the rate of £4,500 a ton,

When laying out the market garden, however, it is not wise to reserve too large a piece for experimental purposes. To attempt to raise an improved new potato is very much like taking a ticket in a lottery, there are so very few prizes and so many blanks. Cautious growers, who have made up their minds not to soar above the limitations of a moderate income, will carefully ignore the experimental ground altogether, and content themselves with buying stock of any desirable novelty from the lucky raiser.

The Profit and Loss Sides of a Market Garden. Within the last few years many thousands of acres of agricultural land have been diverted from the purposes for which they have hitherto been employed, and used for raising crops of fruit and vegetables for market. The Board of Trade returns show that this acreage is increasing every year, a fact which goes some way to show that the occupation is a profitable one, an assumption which is further borne out by the curious reticence of professional market gardeners at all times to give any reliable figures for publication.

As far as his profit and loss is concerned, the market grower is largely at the mercy of the weather, and it is not only bad weather that he has to fear. Storms, winds, and other inclemencies, will, of course, retard progress and tend to produce only scant and immature crops—a source of considerable loss, as the expenditure for labour, manure, and materials is just as heavy as in the case of a generous yield. Too favourable weather also is not a source of unmixed satisfaction to the market grower. It means a full crop, certainly, possibly a glut, and when this happens the prices realised immediately fall so low that there is little or no profit for the grower.

In all market gardens where there is a large amount of glass for growing cucumbers, tomatoes, grapes, and other such things, there is always danger during severe weather of damage due to breakage. A single hailstorm has been known to do £20,000 worth of damage to glasshouses alone, in addition to which, tens of thousands of tender plants perished at the time from exposure. Every market gardener should guard against loss from this source—and it is a more frequent danger than is customarily imagined—by insuring his glass-house against damage by the weather. Several companies will take such risks at a moderate premium, and one in particular specialises in them.

When starting in business, the young market gardener should be careful to ascertain that he is properly rated, as, if his holding is of any size, such rates will form a considerable item in his profit and loss account. Market gardens are only to be rated at one-fourth of the amount in the pound which is payable for a dwelling-house—that is, as far as the general urban district rate is concerned. For a Poor rate they are liable for half the amount payable for a dwelling-house, but buildings thereon, such as greenhouses, are liable for the full amount. It may be well to state here that, according to the Market Gardeners Compensation Act, a market garden is "a holding wholly or partially cultivated for growing produce for market"—that is to say, the crops grown on such land must be for market purposes only. A private individual, who has a very large garden, and disposes of certain surplus fruit and vegetables in the markets, is not a market gardener within the meaning of the Act, and his garden is liable to be rated at the full amount. It is always well to see that the rates are properly adjusted at the commencement of the tenancy, as, when once a payment has been made on a higher scale, it is a long and tedious process to get either a reassessment or a refund.

It is, of course, impossible to lay down any hard and fast rule that will apply to the whole of the country as to the cost of maintaining a market garden, and the return that may be expected from each crop.

The table given below has, however, been carefully prepared with a view to showing the average returns which may be expected from land carrying the various vegetable crops, and will, at all events, be of assistance to the novice who is in doubt as to whether he is managing his market garden in an economical manner.

AVERAGE YIELD OF MARKET LAND, COST OF CULTIVATION, AND MARKET PRICES

——	Average yield per acre.	Cost of cultivation per acre.	Average market price
Artichoke (Globe) ..	15,000 heads	Approximately same as cabbage	1s. 6d. per doz.
Artichoke (Jerusalem) ..	250 bushels	Approximately same as potato	2s. 6d. per bushel
Asparagus	5 cwt.	Varies widely	1s. to 5s. per bundle (100 shoots)
Beans (broad)	120 bushels	Varies widely	2s. 6d. per bushel
Beans (kidney)	250 bushels	Varies widely	3s. per bushel
Beetroot .. .	350 bushels	24s. per acre	9d. to 2s. per doz.
Broccoli	8 to 10 tons	Same as for cabbage	10s. per crate of 6 doz.
Brussels sprouts.. ..	150 bushels	From 50s. to 55s. per acre	5s. per bushel
Cabbage	10,000 heads	24s. to 28s. per acre	1s. per doz.
Carrots	500 bunches	70s. per acre	3s. 6d. per doz. bunches
Cauliflower	15 to 20 tons	35s. per acre	2s. per doz.
Celery	12,000 heads	£4 to £5	1s. 6d. per doz. heads
Cucumber	6,000 from 100 ft. house	£25 per house	2s. per doz.
Herbs (various)	1 ton (when dried)	Varies widely	30s. per cwt.
Horseradish	10,000 bundles	28s. per acre	1s. 6d. per bundle of 25 roots
Leeks	17,000 bunches	£6 per acre	2s. per doz. bunches
Lettuce	25,000 per acre	Varies greatly	6d. to 1s. 6d. per doz.
Mushrooms	12½ cwt. per 100 yd. run	£17 per 100 yd. (ridge bed)	6d. per lb.
Mustard and cress ..	This crop is grown in	many varying ways	1s. per doz. punnets
Onion	400 bushels	£6 10s. per acre	2s. 6d. per bushel
Parsnip	600 bushels	70s. per acre	2s. 6d. per bushel
Peas	150 bushels	Varies greatly	2s. per bushel
Potatoes	8 tons	28s. to 30s.	£4 10s. per ton
Savoy	—	Same as for cabbage	
Seakale	Varies greatly	Varies greatly	1s. per 2 lb. punnet
Spinach	450 bushels	As for cabbage	2s. to 3s. per bushel
Tomatoes	3 lb. per plant	Varies greatly	3d. to 4d. per lb.
Turnips .. .	700 bushels	40s. per acre	4s. per doz. bunches
Vegetable marrow ..	1,500 doz.	20s. to 25s. per acre	1s. 6d. per doz.

In the item "cost of cultivation" in the table no provision has been made for the cost of manuring. Here, again, no hard and fast rule can be laid down. Where plenty of natural manure is obtainable, the use of much chemical or artificial manure is not recommended. In most cases, however, the soil of market gardens needs a stimulant of some kind, and the following little table gives particulars of those which are most economical.

Basic slag ..	3 cwt.	£2 per ton
Dissolved bones	5 cwt.	£4 10s. „
Guano	1 cwt.	£11
Nitrate of soda..	1 cwt.	£8
Sulphate of ammonia	1 cwt.	£9
Sulphate of potash	cwt.	£6

Any of these manures are suitable for market garden crops, with the exception of sulphate of ammonia and nitrate of soda, neither of which is it desirable to apply to peas or beans. A very cheap and effective manure for potatoes and onions is ordinary soot, used at the rate of three dozen bushels per acre. In the neighbourhood of a town this can usually be obtained at a few pence per bushel, rarely more than sixpence.

GARDENING *concluded*

FIRE BRIGADE WORK

The Routine of the Fireman's Duties and Conditions of Work. Fire Engines and Fire Escapes. Fire Prevention Devices

Group 4
FIRE
EXTINCTION
Following UPHOLSTERY
from page 6723

By JOHN HENRY WHILE

THE profession of a fireman offers a wide field for activity and energy, and also affords scope for inventive genius. A young man desiring to become, as a fireman, a member of a trained, skilled, and well disciplined force, must start with the determination to be efficient in his work, and to study it in both theory and practice, in order to be able to work all appliances which will come under his charge to the best advantage. In the following description of the training and work of firemen, the procedure and system of the London Fire Brigade, as being the premier organisation of its kind in the world, have been taken as the basis upon which the subject should be studied in theory. Practical training, work, and experience are, of course, the essentials to enable a fireman to rise high in his profession.

Selection of Candidates. The system of appointing men as members of a trained fire brigade is practically the same in all large towns, the Chief Officer seeing all candidates at the principal station. In London, until quite recently, it was necessary that candidates for the appointment of firemen should be seamen, but this rule has to some extent been relaxed in recent years, although a young man fresh from the sea, with clean discharge papers, has a decidedly better chance of acceptance than a candidate who has been employed in more sedentary work. The men must be under thirty years of age, must measure at least 37 in. round the chest, and should be at least 5 ft. 5 in. in height. They must be men of general intelligence, and able to read and write.

The Man's "Pedigree" and Strength. The first thing the candidate is asked to do is to produce his birth certificate and his discharge papers, or testimonials as to character, service, etc. These are carefully scanned, and if they are satisfactory his height and chest measurement are taken, and he is called upon to prove his strength by raising a fire escape single-handed, with the tackle reversed. The rope or fall of a fire-escape tackle is 20 fathoms, or 120 ft. in length. The escape is laid on the ground rather below the horizontal position, and a tackle is attached to the carriage end of the machine and to a ring in the ground. The candidate stands on the levers of the escape and, hauling at the tackle, has to pull the machine up from the horizontal almost to the perpendicular until the lever wheels rest upon the ground. When a man on the carriage lever is pulling up the machine with the tackle reversed, the initial pull is 240 lb., and the fixed strain when he is not pulling is 70 lb. When the machine comes to an angle of 45° the pull is 200 lb., and the fixed strain 70 lb., and this gradually diminishes until the hind wheels touch the ground.

Medical Examination. This ordeal having been satisfactorily passed, and the candidate having been approved by the Chief Officer as stout, strong, healthy-looking, intelligent, and in all other respects apparently eligible, he is sent for medical examination to the surgeon appointed for the purpose. Inasmuch as service in a fire brigade requires all the energies of a man, it is imperative that only such men should be appointed as are able to pass the surgeon satisfactorily, after having gone through the very severe test described. The surgeon, as he thinks fit, either rejects or passes the man, in each case giving a certificate. The certificate given in the case of an approved man takes the following form: "This is to certify that I have examined A. B., and believe him to be free from disease and well suited for the situation of a fireman in the London Fire Brigade."

Probation. These preliminaries settled, the candidate becomes a probationary fireman, and is drafted into the drill class among other men undergoing instruction. In London his course of instruction is carried out at the fine headquarters at Winchester House, Southwark Bridge Road, where he lives for the first three months of his life as a fireman.

A Fireman's Kit. The first morning after the candidate joins he is introduced to his future companions of the drill class and receives his kit. This consists of three pairs of top boots for fire purposes, three pairs of trousers, three cloth tunics, two "jumpers" for light wear, three caps, a helmet, belt, axe, spanner, and a pair of shoes for gymnasium purposes. He is found quarters in the drill-class block, and messes with his future comrades. He is supplied with a mattress, palliasse, three blankets, and a pillow, but has to find his own sheets and pillow slips. His drill commences from the first day he joins, and he has to complete three months in the drill class from the time of joining. If it is necessary to send him to an "out" station before the time has elapsed, he has to return to Southwark and complete the period of drill.

Syllabus of Drill. The drill class of the London Fire Brigade is split up into two parts, the theoretical and the practical sections. For both sections there are two syllabuses of instruction, which are worked in alternate weeks in order to make some change in the routine. The men under instruction, it should be said, are under two instructors, with a station officer in charge. In all cases, the bells are rung at a quarter to seven o'clock, and the day's work is opened by physical exercise with Indian clubs and fire ladders. An hour is devoted to cleaning the dormitories, etc. From eight o'clock until nine the men are engaged in breakfast, bed-making, and so on, and from nine o'clock to half-past nine in cleaning the appliances. There is a "stand easy" from 9.30 to 9.45, and then the actual work of the day commences.

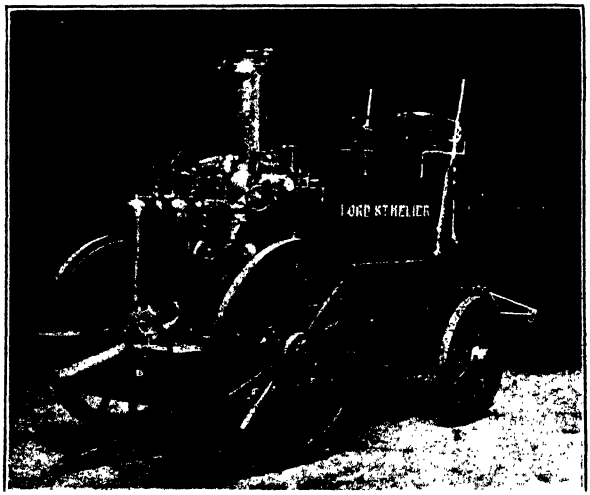
Theoretical Instruction. The syllabus of work for the theoretical section may be set out in detail day by day. It is as follows:

Monday. The men are lectured for three-quarters of an hour on the organisation of the brigade and the duties of a fireman. The clothing and general surroundings of the watch-room are inspected. An explanation of the nature and use of the helmet, axe, spanner, and gear generally is given, and the instructor adds hints as to the mending and general care of the London County Council clothing. Two hours are allowed for dinner. In the afternoon, the instructor gives a general explanation of all gear carried on the engines, the method of stowing it, and the different screws and couplings used in the brigade.

Tuesday. After physical drill, the instructor gives lecture No. 2, on the mobilisation of the brigade, and the systems of fire alarms and communication by telephone and electric bells. He also deals with the use of long and short lines, knotting, hitches, etc., and explains methods of rescue by means of lines. In the afternoon instruction is given on London water supply, mains, service pipes, supply pipes, fire plugs, cocks, and hydrants, the men receiving a thorough insight into the way in which London is supplied with water for fire purposes.

Wednesday. After the usual drill the members of the theoretical class assist to prepare for the general display which is always given to the public at the Southwark headquarters on Wednesdays, and are instructed in jumping into sheets and in methods of rescue work with lines. In the afternoon they assist with the general drill.

Thursdays. The instructor delivers lecture No. 3, on fires, methods of dealing with chimney fires, and the use of large and small canvas dams at fires. In the afternoon the men are instructed in the use of first aid appliances, and receive an explanation of the methods of using branches, nozzles, hose suctions, and couplings, together with a description of the manufacture and method of making up lines of hose.



GALLONS EXPANSION STEAMER
(Shand, Mason & Co., Ltd.)

Friday. After physical drill the men are instructed in bringing down insensible persons, and in the use of the smoke helmet. In the afternoon they take part in wet drill with a steamer, and in the evening clean out all the dormitories.

Saturday. After the general work of assisting in cleaning all gear and the headquarters generally, the men "stand easy."

Alternative Syllabus. The alternative syllabus of the theoretical class, which is carried into effect on the second and fourth weeks in each month, includes the usual routine of physical drill every morning. On *Mondays* the men receive instruction in picking up and bringing down insensible persons, and take part in bucket, hand-pump, and manual drill. In the afternoons, they carry out scaling and hook ladder drill, and receive explanations of the fire alarm system, and of the proper methods of forwarding "calls," "stops," etc., in regard to actual fires.

On *Tuesdays* they enter upon hose-cart drill with hydrants and stand-pipes, and in the afternoon take part in horse-escape drill, and in exercise rescue work.

On *Wednesdays* the work is practically the same as that given under Theoretical Instruction.

On *Thursdays* the men receive an explanation of the use of the manual engine and of first aid appliances, and undergo in the afternoon watch-room instruction, and an explanation of the methods of carrying out duties and watches at street stations and in fire-escape boxes.

On *Fridays* they are drilled in the work of carrying down insensible persons, restoring life by artificial methods, and in escape work. Friday afternoons are devoted to general cleaning up work.

The Practical Class. From the theoretical class, the novices under instruction are promoted to the practical class, where the early morning routine is the same. The first week's syllabus of instruction, apart from this routine, consists, briefly stated, of the following programme of work.

Monday. The men are instructed in the method of picking up insensible persons; they prepare for and carry out wet drill with a steamer. In the afternoon they receive instruction in testing and repairing hose, undergo practice in rendering first-aid to the injured, drill with the horsed escape, are instructed in the use of escapes and ladders in cases of emergency, and carry on rescue work with lines. They pack up at four o'clock. The men are divided into three watches of leave, and those on leave are at liberty until 1 a.m., while the others engage in station and other duty.

Tuesday. The members of the practical class are exercised with jumping sheets and in hose-cart drill,. in addition to horsed-escape and manual drill. In the afternoon they are instructed in the geography of the London County Council area, the mobilisation of the Brigade, and the duties of firemen generally.

Wednesday. The curriculum includes much of the previous drill, and also extends to the use of smoke helmets, scaling ladders as used in climbing over walls and roofs at actual fires, hand-pump drill, rescue by lines, long-ladder drill, and preparations for the general drill. The men construct large canvas dams in the drill yard and fill them for the purposes of the public drill.

Thursday. The same drill, with variations, is carried out, and in the afternoon all appliances are washed off, tested, oiled, and cleaned generally.

Friday. The men receive instruction in the stables, harnessing horses, and are taught to assist the coachmen in getting them away quickly. Later on, they practice carrying insensible people off the roof, and take part in smoke-helmet and hose-cart drill combined. All dormitories are cleaned out in the evening, and on all Tuesday and Friday nights ambulance classes are carried out.

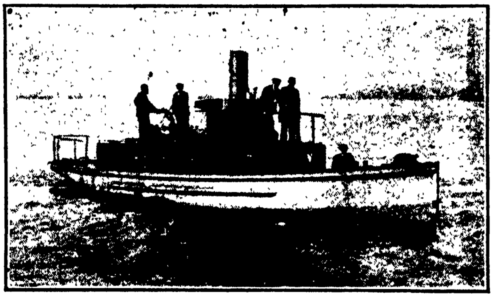
Practical Class. The alternative syllabus for the practical classes includes, on Mondays, a lecture on the duties of firemen in regard to calls to fires and chimney fires, and to the methods of work at actual fires. In the afternoon, the ladders and lines used in the Brigade are tested, and wet drills with a steamer and horsed escape, manual, and scaling ladder drills, are carried out. On Tuesdays, the curriculum includes horsed escape, hose-cart, and escape drill, the use of first aid appliances, and instruction in the organisation of the Brigade, watch-room routine, and the methods of keeping an "occurrence book." On Wednesday, the ordinary routine of the public drill day is carried out. On Thursdays, the chief duty is to test, wash, and clean all appliances, while on Fridays the work includes physical drill, instruction in stables, practice in carrying down insensible persons, hook-ladder and escape drill, and wet drill with the steamer. The bedrooms and mess-rooms are scrubbed out, and at night the ambulance class is held.

When a period of three months of this arduous and continuous drill has been carried out, the men are rightly considered to have become proficient in their new calling, and, as vacancies occur, are drafted out to different stations in various districts of London.

Duties of Firemen. The general duties of a fireman are to reside at the station to which he is appointed, to be at all times within hail, and available for any duty, unless specially booked otherwise; to take his turn in watching at the station, taking charge of escapes, attending fires, and all other duties, when ordered by his superiors; to assist in the cleaning and other work at the station, relieving the men on duty for meals, etc; to be civil and respectful in his demeanour, and clean in appearance; to perform all duties entrusted to him in a prompt and efficient manner; to hold himself in readiness for any duty he may be called upon by his superiors to perform; to obey implicitly all orders of his superiors, and to exact the strictest obedience and respect from those under him; to study and otherwise endeavour to qualify himself to perform the duties of his superiors when called upon to do so.

Special Duties. There are four distinct classes of firemen, apart from officers—namely, first, second, third, and fourth—and the above duties, as general rules, apply equally to them all. It happens, however, that in the carrying out of the laborious work of a fire brigade, there are many duties requiring special qualifications and capacities, and these naturally fall in most cases to the lot of those who have served longest and worked hardest. These duties consist of taking charge of the floating steam-engines and the land steam-engines, mechanical work at the factory, repairing engines, and so forth, drilling and instructing the young hands, keeping the accounts, books, and records of the establishment, and preparing reports, etc. It is therefore incumbent on all ranks to study and understand, not only their ordinary duties, but also those of their superiors, in order that, when called upon, they may be found equal to the performance of any duty devolving upon them.

General Working. Every man is always supposed to be on duty, for duty, on leave, sick, or suspended. -Those on duty are in full dress, with the exception of their helmets. Those for duty are ready to turn out at a moment's notice, and are therefore not permitted to go outside the station, except within view. An officer in charge of the station has power to grant leave to any man of his own station up to eight hours; a Superintendent has power to grant leave up to 48 hours; and any leave which exceeds 48 hours must be granted by the Chief Officer.



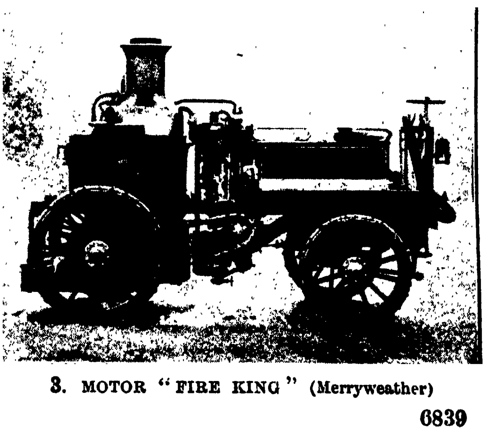
2. RIVER FIRE FLOAT
(Armstrong, Whitworth & Co., Ltd.)

When the men under instruction are drafted out, as already described, they are classified as fourth-class firemen, and remain in that position for three years. At the expiration of that time, on the recommendation of their officer, they are promoted to the rank of third-class firemen. After that, promotion is by merit, as proved after examination.

Steam Class Drill. In due course, the third-class fireman returns to headquarters to undergo a course in steam drill, which will enable him to take charge of a steam fire-engine. Later on, if he succeeds in passing an educational examination, he rises to the rank of second-class fireman, every promotion carrying with it increased pay. Promotion to the first class is obtained by the passing of a special examination, which includes writing, arithmetic, the making up a pay-sheet, the geography of the Brigade, and such miscellaneous subjects as may be selected by the education board, which is drawn from the officers of the force.

Higher Promotion. As time goes on, and vacancies occur, men passing special examinations become sub-officers, and at the end of 15 years of completed service a fireman in the ranks has a fair chance of becoming a station officer, and of taking charge of one of the fire stations which are scattered all over the metropolis. The next rank is that of District Officer, and finally a member of the London Fire Brigade has a chance of rising to the status of Superintendent, and of taking charge of one of the six districts into which London is divided for fire brigade purposes.

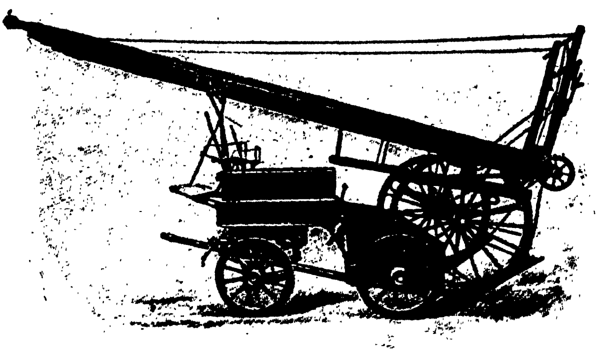
Fire-engines and their Management. The plant with which a fire brigade has to deal naturally varies in extent, according to the size of the city or town which it has to protect. In London the appliances used are of a very varied



3. MOTOR "FIRE KING" (Merryweather)

character in order to suit the different localities which have to be protected, the City and Central London districts requiring more powerful appliances and longer fire ladders than are requisite for service in suburban districts. The plant may be summarised as consisting of hose-carts, manual engines, steam fire-engines [1], motor fire-engines [3], horsed escapes for life-saving purposes, extension ladders for fire extinguishing purposes, chemical first-aid appliances (now carried on all horsed escapes), hose, coal, and oil vans, fire-engines on barges, and a river float [2] for dealing with riverside fires. Fire-engines, it may be briefly said, are of various kinds. Some are fixed in walls or stationary places, and cannot be moved at all; some are fixed in ships or barges on the water, and others in carriages on land; some are in themselves movable, and, whether on fixed or movable foundations, can be mounted or dismounted at pleasure; some are worked by water, some by steam, some by manual power, and some by chemicals.

Hose-carts. A hose-cart is a light box built on a pair of wheels to carry three 100-ft. lengths of hose, without the inconvenient addition of a reel. The box has a capacity of 13 cubic ft., of which 10 cubic ft. are for the hose and three for the tools. The hose can be laid out from a hose-cart as from a reel, and when not in use is protected from the weather and kept quite clean. A hose-cart, when empty, weighs 2½ cwt., and when full, 5½ cwt., and it can easily be run to a fire by one man.



4. HORSED HOSE AND LADDER TRUCK
(Bayley's, Ltd.)

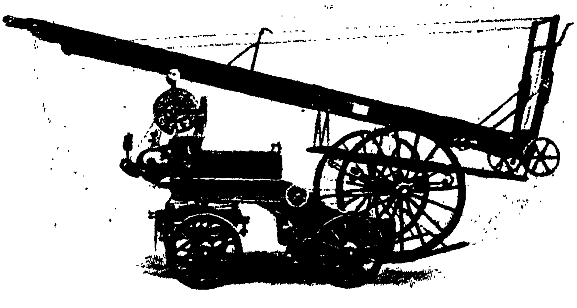
A Six-inch Manual Fire-engine. Although manual engines have gone out of vogue in London, they are still extant in certain local districts of the metropolis, and a great number are in use by brigades all over the United Kingdom. A 6-in. manual consists of a pair of single-acting force pumps, with an inlet pipe, four valves, an air vessel, two delivery pipes, and a rocking-shaft, mounted on a carriage with four wheels, and worked by levers, which are attached to a spindle passing through bearings in the carriage frame. It is, therefore, so far a fixture that the pumps cannot be separated from the carriage without delay and difficulty, but the whole machine, including the travelling and working parts, is movable, and is made as light and portable as is consistent with the necessary strength.

The sole-plate, on which the works are fixed, is a box or bed of cast iron, comprising the bottom, sides, and part of the top of two pairs of valve-boxes, one pair behind and one in front; flanges to receive the corresponding flanges of the cylinders, and the bottom and sides of two waterways, one at each side. The waterways begin at the hind or stern end of the valve-box, where they are separated and pass forward, each through one part of the hind valve-box, underneath the cylinder at the same side, and through the front valve-box, in front of which they come together again, thus forming two curved channels, starting from the same point behind, and joining again in front. The suction-valves, two in number, are made of gunmetal, and are of the kind commonly known as hinged inclined metallic valves. These valves are self-acting—that is, they are not fastened by means of connecting rods or otherwise to any of the moving parts, and consequently are not set in motion by any direct action of machinery, as is the case with mechanical valves, but are opened by the fluid, whether air, water, or other substance, which is passed through the pump, and when this pressure ceases, close of their own accord by gravitation. The lift of these valves is 1¼ in., and the area of the opening is 4·9 sq. in. The force necessary to open them is a pressure of ·254 lb., or, in round numbers, about ¼ lb. on the square inch.

The engine has a pair of cylinders on opposite sides of a rocking-shaft, with pistons driven by a reciprocating movement of the arms of the working beam. The united capacity of the two pumps, or the quantity of water received and discharged on a stroke of the engine is 452·38 cubic in., or 1·63 gal. In round numbers, the capacity of the engine is a little over 1½ gal. When the engine is in proper order, and worked at reasonable speed, the quantities of water delivered are in exact proportion to the number of strokes made, without reference to the force applied, the speed at which the handles are worked, the pressure, or any other circumstance. The engine can be worked to the best advantage by thirty men, and the harder they work the greater will be the result: but the quantities of water delivered are measured not by the amount of their labour, but by the actual result made good in the number of strokes. The proper crew for this engine consists of four firemen and a coachman, and their weight in full uniform may be taken at an average of about 7½ cwt. The total weight of this engine when proceeding to a fire may be estimated as follows: engine, 18 cwt.; gear, 6¼ cwt.; men, 7½ cwt.; total, 32 cwt., or, in round numbers, between 1½ tons and 1¾ tons.

Steam Fire-engines. The fire brigade experts of London and other great towns have found that the best steam-worked pumps, or steam fire-engines, are those which are of simple construction, the parts of which are the most visible and accessible, and it is hardly necessary to point out that in principle there is no difference in the action of a pump, whether the motive-power be produced by men, by water, by steam, or in any other way. Pumps driven by steam are, in practice, run faster than those driven by hand power, and consequently the valves are generally arranged to work more quickly. For the sake of silence, as well as to avoid the risk arising from constant blows, they are generally made either of some soft material or of metal mounted with a soft facing of leather or rubber. Occasionally absurd powers are attributed to steam fire-engines by ignorant or interested persons, and in that respect it is necessary only to say that the real capacities of the machine can be tested by any engineer in the ordinary way by having their horse power indicated, and that the equivalent man power can be obtained by multiplying the horse power by 5. Where steam fire-engines are used there is a choice of only two courses with respect to their getting to work. One is to wait fourteen minutes while raising steam, and the other is to keep the water boiling in the engine-house, so that the steamer, when called out, will have a sufficient working pressure of steam in about three minutes.

Manipulating the Fire-engine. Every boiler of the pattern at present in use is fitted with a glass water gauge, of which the bottom cock is on a level with the upper tube-plate or crown of the fire-box, and the top cock 12 in. higher. The glass is protected by guard brasses, fastened at the top and bottom with sheet-brass clamps, and the guards are marked so as to show the inches above the crown-plate. There are 7½ in. of the glass visible between the clamps. Each boiler has three gauge-cocks, the bottom one being 2 in. above the crown-plate, the middle one 3 in. above the bottom, or 5 in. above the crown-plate, and the upper 3 in. above the middle, or 8 in. above the crown-plate. The bottom gauge-cock should always show water, the top gauge-cock should always show steam, and the middle gauge-cock should generally show both water and steam.



5. CHEMICAL EXTENSION LADDER

Steam duties on board the floating engines[2] and in charge of the land steamers comprise work which requires a large amount of special explanation, which is given by responsible officers, and can be understood only after long study and explanation. No man receives a charge of this kind until he has first proved his professional qualifications for it. The general instructions issued in the London Fire Brigade for working a land steam fire-engine, it may be stated, include the following:

1. The boiler of this engine is to be worked at a pressure not exceeding 120 lb. on the square inch.

2. The safety-valve is not to be screwed down to more than 100 lb., and the engineer must occasionally raise it, by hand or otherwise, both when getting up steam and when at work.

3. In order to keep this valve free, and to prevent it sticking, he is to ease up the spring, and to remove the whole pressure from it when not required, except sufficient to keep the lever and spring balance from shaking while the engine is travelling.

(4) Whenever the work admits of it, the engineer is occasionally to fill his boiler with water as high as possible without allowing it to prime, and then blow off from all the cocks, including the gauge cocks, using only one at a time. This is the best precaution against scale or scum, and an intelligent engineer will find many opportunities of adopting it without interfering with the necessary work of his engine.

(5) In addition to this, the boiler is to be altogether blown out, and washed out occasionally.

(6) The engineer must be careful to see that no soot is allowed to accumulate on the shelf or tube plates of the boiler, as this would reduce its steaming power considerably.

(7) The engineer is held responsible that the water in the boiler is always kept in sight in the gauge-glass, whenever the fire is alight, and in case of any accident, such as the failure of the feeding apparatus, rendering this impossible, he is immediately to draw his fire.

(8) A sufficient quantity of water should always be kept in the feed vessel for supplying the boiler when the engine is not at work.

(9) It being exceedingly dangerous to pour cold water on hot boiler plates, the engineer is desired to be particularly cautious about putting cold water into the fire-box, and in case it becomes absolutely necessary to do so, he is to pour it on the fire bars only, and not on the inner shell of the boiler or the tube plates.

(10) After the suction pipe has been taken out of the water, the engine should be run round for a few strokes, in order to blow the remaining water out of the pump.

(11) On his return from a fire, the engineer is to enter in the book kept for that purpose the following particulars, as far as he is able—namely, time at work, number of revolutions, quantity of water delivered, and any other circumstances which appear worthy of remark, such as the length of hose, number of deliveries, height of branch above engine, etc.

Hose. The laying out and handling of the flexible pipes or hose which convey water have much to do with the most active part of a fireman's work. These pipes are chiefly of two kinds, the one known as "suction pipes," which convey the water from the reservoir or hydrant to the pumps; the other "delivery pipes," or hose which convey the water from the pumps to the fire.

Suction pipes are made of leather, stretched over a metal spiral, which prevents them from collapsing when a vacuum is formed inside. Suction pipes are of three sizes, and are carried on the engines in short pieces. They are mounted with couplings of an exactly uniform pattern, and can be used singly or with several joined together, according to their respective size.

Delivery pipes or hose are made of canvas or leather. The hose at present almost exclusively used by the London Fire Brigade is of canvas, and is for the most part lined with indiarubber. The canvas pipe is made of the best flax, carefully woven, with about 10 turns to the inch in the weft or circular thread, and about 15 threads to the inch in the warp or longitudinal thread. A length of canvas seamless rubber-lined hose, as delivered by the various manufacturers for the use of the London Fire Brigade, has an internal diameter of 2⅜-in., so as to take a coupling with a 2-in. waterway, and is almost invariably 100 ft. in length. Each length of hose is provided with a leather strap, 3 ft. 3 in. long, and

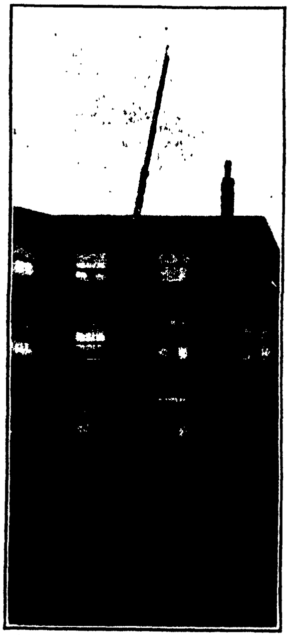
1¼ in. wide, fitted with a suitable tinned-iron roller buckle, riveted to it, and a collar to slide along the hose. The rivets and washers are of the best wrought copper, properly tinned to prevent verdigris.

Chemical Engines, or "First Aid" Appliances. The chemical engine consists of a copper cylinder holding 24 gallons of water. This is connected to a compressed air cylinder by a copper tube fitted with a suitable valve. The compressed air, on being admitted to the copper cylinder, drives the water out through an indiarubber hose which terminates in a stopcock jet. The hose is wound round a reel, and the water enters it from the centre of the reel, so that any length can be run out, and no connecting up is required. A length of 50 ft. of 1 in. hose is usually supplied, and it is carried already filled with water.

The copper cylinder is fitted with a safety valve and pressure gauge, so that the screw-down valve which lets in the compressed air can be opened or closed to the correct extent. On arrival at the fire a man takes the jet in his hand and runs with it to the seat of the fire, the hose winding off the reel as he runs. The valve is open and the compressed air is let in. All the man has to do on reaching the fire is to turn on the stopcock of the jet. He then has a powerful jet of water which will carry 50 ft. to 60 ft., and which flows for about eight minutes.

Should a further flow be required, there is a connection fitted to the copper cylinder to take the standard 2½ in. coupling, so that the water from the main can be brought through the indiarubber hose.

Fire-escapes. Fire-escapes are of various sizes and patterns, and differ considerably in certain small matters of arrangement of parts, and so forth, but the best of those in use are for the most part similar in all the essential points. An ordinary fire-escape is a ladder mounted on a carriage with four wheels, two high and two low. When all the wheels are on the ground the escape stands at an angle of about 25° from the perpendicular, and would fall over unless supported by being pitched against a wall, or balanced by a pressure at the end of the folding lever attached to the carriage. The general dimensions on an ordinary hand fire-escape are as follows: main ladder, 50 ft. 3 in.; fly ladder, 19 ft. 4 in.; first-floor ladder, 16 ft. 3 in.; supplementary ladder, 10 ft. 4 in. The modern appliance, now in use in London, is the horsed escape [**4**], and in this case the escape is carried on a van, which is drawn by two horses, and is turned out from the station and galloped to the scene on the first ringing of any fire alarm signal into the depôt. In the case of these escapes, the ladders are to a certain extent telescopic, and they are supplemented by hook ladders, with which the men mount from window to window for rescue work. They also carry hose.



6. 70-FT. TURNTABLE FIRE LADDER
(Shand, Mason & Co., Ltd.)

A fire-escape when properly pitched may safely carry a man on almost every round, and a fly ladder, when unshipped and standing on the ground, may carry some eight or ten men; but a fly ladder when thrown, ought not to have more than about three men on it at a time, as the whole weight comes on a single spot of the main ladder. In all ladders it is necessary that great care should be taken to distribute the weight, and not to allow it to rest on one spot or one portion. Thus, for instance, a ladder 28 ft. long may carry one man on every round, or 28 men in all, whereas six men at some one spot may instantly break it.

Firemen must always use the greatest discretion in leaving their escapes, even for a moment. There are cases in which a fireman is justified in running away with a hand pump, or one of the small ladders, as, for instance, when a fire is discovered within a few feet of his post and within sight, but even under these circumstances he ought to be very cautious.

Life Saving. The all-important work of saving life from fire includes many and various branches. If all houses were exactly alike, with the same contents, the same number of inmates, and those all of the same ages, the same conditions of activity or helplessness, and occupying the same parts of the houses, it might be possible to lay down precise rules for their rescue; but when it is remembered not only that the circumstances are never alike in any two cases, but that the time of the "call" being sent away from the house on fire, the time of its being received at the escape station, and the time of the arrival of the escape all depend upon a number of contingencies which differ most materially, and can never in any way be foreseen, it will at once be obvious that in almost all cases everything depends on the quickness, presence of mind, and personal activity of the fireman in charge. To do his work properly, a fireman must be strong, quick, fearless, and intelligent; but above all things, he must be resolute.

Extension Ladders. For purposes of dealing with fires in lofty warehouses, extending ladders on a telescopic principle are largely used in the London Fire Brigade, and the most up-to-date appliance is a ladder which extends itself automatically by the force of chemicals [**5**]. In the ordinary long ladders the appliances are usually extended by means of a screw-handle. Turntable ladders are also used by the Brigade [**6**].

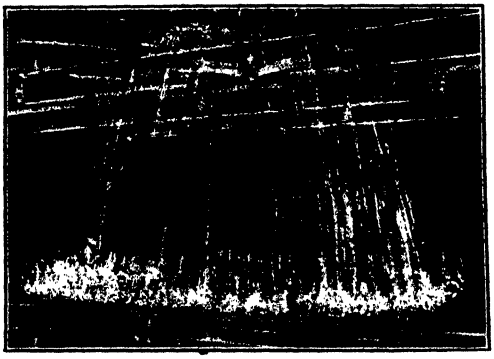
The Actual Work of the Brigade. The manner in which the London Fire Brigade deals with actual fires depends, naturally, upon the character and extent of the outbreak. There are three ways in which the firemen receive "calls" to fires—either verbally from civilians or policemen, by the ringing of fire-alarm signals, or by messages over the telephone through the Telephone Exchange. In any case, the station which receives the first "call" responds by sending out, first, a horsed escape, and then a steamer. The particulars of the first "call" are instantly telephoned by the duty-man, who remains at the station, to the district headquarters, and from that centre the firemen at the other stations nearest to the fire are ordered to proceed with their steamers and other appliances.

Early Work at the Fire. The first arrivals at the fire immediately proceed with the task of extinction and rescue work, if there be any necessary, and upon the officer in charge devolves the responsibility of communicating immediately to his district headquarters a message describing the character of the outbreak. This is done from the nearest fire-alarm post by telephone, for practically all the fire-alarm posts in London are now telephone stations as well. There are three code messages which are used, and which indicate whether the fire is a slight fire, a serious fire, or a very dangerous fire. If the outbreak is one which can be dealt with by the appliances in hand, the words " home call " are telephoned to the district depôt, and no more appliances are sent on. Should the fire be a serious one, and spreading, the message "district call" is transmitted, and altogether a force of about seventy firemen, a dozen steamers, long ladders, and other appliances are despatched from the different fire stations in the particular district in which the fire is raging. The superintendent of the district proceeds to the scene to direct operations, and every steamer, as it arrives with full steam up, begins to pump water on the burning building. In the event of the fire being a very serious one, the message " brigade call " for the particular locality in which the conflagration is raging is telephoned to the Southwark headquarters, and then every district in London is called upon to render assistance. A score of steamers are hastily concentrated at the scene, the river floats are ordered to proceed from their moorings if the fire is anywhere near the river side, huge canvas dams are erected for the engines to pump water from, and within a marvellously short space of time powerful land steamers will be busy in every street surrounding the property involved, throwing thousands upon thousands of gallons of water upon the flames. The efforts of the Brigade will probably be directed by the Chief Officer and his three Divisional Officers, assisted by the Superintendent of the district; and while the fire continues to rage, coal and oil vans will be continuously running between the scene of the fire and the local headquarters, carrying fuel for the steamers, some of which now work with petrol. When the fire is " in hand," a message is despatched giving the code word " stop," and stating that no more help is required; while later on a brief summary message as to the extent of the damage is forwarded to headquarters.

Outside Fire Appliances. Apart from the different devices and appliances which the London Fire Brigade uses in its work of coping with fire are many useful inventions of which large private firms avail themselves for the purpose of disclosing automatically an outbreak of fire, and of checking it in its incipient stages. These devices include automatic fire-alarms, which are arranged so that when the temperature of a room, office, or warehouse floor rises to a certain degree, a melting takes place, the immediate result of which is to ring alarm bells outside the building, or, in connection with one system, into the central office some distance away, from which the fire alarm is given to the fire brigade.

Automatic sprinklers are arranged on a similar system, and when the temperature rises to a certain degree in a room or office in which the sprinklers are fitted, a wax connection is melted which releases a force of water from fitted pipes. The water in its turn acts upon a sprinkler, and the goods beneath this arrangement are presently deluged with water [8]. At least one large building in the City is fitted with a system of sprinklers [7] which, when in operation, makes a complete curtain of water outside the building and on every side of it, the idea being that should a fire break out in an adjoining warehouse, the sprinklers could be set to work and would act as a shield to the warehouse in which the device is fitted.

7. SPRINKLERS IN ACTION OUTSIDE A BUILDING (Mather & Platt, Ltd.)



8. SPRINKLERS INSIDE A BUILDING

Progress and Improvement. In every branch of fire brigade work there is so much scope for improvement that it would be a wise man who could prophesy when finality will be reached, and in view of the remarkable advance which has been made even in the last decade in fire extinguishing and life saving appliances, it seems safe to prognosticate that every year will witness further developments and improvements in these all-important devices.

FIRE EXTINCTION *concluded*

Group 7
LAW
2

Continued from page 6753

COMMERCIAL & PERSONAL LAW

Commercial Law—continued. Employers' Liability. Landlord and Tenant. Personal Law. Marriage and Divorce. The Married Woman's Property Act

remains to be given briefly the rules as to delivery, which will be found in Sect. 29, 32, and 34 of the Sale of Goods Act.

Sect. 29.—(1) *Whether it is for the buyer to take possession of the goods or for the seller to send them to the buyer is a question depending in each case on the contract, expressed or implied, between the parties. Apart from any such contract, expressed or implied, the place of delivery is the seller's place of business, if he have one, and if not, his residence, provided that, if the contract be for the sale of specific goods which to the knowledge of the parties when the contract is made are in some other place, then that place is the place of delivery.*

(2) *Where under the contract of sale the seller is bound to send the goods to the buyer, but no time for sending them is fixed, the seller is bound to send them within a reasonable time.*

(3) *Where the goods at the time of sale are in possession of a third person, there is no delivery by seller to buyer unless and until such third person acknowledges to the buyer that he holds the goods on his behalf, provided that nothing in this section shall affect the operation of the issue or transfer of any document of title to goods.*

(4) *Demand or tender of delivery may be treated as ineffectual unless made at a reasonable hour. What is a reasonable hour is a question of fact.*

(5) *Unless otherwise agreed, expenses of and incidental to putting the goods into a deliverable state must be borne by the seller.*

Sect. 32.—(1) *Where, in pursuance of a contract of sale, the seller is authorised or required to send the goods to the buyer, delivery of the goods to a carrier, whether named by the buyer or not, for the purpose of transmission to the buyer, is prima facie deemed to be a delivery of the goods to the buyer.*

(2) *Unless otherwise authorised by the buyer, the seller must make such contract with the carrier on behalf of the buyer as may be reasonable, having regard to the nature of the goods and the other circumstances of the case. If the seller omits so to do, and the goods are lost or damaged in course of transit, the buyer may decline to treat the delivery to the carrier as a delivery to himself, or may hold the seller responsible in damages.*

(3) *Unless otherwise agreed, where goods are sent by the seller to the buyer by a route involving sea transit under circumstances in which it is usual to insure, the seller must give such notice to the buyer as may enable him to insure them during their sea transit, and if the seller fails to do so, the goods shall be deemed to be at his risk during such sea transit.*

Sect. 34.—(2) *Unless otherwise agreed, when the seller tenders delivery of goods to the buyer, he is bound on request to afford the buyer a reasonable opportunity of examining the goods for the purpose of ascertaining whether they are in conformity with the contract.*

Acceptance. And lastly there is the law as to *Acceptance:*

Sect. 35.—*The buyer is deemed to have accepted the goods when he intimates to the seller that he has accepted them, or when the goods have been delivered to him, and he does any act in relation to them which is inconsistent with the ownership of the seller, or when, after the lapse of a reasonable time, he retains the goods without intimating to the seller that he has rejected them.*

Sect. 36.—*Unless otherwise agreed, where goods are delivered to the buyer, and he refuses to accept them, having the right so to do, he is not bound to return them to the seller, but it is sufficient if he intimates to the seller that he refuses to accept them.*

We have endeavoured to give the simple rules which the business man should master in the daily course of his affairs. To discuss such matters as stoppage in transition, lien, "rights in rem" and in "personam" would be profitless here, since they correlate some basis of legal training.

Agency. It is still necessary to give a few rules explicatory of the doctrine of *Agency*, and then we can pass on briefly to other parts of the law which deals with a man in his life in the world.

The great distinction in *agency* lies between the agent proper, or particular, and the broker or what we might call the agent general. The agent proper is the nominee of any individual business man to do his business, to sign for him in any particular transaction or series of transactions. Such an agent is in a semi-fiduciary position towards his principal; he may be paid by salary or commission, and face to face with the other side in the transaction he practically *is* his principal. What the latter does through him he does himself. The principal is liable for the agent's negligence or tort or (to a certain extent) dishonesty.

A broker, on the other hand, is a person whose business it is to carry through contracts of sale and purchase of goods which are not his and which he does not buy for himself. He may be the agent both of the vendor and the vendee—indeed usually is. His responsibility to either is not in any way so onerous as though he were the appointed private agent of either. The niceties of the law upon this subject are great, but the business man may content himself with this single broad distinction.

He should realise in all cases where he is interested in transactions carried through by delegated authority whether the delegated authority is that of a private agent of his own or of a general agent or broker. And in the same way the agent should be clear in his own mind whether he is employed by one principal or by more than one. The difference is of vital importance to his status, and to what he can and cannot do. With that broad distinction we must leave the law of sale and purchase and pass on to the next branch of a man's daily life.

The Law of Service. Since every human being of adult years is either a servant or a master, and not infrequently both, it stands to reason that the laws governing employment must be of vital importance to very many. In even the simplest cases questions arise as to how wages should be paid, when are they due, what notice should be given, and the like.

At the outset let it be said at once that a great deal of nonsense has found its way into the heads of ignorant people upon these subjects. They imagine that the law will not allow this or will allow that, whatever the arrangement between the individuals. Let it be said at once that the policy of our law is to leave as free a hand to individual idiosyncrasies as possible. So long as an agreement is not immoral or against public policy or obviously oppressive or obtained by misrepresentation or fraud or duress, the law will compel its fulfilment.

If A and B agree to become master and servant respectively, with wages paid at uncertain intervals and no notice of termination on either side, that is a perfectly good agreement and can be enforced. As a rule, however, parties do not care to enter upon eccentric arrangements of this kind. Very often in domestic service no written agreements are drawn up, since none are required, and then it becomes a matter of interest to state what implied rules of law govern these relations. In English domestic service the usage is that, in the absence of any express agreement, the wages should be paid monthly and that the service should be terminated by a month's notice on either side. In lieu of this a month's wages must be paid or forfeited. Of course, gross insubordination upon the part of the servant, or drunkenness or immorality, or culpable and wilful carelessness justifies the employer to dismiss without any notice; and in the same way a servant who is badly treated or starved may leave at once without notice. All these points are matter of fact or proof.

Summary Dismissal. The cause for summary termination must be a substantial one. Carelessness on the part of the servant or irritability on the part of the employer would not justify it. The wages need not be paid in advance unless there is an agreement to that end. But they must be paid when due. The employer may make deductions from them for breakages, but such deductions must be honest and careful and not capricious. The employer is bound to feed his indoor domestic servants and give them proper sleeping accommodation—though there is no real supervision to ensure either of these requirements, and in London, at any rate, even in the best houses, they are often conspicuous by their absence. The servant is entitled to reasonable relaxation. No employer is entitled to turn a servant into a slave. And this relaxation must include leave of absence at stated intervals. Every servant has a right to that, and where it is denied the servant is entitled to leave forthwith, and no court in the country would think for a minute of penalising such conduct.

If a servant is insubordinate an employer may turn him (or her) out, but the employer will not escape responsibility for any breach of the peace that may ensue. If an employer has reason to believe that a servant has secreted some of his property, he is not entitled to search the servant's boxes without an order from a magistrate; and in any case an employer is never allowed to detain a servant's luggage. It may be added that even in cases of summary dismissal a servant is entitled to recover arrears of wages, but of course only those accruing, and not any compensation in lieu of notice. Domestic servants are now entitled to compensation for injuries, but this does not deprive them of their common law right to recover damages against their employer for culpable negligence resulting in disablement.

Clerks and Workmen. Employees who are not menials—*e.g.*, clerks, staffs of banks, etc., governesses and tutors—are usually, in the absence of agreement to the contrary, entitled to a quarter's notice. In this respect the usage of any particular calling may have weight with the court provided it can be proved. Agreements for employment where the employee agrees not to follow out the same business himself in the same area after leaving are good in law. But an agreement not to follow the same business at all anywhere would probably be bad.

Workmen come under a class by themselves, and may be defined thus:

> *A workman does not include a domestic or menial servant, but means any other person who, being a labourer, servant in husbandry, journeyman, artificer, handicraftsman, miner, or otherwise engaged in manual labour, whether under or over twenty-one years of age, has entered into or works under a contract with an employer; whether the contract is made before or after the passing of the Act* (38 & 39 *Vict., cap.* 90), *be expressed or implied, oral or in writing, and be a contract of service or a contract personally to execute any work or labour.*

The Truck Acts. The Acts known as the "Truck Acts," which are now being altered and recodified, are directed to a very simple principle. Their object is to prevent masters paying their workmen in kind, or making deductions from their wages. The Truck Act of 1831 forbids the payment of wages in aught but the current coin of the realm. No stipulation must be made by the master as to where and when the wages may be spent, or how. No employer may pay wages in goods, nor can he set off, against a claim for wages, goods supplied by the employer, or supplied by any shop in which he may have an interest. Infraction of the provisions of this Act lays the employer open to a heavy fine.

In 1887 the former Truck Act, which still remains in principle the law of the land, was greatly extended; and to a certain extent it was modified. Thus, the new Act specifically recognised a contract with a servant in husbandry for giving him food, drink (non-intoxicating), a cottage, or other allowances *in addition to* money wages, as part payment for his services.

It is expressly re-enacted that no employer shall dismiss any workman from his employment because he spends, or fails to spend, his wages at any particular place.

This provision would seem to raise the whole question of how far it is legal for employers to try and place certain places of business (mostly inns and public-houses) "out of bounds" for their employees. That such a practice is resorted to in more than one district no one who knows anything of English industrial life will attempt to deny. That it is illegal, whether from the point of view of the Truck Acts or of the common law of trade interference, is less doubtful.

Payment in Advance. Whenever, by custom, agreement, or otherwise, a workman is entitled to receive part of his wages in advance, it is unlawful for the employer to withold such advance, or make any deduction in respect of interest or poundage.

It may be worth while turning aside here for an instant to point out that the courts almost invariably require a strict proof of the existence of a custom.

Section 8 of the Truck Act, 1887, enacts that:

No deduction shall be made from a workman's wages for sharpening or repairing tools, except by an agreement which does not form part of the conditions of hiring.

Where articles are made by a person at his own home, or otherwise, without the employment of any person under him except a member of his own family, the shopkeeper or dealer who buys such articles from him must pay him in the current coin and not in kind, under penalty of becoming liable to the fines imposed for infringement of the Act of 1831 (Section 10).

This section only applies to articles under the value of £5, knitted or otherwise, manufactured of wool, worsted, etc.

The factory and mine inspectors enforce the Truck Acts in the factories, mines, and workshops inspected by them.

Fines. Under the Truck Act, 1896, it is enacted that:

An employer shall make no contract with a workman to deduct any sum from his wages by way of fine, unless:

(a) The terms of the contract are contained in a notice kept constantly in a place open to the workman, and in such a position that it may be easily read by him; or the contract is in writing signed by the workman; moreover, the contract must specify the acts or omission in respect of which a fine may be imposed, and the amount of the fine. The act or omission must be one likely to cause damage to the employer or hindrance to his business. The fine itself must be a fair and reasonable one, and

(b) An employer shall not make any such deduction except in accordance with such a contract. [illegible] *to be fined has been furnished with the particulars for which he is penalised.*

Shop assistants come under this Act as well as workmen. Where an employee has been fined illegally under this Act he can recover within six months of the fine.

Employees "Living In." As regards the general provisions of the Truck Act, shop assistants are not equally favoured. There has grown up in the large retail shops of many large towns of England a system known as "living in"—the unmarried assistants are supplied with meals and lodging in lieu of possibly more than half of their wages. The objections to this system are obvious. Men are herded together, the good and the bad without distinction. The State obviously cannot deal with morals, as such; but if the employer were handicapped by statute in his facilities in paying wages in kind, the system would receive a deathblow from which it could never hope to recover.

That is the purpose, without a doubt, of the movement of recent years, which, having resulted in a commission to see how far shop assistants can be brought under the conditions of the Truck Act, will indubitably result in legislation crippling a custom which has become an abuse.

Compensation. The whole question of compensation to workpeople has been settled by the Act of 1906, which, coming into force on July 1st, 1907, may be said to have revolutionised in one important particular the law upon the subject. For the first time domestic servants have been admitted to the advantages of compensation. It would not be possible to give in this place any synopsis of the rules and liabilities under the Act. Suffice to say that the prudent employer will now insure against any liability. We append therefore an ideal form of policy which is accepted by several of the better known insurance offices.

SPECIMEN POLICY

M.......... of .... (hereinafter called "the employer") having paid to the above company the sum of .... on account of premium for the indemnity hereinafter mentioned, it is hereby agreed as follows:

The company indemnifies the employer fully and completely against his or her entire liability (including costs), however protracted, under or by virtue of

The Workmen's Compensation Act, 1906,
The Employers' Liability Act, 1880,
Lord Campbell's Act, 1846,
The Common Law,
The Workmen's Compensation Acts, 1827 and 1900.

In respect of any injury fatal or non-fatal, which, at any time or times during the continuance of this policy, shall happen to any servant while in his or her employ, or while by law so deemed to be.

The company in cases of non-fatal accidents will, in lieu of the payment of half the weekly wages provided by the Workmen's Compensation Act, 1906, allow the employer the full wages paid during the period the employee is totally incapacitated from work up to one month from the date of the accident, and thereafter the benefits allowed by the Act, and will reimburse the employer any reasonable medical expenses he may incur in connection with such accident up to but not exceeding five pounds (£5) in amount.

The company shall at its own cost take upon itself the settlement of any claim, and the employer shall not, except at his own cost, make any payment, settlement, or arrangement. The company shall, at its own cost, take over and conduct and control the defence of any proceedings taken to enforce any claim, and defend the same in the name of the employer.

The employer by the acceptance of this policy agrees:

To give notice to the company at its head or branch office of any accident, within a reasonable period of the time when it comes to his knowledge, and of any claim, either verbal or in writing, made upon him.

To render the company at the cost of the company all reasonable assistance in connection with any accident, or any claim which may arise under this policy, and at the expiration of each year of insurance to furnish a statement showing the total number of persons employed during the year, and to pay to the company any additional premium which may be due in respect of persons employed in addition to those on whom premium shall have been previously paid (to which additional servants it is hereby agreed that this policy shall in the meantime apply).

In consideration of an extra premium of .... it is agreed that this policy shall extend to protect the employer against all liabilities under the Workmen's Compensation Act, 1906, to persons not in the employer's permanent service, and temporarily or occasionally employed by him in his capacity of a private householder or of an occupier of office or business premises, or for purposes incidental thereto.

This policy shall be in force for twelve calendar months from the date hereof.

Landlord and Tenant. The folly of the average layman is exemplified in no department of law so much as in the carelessness with which the leasing of houses and rooms is concerned. Tenancies are entered into without agreements stamped and properly sealed, with the result that the tenants entail upon themselves much hardship, and what seems to them to be illegality. At the outset, then, we would offer this golden rule:

Never enter into any tenancy which is for over a year without having a properly stamped and signed agreement. The value of the stamp required will only be a few shillings, and the advantage of security will be incalculable. The tenant should also be careful to note that the lease contains clear and exprcss provision as to the amount of rent, the mode of payment, and the notice required for the termination of the tenancy.

As a matter of practice, most tenants, certainly in humble circumstances and in agricultural districts, are content to take a tenancy without any agreement in writing. In such cases, if they pay weekly, they are weekly tenants; if monthly, they are monthly tenants, and can terminate their tenancy by a month's notice. Causes of perplexity not infrequently occur where the tenancy has begun on a year's agreement which has come to an end. The tenant continues in occupation. His tenancy is then governed (in point of time) by the mode of payment. If his rent is paid quarterly, he is a quarterly tenant, and must pay and give notice on the day he desires to terminate his tenancy.

Mode of Notice. Notice, whether given by the landlord or tenant, may be verbal, but the onus is upon the person giving it to show that, if verbal, it was properly given. Thus it would not be considered a good notice if the tenant called at the landlord's house and rang the bell, and on being informed that the landlord was not at home, left the verbal notice with the servant to hand on to the landlord. Nor is it a good notice when the date of leaving is placed at a day and time which is not legally in accordance with the requirements of the tenancy. Such a notice is altogether bad, and may be disregarded. The tenancy always expires at midnight on the date fixed for termination of the tenancy, and the tenant cannot be called upon to quit the premises before.

The landlord's remedies against a tenant who fails to pay his rent are dealt with briefly in another place, but here it may be said that where cases arise of tenants "flitting," leaving the house or rooms barred up and empty, the landlord is entitled to break in and obtain possession. If the tenant should happen to have left anything of value behind, the landlord may sell the same to cover the arrears of rent, and such rent as would be due in lieu of proper notice. But he is not entitled to double rent from the departed tenant and a new one, should he have succeeded in obtaining a new one.

Distress. The landlord's remedy where the tenant fails to pay his rent is by "distress," which can only be levied by a certificated bailiff, and must be between the hours of sunrise and sunset. Even then, the landlord must see to it that there is no forcing or breaking into the house, for the rule of the law is that "an Englishman's house is his castle." The bedding of the tenant and his family, and wearing apparel in actual use, and tools and implements of his trade to the value of £5, must not be distrained upon. Goods belonging to a lodger or visitor in the house should not be seized, but it is incumbent upon them to serve a declaration of ownership upon the landlord, accompanied by an inventory specifying the property in question. It may also be added that:

Kitchen ranges, stoves, coppers, grates, and other fixtures of the like nature put up by the tenant for the more convenient or profitable use of the demised premises, and which he is entitled to sever and remove during the term, are not distrainable for rent.

The other rules for distress, inasmuch as the process is compulsorily in the hands of experienced people, need not be given here. It will be enough to add for the benefit of unfortunate tenants that the penalties for illegal distress are very heavy.

Another branch of house letting of importance to tenants concerns the question of repairs.

Repairs. Probably it would always be safer to specify more fully than is habitual at present the repairs for which the landlord is responsible, and those which should be upon the tenant. At present, the favourite phrase is "*tenantable repair*," and the necessity of keeping the house in this condition is upon the landlord. But the meaning of that phrase is rather an elastic one. It is not, indeed, possible to define it more than generally. In as few words as possible, it may be said that the landlord must keep the house in a habitable condition. If the roof falls in, or one of the ceilings, if the cellar becomes full of water, he must see to rectifying these defects. But he will not be responsible for broken sash cords, or door handles that tumble off, or if the chimney smokes.

Failing, however, any express agreement, the landlord has no such liability at all. There is no implied warranty on his part that he will keep the premises habitable, or rebuild them in case the roof falls in or they are burnt down. So a tenant who is burnt out will find himself under the unpleasing necessity of still having to pay rent. And more than that, the landlord can get the insurance money for the destroyed premises and yet refuse to rebuild them. Surely this may be said to be a branch of our law conspicuous by its oddity.

Fair Wear and Tear. The responsibility upon the tenant, in the absence of any express agreement, is to leave the premises at the expiration of his tenancy in a reasonably clean condition, fair wear and tear being allowed. But if he has pulled down a wall during his tenancy he must rebuild it, of course, unless he has obtained the landlord's permission for the structural alteration. This branch of our subject includes the question of fixtures, the legal aspect of which has given rise to much perplexity in the past.

The broad rule is that the tenant, at the expiration of his lease, may *remove trade and ornamental fixtures, but he must take care that in so doing he does no damage to the fabric.* Thus, a chandelier put up by the tenant may be taken down only if the ceiling is left in proper condition. Trees and shrubs planted by the tenant could be removed if by so doing no harm was done to the garden—a rather prohibitive condition. The tenant in such cases would be in a better condition if he happened to be a nurseryman, and could describe these articles as trade fixtures.

A shop window or counter or show-cases can be removed at the end of the tenancy, but the premises must be restored to their former condition. It will be seen then that the subject is one on which no definite rules can be enunciated. The safest course in all cases is to make these alterations the subject of express agreement with the landlord. The tenant who, for instance, is at the expense to fit up the premises as a shop, and then discover that it will cost more to remove his fixtures, must bear in mind that he will not be entitled to any compensation from the landlord for the things left behind—unless, of course, the whole matter had been the subject originally of express agreement.

PERSONAL LAW

"He who is his own lawyer has a fool for his client" is a saying which has in it much truth and much fallacy. At any rate it applies to lawyers as well as laymen, for the family which had good cause to rue home-made law was that of a former Lord Chancellor who drew up his own will with remunerative consequences to the class from which he sprang. But the drafting of legal documents is another story. And here it may be said at the outset that the drafting of legal documents, wills, contracts, bills of sale, deeds of gift, should never be undertaken by amateurs, however vital the needs of economy. If a man has twenty pounds to leave behind him, it will be far cheaper in the long run to have that trumpery amount conveyed by a proper will executed by a qualified solicitor. Home-made drafts are short cuts to litigation; the man who uses them may write himself down penny wise and pound foolish.

But in daily life legal points arise, too trivial to take to a solicitor, or perhaps too sudden to leave time for consultation. Often in a man's business or employment, or in his relations with his landlord or his tenants, or with the doctor who attends his children, or the schoolmaster who teaches them, he takes a false step sufficient to put him out of court for ever so far as that particular case is concerned. Husband and wife, through ignorance of a minimum of law, may entail consequences upon themselves of a most uncomfortable kind, to say nothing of the legacy of woe daily left to children by married persons who are ignorant or careless, or both.

Husband and Wife. The only bars to marriage under our law are disabilities through five causes:

(*a*) Mental Incapacity. A marriage with a lunatic "so found by inquisition" is void, or with a person who, though not the subject of an inquisition, can be proved to have been insane at the time of the marriage. "Insanity" must, of course, be taken to mean real, definite insanity, not mere oddness or eccentricity. It may be added that to go through a form of marriage with a declared lunatic (so found by inquisition) is punishable as a very serious contempt of court.

(*b*) Age. Marriages contracted under fourteen by the male and under twelve by the female are voidable—that is, they can be annulled at the will of either of the parties on reaching the marriage age.

(*c*) Relationship. The prohibited degrees of relationship are to be found in the Prayer Book. These include illegitimate relations and relations by the half-blood. Thus, a man may not marry his deceased wife's step-sister, though there may have been no blood tie between the women at all: also a man may not marry his deceased wife's illegitimate daughter.

(*d*) Prior Marriage. The existence of a prior marriage renders a new marriage absolutely null and void.

(*e*) Physical Incapacity is a ground for voiding a marriage. The distinction between *void* and *voidable* in the above paragraphs must be clearly understood. *Void* means null from the very beginning—never anything else; while *voidable* signifies that the marriage is a good one until either of the parties chooses to void it. But in the latter case, if it could be proved that a party chose to take advantage of its voidable character through capriciousness—*i.e.*, long after he or she knew that it was possible, the court might very well refuse to allow it to be voided.

Formalities of Marriage. Marriage can be solemnised according to the rites of the Church of England, or civilly. Thirdly, there are Nonconformist marriages.

Church of England Marriages are either by Banns, Licence, "Special" Licence, or Registrar's Certificate.

(1) Banns. The Marriage Act, 1823, directs that:

All banns of matrimony shall be published in an audible manner in the parish church or in some public chapel, in which chapel banns of matrimony may now or may hereafter be lawfully published, of or belonging to such parish or chapelry wherein the parties may be married shall dwell, according to the form of words prescribed by the rubric prefixed to the office of matrimony in the Book of Common Prayer, upon three Sundays preceding the solemnisation of the marriage, during the time of Morning Service or of Evening Service [*if there shall be no Morning Service in such church or chapel, upon the Sunday upon which such banns shall be so published*], *immediately after the Morning Lesson, or whensoever it shall happen that the parties to be married shall dwell in diverse parishes or chapelries, the banns shall in like manner be published in the church or in any such chapel as aforesaid belonging to such parish or chapelry wherein such parties shall dwell.*

If the names of the parties are misstated in the publication of the banns, and this misstatement is the result of false information given *with the knowledge of both parties*, the marriage is void. One wrong name might not render the marriage void, though this is possible. If the misdescription can be proved to have been due to no fraudulent intention, or if only known to one of the parties, the marriage is good. A misdescription of status, as where a widow describes herself as a spinster, does not matter, and has no effect upon the validity of the marriage.

Seven days' notice of the publication of the banns must be given to the clergyman of the parish; consequently it must follow that *twenty-two days'* residence is compulsory in the parish on the part of the party who has to obtain residence in the parish for the publication of banns. This, of course, refers to a person who has no parish of his or her own. Then, "a traveller is a parishioner of every parish he comes to"; accordingly the man (without a parish of his own) who desires to marry a woman, say in Folkestone, must himself become a resident in that parish (or any parish where he chooses that his banns shall be published) by remaining there seven days to cover the notice to the clergyman, and fifteen days to cover the three Sundays when the banns are put up. If the marriage does not take place within three months after the complete publication, then there must be republication for three Sundays.

The marriage must be solemnised in one of the parish churches in which the banns were published.

(2) Licence. Where it is desired to dispense with banns, Church of England marriages can be by licence, to be obtained from the episcopal head of the diocese in which the marriage is to take place. No licence can be granted unless there has been a residence *for fifteen days by one of the parties* in the parish where the marriage is to be celebrated. Then before the licence is granted one of the parties must swear before the bishop's officer that there is no lawful impediment of kindred and that there has been fifteen days' residence, and if either party is a minor, and not previously married, then that the consent of the parent or guardian has been obtained. A false oath in regard to any of these particulars is a misdemeanour and punishable as such.

The licence must be produced for the clergyman at the marriage, and will be retained by him. The cost of such a licence varies in different dioceses from £2 to £4.

(3) Special Licence. Special licences, which cost £30, can authorise marriage without residence, at any hour of the day or night, and in any place whether consecrated or not. The special licence is granted only by the Archbishop of Canterbury, for any part of England, and the application for it must be accompanied with an affidavit giving particulars as to names, etc., and made to the office of the Vicar-General.

(4) Registrar's Certificate. Marriages may also be solemnised in church on a registrar's

certificate. This certificate is also used in Nonconformist marriages and will be treated under that head.

Nonconformist Marriages. By the present laws of the land marriages between persons belonging to denominations other than the Church [illegible] worship of the denominations to which the parties belong. A notice to the registrar is required, after which a certificate or licence is granted and the marriage can proceed.

A registrar's certificate or licence is valid for marriages in Church of England or Nonconformist places of worship, or for civil marriages.

A form must be procured by one of the parties from the registrar's office, and filled in with the full names, status, etc., of the contracting parties. Anyone who wilfully signs a false statement knowing it to be false is guilty of perjury and can, on conviction, be sent to penal servitude. At the time of giving notice the party must also make a solemn declaration of seven days' residence (fifteen, if the marriage is to be by licence) in the district of the superintendent registrar.

If either of the parties is a minor, then this solemn declaration must contain a statement that the marriage is taking place with the consent of those entitled to withhold it.

A false statement wilfully made is perjury, and can be punished, on conviction, by penal servitude. But such false statement does not render the marriage void.

The notice of such a marriage must be conspicuously exhibited in the office of the superintendent registrar for twenty-four hours prior to the solemnisation of the marriage, to give an opportunity for any authorised objection.

Following upon the notice, the parties can take their choice of a licence or a certificate. The former is the more expensive and the more expeditious. In the case of the licence also the need of a public exhibition of the notice is dispensed with. The fees in either case are not very high, and the exact formalities as to prior residence in the district will always be given at the office of the superintendent registrar.

The certificates or licences above referred to are valid for the solemnisation of marriage in a place of worship or in a registrar's office.

Marriages must in that case be solemnised in the usual form before the superintendent registrar in the presence of two witnesses.

Marriages Abroad. The question of marriages abroad opens too wide a subject to be dealt with in an article written for laymen. One golden rule taken to heart by British men and women in foreign countries will save much future unhappiness. Never enter into a marriage contract with a non-British subject without first finding out from the British Consul in that particular place how to set about making the ceremony a valid one, both by English law *and the law of the land in which the marriage is celebrated.*

The rule of our law is that every child born of the wife after lawful wedlock is presumed begotten of lawful intercourse, and therefore legitimate.

But if it can be conclusively proved that the husband has had no access to his wife the child can be bastardised.

The old days, when a husband could chastise his wife or take her to Smithfield, there to sell her to the highest bidder, have passed away for ever. In the eyes of the law, as it stands to-day, a husband is entitled to be master in his own home, but is no longer allowed to be tyrant. A married woman has many legal opportunities of getting away from a husband who is capriciously domineering, orders for the sake of ordering, or attempts to rule the household to beyond the limit of what is really reasonable.

Property Act. It is obviously impossible in this place to give the thousand-and-one details of the law governing the relations between husband and wife. Inasmuch as the bedrock of those relations is usually the question of property, it will be enough here to refer fully to what may be called the Magna Charta of married life—the Married Woman's Property Act of 1882. The main clause of the Act is the first. For that reason it is given in full in this place.

1.—1. *A married woman shall, in accordance with the provisions of this Act, be capable of acquiring, holding, and disposing by will or otherwise of any real or personal property as her separate property, in the same manner as if she were a femme sole, without the intervention of any trustee.*

2. *A married woman shall be capable of entering into and rendering herself liable in respect of and to the extent of her separate property on any contract, and of suing and being sued, either in contract or in tort, or otherwise, in all respects as if she were a femme sole, and her husband need not be joined with her as plaintiff or defendant, or be made a party to any action or other legal proceeding brought by or taken against her; and any damages or costs recovered by her in any such action or proceeding shall be her separate property; and any damages or costs recovered against her in any such action or proceeding shall be payable out of her separate property, and not otherwise.*

3. *Every contract entered into by a married woman shall be deemed to be a contract entered into by her with respect to and to bind her separate property, unless the contrary be shown.*

4. *Every contract entered into by a married woman with respect to and to bind her separate property shall bind not only the separate property which she is possessed of or entitled to at the date of the contract, but also all separate property which she may thereafter acquire.*

5. *Every married woman carrying on a trade separately from her husband shall, in respect of her separate property, be subject to the bankruptcy laws in the same way as if she were a femme sole.*

The remainder of the Act is equally important. It provides remedies of married women for protection and security of separate property. Another section refers to the wife's ante-nuptial debts, for which the husband is responsible only to the extent of any property of hers of which he has the enjoyment. But whereas that Act has the effect of putting married women on an equality with all other adults in respect to the owning of property, the law has gone a step further and endowed them with a privilege denied to everyone else. This is the *Restraint of Anticipation,* which is permitted to be added to any gift of land or income made to a married woman. During her husband's lifetime she may enjoy this income or the land as her separate estate, but she may not alienate it. Directly he dies she may dispose of it as she pleases—capitalise it, if it is income; sell it, if it is land; give it away or exchange it.

These broad lines, then, are sufficient to show the main features of the law governing marital relations where property is concerned. One important subsidiary question remains: *How far is a husband* *responsible for his wife's debts?* It can only be said that the law is by no means settled. For her debts contracted prior to the marriage he is responsible only to the extent of her estate which he may enjoy.

But the debts contracted during marriage are another matter. He may safeguard himself, it is true, by advertising in the newspapers that he will not be responsible, but that is a counsel of despair not likely to be thought of until the mischief is done. At the same time there is the point of view of the creditor to be considered, the tradesman who sells the goods and has a right to expect payment.

Probably in no recent instance has the need of a code ever been more emphatically instanced. Paquin *v.* Beauclerk (otherwise Holden), the last recorded case upon the subject (1906), equally divided the House of Lords, with the result that the Lord Chancellor (Loreburn) and Lord Macnaghten took one view, while their two legal brethren, Lords Robertson and Atkinson, took the other.

The result is to make it possible only to state the rough rule with considerable doubt. Within the next few years, months even, what lawyers now regard as settled upon the subject may be altered, and a definite code be established as to how far married women may contract debts on their own and their husband's credit.

The Tradesman's Liability. As the law stands, then, a tradesman who supplies a married woman with necessaries befitting her apparent station in life, or with goods for use in the household, must look for payment to the husband. Groceries supplied to a villa residence in Sydenham must be paid for by the husband. It matters not that he has given his wife fifteen pounds a week for household expenses, and she has spent the money instead on cards and racing and finery; the unpaid household bills are accumulating against his credit, and he must pay them or no one else can be made to. But the tradesman is called upon to exercise a little discretion. The wine merchant who, on the wife's order, sends in five dozen of his best brand of champagne to the house in Park Lane where he knows the husband to be living is in a worse position as regards the wife's liability than if he takes an identical order for a lady whom he has every reason to believe is a widow, though living in an equally expensive neighbourhood. Again, the draper who sells a bricklayer's wife an expensive piece of silk may find it difficult to prove the liability of the bricklayer to defray the bill. But these are refinements which lead only to confusion. Summed up in a simple sentence, the present rule is *Caveat vendor*, the creditor supplies a married woman at his own risk.

The End of Marriage. The methods of ending marriage other than death are numerous. If the wife is guilty of misconduct the husband can obtain a divorce. If she deserts him, he can no longer compel her to return to him, except through the process of the court, and to the extent that that will help him. Certainly he may not employ physical violence, or constraint in any shape or form. Just as the Married Woman's Property Act is the charter of her liberties as regards property, so the *Jackson Case* may be called the seal of her freedom. The decision in that case laid it down once and for all, so far as our law is concerned, that the wife could not be constrained to live with her husband against her will. Both parties are now in the same position.

The party desirous of cohabitation, whether husband or wife, may sue for restitution of conjugal rights. The other side failing to comply within a specified period, the only course then left is to petition for a judicial separation. This does not allow either side to marry again, but neither side can afford to disregard it without the consent of the other. It acts as an absolute bar to any meeting. The party against whom it is granted, if the husband, or the wife with money, will also find him or herself burdened with the payment of maintenance to the other side, while the custody of the children will also be in the hands of the petitioner, though the respondent will not be denied reasonable access to them.

The Wife's Claims to Divorce. The same remedy is in the hands of the wife whose husband has been guilty of misconduct; for a wife cannot obtain a divorce unless she can prove that her husband, in addition to misconduct, has also been guilty of legal cruelty. Mere rudeness or an occasional outburst of temper on the husband's part is not enough. The wife must prove that her husband has been systematically cruel, and that his behaviour has had a bad effect upon her health. She may also obtain a divorce if the misconduct is coupled with desertion without any reasonable cause for a minimum period of two years. There are certain crimes on the part of the husband which entitle the wife to petition for divorce. It remains to state that the husband against whom a decree is made will have to provide for the maintenance of his divorced wife and children, and though the custody of the children will be with the wife, he will not be denied reasonable access to them. It is different with the wrongdoing wife. The court will not grant her access to her children under 16 years of age. With children over 16 years the court has no concern, and refuses to make any order. It must be noted that where a divorce is granted, a *decree nisi* is granted in the first instance, and the parties are not free to marry again until this decree has been made *absolute*. No decree will be granted where it can be proved that the petitioner subsequently condoned the misconduct, as knowingly resuming cohabitation with the guilty party. Nor will a decree be granted to a petitioner who has been proved to have been privy to the act of misconduct, nor to the party whose own conduct has palpably and glaringly conduced to the misconduct. Disappearance of a party to the marriage is not in itself a dissolution of the marriage. The other side must get leave from the matrimonial court to presume the death of the disappeared: and whether this will be granted will depend on the length of the disappearance and the likelihood of death. To marry without such permission is bigamy.

One word of general interest to laymen must be mentioned. Poor people are now enabled by law to petition for a divorce at a very small cost. The Probate and Divorce Division of the High Court, Law Courts, Strand, London, should be applied to in the first instance, and the mode of procedure will be pointed out.

Parent and Child. The modern parent is no longer an absolute tyrant. He is a constitutional monarch. He has a right to exact obedience from his child who is still a minor (under 21 years); he can withhold his consent to his child's marriage, and no marriage can be solemnised without that consent. But it is a very negative sort of privilege. Thus the solemnising clergyman, or the registrar who issues the licence or the certificate, may assume that the consent is given, unless he is informed that the contrary is the case. Consequently the onus is upon the non-consenting parent, and when it is remembered what opportunities for secret marriages our very elaborate civilisation offers young persons, it will be seen that in modern life the parent has very little say in the matter. The fact that he opposes the marriage when he learns about it does not render the union null and void. Of course, a parent can use reasonable constraint on the person of the child—a young person predisposed to a specific act of matrimony against the wishes of the parent may be even locked up in a room, but such " durance vile " must not go beyond what is reasonable discipline. It must not savour of cruelty at all, nor have any injurious effect upon the health of the child, for here the community steps in, and it becomes a matter for the police court.

The parent, again, is the chief arbiter as to the religion of the child, or he may decide to teach the child no religion at all. Again, he may decide what secular instruction the child is to receive and where, but he must arrange that the child *is* taught, or the State will step in and do it for him. The parent, however poor, will be responsible for the maintenance of the child, and if the latter is starved or neglected wilfully (save, of course, through the misfortune of the parent), the latter is criminally responsible. Conversely, adult children are civilly responsible for the maintenance (or a contribution thereto) of destitute parents. Parental control does not continue in the case of children over 21 years.

Wills. No such view of law as the present one would be quite complete without a few words on the subject of wills. Persons who have property to leave should be warned to avoid home-made wills. In no other branch of law is the rule so often exemplified that " the man who acts as his own lawyer has a fool for a client." But if testators will insist upon making their own wills, let them make a point of simplicity, unambiguity, and clearness. The use of technical words is to be deprecated. If they employ them, it will be assumed that they know the meaning of the words they use. Neither stamps nor seal are now required to the validity of a will. It may be drawn up in any form the testator pleases, but it must be signed at the end by the testator and two witnesses in each other's presence. Creditors and executors are competent witnesses, but not beneficiaries. It may be added, however, in this respect, that the will is bad only so far as it concerns the beneficiary witness. But such a beneficiary witness may be given a legacy by a codicil which is duly witnessed by other witnesses.

Intestacy. Intestacy is the term applied to a person who dies without leaving a will. The rules for the division of such property are very clearly defined. But no family of an intestate should attempt to divide the estate except with the help of a solicitor.

The office of executor is not by any means an easy one. It is his duty to wind up the estate, and he must bear in mind that his responsibility for proper administration is a very heavy one. It is open to him to renounce the position at the outset, but if he accepts it is incumbent upon him to carry the will through to probate. If this is not done within six months he lays himself open to a very heavy fine. The Chancery Court, however, will give relief in special cases. A public trustee has now been appointed by Act of Parliament, and comes into existence from January 1st, 1908. He is a government official who, in return for a small fee, acts as trustee, and (if required) executor, in small and large estates. The security thus given against the fraudulent conversion of trust funds is obvious.

A SHORT DICTIONARY OF TERMS USED IN LAW

AGENT—A person authorised to contract legal obligations and acquire legal rights, and generally to enter into relations involving rights and duties on behalf of another, from whom his authority is derived.

Agreement—A mutual contract or consideration between the parties.

Aliens—Subjects of a State other than that in which they happen to be residing temporarily or permanently.

Ancient Lights—Uninterrupted enjoyment of light for twenty years.

Antenuptial Settlements — Settlement of property, etc., upon an individual prior to his (or her) marriage.

Appearance—Attendance, either in person or by proxy, at a court of law in reply to a demand for reparation.

Arson—Deliberately setting fire to buildings or such property as mines, crops, etc.

Assignment—The conveyance by the holder of a lease or part of a lease to a third person or set of persons.

Assurance—Guarantees to cover risks and compensate for losses, given by one party to another for payment.

Attestation—The act of witnessing: the signatures of the witnesses when complete.

Attorney, Power of—The delegation capacity to enter into binding arrangements on behalf of the person so delegating.

BAIL—Security taken by the court that a person charged will attend at a future date to answer to the charge.

Bailee—The holder of goods to obey the direction with which the delivery to him is made.

Bailiffs—Officers of the court employed to prosecute directions and orders of the court as to ejectment and distress for rent.

Bankruptcy—Insufficient assets to cover all just claims, and such insufficiency publicly declared by some act.

Barratry—Wilful damage to ship or cargo done by master or any member of the crew, without the privity of the owner.

Barring of Action—Limiting of right to bring an action after a certain interval of time.

Battery—A hostile touch or the hostilely throwing of anything at another person; or spitting at him. Practically a convertible term in law for Assault.

Bequest—Property left by will.

Bigamy—The offence of going through the ceremony of marriage when the first husband or wife is still alive, and the former marriage has not been dissolved.

Bills of Exchange—A bill of exchange is an unconditional order in writing, addressed by one person to another, signed by the person giving it, requiring the person to whom it is addressed to pay on demand, or at a fixed and determined future time, a certain sum in money, to, or to the order of, a specified person, or to bearer.

Bills of Sale—Documents operating as the transfer of property from vendor to purchaser, or as the evidence of such transfer.

Breach of Condition, Contract, etc.—Breaking the agreement to perform a certain act, etc.

Burgess—Enrolled and fully qualified member of a borough.

CESTUI QUE TRUST—The person for whose benefit the trust has been instituted.

Champerty—Bargain between third party and a party to a suit, to divide the object of the suit (land), if successful; supplying in return money to prosecute the suit.

Chattels—Personal property.

Cheque—An authorisation to the bank (or holder of any deposits) to pay a sum of money belonging to the drawer of the cheque to the payee.

Claim, Statement of—The legal document used in proceedings to set forth the demands of the suitor who is the plaintiff in the case.

Collusion—A private understanding between parties, made to influence or negative the course of justice. Used principally in cases in the Divorce Court, where husband and wife have a private understanding with a view to obtaining a dissolution of their marriage.

Compounding—Agreeing to suppress a crime, so that the wrongdoer may not be brought to justice.

Conjugal Rights—The rights of husband and wife to the society and support of the other. The compulsory common life.

Consideration—The reason demanded in law for the passing of any property from one person to another.

Contracts—Agreements between two or more parties to perform some act or pass property, etc., etc.

Contributory Negligence — Negligence in law on the part of any victim of an accident, disqualifying him from obtaining compensation from the employer or person responsible primarily for the accident.

Copyhold Estates — Tenancies held from the lord of the manor and entered in the Court Rolls of the Manor.

Copyright—The property in writings or paintings, etc., which prohibits their reproduction save at the will of the owner of the (copyright) property.

Corporations—Bodies of individuals or shifting aggregates or institutions treated as single individuals as respects their powers to sue or be sued, but differing from individuals in this that they are immortal.

Counterfeiting—Making base imitations of the coin of the realm.

Counterpart—The duplicate of a document—*e.g.*, the lease, deposited with the lessor.

Covenants—Clauses in a lease promising to do or abstain from doing certain acts and duties in connection with the tenancy.

Curtilage—The same common fence surrounding a house and outbuilding.

DAMAGE FEASANT—Any person whose property is injured by the cattle of another straying thereon, without any contributory fault of his own, is entitled to seize the cattle and retain them until he has been compensated for the damage done. This is known as "distress damage feasant."

Damnum Sine Injuriâ — Damage caused without a wrongful act.

Debt Judgment—Debt found owing by the decision of the court. Money owed as the result of a judgment of the court.

Dedication of Highways—Devoting a thoroughfare (through specified legal means) to the use of the public.

Defamation—Blackening the character of another person, either by words uttered or written.

Default—Failure to appear in satisfaction of legal proceedings.

Delivery—The legal passing of the property in goods.

Demise—The granting of a term of years' interest in property.

Devise—Testamentary grant of property.

Dissolution—Legal termination of a contract—usually employed with regard to the contract of *partnership* or *marriage*.

Distress—"The taking, without legal process, cattle or goods as a pledge to compel the satisfaction of a de-

the redress of an injury." (Woodfall.)

Domicile—The place where a person has his permanent abode, and whither (when absent) he has an intention of returning.

Drawee of Bill—The person in whose favour a bill is drawn (drawee or payee).

EASEMENT—A right over another's land, under which some service or enjoyment is vested in a person who has no property in the land, and no right to draw any profit from it.

Ejectment—Forcible expulsion of defaulting tenants from house or land.

Embezzlement—Robbery by a clerk or servant of his employer's money, etc.

Employers' Liability—Responsibility of employers to compensate workpeople injured in their service, by any cause other than the workman's own fault, or the fault of a fellow-work man.

Entail—The line of succession to land indicated.

Estate Duty—The taxes required to be paid on succession.

Execution of Judgment—Enforcement of decree of any court.

Executors and Administrators—Officers appointed under a will to fulfil the terms of the will and administer (so far as required) the estate.

FACTORS—Agents employed and empowered to buy and sell.

Fee Simple — Practically absolute ownership of personal property.

Fee Tail—A limited estate, or property in an estate.

Felony—"An offence which occasions a total forfeiture of either lands or goods or both, at common law, and to which capital or other punishment may be superadded according to the degree of guilt." (Russell.)

Foreclosure of Mortgage—Taking complete and actual possession of property upon which money has been raised, in default of repayment of said sums.

Forgery—Personating another through the means of counterfeited writing.

Fraud—Wilful misrepresentation in entering upon an agreement.

Freehold—Estates held in fee simple, fee tail, or for life. [q. v.]

GRACE, DAYS OF — Extensions allowed by law before a just debt, etc., becomes due after the actual date of repayment has vested.

Guarantee—The acceptance of the obligation of a third party to complete some agreement.

HEARSAY EVIDENCE—Report of words used by a third party not present before the inquiry.

Hereditaments—Inheritances applied to land.

Heriot—Feudal "service" due to the lord of the manor on the death of the tenant.

Highways—A way open and common to all the King's subjects.

Hire-purchase—Payment for goods, the actual possession of which has passed already to the purchaser, by instalments.

IMMEMORIAL USAGE — Custom which has obtained so long as the memory of man can extend back.

Indorsement—Signature of payee (or drawee) acting as negotiation of the bill.

Infants—Legal description of those who cannot enter into contracts for reasons of age.

In Formâ Pauperis—Facilities for sueing or defending in courts of law where the suitor is too poor to

Inhabited House Duty—A tax upon occupied houses, the incidence of which falls upon the occupier or landlord according to the rent paid.

Inland Bill of Exchange—A bill both drawn and payable upon presentation within the British Isles.

International Copyright—Protection of literary property extending over its production in foreign countries.

Interpleader—Process to ascertain real ownership of goods seized under a distress for rent.

Intestacy—Disposal of the property of a deceased person who leaves no will.

JETTISON—Throwing cargo overboard to save the ship.

Joint Tenancy—Two or more persons holding land in common.

Judicial Separation—Legal status (short of the dissolution of the marriage tie), pronounced by the Divorce Court, entailing living apart, but not entitling the parties to re-marry.

LADING, BILL OF—Document containing description, etc., of cargo consigned to a ship.

Larceny—Feloniously taking another person's property against his consent, with a view to converting to use of the taker.

Lien—Hold on property vested in persons having some claim upon the actual owner.

MALICE—The conscious violation of the law to another's detriment.

Market Overt—"A fair or market held at stated intervals, in a particular place, by virtue of a charter or prescription. In the City of London every shop is, on every day except Sunday, a market overt for the sale of goods usually sold therein." (Chitty.)

Memorandum of Association—Document demanded by law and containing the terms governing the formation of a limited liability company.

Misdemeanour—Any crime less than a felony (q.v.).

Mortgage—Security given by a debtor to his creditor, either on land or personalty, to safeguard the repayment of the amount owed.

Mortmain—Transfer of property to any corporation as distinct from individuals or cluster of individuals.

NECESSARIES—Articles supplied to infants or married women which they are bound to pay for personally as essentials to their mode or condition of life.

Negligence—Acts of commission or omission other than those likely to be done by a reasonable man.

PAROL—Verbal as opposed to written.

Perjury—Swearing to what one knows is false.

Personalty—Property in cash and movables as opposed to realty (land).

Privileged Communications—Letters to solicitors from their clients, or from a person to any professional man who he is consulting, and concerning matters which it is the professional man's calling to deal with.

Procuration, Powers of—Delegating authority to bind another to agreements, etc.

Promissory Note—A promise in writing to pay certain sums, made without qualification or condition.

RATIFICATION—Confirmation of any agreement.

Receiving Order—Term used in bankruptcy for appropriating the assets of a bankrupt towards the payment of his creditors.

Representations Fraudulent—Statements of untrue character made

they would not make if they knew the facts.

Repudiation — Refusal to complete terms of a contract, on the ground that said contract had been obtained by the other party by misrepresentation, etc.

Reversion—Possession of realty or personalty vesting after the death of the actual possessor.

Rights of Way—Public capacity to cross private property at certain points [see *easement*].

SEISIN—To become possessed of realty.

Stoppage in Transition—The stopping of goods on their way to the perspective possessor; for debt, and so on.

Surety—Individual who accepts responsibility for the performance of some obligation on the part of another.

TORTS—Civil wrong for which one is liable civilly, but not criminally.

Treasure Trove—Valuables, to which no owner can be traced, found either in public or private land.

WRIT—Legal document used in process of civil and criminal actions, setting forth the cause of action and formally demanding the satisfaction claimed by the plaintiff.

LAW *concluded*

WOOD-TURNING

Woodworkers' Lathe and other Tools. Work Between Centres. Chuck Work. Measurement. Square Turning. Ornamental Objects

Continued from page 6756

By JOSEPH G. HORNER

The Lathe. The craft of wood-turning is very ancient. It was formerly done by a reciprocating mandrel, operated by a bow and cord; or by an overhead spring pole, operated by a treadle. The bow and cord still survive in the East. All modern wood-turning lathes are fitted with continuously running mandrels. Lathes for wood-work are much plainer than those for metal turning, seldom comprising more than a plain ungeared headstock, a simple poppet, and a hand tee-rest. For some engineers' pattern turning, a plain slide rest is fitted and a large face-plate, or a special face lathe. But with these exceptions, and that of the ornamental turner, wood-turners' lathes have no aids to supplement the work of the hands. The fact is, a skilful turner is more nearly independent of his lathe and tools than most craftsmen, and excellent work is done by such men on lathes that would excite the derision of the engineer or the wealthy amateur. Wood-turning is one of the crafts in which manipulation is the supreme factor, one in which the essential tools are few in number, and very simple in character.

A large, high-class lathe, much superior to those usually found in wood-turners' shops, is shown in **1**, made by T. White & Sons, of Paisley. It is all of iron, while wood figures largely in much lathe construction. It is of large size, 12-in. centre, designed for pattern turning, and general utility. The following are the principal parts: the *bed*, A, having at one end the *headstock*, B, with the four-stepped cones, C, turned inside and out for perfect balance, and driven from the cones, D, on the countershaft, fitted with fast and loose pulleys. E is an iron *face-plate*, to which work can be screwed directly, or through an intermediary plate of wood. F is the *fork*, or *prong* centre. G is the *loose poppet*, or back poppet, or movable poppet, or loose head, and its centre is the *back* centre. It is fitted for turning long tapers, as on columns, by utilising the cross-traverse movement provided. The tool rest commonly used is the *tee-rest*, H, with which nine-tenths of wood-work is done. But for long pieces, a *slide-rest*, J, is provided, comprising the tool holder on a cross slide, adjustable across the top of the saddle, which is fitted to the bed with vee'd edges, and an adjustable strip. The saddle is travelled up and down the bed by a rack, K, the pinion of which, L, is actuated through a pair of gears, N and O, by the lower lever handle, M, the upper handle being for the cross traverse. A nest of drawers, P, is formed underneath the bed to receive the tools, and a rack, Q, adjacent, receives face-plates. R is the *back board* for tools in use.

Wood-turning Tools. The principal operations are performed with two tools only, the *gouge* [**2**] and the *chisel* [**3**], each being used in three or four different sizes. Both are true cutting tools, both require practice and skill in their manipulation, but all conceivable shapes are outlined by deft handling of these two. True, there are many others which complete a turner's kit, but they are only used for occasional finishing, smoothing, and correcting. All the roughing out, and by far the greater portion of the finishing also, are done by these two very simple tools. We will consider them and their work in turn.

The Gouge. This [**2**] is like no other gouge. It has a considerable convexity of the cutting edge, the reason of which is to prevent, or to lessen risk of hitching or catching of the revolving work against one corner of the tool, which would happen if an ordinary firmer gouge were used for turning; or if the gouge were ground like **4**, instead of like **5**. It is this rapid revolution of the work, with the centrifugal action, tending to knock the gouge away, that the turner, consciously, or instinctively, born of habit, always has to bear in mind. The beginner, after sundry hitchings, and damage to the work, his hands, or the tool, or all in unison, soon learns to present the gouge warily. The thing to remember is not to allow the work to catch in the sides of the gouge, but to do the cutting at and near the point *a* only. Bearing this in mind, faces that are perpendicular to the axis of rotation can be roughed down safely, the back of the gouge being held next the face being cut. Concave and convex portions are also easily cut, the back of the gouge always lying next the face being turned.

When turning a parallel, or straight portion, the gouge can be held straight forward [**6**]; but, generally, more rapid reduction can be effected by turning with a diagonal cut, or sideways, changing the direction of cutting towards right and left alternately. Deeper cutting can be done by this device than by straight-forward presentation, though the latter is suitable for taking finishing cuts. To suit details of work of different dimensions, gouges are made in different sizes, from ¼ in. to 1¼ in., so that either fine details or heavy roughing down can be done by selecting suitable gouges. The *handles* of these gouges [**2** and **6**] will be noted as being characterised by much leverage. To this, in fact, they owe so much of their value. The workman is thus able to control their movements in opposition to the severe stresses caused by the revolution of the work. A firm grip is taken at the fulcrum—that is, the place where the gouge lies on the rest [**6**]. The gouge is gripped there between the forefinger and thumb of the left hand, while the end of the handle, gripped in the right hand, is kept in constant movement in arcs of circles to suit the nature of the cutting being done. In some cases the side of the gouge is presented, as in taking a finishing cut in a bore [**7**]; **8** is a gouge used on the slide rest.

The Chisel. This [**3**] is the only turning chisel with a doubly bevelled edge like that of the axe, though used in quite a different manner. It is presented and traversed against the revolving work, cutting shavings at and near the obtuse-angled end. The degree of pressure exercised is controlled by the hands of the workman. The tool is gripped on the rest [**10**] by the forefinger and thumb of the left hand, similarly to the gouge, while the right manipulates the handle. Like the gouge, the chisel will turn straight and convex portions, though not concave ones, unless of large radius. The point to observe is that cutting must not be done far away from the point, *a* [**9**], and, say, over one-third of the width from the point, otherwise the tool is liable to be caught, and damage the work. It can be used indifferently in right and left directions [**11**]. The chisel, like the gouge, if used properly, leaves a very smooth surface. The acute-angled corner of the chisel fulfils the special function of cutting down perpendicular, or nearly perpendicular faces [**12**], and of severance. Being so keen a wedge, it will cut deeply and rapidly, leaving the smoothest possible face. It cannot be used for turning like the other angled corner, but would be caught by the work if presented thus.

Scraping Tools. Though the gouge and chisel are the sheet anchors of the turner, it is obvious that they cannot cover all details of work, and especially in pieces of large dimensions. Thus, a disc on the face plate cannot be turned and finished with the side chisel. For this a *firmer* chisel, acting as a scrape, must be used. A deep hole can be roughed with the gouge, and partly smoothed with the keen angle of the side chisel, but a true, smooth face must be finished with a *side tool.* A concave portion can be roughed with the gouge, and is often finished with it; but frequently it is finished with a *round nose,* especially in work of large diameter. These and some other tools act by scraping only. Hence, as scraping roughens up the grain, the object always sought is to do as much preliminary work as possible with the gouge, and take the merest film off with the scraping tools. Round nose and side tools are shown on page 4261, in group **22**.

Hard and Soft Woods. The relative utilities of scraping differ in the practice of turning hard and soft woods. It is done much more extensively in the first named than in the second. The reason is that the grain of hard wood does not become roughened up nearly so much as that of soft timbers. This, of course, is not an argument in favour of scraping, when turning can be done by the gouge and chisel. But when work is of a highly ornamental character, and of large dimensions, as in much of that done on the face-plate, the risks of hitching are lessened by the use of scraping tools. The harder the wood, the more nearly the conditions approach to the turning of the softer metals. Thus, Spanish mahogany is harder than baywood, and lignum vitæ or box are more suitably scraped than beech or birch. Also, dry, well-seasoned woods can be more readily scraped than moist and spongy stuff. So that there is room for exercise of judgment. When details have to be turned to exact dimensions the scrapes are valuable aids, because very minute amounts can be removed by their assistance. The hardwood turners, therefore, have a large assortment of scrapes for turning concave and convex portions, for recessed work, right and left-handed, besides special forms of tools for internal shoulderings, etc., in some of which it would be quite impossible to use the turning gouge or chisel.

All turned work may be classified under two heads, that done *between centres* and *chuck work.*

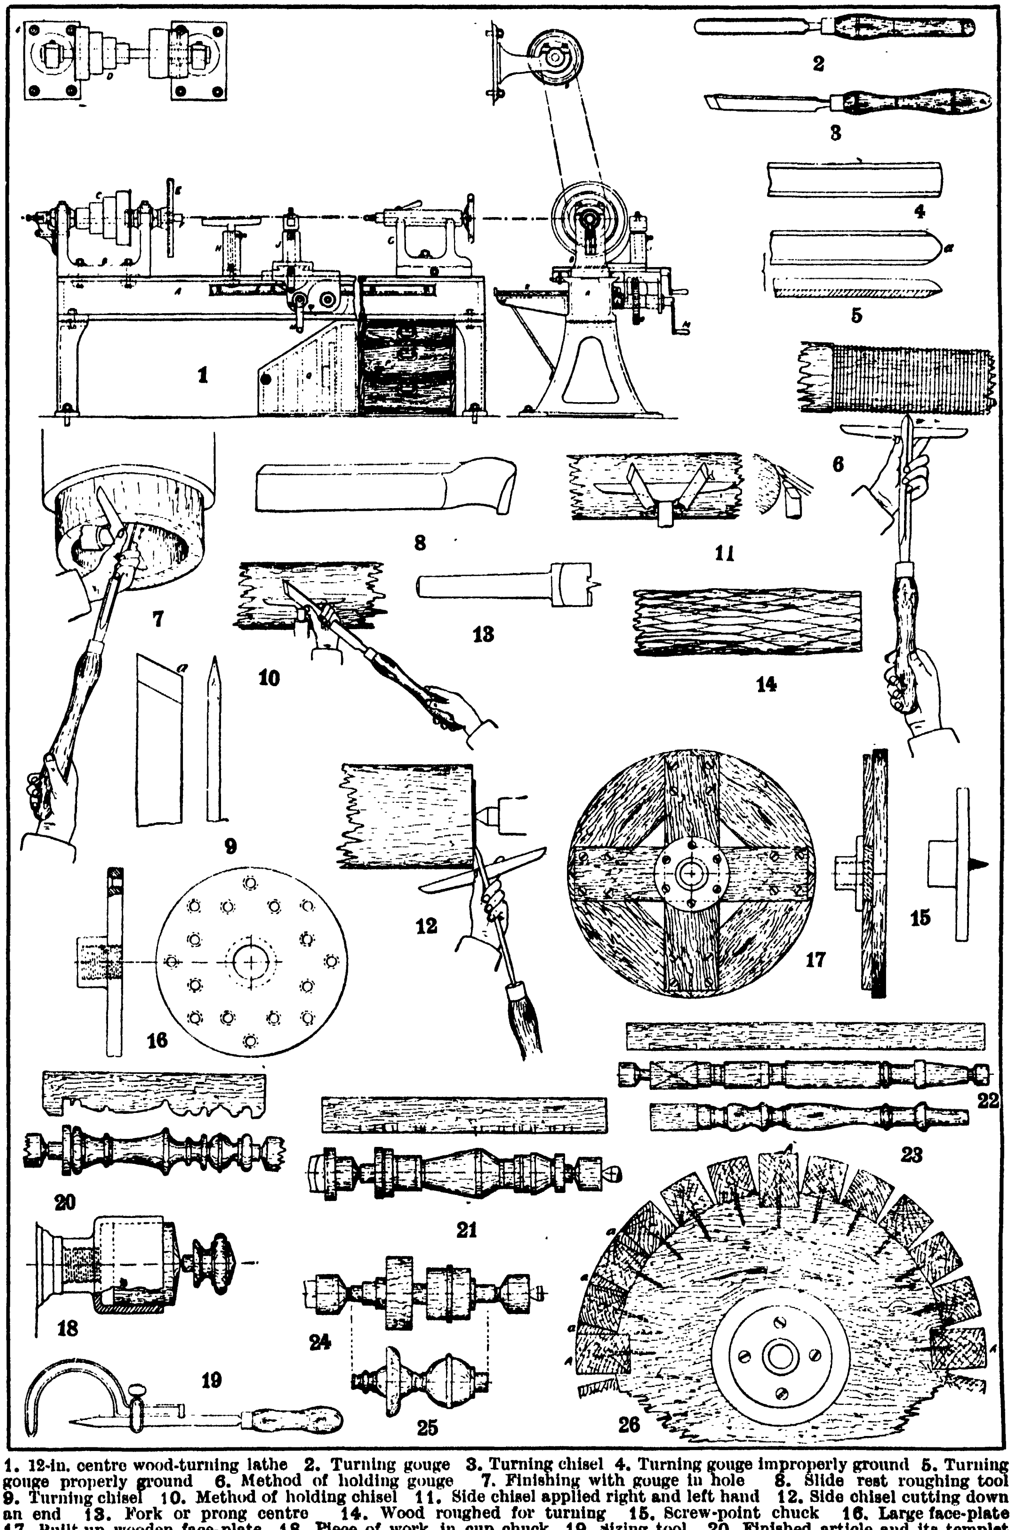
Work Between Centres. This signifies that the piece to be turned is supported and revolved between the fast headstock and the loose poppet. It includes all pieces the length of which exceeds the diameter by so much as to require support besides that afforded by the headstock. Generally, such pieces are held and rotated by the fork or prong centre. This is interchangeable with other chucks on the mandrel nose. It derives its name from its fork or prong-like character. The end of the wood, if soft, is driven against it, or, in hard wood, a saw kerf is often made to receive it. The back poppet centre is entered readily by screwing up the mandrel slightly. Occasionally other chucks are used to drive work between centres, but in most instances the fork is employed; **14** shows a piece of wood roughed out with the axe preliminary to turning.

Chuck Work. This signifies that pieces are held at the headstock end only, and without other support. Pieces the length of which does not greatly exceed the diameter, or which are of less thickness are turned thus.

Face-plates. These are the principal chucks. They differ from those for metal turning in their greater simplicity, comprising only two forms, in a range of dimensions. One is the *screw point chuck* [**15**]—that is, the work is held on it by a central, short, tapered screw, having a coarse thread. This is sufficient to hold a small piece of wood, say, not exceeding 4 in. or 5 in. in diameter. Thick blocks —say, above 3 in. or 4 in. diameter—are generally secured in addition with a couple or three wood screws put in from the back of the plate.

Large Face-plates. These [**16**] have countersunk holes for the attachment of work by wood screws inserted from the back of the plate. They are made in as large a range as the capacity of the lathe will admit. For very large face work, lathes are made either with a deep gap in front of the headstock, or the headstock is made to turn round through 90° or 180°, so that work can be taken as far down as the floor. In such cases a special rest is rigged up on a heavy *floor stand,* sufficiently massive to remain steady under the stress of turning. In many cases the trouble of reversing the headstock is avoided by carrying the mandrel out at the rear to hold the large face-plate, so that it is always ready for use. Pattern-makers, as well as wood-turners, use these face lathes for wheel work of all kinds.

Wooden Plates. The face-plates are made of iron, except in the very small sizes—say, under 4 in.—for which brass is commonly used. But a large proportion of turners' work, and much the largest in pattern turning, is done, not on the metal plates directly, but against an intermediary plate of wood screwed to the metal. The advantages are these: The wood plate can be faced up truly, while the metal plates often run slightly out of truth, due to wear on the thread. Turning can be done right up against the wood without inflicting damage on the tool edges. There is a slight elasticity in the wood, noticeable when turning, by comparison with turning done down close to the iron. But the principal advantage is that the wooden plates can be recessed to receive work for re-chucking centrally, often, too, without using screws, the friction of the work in its recess—or over a check standing out, in the case of chucking by a hole—being sufficient to retain it in place for light turning. In time, as a face-plate becomes turned down thus, a new one is substituted. Small plates are made of solid stuff; but those over 12 in. to 18 in. diameter are built up, the plainest with battens, the largest with a cross and diagonals [**17**]. Much work is chucked, not directly on the plate, but on blockings screwed to it. The reason is, that plates of several feet in diameter are rather expensive, and would soon wear out if frequently recessed. The face is, therefore, retained plane, and chuckings are done on



1. 12-in. centre wood-turning lathe **2.** Turning gouge **3.** Turning chisel **4.** Turning gouge improperly ground **5.** Turning gouge properly ground **6.** Method of holding gouge **7.** Finishing with gouge in hole **8.** Slide rest roughing tool **9.** Turning chisel **10.** Method of holding chisel **11.** Side chisel applied right and left hand **12.** Side chisel cutting down an end **13.** Fork or prong centre **14.** Wood roughed for turning **15.** Screw-point chuck **16.** Large face-plate **17.** Built-up wooden face-plate **18.** Piece of work in cup chuck **19.** Sizing tool **20.** Finished article and its templet **21.** Article as roughed out and strip marked out in lengths **22** and **23.** Article roughed out and finished **24** and **25.** Article roughed out and finished **26.** Square turning temporary blocks screwed to the face. This is done in large gear wheels, pulleys, and rings of various kinds.

There are some classes of turned work in which it is undesirable or inconvenient to insert screws, yet which must lie against a flat face-plate. Then *paper joints* are useful. These are adopted extensively in pattern turning, and it is surprising how great a mass paper will hold. Newspaper is suitable. It is glued on both sides, one side going next the plate, the other receiving the work. On large pieces, narrow strips of paper at intervals are sufficient; pieces of a few inches diameter may be carried with one piece of the same diameter. The joint is broken after turning by lifting the work with a chisel inserted in the joint, when the paper splits into two.

The Bell Chuck. The bell chuck is termed the *cup chuck* [**18**], and is used for some classes of work too small or too long for the face-plate, and also for pieces which have to be bored [**7**], or for objects that have to be turned and cut off in succession [**18**]. Boxes, egg-cups, vases, are examples of the first; drawer-knobs and cord-pulleys of the second. The wood is driven into the cup and holds by friction alone. The chuck is usually of brass.

There are many very delicate objects which will not bear any driving into the bell chuck, or into a wooden chuck driven into the bell, and recessed to receive work. For such objects the *spring chucks* are valuable. These are made generally in a hard wood, box being the best, sometimes also in brass. The body of the chuck, slightly tapered outside to receive a ring, is split by several saw kerfs cut radially nearly to the bottom of the chuck, and the metal ferrule is made to compress the body round the work by tightening it down the tapered body. Turners make these for their own use in several diameters.

Methods of Measuring. The diameters of turned work are mostly taken with common calipers. When large numbers of similar pieces have to be done the calipers are often fixed with a thumbscrew. A sizing tool [**19**] is also used with a guide at the back, for repetition parallel turning.

Dimensions in the longitudinal direction may be taken with a rule; but when quantities are done, a strip is generally used, having the various lengths marked across it, whence they are transferred to the work. In such cases the piece is roughed out approximately parallel to the largest diameters, and the lengths set off on the rotating piece. Then these are set in with the keen angle of the side chisel down to the various diameters, which are turned, and checked by the calipers. Every portion is first turned as a parallel section, after which the different moulding sections are shaped with the gouge and other tools. Compare **20** to **25**.

Templets. These afford much aid to calipers in repetitive work. They are cut from a thin strip of wood and tried upon the work [**20**] from time to time as the final corrections are being made. A little chalk or red lead may be rubbed on the edge to indicate the localities where contact takes place.

Straight Shafts. When a long portion of turned work is to be perfectly straight, as in the shafts of columns and pillars, and in pattern pipe-turning, much time may be saved by first turning down at each end and in the centre to the correct diameter, and then planing a flat along from end to end, forming a tangent to the diameters. This, being chalked or red-leaded, becomes a guide to rapid reduction of all the intermediate portions, which can be turned almost to size without stopping the lathe. It is then easy to finish with a side chisel, and correct, finally, with a firmer chisel.

Steadies. When long, slender pieces are being turned between centres they wobble, and cannot be turned truly without support intermediate with the centres. These steadies are very plain by comparison with those used by metal turners. Sometimes a rigid rod only is wedged between the ways of the bed, to be kept in contact with the back of the work; but, generally, a block of wood or an iron bracket is bolted to the bed to carry either a vee-block or to receive semicircular blocks. A single vee-block will cover a moderate range of diameters, but semicircular blocks will fit only one side. The practice is to turn down a portion to the correct size, somewhere about the centre of the length; grip that with the steady blocks, and then proceed with the remainder of the turning. In very flimsy work the steady is shifted to two or three successive positions; or more than one steady is used. Lubrication is necessary, or the friction between the work and the steady will cause smoking, and char the wood. Soft soap is the best material to employ. If a lathe is fitted with a slide-rest, then a travelling steady which follows the work behind the tool can be used, as in metal-turners' lathes.

Square Turning. The principle of this is illustrated in **26**. The articles to be turned are arranged round the periphery of two or more discs, which are driven between the centres, driving with a face-plate at one end attached to its disc, the other end being supported on the back centre. The pieces of wood are attached with screws, the lengths being in excess of the finished article, to allow of the portion with the holes to be cut off subsequently. It is not necessary to fill in the spaces between the pieces with a view to prevent breaking out of the grain by turning, but those who are not skilful in the use of the tools glue strips in, as shown at *a* in **26**. The blocks, A, in the illustration are simply distance pieces, by which the end discs are retained rigidly. Of course, the larger the diameter of the ends the less will the slight curvature due to the radius be in amount, and generally such ends would have to be framed up with a cross and segments. After the faces have been turned corresponding with one position of the articles, they are turned round and re-screwed in successive fresh positions, until all four sides are finished.

Ornamental Objects. The work of the geometrical turner requires special high-class chucks, and a special lathe. But very beautiful, effective ornamentation can be produced by the plain wood-turner by the repetition of similar figures, such as those shown in **20** to **25**, and allied forms, for there is no limit to the combinations of curves and straight lines which are possible. Vases, flower-holders, candlesticks, watchstands, work about overmantels, toilet-boxes, epergnes, and much beside, can be so made, or enriched with ornament. Much may be done by turning rings the cross sections of which are those of various geometrical figures, and cutting off arcs therefrom to form the tripod-legs for stands of various kinds, or for carved handles. These are turned on the face-plate, most figures requiring re-chucking; objects of square, circular, octagonal, or fluted sections can thus be produced by turning.

With regard to the finishing of woodwork, any of the usual preparations can be employed, according to the character of the wood and the work — brush varnishing, French polishing, lacquering, painting. Inferior woods may be stained previous to polishing.

WOOD-WORKING *concluded*

ADVERTISING

The General Avenues of Business Publicity. Mail Order Advertising. The Business of Advertising

Continued from page 6802

By WAREHAM SMITH

ADVERTISING is the art of creating a demand by publicity; it is to-day one of the greatest forces of commercial life, and it is no exaggeration to say that millions of pounds are spent annually in applying the power.

Advertising—the art of advertising—cannot be taught in the usual way. There are no text-books or acknowledged professors, and the attainment of a position in its ranks does not entail an expensive course of instruction or necessarily involve a long apprenticeship. The qualifications are a strong personality, a sound general education, and a keen perception. There is no business that offers greater advantages to the man who can see and grasp an opportunity.

We have said that advertising cannot be taught—nor can it. One may learn how to draw up an advertisement, what type to use, what space to buy, and how to buy it, and some useful hints are given in these pages on these points. You can learn a thousand and one things, useful and even necessary to know in the connection, but of themselves they are not advertising—they are not the *spirit* of advertising. It is the argument—the happy thought—the bright idea—the smart catch phrase—the power of perception—the insight into human nature, that sell the goods, and these things cannot be learned by rule of three.

Placing Advertising Business. It will be as well first of all to enter somewhat into the conditions of the advertising business. An advertiser wishing to inaugurate a campaign arranges details as to space, price, position, etc. (*a*) with the advertisement manager of the various publications direct; or (*b*) he employs an advertising agent to make the necessary arrangements; or (*c*) he places some contracts direct with the publisher, and some through an agency, as he may deem it expedient.

Generally speaking, the business is apportioned in the following way:

About nine-tenths of the total is done through advertising agents. The agents handle nearly all the business that is placed with daily newspapers. The monthly magazines accept a small amount of business from the advertiser direct. Of the advertising in the illustrated weeklies about 25 per cent. is arranged without the intervention of an agent. It will be seen from this that the advertising agencies play a very important part in the business, and their position in the field is rather a peculiar one for the reason that although they work ostensibly in the interests of the advertiser they receive their remuneration from the publisher. On all contracts placed by the agency the publisher pays a commission, varying generally from 10 per cent. to 15 per cent., according to the standing of his publication and its power to command business. Various other arrangements are often entered into between publisher and agency, such as an additional discount for cash or an extra commission if the business received exceeds a certain amount. There is no fixed rule, each publisher being a law unto himself in this respect, but 10 per cent. is the usual commission paid by first-class publications. The agency is responsible to the publisher for payment for contracts placed by it, and is regarded as a principal, all contracts being made as such, and not as an agent for the advertiser. The position of the agency is analogous to that of a man serving two masters, and although much controversy has arisen within recent times as to the efficiency of the system, still, as exemplified by first-class agencies, it appears to work satisfactorily.

The Advertising Agent. It is not perhaps of particular importance for present purposes to enquire into the inner working of an advertising agency, but it is at least relevant to the subject, and digression in this direction may not be uninteresting. The agency acts: (1) as space brokers—that is, buyers of space from the publisher on behalf of the advertiser; (2) as advertisement managers and advisers to the advertiser.

In either case the commission paid by the publisher is the same. Some agency businesses consist entirely of the former, some the latter—others combine the two according to the requirements of individual clients. Generally one of two methods is adopted by the advertiser in prosecuting his campaign: (1) The organisation of an advertisement department under the control of a man who combines a knowledge of advertising with a study of the exigencies of the advertiser's particular line of business, or (2) he places himself almost (in some cases *quite*) unreservedly in the hands of an agency. In the former case he makes such arrangements as will, in his opinion, ensure that his business will be properly and profitably conducted. His advertisement manager is generally a man with an extensive knowledge of the art of advertising. He has learnt from experience what to buy in the way of space, and the lowest rates at which it may be obtained. He designs copy, or has in his department experienced copy-writers, and, being on the spot, he has his fingers on the pulse of the business, and should be able to tell without loss of time when a publication or a particular advertisement fails to show a profit on the outlay. Almost invariably he employs an agency to act as space broker, to make the necessary arrangements with the publisher. By doing this he often saves time and money, the agency, acting for several advertisers, being frequently in a position to buy more cheaply; and, on the ground that service is not required in any other direction, the agency frequently comes to an arrangement with the advertiser concerning the commission received from the publisher.

Turning to the second method, the properly-equipped agency can and generally does render very important service to the advertiser, whether his outlay be large or small. It acts the part of an advertisement manager, and, in addition, brings to bear the experience gained by years of experimenting and observation made in the interests of numerous clients with diverse interests. The agency maps out the campaign, the publications to be used, advises as to buying space, and secures best positions possible. It writes the advertisement copy and booklets; executes illustrations, and makes the process blocks; designs posters and sees that they are properly displayed; organises where necessary a follow-up system; originates selling schemes; checks accounts to make sure that the advertiser has received the space ordered and charged for, etc.

In addition to the business of space broker and advertisement manager to the advertiser, the agency sometimes undertakes the duties of advertisement manager to a publication—that is, it takes over the whole of the advertising space in the journal. This is known as "farming," and the financial arrangement is either a commission paid to the agency on the advertising revenue it earns for the publisher, or the payment of a fixed sum by the agency for a fixed amount of space.

These, then, are the conditions under which the business of advertising is conducted. A knowledge of advertising may be acquired in anyone, and applied to anyone. The defined tracks are—service with the advertiser, with the publisher, or, with the advertising agency. For service with an advertiser a knowledge of the following subjects is required: the writing of advertisements (technically copy-writing); conditions governing the buying and using of space in the press, and outdoor publicity; the buying of advertising material such as colour printing and show-cards; the weight of paper, etc.

Copy-writing. The broad principles which must be followed, if advertising as a whole is to be successful, and a particular advertisement is to fulfil its purpose, may be stated as follows: an advertisement must (1) attract attention: (2) invite reading; (3) carry conviction.

Various devices are employed to arrest the eye of the reader. A distinctive border may be used with effect, but to rely on a border is to a certain extent a confession of weakness on the part of the text.

Pictorial blocks also find favour with many, but the picture which has no relation to the text is open to the same criticism as that applied to the distinctive border. If a block is used at all, the design should be an integral part of the advertisement as a whole. Such a block will serve a double purpose. It will arrest attention in the first instance, and will then fulfil the second requirement of a good advertisement by drawing the reader unconsciously to a perusal of the text. The same may be said of a pregnant and illuminative headline—a collection of words which gives, as it were, a slight mental shock to the reader, stimulates his curiosity, and makes him ask for more.

The Heading. To invite reading, as we have just seen, an advertisement must in the first place have a significant design or letter-press heading. After that, type-setting plays a very important part; excessive display should be avoided, and a generous allowance made for white space. Type of a smaller size set in an open manner will always present a more attractive appearance than type two or three sizes larger set so as to cover the whole space available. In order to sustain the interest of the reader the minor headings should, if possible, be made no less significant than the title itself. Up-to-date newspapers and magazines contain in their editorial columns excellent examples of the use of attractive cross-headings, which the advertiser who desires to give life to his advertisement will do well to study and imitate.

We now come to the most vital characteristic of a good advertisement. The announcement may be seen; it may be read; but if it fails to convince the reader of the merits of the commodity offered, and of the desirability of possessing it, all effort has been wasted. It is here that the art of the copy-writer comes into play. The qualities of good copy are so subtle that it would be hopeless to give any directions likely to help the aspirant. Suffice it to say that the best copy is clear without being wordy, terse without being obscure, eloquent without being extravagant.

1. EXAMPLE OF DUMMY ADVERTISEMENT

To write intelligently, an intimate knowledge of the article is required, its value from all points of view, what the buyer wants to know about it; and, equally important, what you want him to know. It should also be remembered that different subjects require different treatment; a motor-car cannot be advertised in the same way as a patent medicine. The public, too, vary in class and temperament, and a successful appeal to one class may prove a failure to another if the same point of view is taken.

The "Dummy" and its Uses. The copywriter is furnished with particulars of the subject of the announcement and of the space allotted. His first duty is to rule off on a sheet of paper a diagram exactly the dimensions of the proposed advertisement. This sheet, which should have a total area at least twice as large as that of the diagram, is known in printing offices as a "dummy." We shall assume that the copy-writer has drafted the text to his satisfaction, and that it now remains for him to adapt the text to the space before him. For the sake of simplicity we shall suppose that the advertisement will consist of letterpress only.

How to Make Headings Attractive. The main heading first claims attention. Sufficient space must be allowed to enable it to stand out clearly. White space should be left either on one side or on both. The heading which runs across the full measure of space allotted is seldom effective. The secondary headings, in which doubtless other important features of the advertisement find expression, should next be considered. The probable distance between each should be calculated and care be taken that no two of them come too closely together. Should this appear likely to happen there is nothing for it but to alter the intervening text. The positions of headings or display lines being thus more or less settled, these headings may be sketched in on the "dummy," and the subsidiary matter, or, to give it a simpler term, the "story" may now be dealt with. If the story be a long one, any attempt to write it in the space left between the headings on the "dummy" will only give trouble to the unfortunate printer and result in typographical errors. A much better plan is to have it written separately, marked off in sections A, B, C, etc., the spaces in the "dummy" which each section is to fill being marked correspondingly.

FIRST

IN EIGHTY YEARS.

This will be no ordinary sale, but one that will be exceptional—
not only in the bargains to be offered, but in the fact that it will
be the first sale since the firm was established eighty years ago.
We mean to make it one that will be long remembered, both for
the quality of the articles to be offered, and for the price at
which they will be sold.

2. ADVERTISEMENT SET UP FROM DUMMY

The illustration [1] shows a "dummy" advertisement ready to hand to the printers, and 2 shows the same advertisement in type. At this stage the advertisement is known as a "proof." For instructions in correcting proofs, see page 4193.

Use and Abuse of Bold Type. The last point which falls to be considered is the choice of types. As a rule, this is a matter which may generally be left to the printers, if the copy is to be set in an office which is known to employ expert display compositors. It is a great mistake to insist on the use of bold type throughout. Bold type is all very well for headings, and even then it should be used with discrimination and in different degrees of boldness, otherwise one heading will kill the other. In the body, bold type should never be used except for one or two lines at a time which require special emphasis. The eye soon tires of following more than a dozen lines emphasised in this manner. For different styles of type, see article beginning on page 5026.

Some Devices of Display. The advertisement shown in "dummy" and in type is of the most straightforward character. The object has been merely to show the student how to prepare a simple announcement for the printer, and to initiate him into the more simple devices of display. These devices, indeed, are multitudinous in number. The rules and borders commonly found in a printing office can be employed in almost an infinitesimal variety of combinations. The art of creating new and original devices is a matter of experience, and not difficult to acquire. This leads us naturally to discuss the question of pictorial advertising.

Pictorial Advertising. The term "pictorial advertising," for convenience sake, will be regarded in its widest sense, being taken to include all designs used in advertising which have been created by an artist and reproduced by an engraver. A picture or design which has been reproduced by an engraver for printing purposes is known as a "block." In regard to the value of blocks in advertisements there is some difference of opinion. Certain successful advertisers rarely or never use them. Others, again, depend almost wholly upon an appeal to the eye rather than to the intellect—much depends upon the subject.

Varieties of Blocks. A block may be a reproduction of the article or articles offered for sale; it may be symbolical of some idea which is the main-spring of the advertisement; or it may have no relation to the text, being introduced merely to arrest attention. The first case is simple. The block should represent the article accurately, and without exaggeration, and too much emphasis cannot be laid on this point. The symbolical design or picture affords great scope to the ingenuity and imagination of the advertiser. The design which has no relation to the text is the least satisfactory form of pictorial advertising. It may serve to arrest attention, it is true, but it is quite possible that the reader who has been induced to turn from the latest news of the day to the contemplation of a picture of a beautiful woman may experience some measure of disgust when he finds in the picture merely a device to bring before his notice some prosaic article.

Blocks in common use among advertisers are of two kinds—line blocks and half-tone blocks. For information concerning blocks and their making, see article beginning on page 6481. The advertisement student need not despair if he has no artistic talents—the actual drawing can be done by any artist. It is the *idea* in designs, as well as the text, that commands success.

daily and weekly newspapers (London and provincial), and periodicals (weekly, monthly, and yearly); some popular, some devoted to a comparatively select few, others to given objects. The selection depends entirely on the article to be advertised, and the amount of advertising appropriation. Generally speaking, if the article is a popular one, the daily and weekly press are likely to prove the most profitable. This is evidenced by the attitude adopted by most advertisers to-day. Of course, if the amount at the disposal of the advertiser permits, he can go very much further afield, his only care in any case being to ensure a profitable return for his money. Newspaper advertising differs considerably from that of magazines. In the case of the former, it should be remembered that there are fewer and larger pages, and that each page carries a number of advertisements. The advertiser has the choice of an ordinary or preferred position, the latter being next editorial matter, and costs anything from 10 per cent. to 50 per cent. extra, according to the newspaper. Great care should be exercised with the copy intended for ordinary positions, so as to secure a contrast with other advertisements. Very much, indeed, depends on the intelligence of the printer or advertisement office clerk, as the ordinary position advertiser is not allowed to dictate just exactly where his advertisement shall appear on the page. Several successful attempts have been made to print half-tone blocks in newspapers, but the result, at the moment at all events, is not to be entirely relied upon, and more satisfaction can be obtained from line blocks. If a half-tone is used, the screen should not be more than 60.

At the beginning of a campaign especially large spaces are desirable. To the advertiser with a large appropriation and a popular article, they are always profitable. At the same time there are thousands of advertisers doing a good and steady business by the use of small spaces: much depends on the article—much more on the copy. The arguments in favour of newspaper advertising are, shortly: the price per thousand is low; the returns are quick; it covers an extremely large field; it allows of topical advertising.

Magazine Advertising. With regard to magazines, the chief point to remember is that the paper and printing allow of considerable pictorial effect, and this should be taken advantage of to the full. An artistic and striking design should invariably be used, and, other conditions being equal, the result is good. Here, again, it must be remembered that the advertisements are placed together, mostly at the beginning, and some at the end of the book. The front and back covers are obviously good positions, and one or two preferred pages may be had. If the advertiser can afford it, a whole page should be used, and a right-hand one if possible. The arguments in favour of magazine advertising are briefly: it has a long life; it has generally a home circulation; it allows of artistic pictorial display.

Outdoor Publicity. In this branch of advertising the field is very wide indeed, and includes bill-posting, omnibus and tram advertising, railway advertising, boardmen (commonly known as sandwichmen), signboards, and metal plates, window displays, circularising, etc. It is not within the province of these articles to indicate whether any or

of advertising. As a matter of fact he rarely does. Here, again, much depends upon circumstances, and it is yet another instance of the fact that advertising is not "rule-of-three" work. Bill-posting holds the foremost place in outdoor publicity, and is here dealt with. It is unnecessary to go into details concerning the many other campaigns, as they are comparatively unimportant.

Bill-posting. Bill-posting is—and from the very nature of it probably always will be—a most difficult form of advertising to control, and for this reason it is apt to prove expensive. Posters, to be effective, require considerable skill, and no small outlay to produce—twenty thousand double-crown sheets (30 in. by 20 in.), in three colours, costing about £30 to print, in addition to which there is the designer's fee. The advertiser is at the mercy of the bill-posting men, and has, further, to take into account the vagaries of the climate, a bill often being put up one day and destroyed by rain and wind the next. Then, again, the employment of inspectors is generally necessary to ensure that the bills are in position. Much improvement has been noticed in recent years, however, as far as the human element is concerned.

Hoardings are owned by different firms of bill-posters in competition with each other. In London there are between fifty and sixty firms, but in the provincial towns the hoardings are held by one or two men only.

The charge to advertisers is based upon a fixed sum per week per double-crown sheet. This covers the cost of posting the bill (which, of course, is supplied by the advertiser) on the hoardings, and renewing it as often as necessitated by the weather. The rental varies from 1½d. per week down to ½d., and sometimes less. As the same price is generally paid wherever the location may be, it is obviously more profitable to the advertiser to pay greater attention to position than to price.

The most convenient size bills for posting in the United Kingdom are vertical 16-sheet and horizontal 8-sheet posters, the former being 10 ft. high by 6 ft. 8 in. wide, and the latter 5 ft. by 6 ft. 8 in.

Here, as in press advertising, the success or failure of a campaign depends very largely upon the design itself. Poster designing is a thing which an amateur should not attempt unless he combines art of a very high order with his knowledge of advertising. It should be remembered that very little in the way of argument is possible, the design must speak for itself; the passer-by has not always the opportunity, and rarely the inclination, for absorbing argument. What the poster wishes to convey must be conveyed at a glance or it fails in its object.

Posters are used generally to strengthen a press campaign, although instances occur where the advertiser relies solely on this form of publicity. A great advantage of the system is that advertising can be localised, a consideration to the advertiser who wishes to concentrate his attention to a particular district—a theatrical enterprise, for instance.

Much valuable information regarding billposting and other forms of advertising is contained in "Benson's Facts for Advertisers," published by S. H. Benson, Ltd. (10s. 6d. net.)

Mail Order Business. Mail or post order trading is practised very much more extensively in America than in Great Britain, for one reason because the large shopping centres are far more widely distributed, and but for the mail order advertisers dwellers in remote districts would have to go without many little luxuries that they now enjoy. The system has much to recommend it to everyone but the local provincial trader, who views with some alarm the growing custom of his neighbours to spend money, perhaps hundreds of miles away, that would otherwise find its way into his till. The remedy, of course, is for the local trader to take up mail order trading. [See page 5930.]

The careful student of the advertisement columns of the press will have observed that the popularity of this class of business is increasing. To the aspirant to honours in the advertising field, therefore, the question of mail order advertising is of considerable importance, for, of course, advertising is the basis of the whole business. The watchword of the mail order advertiser should be "now," and his copy must convey that impression to the reader. "He who hesitates is lost," and many an order or inquiry has been lost to the advertiser because of the hesitation of the reader. Goods must be despatched "now," and inquiries answered "now."

Mail Order Advertising. There are three distinct features in mail order advertising—the advertisement; the catalogue; and the follow-up system. The aim of the copy should be, of course, to sell a certain article, or obtain applications for a catalogue. If a comparatively small space is to be used, one article only should be advertised. Particular attention must be paid to the block, which should portray the article in an attractive and pleasing manner, but with absolute truth. The price should be moderate enough to be on the face of it a bargain. Bear in mind that the object of the mail order advertiser is to cultivate satisfied customers—the selling of one article is a small matter—it is subsequent sales to which you will look for business. Every parcel despatched will contain a general catalogue, and such useful literature as you have prepared for the purpose.

The catalogue is the big gun of the mail order trader. It must be well got up, though not necessarily expensive. The blocks must be good and attractive, the type clear, and the arguments conclusive, the whole leaving in the minds of the reader a desire to buy. Bear in mind that you have severe competition from retail traders all over the kingdom. Bluntly, your object is to deprive him of his local trade, to bring that trade to a centre—your establishment.

On the tradesman's window depends much of his trade. Your catalogue is your window. See that it is well dressed. You cannot expect a purchaser to desert his local man without good reasons. See that those reasons are logical and clearly defined.

Save your customer as much trouble as possible; enclose simple self-measuring forms, if necessary, and always an order form, which should require very little filling up; also printed addressed envelopes. In addition to the catalogue, a nicely got-up brochure should be prepared, the object of which will be to interest the applicant for catalogues in yourself, your business, your methods, etc., with illustrations of the premises, different departments, staffs at work, etc. This will create a valuable personal impression. If the public do not know you, they will know *of* you, and it all helps to instil confidence.

The Follow-up System. The follow-up system is brought into use (1) to coax an applicant for a catalogue into becoming a purchaser; (2) to sell further goods to a customer already on the books. The card index system is the only successful method for the purpose [see page 6520]. Below is printed a suggested card for the former purpose.

CARD No. 1.

Name: THOMAS SMITH.

Address: 3, Wentworth Street, Leeds.

No. 1.	No. 2.	No. 3.	No. 4.	Remarks.
	8/7	15/7	22/7	

○

The card shows to exactly what use it should be put. The details can, of course, be altered to suit individual trades, the one given being intended to illustrate the method. The card should be kept under forward dates, so that as each date comes along the second or third follow-up can be despatched. For instance, the catalogue is despatched on July 1st, the date is entered on a card which is put into a date file under date July 8th. The date file is examined every morning, and July 8th is reached automatically. Follow-up letter No. 2 is then despatched, the date marked on card, which is then put forward to, say, July 15th, and so on. At the end of your system you will have either secured an order, or given the applicant up as hopeless.

Follow-up Letters. There are divergent opinions as to the length, number, and character of follow-up letters; but there should be no two opinions as to how they are turned out. The letters are a personal matter between the advertiser and his correspondent, and should be written in a personal strain—as a *letter*, not a circular. To be effective, it is well to let the recipient think that your message is to him, and him only. With the up-to-date mechanical appliances now on the market, it is a simple matter to type in a name and address to match the body of the letter. Above all, the signature must be an autograph. A print, litho, or rubber stamp deceive few people nowadays. The employment of a few girls to autograph letters will well repay the outlay.

The object of the follow-up letter is to establish personal relations—to put you on calling terms, so to speak. The letters must be consistent and continuous as to contents, and with increasing insistence, but not to the point of causing annoyance. Letter No. 1 is sent to cover catalogue, draw attention to the comprehensive character of the book, and suggest that recipient will find what he requires within its pages. In letter No. 2 trust that catalogue was safely received; assume correspondent undecided as to making purchase, although full particulars given of articles similar to that described in original advertisement upon which application for catalogue was made; dilate a little on prices and quality, and hope to hear by return. In letter No. 3 express regret at not having heard; ask if there is any further information required; suggest as goods are seasonable lines will shortly be out of stock, and will not be replaced; that it is a good opportunity to test value given at the emporium, the cost of the particular goods being so small; the cold weather will shortly be setting in; has correspondent noticed the bargains in warm underclothing (or other topical allusion). In letter No. 4, after referring to correspondence, point out in strong sentences that goods are guaranteed to be as described, will be sent on approval—carriage paid; that you please thousands of customers weekly, and have no reason to think cannot please correspondent. Perhaps particular requirements are not listed; catalogue of other departments enclosed. Try another topical allusion.

The above are given to show the idea, and are probably more or less commonplace in themselves. The follow-up letter gives unlimited scope for the display of individuality, and on this quality depends the success of the attack.

Each successive transaction should be noted on card. These cards should be examined periodically to see if the customer has ceased to do business, and should this occur, as, of course, it must in time, a little follow-up series should be sent asking reasons, etc., and card should be taken from active file. This will avoid waste of postage, catalogues, etc., through sending to people who have removed.

CARD No. 2.

Name: THOMAS SMITH. *Folio*.....
Address: 3, Wentworth Street, Leeds.

16/9/07

Tracing Results from Advertising. This is technically known as "keying." A key is a special mark, appearing in the advertisement which, when answered, shows at once the medium which produced it, and it can be extended to show the particular copy used.

Presuming the name and address of the advertiser is W. A. Baxter, 14, Fenchurch Street, London, E.C., variations could be made as follows:

H. A. Baxter (a different initial for each paper), or—

W. A. Baxter, 14A Fenchurch Street (different letter to number), or—

W. A. Baxter, Dept. A., 14 Fenchurch Street (different department letter).

Different combinations can be used to distinguish particular copy. Every envelope containing an order or application for catalogues should be scrutinised for distinguishing signs, and a careful record kept in a book ruled as follows:

FOR CATALOGUE APPLICATIONS (left of book).

Date of	Space of	Copy used.	cost per application.	Subsequent value of sales at end of follow-up system.

DIRECT SALES (in right of book).

Total value.	Average cost per	Cost per £100 of sales.

A most reliable clerk should be placed in charge of the book, and the advertiser, or his advertising manager, should watch it closely. Directly a medium fails to produce profitable results, a strict inquiry should be made and, if necessary, the offending sheet cut off at once.

General Advertising. The advertiser who trades through the retailer invariably, at the beginning of his campaign, backs his advertising with a "selling" scheme in order to get his goods stocked. As a particular selling scheme is rarely used more than once, there is no object in dealing with the subject here. Such schemes can be thought out only after careful consideration of the conditions governing the particular trade in view, and the advertising man who can originate and carry through a good scheme is eagerly sought after, and commands a high remuneration.

At the beginning of a campaign the press advertising should be of an educational nature. A series of talks on the why and wherefore of the goods, written in good telling language, and set in plain, easily-read body type with little display besides the heading. The pictorial designs and fancy borders will follow after to serve as continual reminders. It should be remembered that designs consume much space, and only a little letterpress can be included—see that that little is good and to the point. It is impossible in the space at our command to give further specimens of advertisements, or examples of copy-writing. The student has the whole of the press before him to use as text-books, and a study should be made of the announcements put out by the many prominent advertisers of to-day. A habit of advertisement reading should be cultivated, and close study will soon indicate the line to be adopted.

To Obtain a Position. As in other walks of life, luck must enter somewhat into this matter. On leaving school, and especially if influence cannot be brought to bear, the young man is often obliged to take the first promising berth that is offered to him, but he can influence his destiny very much by continually being watchful for an opening elsewhere. If he has a gift for copy-writing little difficulty need be experienced. In these days copy-writers are in great demand, but the work must show signs of genius to earn appreciation. A good plan is to study as far as is possible from the outside the business of different advertisers, and to submit the advertisement personally. The common mistake should be avoided of putting a price on one's work until it has been accepted. In the case of a mail order proposition the advertisements should be offered on the "no cure no pay" principle—that is, if the advertisements fail to produce results they are not to be paid for. An offer of this kind will create confidence, and should the designs be successful more will be requested.

THE STAGE

Broadly speaking, actors resemble poets in that their gifts come direct from nature, and only to a limited extent is their art a thing of schools. There are many critics, of course, who object entirely to the word "art" being applied to acting, and it is no doubt true that any art which relies so much on the physical personality of the artist is not entitled to rank high; but, with this limitation, a good case may be made for the art of acting. We have here, however, no space for academic discussion, and must confine ourselves to a very brief and practical consideration of the qualities necessary for success on the stage and the means whereby these may be brought into use.

The Efforts to Teach Acting. Schools of acting innumerable have had their little day and ceased to be, from Macklin's school, whence came Foote and Dr. Aaron Hill—who also tried to found an "academy"—and Sheridan's more ambitious, but more visionary, "oratorical academy," to the different projects associated with the name of the late Sir Henry Irving. Doubtless, long before Macklin and Sheridan, enthusiasts set up dramatic schools, and long after the present generation has disappeared enthusiasts of the future will be wasting their time at the same futile business. For there is no gainsaying that the only good school of drama is the stage itself. It is true that on the Continent dramatic teaching has long obtained, but the best judges are agreed that the methods of the Théâtre Français applied in England would do more harm than good. It is all in the best interests of English acting that the notion that an actor can be taught should be consistently discouraged. There is, perhaps, no calling for which the impulse must be accompanied by natural aptitude to the same degree as that of the actor; and we would have the aspirant understand, in the most unmistakable manner, that, lacking this, no amount of hard work, no amount of intellect, will help him to success; and, equally, possessing it, success is most elusive and less to be reckoned upon here than in any other profession, while, once secured, it is more difficult to maintain.

It is true that in the case of women, good looks and a commanding figure may help in these degenerate days to secure success on the stage. We have in mind at the present moment a lady whose name is familiar among the eminent actresses of to-day, whose photograph is vastly popular with collectors, who is never out of an engagement, and, beyond looking handsome, and walking across the stage with some degree of gracefulness, she is utterly destitute of the slightest dramatic ability. There are others in like case, and the serious student will have these awful examples always to remind him or her that there is something rotten in the state of the stage!

Adult Acting and Child-play. The natural gifts that are essential to good acting have been in the possession of each one of us, but we have not all succeeded in retaining them. The dramatic instinct is born in every human being; a great deal of child-play is essentially acting, and excellent acting sometimes. But most people, as they leave their childhood behind, leave with it the land of make-believe, become self-conscious, and cannot *at will* subordinate their own personalities to those of imagined characters, which in childhood they had done almost as an act of faith. The actor has to be consciously unconscious, so to speak; he has *consciously* to imitate the gestures and attitudes which, in a child, are the result of no artistic effort; he has to be as "natural" as the child by means of consummate art; he has to *appear* to believe in fictions of the brain in which the child actually *believes*. This faculty, which is far more rare than people are apt to think, is somewhat vaguely defined as "dramatic instinct." It follows, therefore, that a technique of acting can only begin by assuming the presence of this faculty, and in its absence all is vain.

The Essentials of Good Acting. Assuming that the aspirant has dramatic instinct, which involves a natural feeling for the display of emotions, a ready sympathy for the distinguishing traits of character, and the power of expressing feelings with some dramatic conviction, there remains much that may be done by study, and something also by instruction, in order that the dramatic talent may be developed to the fullest extent. Lloyd, in his poem, "The Actor," very justly observes:

> "To this one standard make your just appeal,
> Here lies the golden secret: LEARN TO FEEL.
> Or fool, or monarch, happy or distrest,
> No actor pleases that is not *possessed.*"

But even so, the poet points out further on that feeling is not enough:

> "The player's province they but vainly try
> Who want these powers—Deportment, Voice,
> and Eye."

That is to say, having derived from nature the great and essential gift, one must turn to art for the means of applying that gift to the best advantage.

The Actor must "Feel" His Part. Perhaps feeling might be given forty points, and all the other qualities together, sixty; but feeling is precisely the quality in which the ruck of our actors are deficient. It alone can give intelligence and consistence to the reproduction of a character on the stage or the interpretation of a sequence of emotions. "I cannot simulate suffering without an honest sympathy with it," says Mrs. Bancroft. "I hold that without great nervous sensibility no one can act pathos; it is impossible to feel the sentiments one has to utter, and but half the author's meaning can be conveyed. It is a casket with the jewel absent. The voice in emotion must be prompted by the heart, and if it is 'out of tune, and harsh,' why, then indeed, the voice is 'like sweet bells jangled.' Art should help nature, but nature must help art." The celebrated actress puts the matter very clearly in these words, which indicate that a deep and abiding interest in one's fellow-creatures is an essential characteristic of the good actor.

Studying Others and Ourselves. "The proper study of mankind is man," and assuredly this is a maxim that must ever be in the mind of the actor. Not only must he study and sympathise with his fellow-men, but, as Lewes remarks in his classic on acting: "We are all spectators of ourselves; but it is the peculiarity of the artistic nature to indulge in such introspection even in moments of all but the most disturbing passion, and to draw thence materials for art." This is well illustrated in the confession of Talma, the great French actor, when he says: "I have suffered cruel losses, and have often been assailed by profound sorrows; but after the first moment, when grief vents itself in cries and tears, I have found myself involuntarily turning my gaze inwards, and found the actor was unconsciously studying the man, and catching nature in the act." It is thus that great acting becomes possible. A tailor's dummy or a dressmaker's model would be quite sufficient to study for many of the actors and actresses who cumber the English stage to-day.

Given great natural gifts of sensibility, a rich, passionate nature, strong sympathetic voice and expressive features, but above all an utter absence of self-consciousness, it is surprising how physical defects may be overcome. Many famous actors, such as Betterton, Garrick, and Macready, triumphed thus over physical inequalities; but a pleasing personality is also greatly to be desired, though beauty of feature is by no means essential, as it is notorious that most of the great actresses have been plain women: and in the strong light of the stage a plain woman often looks better than one who is naturally beautiful. This, however, touches the question of "make-up," at which we shall arrive in due course. Of first importance after the qualities we have already mentioned is the art of speaking. It is doubtful if there is a people, other than the Americans, who speak, on the whole, more [illegible] do. [illegible] stage is immeasurably behind the French stage, and this is one of the elements of the actor's art that can be taught.

Elocution or Effective Speech. Some there are to whom a clear and effective manner of speech, with a good range of voice, which almost unconsciously they can pitch to suit the hall or theatre they are speaking in, has come as a direct gift of nature. But they represent a very small minority, and it may be taken that most aspirants to the stage or platform, however good their natural speaking voice may be, would be the better for a thorough course in elocution or voice production. Into the matter of elocution the personal equation enters so largely that it is not possible to lay down any hard and fast rule which would be of equal service to all beginners. That might be done, and has, indeed, been done, with some measure of success in a long treatise, but nothing can quite take the place of a course of study with a master, who is watching every characteristic of the student, correcting his faults and leading him gradually to the full exercise of such powers as he possesses. Provided the student is already endowed with the histrionic qualities enumerated above, a course of voice-production might with advantage take the place of the ordinary lessons in elocution, as there is a tendency in the latter to leave the student with some mannerisms acquired from the master, and this, unless it is strenuously resisted, may be disastrous.

While we are all for the "natural" in acting, it is imperative to remember that natural acting is not the mere reproduction of everyday speech and gesture. Heaven forbid! Shakespeare's plays hold the mirror up to Nature in a way that is at once the admiration and despair of all modern dramatists; yet his characters, throbbing with human passions, are made to declaim their emotions in blank verse such as no human being ever spoke in actual life. Here is the poet's art; he enthralls us with the beauty of his diction and the reality of his creations. So should the actor aim at perfection in his speech, which, carefully studied and polished, will bear no absolute resemblance to the ordinary speech of daily life, but will yet, by its charm and natural delivery, produce in the audience the agreeable feeling that it is "true to life."

Importance of Emphasis and Pause. After having understood his author—which is, of course, the first duty of the actor—he must next make clear his author's meaning, for, as Tennyson says, "Words half reveal and half conceal the soul within." A word may be made to convey just as much or as little as the speaker determines; hence the need for him to know precisely what he wishes it to convey. Thought must precede and regulate the utterance. "Emphasis and pause," says Lewes, "are, indeed, the supreme difficulties of elocution. They are rarely managed by those who read blank verse, even in a room, and on the stage the difficulty is greatly enhanced. Nevertheless, no one can pretend to be an actor of the poetic drama who has not mastered this art, although in the present day it is like many requisites, badly disregarded, and we hear the noblest verses spouted (not spoken) with the remorseless indifference of the actor who announced himself thus: ''Tis I, my lord, the early village cock!'" Colley Cibber also observes justly that "the voice of a singer is not more strictly ty'd to time and tune than that of an actor in theatrical elocution."

Canon Fleming, in his excellent treatise on "The Art of Reading and Speaking," illustrates very effectively the importance of proper emphasis thus: "On the right management of emphasis depends the very spirit and life of good speaking. If no due emphasis is placed on any words, not only is our speaking heavy and lifeless, but there is no intelligent meaning thrown into what we speak or read. Let us take a simple question: 'Do you ride to town to-day?' These six words are capable of no fewer than four different meanings. If pronounced thus, 'Do *you* ride to town to-day?' the answer may be, 'No; I intend to send a messenger in my stead.' If thus: 'Do you *ride* to town to-day?' the answer may be, 'No; I intend to walk.' 'Do you ride to *town* to-day?' 'No; I intend to ride into the country.' 'Do you ride to town *to-day?*' 'No; but I shall do so to-morrow.' Thus the whole force of an expression may depend on a word, and we may give our hearers quite different views of the same sentence by placing the emphasis differently."

It may be thought that these niceties of detail are scarcely necessary where one has mastered the sense of the words to be spoken, but that is as great a mistake in acting as depending upon "the inspiration of the moment," which Lewes very happily likens to trusting to a shipwreck for one's first lesson in swimming. Perhaps the crowning difficulty of elocution, which nothing but constant practice will overcome, is the need to be slow while not seeming slow, "to speak the phrases with such distinctness, and such management of the breath, that each shall tell yet due proportion be maintained," as hurry destroys all effect, and is the hallmark of the incompetent actor. Even Garrick in his early days had not attained proficiency here, and, having failed to study his breathing, came near to spoiling his greatest scene on his first appearance. On the whole, we urge the aspirant to stage honours to make a most careful study of voice-production.

Gesture on the Stage. Following the mastery of the art of speaking, and intimately associated therewith, is the consideration of gesture. Here, again, our national characteristics have to be overcome, as there is so little natural grace in the gestures of English people that on the stage actors are apt either to be deficient in gesture or to overdo it. Hamlet's address to the players is the supreme classic of advice on the subject, and there it will be remembered the actor is advised to "suit the action to the word," but equally "the word to the action." He is also warned against excessive gesticulation in these words: "With this especial observance, that you o'erstep not the modesty of nature; for anything so overdone is from the purpose of playing." A visit to almost any London theatre to-day will show that, impeccable though Shakespeare's advice undoubtedly is, surprisingly few have profited by it. The annals of the stage from Betterton to the present day are full of stories illustrating the errors of even great actors in the important art of gesture. When one reads, for instance, of the extravagances of Quin, it is difficult to understand how he came by his reputation.

Even Garrick never quite conquered the art of "repose on the stage," and Macready only achieved it by the most rigorous training, such as reciting violent scenes from Shakespeare's tragedies with his arms bandaged, so that his tendency to overgesticulate might thus be overcome. "The easier an actor makes his art appear, the greater must have been the pains it cost him." Let all aspirants bear these words of Macready in mind. We have seen many books illustrated with numerous diagrams purporting to teach the whole art of gesture, but we cannot recommend any, and, except certain rules for walking upon the stage, which may be imparted to the student or acquired by him from observing graceful actors, there is nothing that can be set down in writing beyond the words of Shakespeare: "Let your own discretion be tutor," and "do not saw the air too much with your hand." Of course, all exercises of the limbs, such as calisthenics and dancing, should be undertaken by the would-be actor, as they tend to impart grace and suppleness of the body, and if there is an intelligent mind controlling that body, the result cannot help being satisfactory.

Costume and "Make-up." We come now to the question of making-up, but can only touch upon this in the briefest possible way, as nothing but experience gleaned from "old stage hands" will help in the details. It is an art in which the modern stage is vastly in advance of the days of Garrick or Macready. Actors of our generation have largely thrown off the traditions that used to rule in the matter of costume and make-up. For generations Shylock was played in a red wig. Edmund Kean was the first to break this tradition, which originated from the belief that Judas was a fair Jew. Macready was probably the last to observe the old custom of wearing a plume of feathers, long thought to be indispensable to the leading figure in a tragedy. The red wig still lingers in the make-up of the country bumpkin, but, broadly speaking, the stage is now rid of all stupid conventions in the matter of costume, education and travel having made such inappropriate dresses as Garrick wore in Shakespearean parts and foreign characters quite impossible. Thus, in the matter of costume no advice beyond the dictates of common sense and historical accuracy is required; but in the make-up of the face there are still many actresses, though chiefly those of no importance, who require to be reminded of these words written by the late Lady Martin (Helen Faucit) many years ago: "When the skin is covered with what is in fact a painted mask, the colour, which, under strong emotions would come and go, is hidden under it, and the natural expression of the countenance destroyed."

Prospects of Success. Having every qualification for success on the stage, the aspirant may still find himself faced with nothing but failure. As already hinted, it is not always genuine ability that leads to success, but we have not the space here to deal with the varied causes which make the life of the player a greater lottery, and, on the whole, a source of less satisfaction than that of any other professional. The theatrical world swarms with undesirables, with harpies, and with sharpers; and the path of the aspirant is, in consequence, full of pitfalls. The real tragedies of the stage-door are often as poignant as, and infinitely more numerous than, the mimic tragedies of the stage. We can, therefore, only advise aspirants to act with the greatest possible caution in any dealings with "theatrical agents," and to endeavour rather to get into touch with the managers of provincial companies.

The Best Fields for Aspirants. Time was when the avenue to success was clear and unobstructed to all who had the talent. That was in the old days of the stock companies, when in all the large towns theatrical managers employed permanent companies of actors who could support any "star" from London in whatever repertory he or she chose to give the local playgoers. These stock companies, and the old "circuits," were the training ground of the Victorian stage, and produced many of our most famous actors, not a few of the "older hands" of the present day having graduated from them. But, unhappily, the modern system of flooding the provinces with "touring companies," that merely give imitations of London successes, has ruined this most excellent training ground for the stage. An actor of very limited ability can pass muster for a few years, and possibly have an enjoyable life meanwhile, as an intelligent parrot, repeating to provincial audiences imitations of London acting: but this is not training nor experience worth having for the serious aspirant, and in the end it is a very poor life indeed. There are a few repertory companies, such as Mr. F. R. Benson's and Mr. Ben Greet's most excellent Shakespearean and "old comedy" companies, that provide the young actor with a good substitute for the stock companies; and proof of the value of such companies, which tour the provinces with considerable repertories, changing their bill almost every night during a fortnight, is seen in the fact that many of the leading actors on the London stage to-day have been trained in these repertory companies. It is to companies of this kind, where, instead of playing the same piece for three years on end, the young actor will have constant and refreshing change of parts, that the aspirant should direct his attention. Needless to say, the amateur dramatic society is a most useful first step in the direction of a stage career, and enables a person of sense and sensibility to ascertain whether or not he has any aptitude for the art.

We cannot but confess that, if asked to advise anyone on the adoption of a stage career, the person of discretion with knowledge of the theatrical life is bound to say that if one can find profitable occupation in any other branch of work, one would do well to leave the stage severely alone, and to young women this applies with especial emphasis.

Playwriting. Here we can only touch very briefly on the subject of playwriting, as it is not at all probable that any student of the SELF-EDUCATOR will look to it for assistance in the writing of a play. Although we have many examples to the contrary, there is little doubt that a practical knowledge of the stage is of great importance to the dramatist. Mr. Pinero, Mr. Jerome, Mr. Brandon Thomas, and many other successful dramatists, have begun their careers as actors. It is worth while remembering also that many of the Elizabethan dramatists, including Shakespeare himself, were actors also. The ability that makes of a man a successful novelist might be of very little value to the making of a playwright: but the income that can be earned by a popular dramatist is so great that there are few novelists of note who have not made a bid for stage success, and not one in a score has succeeded. If one has the ambition to write stage plays, it would, therefore, be well to secure some practical knowledge of the stage in any sort of company as a preliminary step. But so far as the actual writing is concerned, we fear that only a laborious study of published plays—classic and modern—will help to a mastery of technique, and after that there is a pressing need of some original inspiration. Given the latter, one might succeed even with bad technique, but without it the best technique in the world could not prevent failure!

THE BUSINESS SIDE OF AMUSEMENT

By Algernon Rose

The degree of enjoyment is governed by the capacity to appreciate. Thus, the habitual theatre or concert-goer in a city becomes more and more critical. He is not content unless the performance possesses artistic excellence. In small provincial towns people are less fastidious, and audiences welcome less accomplished performers. Great talent, as long as it draws, may, in a big town, demand its own terms; but mediocre ability must take what it can get.

Acrobats. The term acrobat applies chiefly to equilibrists, contortionists, and trapezists. Since 1894, the law in England has prohibited the training of children as acrobats before the age of sixteen, except by their own father. Trainers, in consequence, have removed chiefly to Brussels and Antwerp. There, children of tender years are put through many cruel exercises in order to give abnormal flexibility to their bones and muscles. Acrobatic talent often runs in families. The members will practise perseveringly together and work at certain tricks for many years before exhibiting in public. This has been the case with the famous Craggs—the father, who was self-trained, teaching his five sons and one daughter many extraordinary feats.

There is as much difference between an ordinary tight-rope dancer and such finished performers as the Craggs as there is between a "pianist" who "vamps" an accompaniment and Paderewski. While the remuneration in one case may be 5s., in the other £50 a night may not suffice. In this class of entertainment, certain names stand out above all others, even as those of a few musicians appear as Tritons amongst thousands of struggling minnows. There were possibly many acrobats able to balance themselves as well as Blondin. He was recognised—they were not. In like manner Leotard could ascend and descend an immense spiral, balancing himself on a large ball. He obtained a vogue, and a consequent bigness of salary which others failed to get. Amongst many clever jugglers with inanimate objects we find the personality of Cinquevalli eclipsing that of his rivals, and his dexterity in accomplishing the apparently impossible exciting the interest of vast multitudes.

Trapeze Work. When we come to trapeze work, the names of the Leamys are remembered everywhere. Although the safeguard of the net has made such performances less dangerous than they were, emulation has increased proficiency. The best trapeze work of to-day excels that of twenty years ago. Trick bicycle riding, balancing on the back in Japanese fashion, equestrian feats, and strong-man business, if remunerative, depend not alone on perseverance, daring, and ability to do what is undertaken, but on the gift possessed by the performer, or leader of the troop, to convince those who give engagements that the entertainment offered will attract powerfully and more than justify the terms demanded. The "management" of a hall have an unsympathetic way of regarding art. They estimate the precise amount in cash that each turn will "draw." This applies equally to the greatest concert performers. From a business point of view, Caruso or Melba are "good for" so much. It is a mathematical problem. Reckoning 21 in. as the space each person in the house will occupy, if a certain star will "draw" a specified number of people, and the auditorium "holds" a given sum, the fee to leave a tangible profit cannot exceed a certain limit unless a larger building is taken and a greater risk incurred.

Advertising. It is well known, in dealing with the commercial side of amusements, that the cleverest artist frequently possesses least aptitude in financial negotiations. If he gets big terms he is indebted for them to the ability of his agent. Where, however, as in the case of Sarah Bernhardt or Adelina Patti, artistic and commercial talent are almost equal, the way in which the former is aided by clever réclame considerably enhances in public estimation the status of the individual. The study of the public performer who receives big fees is how constantly to attract the notice of those who pay willingly high prices for admission. Such is the contrariness of human nature, that it is a truism to say, "Once convince the public that they cannot get into an entertainment, and they will clamour for admission." But it should not be forgotten that if inadequate ability is "boomed" unduly, it frequently means disaster to the artist.

To turn to early engagements, the young professional, if without other means, must contrive to live by fees received from pupils. Without experience as a teacher, he cannot at first demand his own terms. Yet, the axiom, "do as you would be done by," should be remembered. It is not chivalrous to declare that a neighbour's system of teaching is wrong and to offer instruction at half-price. When there are other children not being taught, it is despicable to "poach on the preserves" of a fellow professor by underselling him. In past years professional jealousy has done much mischief to the interests of musicians as a body. To counteract such tendencies, the Incorporated Society of Musicians was formed, membership being confined to properly qualified candidates. In many ways, the society is most helpful to those embarking on a career. The young professional, therefore, cannot do better than seek election as a member. It will bring him in touch with the right people, and differentiate him from certain bogus teachers who advertise lessons at 2s. 6d. a course, or 3d. each. They are dear even at that sum.

To make a beginning, it is advisable to have a neat circular printed and sent to the most likely addresses given in the local directory. More effective than printed matter is, however, personal recommendation. In return for assistance given at charitable performances, the clergyman, organist, or other officer of the place of worship attended by the young musician, can often assist him materially. In order to get one's name into the programme and become known, there need be no scruple in offering to assist at a bonâ-fide charitable entertainment. At a time of life when the enthusiast is most impetuous it may be difficult to wait in hope of engagements to come; yet it is waste of energy to badger acquaintances in a tactless way.

Getting Known. The young professional should be contented with a little at first and devote his energies to practice and composition rather than spoil a favourable impression he may have made by declaiming against those who happen to be more fortunate than himself. If, presently, he obtains two pupils a day at 2s. 6d. an hour they will bring him in 30s. a week. This is more than many a young physician, after a far costlier training, earns in the first or second year of his professional life. The physician may not advertise any more than a member of the Stock Exchange; but the musician has no such restriction. Nevertheless, he must be careful not to indulge in any advertising which looks vulgar. If he desires, ultimately, to win the favour of cultured people, he must strive to keep up the dignity of his profession in all that he does.

The biographies of most of the great virtuosi show that before becoming famous they had to go through the drudgery of teaching unmusical pupils, however galling it may have been to them. As a rule, the life of the great executive artist begins with teaching reluctantly. But it ends with imparting experience whole-heartedly to pupils of his own choice. Keen on getting recognition, the talented young singer or player endeavours to procure a minor engagement in a company making a provincial tour. This may be fixed during the summer vacation, when the company may visit various seaside resorts. As his pupils are then taking holiday, permanent teaching will not be lost.

Touring. As with theatrical touring, a concert tournée requires good health on the part of every member of the company. If the tour is to pay, to get from one town to another in a given time may necessitate frequent night-travelling. Sometimes, on arrival at a destination, it may be necessary to proceed immediately to the concert-room without a meal. If the rough is taken cheerfully with the smooth, and the manager of the tour is honest, when it is ended unpleasantnesses will be forgotten and the change remembered happily.

During a tour the young musician should collect carefully any favourable allusions to his performance in the local papers. Printed subsequently as "Opinions of the Press," such testimony will carry more weight than the most conscientious self-praise, or even certificates won at a music school. Possessed of a number of newspaper notices, his plan—if he is a solo singer or instrumentalist—is to send his circular to the secretaries of various societies, in the provinces or London suburbs, mentioned in the Musical Directory (Carte, Berners Street, W.), in which he should be careful also to have his name entered. Personal appearance being of equal importance on the concert platform as on the theatrical stage, it is customary to have a photograph printed on the front of the circular. These may be taken also to the music shops or music publishing houses, the latter being requested to send professional copies—if the musician is a singer—of any songs they wish made known. It is the experience of publishers that, if a new song is encored at a concert, its sale is increased. For that reason the services of a good singer are recognised by the payment of a small fee for each public rendering. The singer forwards copy of the programme as a voucher.

Paying for Appearances. The pressure of young artists to obtain a hearing in a limited number of influential concerts is nowadays excessive. Ambitious performers, possessing private means or well-to-do friends, have become, therefore, easy victims of unscrupulous concert agents. By this it is not inferred that all agents are dishonest. Those of reputation, who act on behalf of established favourites, seldom concern themselves with artists seeking recognition. But a new and less scrupulous "Concert-Direction," on being established, will often send circulars to young musicians requesting a visit. A critical hearing is given, as well as sympathetic advice. It is pointed out that to hide such light under a bushel is wrong. To achieve success a concert must be given, to which the musical critics will be specially invited. The agent undertakes to hire the hall, engage attendants and artists to assist, to print tickets, programmes, and see to the advertising. An estimate is given. If beyond the means of the aspirant or his friends, the sum is reduced. A substantial deposit being paid in advance, the concert takes place.

As space is valuable in the daily papers, the critics do not attend. Minor journals may insert paragraphs supplied by the agent, or even detailed comments. These are of little worth. According to the gullibility of the victim, so is the length of the bill. The artists who have assisted, and whose fees are specified in a lump sum, may, individually, have paid for the privilege of appearing. Yet, in a business sense, the agent may have acted honestly in regard to the items for the hall, printing, and advertisements In any case, the money is lost so far as the artist himself is concerned. Whether at bogus or bonâ-fide concerts, the system of paying for appearances is wrong. Conspicuous talent, providing that it exists, cannot for ever remain unrecognised.

The Theatre. Successful theatrical speculation involves considerable capital. The actor-manager, who takes the financial responsibility upon himself, has an exceedingly anxious time. Not only have suitable premises to be leased and staffed by a small army of workers, but if the piece put on is a new one and musical, unless the manager has a will of his own, what with the interests of the librettist, lyric writers, composer, singers, and actors to consider, little progress will be made. When we hear of one artist receiving £100 a week, another £70, and another £60, it may surprise the amateur to be told that, on the authority of a London magistrate, well acquainted with the subject, an actor's average is not more than 35s. a week. What many members of the profession, therefore, desire are "smaller salaries and larger incomes." It is, of course, better to receive 35s. a week regularly than to play in a piece at £30 a week which runs less than a month, the cost of dresses being deducted from salary, and, after rehearsing gratuitously for six weeks, "resting" the other ten months in the year. For rehearsals there is no pay. These sometimes go on for months. In a few London theatres salaries are now paid during the last fortnight.

Opera Companies. One opera company advertises that chorister-pay per week is for tenors, £2 7s. 6d.; baritones and basses, £2 5s.; sopranos and contraltos, £2; extra salaries being given for small parts played by the chorus.

To many aspirants such terms may appear attractive. It by no means follows that the amounts advertised will be received. When a personal trial is given, the manager may consider the quality of voice, or ability to act, falls short of his standard. In certain choruses, instead of receiving salaries, novices have to pay for appearing in minor parts to get experience. In a West End theatre a stage manager (not actor-manager) may get £10 a week for much hard work, having to be in the theatre from early morning till late at night. The stage-carpenter will probably receive £3 a week. This he supplements by perquisites; otherwise there might be no limelight to spare for the lesser stars. In certain theatres the conductor of the orchestra receives £12 a week. Daly's band alone costs over £200 a week. Some of the players in this band possess violins valued at more than £50 apiece. A West End box-office keeper receives £6 a week, and his assistant £3. Programme-sellers and cloak-room attendants get 3s. a night, and the supers 1s. 6d. In the provinces half West-End prices are paid. The aspirant who has taken part in amateur theatricals and become stage-smitten finds the glamour dissolve when coming to the practical side of theatrical life.

The Dramatic Agent. Engagements are solicited through the dramatic agent. His office in London is either in the Waterloo Bridge Road, a turning out of the Strand, or in the purlieus of Shaftesbury Avenue. The hours are from 11 a.m. to 4 p.m. Contingents of unemployed, sometimes in poorest attire, wait their turn to hear if engagements can be found for them. On a name being entered, a small fee is paid. If an engagement results, 10 per cent. or more is charged on the first year's salary. Without interest, the chance of getting into a good touring company is nil. All that can be hoped for is that the tour will be genuine. There are few actors who have not experienced being stranded a long distance from home in their early days when a tour has collapsed. If the company is bonâ-fide, an engagement, including travelling, seldom yields more than 30s. a week. Out of this, board and lodging have to be paid and sometimes dresses provided. In case of illness no margin remains. There may be a fatiguing journey in the morning, a rehearsal in a strange place all the afternoon, prior to the performance the same night. After that it may be necessary to search for lodgings, unless these have been secured in advance. Add to these troubles the rivalries and jealousies of stage life, and it is a marvel that "mumming" should continue to attract so many victims.

Pantomime. The manager relies chiefly nowadays on scenic and spectacular effects. Large sums of money are lavished on the mise-en-scène, often at the expense of the salaries of the majority of the company, just as, in grand opera, the chorus may be starved in order to provide big fees for a few stars. After long gratuitous rehearsals, ladies of the ballet receive 25s. a week. But their dancing is not comparable with the highly-trained terpsichorean skill of the prima ballerina, whose salary will be £30 or £40 a week. The principal boy may receive £10 a week. The first clown will probably get £20 a week, the harlequin and pantaloon receiving £5 each, whilst an ordinary knockabout has 30s. The harlequinade, which used to be the chief pantomime attraction, is now relegated to the end. In the days of Joseph Grimaldi, his genius brought the clown into great prominence. Since his time there have been no men of similar ability in his line, and the clown no longer draws in the same way.

Music Halls. A comic singer, doing three or four halls a night will receive, according to his ability, from £10 to £40 a week. From this he has to deduct the hire of a conveyance from one theatre to another. Only exceptionally gifted artists command their own prices. Dan Leno, working four halls a night, made over £200 a week, but the excitement killed him. A well-known serpentine dancer in ever-changing colours received £20 a week. A troupe of good acrobats may get £50 a week, whilst débutants who have not yet made a name, may only receive £7 between a troupe of seven. A wrestler will get about £20 a week, as well as a purse, if successful. Unknown performers are paid nominal sums on short contracts, and are put either at the beginning or end of a programme. Should the "turn" score a success, they are then at liberty to demand higher fees and receive longer agreements. As long as they are capable of drawing the amount asked, the management is not likely to let them go elsewhere. After some years of minor engagements, a husband and wife, making a prodigious "hit" in so-called "thought transference," are receiving £500 a week because they draw more than that sum.

Circuses. Whether in town or country, the chief care of the circus manager is his stud of horses. These are often of great value. An intelligent performing horse may be insured for £1,000 or more. Besides these, the manager has always a plentiful supply of daring riders. As there is an excess of young men desirous of breaking their necks in public, the fees paid are not high. The English horseman, being superior to most foreigners, it is often possible to get more lucrative engagements on the Continent than in this country. Here the riding-master may get £5 a week; principal equestrienne, £20 a week, and the principal horseman, £30.

Conjurers. West End ticket agencies or libraries do considerable business during the season in supplying all sorts of artistic talent for bazaars, juvenile parties, or social functions. As a rule the agent deducts 10 per cent. as his commission from the fees paid. Sometimes an agent will make an exclusive arrangement for the services of an artist who cannot himself obtain engagements. A clever conjurer known to the writer found it to his advantage to make such a contract with a firm in Regent Street. A brougham was in waiting for him every evening. During the fashionable season he was driven off to different aristocratic houses. There he gave a two hours' entertainment of sleight of hand, ventriloquism, and so forth. After having supper, he was driven home. For this he received

£6 a week. Beyond drawing up his programmes, he had no correspondence to attend to.

In this case, when charging a fee of ten guineas for a performance which cost only £1, the agent often made a big profit. Nevertheless, the entertainer was contented with his bargain. He had no expensive premises to maintain, and although skilled in his peculiar way, had no ability to make negotiations direct. So far as he was concerned, as long as he was in good health and able to entertain, he had a sure income of over £300 a year. If his agents occasionally made a large sum, it was their speculation and not his. But between the conjurer of average ability, who may get £1 a night, and a phenomenal prestidigitator like the late Mr. Bertram, whose fee for a single appearance sometimes exceeded £20, there are many intermediate stages of skill.

Dance Music. The fee paid to an agent for a lady pianist for four hours is usually 9s. 6d., with 2s. per hour afterwards and travelling expenses. In other words, she may get a fee of 7s. 6d. plus 1s. 6d. extra for every hour, and her rail or 'bus fare. A man pianist, for the same work, is charged by the agent £1 1s. and cab fare. This probably means for him 15s. for the night. A trio, consisting of violin, cornet, and piano, is usually charged £3 3s. for the night. Quadrille bands cost £1 1s. for each performer.

Concert Promotion. Whether the event be a concert, lecture, dance, or other entertainment, the cost of organisation is first governed by the necessary payments for hiring the hall and adjoining rooms. In municipal buildings, the hall-keeper has a graduated list of charges. For a public meeting of ratepayers, the hall is free. Special reductions are made if the entertainment is in aid of a local charity. On the other hand, for a gathering not coming under these headings, full prices are charged. The cost may vary from £1 1s. for the use of a small room during the afternoon, to £10 10s. or more for the large hall arranged for a concert. Proprietary concert halls have their own scale of fees. The highest charges are usually for an all-night ball. This necessitates the hall being cleared beforehand, and the floor specially prepared. Two guineas may cover cost of printing tickets and programmes for a dance. If light refreshments, or a sit-down supper, are included, the catering is estimated at so much per head. When fixing the price of tickets, the cost of the band must also be considered. Refreshments should be provided for the latter. In other entertainments, the fees of the artists constitute the main items to be defrayed.

Concert promoters should remember that all performers should be given their fees before they leave. The money should be enclosed in an envelope and handed over by the treasurer or secretary, a voucher being signed as receipt. Where several performers receive different fees, enclosing the latter saves unnecessary jealousy. Prompt payment also, after a professional performer has done his best, is more satisfactory than to be told that his "cheque will be sent on."

Lectures. Lectures, either grave or gay, by celebrities well known in the literary world can be arranged through various lecture agencies. The fees paid range from £1 1s. to £10 10s., and expenses. If the lecture is illustrated, and an oil lantern is required, it will cost £1 1s. extra. With limelight, the fee is £1 11s. 6d. A pianist may also be required. Where cinematograph exhibitions are given, the apparatus and attendants will probably run into £5 exclusive of travelling expenses.

OFFICIALS IN SPORTS AND PASTIMES

By Ernest A. Bryant

Cricket and football are essentially the sports of the masses. The development of the attractions of football is one of the most striking features of latter-day outdoor life.

The Professional Footballer. Some thousands of men of varying skill make a livelihood from football, but if a man means to be a professional footballer, he must make up his mind to devote the whole of his time to the game.

Under the rules of the Football Association, the maximum wage to be paid to players is £208 per year. The actual period over which play extends is only thirty-five weeks in each year. Football in public begins on the first day in September, and ends on the last day of April. For seventeen weeks in each year the player has his time to himself, except that in the early days of August he is expected to be within reach of his club to begin training for the first match of the season. Until a few years ago this limit in the wage-earning power of the player did not exist. Men were paid as much as £500 a year in actual wages, to say nothing of the gratuities given for the winning or drawing of matches. It proved in practice that the clubs could not maintain the pace which they had set. Football finance had become one huge gamble. At the end of one season clubs, hoping for success in the following season with the big "gates" which this would mean, bid high for players, and found, too late, that they could not support the liability to which they were committed.

In addition to the £208 per year which a man may receive in wages, he is entitled also to a benefit match after he has served his club for five seasons. This may amount to anything from £100 to £1,000, and so considerably increase the average of his earnings. Only one other payment is permitted: the player on signing an agreement to serve a club is entitled to a gratuity of £10.

The Start. To a man of sound physique, good health, and average agility, the way into a football team of repute is not difficult. Nothing, in fact, is easier, provided he have the qualifications, for football, like cricket, is one of the spheres in which the demand for first-class men always exceeds the supply. A player takes to the game, because he likes it, while a boy. Generally he begins as a forward. If he has not speed enough for that position, or finds that it is more to his taste to spoil the game of another player than to take the initiative in attack himself, then his place is at half-back. Centre half-back is the position at which a man should aim. In that place he must be equally ready with either foot, and this gives him such command of the ball and players that he can take either wing at a moment's notice. He has to accustom himself to placing the ball with accuracy to his forwards, to take a shot at goal himself, or to drop back to the assistance of the men in his rear. He is the pivot of the whole team. The man with a particularly good kick will adapt himself to the full-back position. He must be alert and courageous, and as little prone to nervousness as possible.

From a junior club the player will go to one of better calibre, and soon find, if he has any real aptitude for the game, that openings in still stronger sides are available. Many men have made their entry into First League football while still in their teens, and represented their country in international matches before their twentieth year has been reached. The trainer of a football team is generally an old player. He looks after the physical training of the men during the week, travels to and from their matches with them, and, in a rough-and-ready way, acts as first-aid in the case of an accident on the field. For a really educated trainer, with a sound knowledge of anatomy, dieting, and rational exercise, there should be a good opening. Many trainers of teams are retired professional pedestrians, whose system of training is wholly wrong when applied to footballers, whose need is speed with endurance. A good trainer can command from £2 to £4 a week. The secretary of the club is generally team-manager. Recently it has become the custom to appoint old players of good reputation to this office, with a clerical assistant to keep the books. The secretaryship of a good club is worth £5 per week. At the end of his playing career—which may extend over ten to fifteen years, the footballer may hope for an appointment as a linesman. For this he receives half a guinea a match in addition to travelling expenses. This appointment, if satisfactorily discharged, leads to his engagement as referee, in which he is paid a guinea a match, sometimes two, as well as train fare and hotel expenses.

Cricket. It is less easy to succeed in cricket than in football, for the reason that there are fewer first-class teams. Good men are always wanted, but they cannot produce the necessary ability. There is a vast difference between high-class club cricket and the cricket which even a moderate county side plays. A man who scores hundreds regularly for his local club, or takes half a dozen wickets for next to no runs every Saturday afternoon, may be a hopeless failure on appearing for his county. Men like Hutchings of Kent, and Rhodes of Yorkshire are few and far between. They stepped full-fledged experts into county cricket. With the average man the process is long and arduous. Experience proves that only one man in a hundred can bowl as well as bat. Therefore it is as well, perhaps, that the aspiring player should develop that game for which he has a natural inclination. If he bowls naturally, he had better bowl; if batting be his forte, let him practise batting. But there is this reservation: no man should cultivate one phase of cricket to the entire exclusion of others. The good batsman must learn to bowl sufficiently well to take his turn as a change bowler. Hundreds of matches have been won by the man who goes on to bowl a new style of ball when all the regular bowlers are weary and unable to dislodge a "stonewalling" batsman. Hayward, A. O. Jones, Quaife, the late J. T. Brown, and many other examples will come to mind.

No man should presume to send in his record to his county club until he has made himself a master of fielding. He should model his work in the field upon John Tunnicliffe and Ranjitsinhji, for the slips; upon Jessop, Ernest Jones and Denton for mid-off and mid-on; and upon William Gunn and Victor Trumper for the long field. These men are worth their places in any team for fielding alone; they not only score runs themselves, they prevent their opponents from doing so. And that is the whole aim and art of cricket.

Cricketer's Fees. Thus equipped, the young player at the end of the summer sends in a record to the secretary of his county club, giving his average in batting and bowling for the season. If he be worth a trial, he will either be permitted to play in the following year in one or two of the less important matches, or will be appointed to a place on the ground staff. In the latter case he will bowl for practice games, and members of the club will reward him for skill, assiduity, and courtesy. When he becomes a regular member of the eleven he will receive, on an average, £5 per match, out of which he will have certain expenses to meet. Every time he scores a given number of runs, or takes so many wickets, he will be entitled to what is termed "talent money," while he may be sure that a specially good performance will then and there result in a subscription on the ground. He should average £200 a year from his cricket, while his benefit match will be worth £500 with a team like Warwickshire, or if the man be a Hirst—which does not happen to be likely—he will realise as much as £3,000 from teams like Yorkshire or Lancashire.

Handsome additions to the cricketer's income result from private engagements to "coach" 'varsity or other players, from schools, and from private clubs. When his playing days are done he may be appointed an umpire, for which he will receive a guinea a day. Many men have retaining fees from the M.C.C., to earn which they must play in matches, and make an occasional appearance at Lord's ground.

Gymnastic Instructors. The gymnastic instructor is a man always in demand during the winter. He should be still more in demand. As a rule, however, the instructor is content to follow where others have led. The man who hopes to succeed in this line must be prepared to initiate new schemes for gymnasia. He must, of course, be master of bars and boxing; must be able to show something new with the Indian clubs; invent new exercises with dumb-bells, and have the true eye and supple wrist for single-stick and foils. Army men hitherto have made the best gymnastic instructors, but too often they have preserved the same old system year after year, and killed the interest of their pupils. The man who knows his work will be always devising ways and means, not only of maintaining, but of increasing his membership. A prosperous club can afford to pay him £2 or £3 a week, which sum he will increase by private lessons to nervous or backward pupils.

Billiard Players. The billiard profession is very much envied by young men who can make two or three "twenties" in the course of a game of "a hundred-up." The life is not a pleasant one. Very few succeed.. Such harvest as is to result must be gathered early in life, for the vitiated atmosphere in which billiards is played does not make for protracted possession of undimmed eyes and nice touch. The man who succeeds has, as a rule, begun his career in a billiard saloon as a marker. This is the last occupation to be commended. It involves long hours in a bad atmosphere, and temptations to intemperance and gambling. Still, the youth who has an aptitude for the game, and is thoroughly steady, can make a good living in this manner. His salary, which may be anything up to £2 a week, does not matter. His presents prove of more importance. By steady practice he qualifies for match play. He enters the Markers' Handicap, perhaps, or meets privately another player. As soon as his reputation becomes noised abroad he is invited to appear in exhibition matches, and when he qualifies for games in London he may make his thousand or more a year. Once his name is made he can earn a great deal of money by teaching billiards. On the whole, the calling is one of many risks and few successes.

THE PUBLIC LIBRARIAN

The Genesis of Free Libraries. The Work of the Librarian. Classification and Cataloguing Systems. How to Become a Librarian

By WILLIAM ANDREWS

THE popular library movement in England goes back only to the middle of the eighteenth century. It was not until 1753 that the British Museum was founded. It was the outcome of a bequest of Sir Hans Sloane, who left his extensive collection of objects of natural history, works of art, books, to the nation subject to the payment of £20,000, two-fifths of its original cost. The Government accepted the offer, and raised the purchase money by means of a lottery. Other collections of books, including those belonging to the English monarchs from Henry VII. to George III., were brought together and formed the library of the British Museum, which is now one of the leading libraries of the world.

The Genesis of Public Libraries. Before the passing of the Public Libraries Acts there were several important free libraries in various parts of the country, the chief being the noble library founded in 1653 by Sir Humphrey Chetham at Manchester. After much opposition, Mr. Ewart got a Bill through Parliament for the establishment of free libraries and museums of art and science, together or separately, in municipal boroughs of England. The Act was a somewhat restricted one, and was extended somewhat in 1855 by another, which remained in force until repealed in 1892 by an Act which provided for the adoption of the Libraries Act by appeal to the ratepayers.

In 1893 an amendment to the Public Libraries Act of the previous year was passed enabling all urban authorities, save the London parishes, to adopt the Libraries Act without an appeal to the ratepayers.

Other Acts have been passed, but they do not affect the main principles, or materially assist the working of the free library movement.

The great usefulness of free libraries is now being fully recognised, and there can be little doubt that in the immediate future their power and usefulness will be extended. In addition to meeting the more popular requirements of a lending library of good and wholesome literature, provision is made for juvenile readers, for getting them early interested in reading, and for helping forward school studies. Reference libraries are formed, containing the best books in various branches of knowledge. In most instances the best and latest technical works are procured, especially those relating to the trades of the place. Collections relating to local history and topography are usually garnered in this part of the library. Provision is made for the student to work with pleasure and profit.

Selection of Books. The formation of a library is by no means an easy matter, and in doing this, where a large number of books is required for a reference library, the librarian usually prepares lists of works covering various branches of learning, and submits them to two specialists in each branch for approval and amendment. Local requirements have much to do with the selection. One point to bear in mind is to have the best books of an author instead of all his works.

Equal care should be taken in selecting the books for the circulating library. Good books which the people will read with pleasure and profit should be placed at their disposal. A library must be kept up-to-date, and to enable the librarian to do this he should read carefully the reviews in the "Athenæum," "Academy," "Spectator," "Saturday Review," "Bookman," the "Times," and other critical journals, as well as watch the advertisements of publishers. The librarian and those under him should know something of the *inside* as well as the *outside* of books, so that when required they may be able to advise those in search of information.

It is customary to invite tenders for the supply of books, and care must be taken that prompt delivery is made. The readers should have new books in their hands as early as possible. All orders should be given in writing, and a copy taken in a copying press. When the books arrive they should be checked with the invoice, carefully collated, not only as regards pages, but also maps and plates. Then those requiring cutting should receive attention. Next the books must be stamped with the library stamp.

Then they are entered in an accession register, and afterwards in the stock-book, which contains a list of all books going into the library. This book should be kept in a fireproof safe. In the event of a fire, it will be required when making a claim on the insurance company. It also shows at a glance the money spent on books. The stock-book should give the following details: Date when the book was admitted, title, author, number of volumes, date published, class, vendor or donor, published price, cost price. Other particulars are sometimes given, such as size, style of binding, etc. It is customary in some libraries to give some of the details indicated above at the back of the title page.

The book is now ready for location on the library shelves. It is entered in a public library in its number in the Cotgreave or other indicator, which is a simple and useful means of recording the issue and return of books. Shelf lists of all books should be kept as a ready means of checking the stock of the library.

Classification. It is not an easy matter to classify books, and some thought and study must be exercised before it can be done in a satisfactory manner. In past times little care has been given to this subject, but to-day librarians are alive to the best methods.

That more generally adopted is the Dewey system, planned by Mr. Melvil Dewey, of the State Library, Albany, New York. By this system knowledge is divided into ten main classes, as follow:

0. General Works.
1. Philosophy.
2. Religion.
3. Sociology.
4. Philology.
5. Natural Science.
6. Useful Arts.
7. Fine Arts.
8. Literature.
9. History.

These classes are subdivided to any extent in tens, as decimals are the simplest means of dealing with figures. The plan of this system has thus been explained: "5.537 means Class 5, Natural Science; Division 5, Geology; Section 3, Economic Geology; Sub-section 7, Mineral Waters." This seems complicated, but it is really a very simple and elastic system, and is now largely used in both large and small libraries.

Mr. Charles A. Cutter, another American librarian, has a somewhat elaborate system, too elaborate to be extensively employed. It is known as "Cutter's Expansive Classification." He employs the 26 letters of the alphabet to indicate his classes, and the second letter to mark his subdivisions. "This second letter," says Mr. Cutter, "divides each of the 26 main classes into 26 parts, and then a third letter divides each of these 676 divisions into 26 parts, or over 18,000 in all, taking the single letter, the double letter, and the triple letter classes together." Anyone wishing to study this system must consult Mr. Cutter's published tables.

English Classification Systems. A really excellent and simple system was invented by two experienced English librarians, Messrs. J. H. Quinn and J. D. Brown. Books are divided into 11 main classes, as follow:

A. Sciences.
B. Useful Arts
C. Fine and Recreative Arts.
D. Social and Political Science.
E. Philosophy and Religion.
F. History and Geography.
G. Biography.
H. Language and Literature.
J. Poetry and the Drama.
K. Prose Fiction.
L. Miscellaneous.

"In each main class," says Mr. Brown, "the class letter alone is given to general works covering the whole, or a considerable portion of the subject matter of the class at large. Thus 'B' would mark all the general treatises or dictionaries on the 'Useful Arts,' 'G' general collections of 'Biography.' It has not been thought advisable to make an elaborate system of sub-divisions and sub-divisions, but simply to number in one sequence of even numbers each sub-class or division in its order. This enables the class of most books to be easily expressed by the plain notation of a letter or figure or two—G2, B30, F196, etc. The odd numbers are reserved for fresh divisions of the main classes, and it is thought that this feature will be useful in most libraries where new subjects are continually cropping up." Mr. Brown's "Manual of Classification" must also be studied.

Alphabetical Classification. The London Library is large and well planned. The system adopted is as follows: The books are arranged in broad divisions; that is, History in one division, Theology in another division, and so on. History is divided into one large alphabet. Abyssinia, Arabic, Egypt, England, France, etc., follow each other in alphabetical order. All books in these subdivisions are in alphabetical order under the author's name. This rule applies to all divisions. Theology is one large alphabet of subjects—Bible, Bible Commentaries, etc. Learned societies form one large alphabet, each society being placed under the first word of the title of the society. Periodicals are shelved in a similar manner; fiction under the names of the authors. Biography is one large division under the subject of the biography which brings all the lives of one man together. Miscellaneous subjects, such as Agriculture, Anatomy, Art, Motor-cars, Science, Political Economy, Zoology, are arranged under their respective subjects in alphabetical order in one large division named Science.

It will be gathered from the foregoing systems that a librarian must know something of many subjects to enable him to decide in which class to place a work.

Cataloguing. The compilation of a catalogue is, next to the selection of books, the most important part of the work of a librarian. Before starting one a careful examination of the better examples of catalogues should be studied. The compiler must regard his catalogue as the key to unlock the store of knowledge in his library. It must be simple and concise, but sufficiently full to indicate the nature of the book named. In many libraries used by the more cultured classes, the classified system is employed, and librarians, from experience, know how difficult it is to use by anyone except a well educated person. The dictionary catalogue is now the most popular and the most useful. This catalogue supplies names of authors with lists of their books, the titles of all books, and the subjects under different headings, all arranged in alphabetical order. The contents of some books must be briefly indicated. Numerous cross-references must be given in respect to authors' pen names and real names, and where writers change their names. In short the facts given should enable a person to obtain from a library the book or information required. In addition to printed catalogues, card catalogues should find a place in every library, and be kept up to date. The information on a card may be fuller than in a printed catalogue. Various books deal with this important part of library work, and must be carefully studied, and especially well-compiled catalogues.

Education and Examination. The Library Association, founded in 1877, and incorporated by Royal Charter in 1898, carries out a useful work in teaching and holding examinations, and granting diplomas. Summer schools are held in various parts of the country, and practical lectures are given by experienced librarians. Correspondence classes are also conducted. Particulars may be obtained from the secretary of the Library Association, Whitcomb House, Whitcomb Street, London. The course of training is as follows:

(a) Study in various prescribed subjects, namely: literary history, elements of practical bibliography, classification, cataloguing, library history and organisation, and practical library administration.

(b) Examination in each subject, and the writing of a satisfactory essay upon some aspect of each subject.

(c) Practical experience of not less than twenty-four hours a week, for at least three years, as a member of the administrative staff of one or more libraries approved by the council of the Library Association.

The candidates may study as they think proper, but to gain the full diploma their preparation must include the examinations, the prescribed essays, and practical experience. The "Library Year Book" contains all details of examinations and long lists of books to be studied. According to the regulations, "candidates for the full certificate or diploma of the Library Association shall have passed the examination in each of the six sections, and, if required to do so, a further oral test. Each candidate shall be required to make application not later than March 1st in each year to the Hon. Secretary of the Education Committee of the Library Association asking to be granted the diploma. The application must be accompanied by: (1) A thesis on some topic previously

SCHEDULE OF EXAMINATIONS FOR LIBRARIANS

Age Limit.	Examining Body, Time and Place of Examination.	CERTIFICATE EXAMINATION.	Fees.
None.	Library Association, Whitcomb House, Whitcomb Street, Pall Mall East, London, S.W. In May annually, in various parts of Great Britain and Ireland.	Examination in each subject, and the writing of a satisfactory essay upon some aspect of each of the following subjects: (1) Literary History; (2) Elements of Practical Bibliography; (3) Classification; (4) Cataloguing; (5) Library History and Organisation; (6) Practical Library Administration. Practical experience of at least twenty-four hours a week for three years as a member of Administrative Staff of one or more Libraries approved by the Council of Library Association.	None.
		DIPLOMA EXAMINATION.	
		Each candidate to make application to the Honorary Secretary of Education Committee of the Library Association asking to be granted the Diploma. Application to be accompanied by— (1) A thesis on some topic previously set by the Council. Notice of this topic will be given in the January number of the *Library Association Record.* (2) Certificates showing that the candidate has satisfied the Examiners in each of the sections of the Examination. (3) A Certificate, approved by the Council, showing that the candidate has worked for not less than twenty-four hours a week for at least three years as a member of the Administrative Staff of one or more Libraries. (4) A Certificate, approved by the Council, showing that the candidate possesses an elementary knowledge of Latin, and of one modern foreign language. The Examiners decide if it be necessary to subject the applicant to an oral examination.	

set by the Council. Notice of this topic will be given in the January number of the "Library Association Record." (2) Certificates showing that the candidate has satisfied the examiners in each of the sections of the examination. (3) A certificate, approved by the Council, showing that the candidate has worked for not less than 24 hours a week, for at least three years, as a member of administrative staff of one or more libraries, and (4) a certificate, approved by the Council, showing that the candidate possesses an elementary knowledge of Latin, and of one modern foreign language.

A youth entering a library should master "A Primer of Library Practice for Junior Assistants," by G. L. Roebuck and W. B. Thorne. It not only gives advice of a practical nature, but suggests a good course of reading. All persons engaged in library work should cultivate neat and plain writing. This is a most important matter, for he who writes well among the assistants in a library usually gets the more important work. In addition to the use of the typewriter there is much to be done with a pen. It is to be regretted that more attention is not paid to teaching writing in schools.

How to Obtain a Situation. Situations for youths in libraries are usually advertised in the local newspapers. It is, however, a good plan for a person having a taste for library work to write a letter to the chief librarian in the town in which he resides, asking to be put on the list of applicants for a situation. He must state his qualifications, say where educated, and get a testimonial from his schoolmaster, or clergyman, or minister. Boys in the larger public libraries start at 6s. per week, and at the age of 21 are paid about 25s. per week. If he has made the best of his opportunities he may expect to take charge of a branch library or discharge the more important work in the library, or become a librarian of one of the many smaller public libraries, and work his way into a leading position. Librarianship is by no means a well-paid profession, but it is pleasant and improving. Salaries of chief librarians range from £100 (or even less) to £1,500 per annum. The hours worked are not long, generally about 48 hours per week, but often the assistants are engaged when others are on pleasure bent, and this circumstance often leads to unrest. A man to be a successful librarian, useful to others, and happy in his work, must have a real love of books, and know their contents, and be of use to those seeking information. The ideal librarian should be a many-sided man, know something of everything, and everything about something.

Those engaged in library work often have their tempers tried by people who have no consideration for others, and are lacking in good breeding. It is difficult to deal with such people. We must remember if they are rude we must not sink to their level, but do our best under trying circumstances. The chief librarian should set his staff an example, and they will not be slow to follow his lead.

Bibliography. The following books cover the work connected with a library:

Chambers & Fovargue. "Law Relating to Public Libraries and Museums, and Literary and Scientific Institutions," 1899.

Library series, 5 vols.: "Free Library," by Ogle; "Library Construction," by Burgoyne; "Library Administration," by Macfarlane; "Prices of Books," by Wheatley; "Essays in Librarianship," by Garnett.

"British Library Year Book," 1900-1, by Greenwood.

"Guide to the Choice of Books," by Ackland.

"Abridged Decimal Classification," by Dewey.

Library Association series: "Handbook and Library Appliances," by Brown; "Public Library Legislation," by Fovargue and Ogle; "Public Library Staffs," by Cowell; "Public Libraries," by Greenwood; "Care of Books," by Clark.

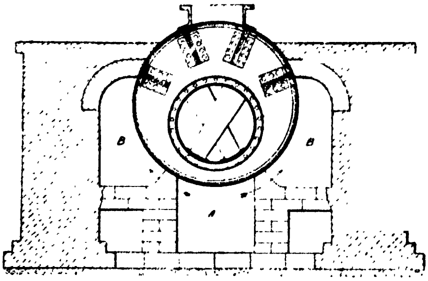
STEAM BOILERS

Classification. Horizontal Boilers. Cornish, Lancashire, Galloway. Multitubular, Marine, Locomotive, Vertical, and Water-tube Boilers. Combustion

By JOSEPH G. HORNER

THE function of a steam boiler is the generation of heat, apart from the engine in which the heat is to be utilised. It is a far cry from the earlier boilers, which carried steam pressures of only 3 lb. or 4 lb. above that of the atmosphere to those of the present, in which pressures of 180 lb. and 200 lb. to the inch are common, sometimes exceeded, and pressures of 60 lb. to 80 lb. low. There are certain early types, often illustrated, which are not made now, though their use lingers in some old firms. These are the externally-fired egg-ended boiler, the Rastrick, the box boilers, and the old type of haystack. Also the use of iron for boilers has been nearly discarded for that of steel, with all the practical advantages that result from the use of the latter. The superiority of mild steel over the boiler qualities of wrought iron is the reason why few boilers are made of iron now. Being highly ductile, severe work, such as bending and flanging, can be done upon steel that could not be done upon iron. Its elastic limit being high, it will stand more severe strain than iron without undergoing permanent set. Being of high tensile strength, higher pressures can be carried in steel boilers than in iron with equal scantlings, or equal pressures with lighter scantlings, or with larger diameters. Owing to the absence of lamination in steel plates, they are less liable than iron to deteriorate due to overheating. The methods of constructing boilers have been treated on page 3095. We shall therefore be able to confine the present remarks to the design of the principal types of boilers now made.

Classification. Cylindrical boilers may be classified in two great groups, *horizontal* and *vertical*, signifying that the longitudinal axis of the boiler is either set horizontally or vertically. The horizontal types include the Cornish, or one-flued, and the Lancashire, or two-flued; the modified Lancashire, with three or five flues; the Galloway, with the two flues united into one behind the bridge, therefore a breeches flue type, with a large number of conical tubes. In the horizontal group, all marine—Scotch type—boilers are included, and these also are classified variously. It also includes the multitubular arrangements as used on the locomotive and marine boiler types, which arrangements are also adopted in a good many Cornish and Lancashire boilers. The vertical group includes plain and multitubular forms in many and varied designs. Outside these lies the great group of water-tube boilers. In these, though tubular, the water is contained in nests of tubes around which the fire plays; while in the multitubular boilers proper the flame and hot gases pass through tubes in the water space. The distinction is a vital one, constituting entirely different types.

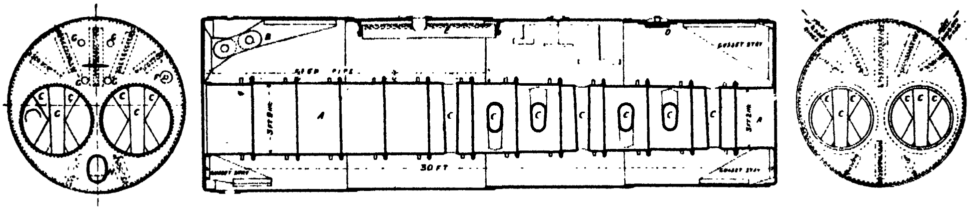


100. CROSS SECTION THROUGH CORNISH BOILER AND SETTING

Horizontal Boilers—The Cornish and Lancashire. The Cornish is a single-flued boiler, shown in cross section in **100**. The flue lies centrally in the horizontal direction, but below the centre in the perpendicular axis, in order to give ample water space above. In Continental types it is placed to one side. A considerable space is occupied by the flue; thus in a boiler 5 ft. in diameter, the flue is 2 ft. 7½ in. in diameter. This is a large space to take away from the water and steam space, and leaves little room between the bottom of the furnace flue and the bottom of the boiler shell, and renders cleaning difficult in the contracted spaces. The Lancashire [**101**] resembles the Cornish in all respects, except that it has two furnace flues instead of one, which is preferable, as boilers increase in size. The minimum diameter of the flues for Lancashire boilers is about 2 ft. 4 in.—2 ft. 9 in. is better—and they range thence to 3 ft. 6 in. The diameter of the flues controls the size of the shell for a given boiler. There should not be less space than 4 in. or 5 in. between the flues, or between the flues and the sides of the shell. Shells range from 6 ft. to 9 ft. in diameter. Lengths vary from about 14 ft. or 15 ft. to 30 ft., 28 ft. or 30 ft. being a usual standard length for a large Lancashire boiler. Roughly, the length of a Cornish or Lancashire boiler is equal to from three and a half to four times the diameter.

The illustration selected [**101**] is one of the standard 30 ft. by 9 ft. boilers by Tinkers, Ltd. It differs from ordinary types in the gradual reduction of the furnace flue, A, toward the back end, and in the hinged character of the gusset stays, B, over the furnace flue. The other gussets are of plated type. The conical tubes, C, are set as in the usual practice, vertically, and at angles of 30° to right and left; D is the manhole; E is the anti-priming pipe whence dry steam is taken. Only the front and back end plates are single-riveted [see the enlarged detail]. The end plates receive additional support from the furnace flues and the gusset stays. Elsewhere the circular seams are double-riveted. The longitudinals eams are treble-riveted through butt straps. Each ring is formed of a single plate, and they break joint in the manner indicated. Such a boiler would, in the old days, have required eighteen iron plates. The furnace flues are plain cylinders, with Adamson flanged seams [see page 3102, and Figure **226**] the seams hit and miss as shown.

The water circulation is sluggish in the bottom of Cornish and Lancashire boilers because the water there lies below the furnace flues. At one



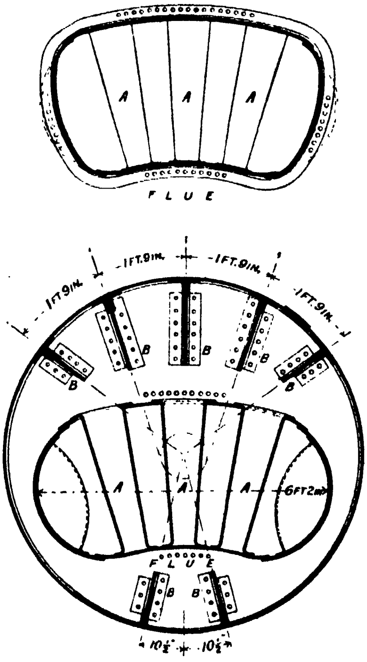
101. LANCASHIRE BOILER, 30 FT. BY 9 FT. (Tinkers, Ltd.)

time this was aggravated by the bad practice of bringing in the cold feed water there, which is now always brought in above them. The seating for the check feed valve which regulates the water supply is seen at F. The seatings for the water gauges are shown at G. H is the mudhole. The various seatings on the top are for different valves. J is for the high steam and low-water safety valve, K is for the junction valve, L for the deadweight safety valve, M is the seating for the blow-off cock.

of the boiler, which is least ected by the heat from the furnace. The brickwork flues are therefore an essential feature of these *land* boilers, as they were formally termed. The boilers are supported on seatings of brickwork, [100], which form the walls of the flues. Dampers are provided to regulate the draught. The resnlt is that the boilers are very economical, easy to operate, and have long been deservedly popular among mill and factory proprietors. The fire bridge [**103** and **104**] is a bridge built of brick at the rear end of the firegrate

shire boilers by improving the circulation between the dead water at the bottom and the hot water at the top. The conical form is imparted simply to permit of the insertion of the smaller end of the tube through the hole cut for the larger end. The tubes are arranged in different planes, vertically and diagonally, in order to allow the hot gases to strike fairly against each successive tube.

The Firegrate and Flues. The firegrate, shown in **103** and **104**, occupies the front of the flue in Cornish and Lancashire and horizontal boilers to a length of 5 ft., 6 ft., or 7 ft. Thence the products of combustion pass through the furnace flue or flues to the rear, and out at the back of the boiler [see the section **100**]. Thence they return through brickwork flues by what is termed a *split draught*; that is, the hot gases pass down the downtake at the rear, and back to the front of the boiler by a central flue of brickwork [**100**, A]. Thence they are diverted to right and left under the action of the chimney draught into side flues, B, B, and so out at the chimney [compare also with **103**]. Frequently an economiser, or feed water heater, is placed in the passage of the gases between the termination of the flues and the entrance to the chimney, so that they yield up heat to the boiler feed water contained in the heater pipes. The gases in their passage through the brickwork flues render up heat to the water in the lower part



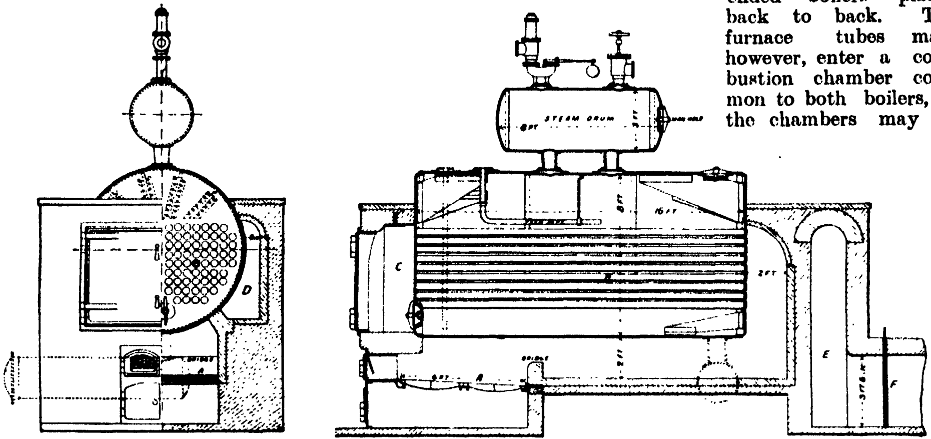
102. GALLOWAY BOILER
A. Conical tubes *B*. Gussets

pie

Three and Five Flued Boilers. Some of the largest boilers have three fire tubes—two below and one above, centrally. The object is to still further increase the advantage of the substitution of smaller for large flues. Boilers are also made with five flues for burning waste gases.

The Galloway Boiler. This is a modification of the Lancashire type, which gives greater efficiency by increasing the number of conical tubes and providing a number of water pockets. The tubes are not placed as in the ordinary boiler, but in a *breeches* arrangement, in which the two furnace tubes unite in a single smoke flue beyond the bridge [shown in section in **102**], which flue contains the Galloway tubes. A modern full-sized boiler will contain thirty of these tubes, besides four side pockets, which help to break up the flame and heat the water.

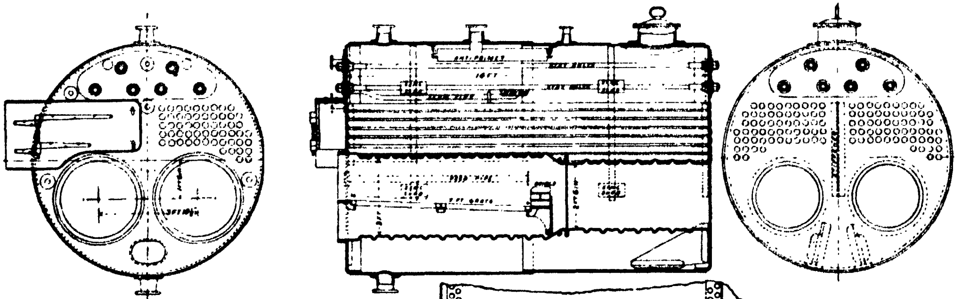
Multitubular Boilers. There are considerable numbers of Cornish and Lancashire boilers made of the multitubular design. That is, the furnace flue terminates a little way beyond the bridge, and the hot gases pass through a nest of tubes to the back of the boiler. The tubes are larger than those of locomotives, being generally about from 3 in. to 4 in. in diameter. They vary in number from about 20 to 90. In some designs the tubular system is adopted entirely, as in **103**, which is a horizontal boiler mounted exactly like a Cornish, over brickwork flues, but is externally fired. It is surmounted with a large steam drum. The flame and products of combustion pass from the grate A along under the boiler, back through the tubes B to the smoke box C at the front end, thence to right and left through the side flues D to the downtake E, and chimney. The damper F regulates the draught.

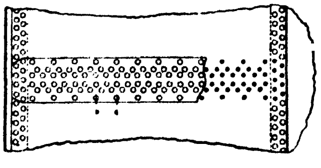


Half front elevation Half front elevation, with brickwork removed

103. MULTITUBULAR BOILER (Tinkers, Ltd.)

Horizontal Boilers—Marine Type. These are commonly termed *Scotch* boilers, and they include several modifications. They are all of *return-tube* design. That is, the products of combustion on leaving the back of the furnace flue return through a nest of tubes which traverse the water space immediately above the furnace [**104**]. At the front of the boiler there is a large casing of sheet iron (not shown) into which the tubes enter. The smoke passes thence into the funnel. Having these features in common, boilers are named according as they have one or more furnace flues, or as they are fired from one or both ends, or as they are wet or dry at the back, besides which there are several more or less specialised designs.



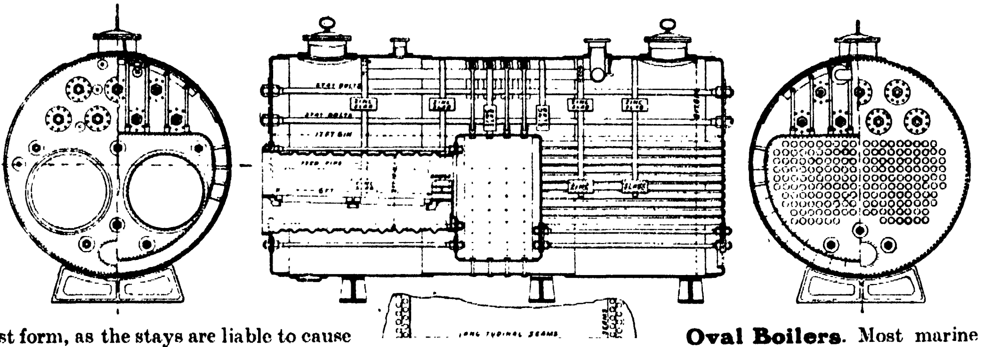


104. DRY-BACK MARINE BOILER (Tinkers, Ltd.)

Single-ended Boilers. These are so termed because they are fired from one end only. An example occurs on page 3099 [**220** and **221**]. The furnace flue C in that figure opens at the end opposite the grate D into the combustion chamber G, which is attached both to the flue and to the shell, and extends up into the latter high enough to cover the ends of the return tubes. Water entirely surrounds the chamber, excepting where it is connected to the furnace flue. The water covers the chamber and the tubes to a depth of several inches, and the space above is occupied by steam.

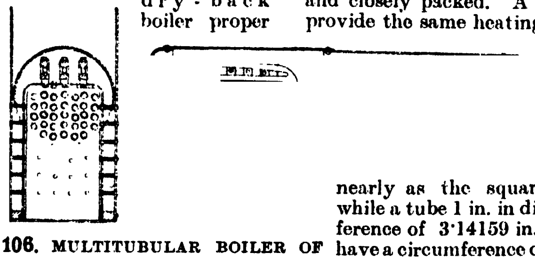
Double-ended Boilers. These are fired from opposite ends, and are essentially two single-ended boilers placed back to back. The furnace tubes may, however, enter a combustion chamber common to both boilers, or the chambers may be distinct, in which case the resemblance to two independent boilers is most pronounced.

Number of Furnaces. Only in the smaller boilers, or those up to about 8 ft. or 9 ft. in diameter, is a single furnace used, the diameter of which should not usually exceed 48 in., and is seldom less than about 36 in. Boilers of 9 ft. and over and up to 13 ft. 6 in. diameter should have two furnaces; up to 15 ft. three furnaces, and over that size, four. If the attempt were made to obtain evaporative power by lessening the number of furnaces and increasing their diameter, the grates would have to be too long to be fired properly, with the result, too, of a larger volume of sluggish water below the flues. An undesirable length of grate would be necessary to get the required grate area, which increases only as the diameter, while the cross section of the flues in which the products of combustion have to be utilised increases as the square of the diameter, which is a correspondingly greater ratio. The question of the number of furnaces involves also that of the combustion chambers. The simplest and the worst design is that in which all the furnaces open into one common combustion chamber. The disadvantages are that a leaky tube places the whole boiler *hors de combat*, and that the firing of any furnace produces a rush of cold air all over the surfaces of the chamber. In another design all the furnaces at one end meet in a common combustion chamber and all those at the other end in a similar chamber, the two chambers being divided by a water space. This is not the best form, as the stays are liable to cause trouble. Another design is that in which each furnace has its own independent combustion chamber. It is satisfactory, except on the score of price and weight, and is not, therefore, used so much as the next one named. In this the furnaces, which are opposite to each other, have a common combustion chamber. Each chamber is divided from the one adjacent by a water space. To lessen risk of leakage of the tubes, due to the inrush of cold air on the opening of one of the furnaces, a semi-partition, a kind of hanging bridge of brickwork, is sometimes fitted across the combustion chamber at right angles to the direction of the tubes, and coming some way down into it. This type of boiler is, perhaps, that most commonly used in marine service.



105 TWO-FLUED MULTI-TUBULAR BOILER

Dry-back Boilers. The foregoing are all wet-back boilers—that is, the combustion chamber is backed by a water space, and this is the design which is almost invariably adopted. There is, however, a type—the dry-back boiler—in which the boiler proper terminates with the furnace end and tube ends, the combustion chamber being formed with brickwork. Its principal advantage is cheapness. Figure **104** is a dry-back boiler by Tinkers, Ltd., the brickwork not being illustrated. The furnace flue goes right from end to end. There are 114 tubes, 3 in. in diameter, solid drawn. Twenty-four of these are *stay tubes*—that is, they are screwed and nutted at the ends to grip both inside and outside the end plates. There are no gusset stays required at the top, but only those at the bottom.



106. MULTITUBULAR BOILER OF ROAD ROLLER
(Aveling & Porter, Ltd.)

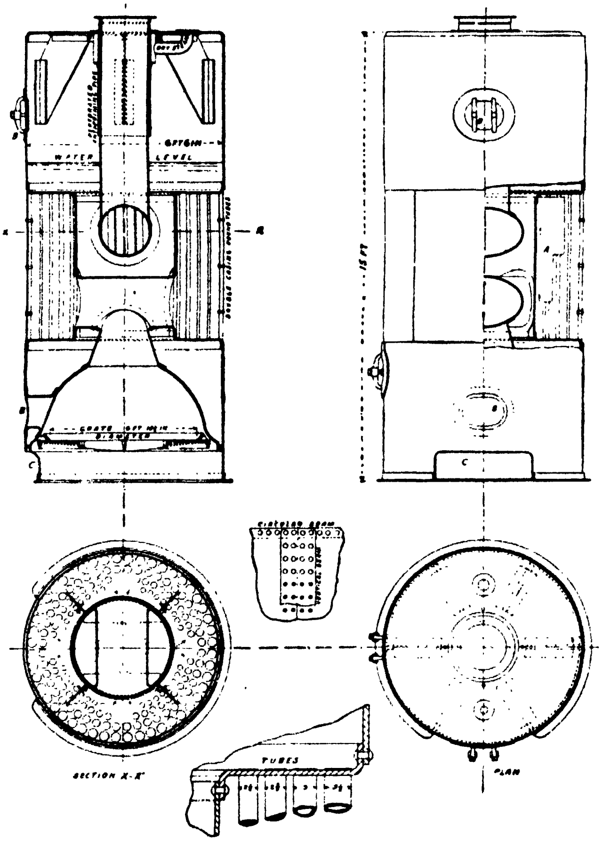
Composite Boiler. In another design of dry-back marine boiler, the combustion chamber is situated at the end of the firegrate just beyond the bridge, and the tubes are carried beyond the chamber instead of returning over the furnace, thus requiring a longer boiler than the usual design. The tubes enter the smokebox at the farther end. Of the 3 in. tubes in this boiler, 183 in number, 40 are stay tubes. As the roof of the combustion chamber is flat, it is stayed to the top of the shell with *sling stays*, an alternative to the *bridge* or *girder stays* on page 3099 [**220** and **221**].

Oval Boilers. Most marine boilers are of cylindrical shape. But a number are made of the so-called oval form, which is, however, composed of two semicircles connected by flat sides. The only advantage of this is that such boilers can be set in spaces where width is contracted.

The Locomotive Type. In this, the distinguishing feature is the large number of smoke tubes which, passing through the water, assist in the rapid generation of steam. For remarks on these, see the article on Locomotives, page 6514; see also **227**, on page 3101. This type of boiler is used extensively in other ways. It is employed on torpedo boats, differing chiefly in the fact that the firebox is wider, and generally longer. It is used for portable and traction engines, **106**, and for the under-type engines.

In order to obtain a large amount of heating surface from tubes, they are made relatively small, and closely packed. A few large tubes would not provide the same heating surface as a large number of small ones, because while the circumference of a tube increases only as 3·14159 of its diameter, the space occupied increases nearly as the square of its diameter. Thus, while a tube 1 in. in diameter will have a circumference of 3·14159 in., one of 6 in. diameter will have a circumference of 6 × 3·14159 = 18·84954 in. But it will occupy an area of cross section of 28·1744 in. So that in an inch tube, the ratio of circumference to cross section will be 3·14159 to 0·7854, and in a 6-in. tube it will be 18·84954 in. to 28·1744 in. Therefore, by placing a large number of small tubes in a boiler, a much greater heating surface is obtained than by the insertion of a few large ones in the same space. But this must not be carried too far, for then the tubes and spaces are liable to become choked and the circulation impeded.

The Vertical Boilers. The horizontal-flued boilers have a good reputation for staying capacity. That is, they will maintain a large supply of steam with little fluctuation. The volume of water and steam space is large, the firing can be done very regularly, the water level and the steam pressure can be maintained very easily. On the other hand, they are not suitable for any but permanent service, being necessarily located in one spot over brickwork flues, and being moreover very massive. Hence, for a large extent of service the vertical boiler is employed. It is never made in dimensions so large as those of Lancashire boilers, though the largest vertical are as big as many Cornish boilers. They require no brickwork, and no foundation, and can, therefore, be easily transported and set down anywhere. But they are generally used as a fixed element, as on the foot plate of a steam crane, or a hoisting engine, or a fire engine. Immense numbers are used, more because of their great convenience than for high efficiency. They are not so economical as the Cornish and Lancashire, the steam supply runs down very rapidly under severe service, because the steam and water areas are small, and firing cannot be done so well as in the other boilers named, because the grate is not suitable for preliminary coking of the fuel, being of rather small dimensions, and having no dead plate. Still, for intermittent kinds of service they are useful and popular, and steam can be got up in them in a small fraction of the time required in the boilers laid on brickwork flues.



107. TINKERS' PATENT "ACCESSIBLE" WATER-TUBE BOILER

The vertical boiler [see 218 and 219, page 3099] is a cylinder standing on its base, the upper portion of which is occupied by steam, and the lower by water, covering and surrounding the internal furnace (firebox). This also is cylindrical, but is a frustum of a cone, the amount of coning on the depth of the firebox amounting to about 3 in. in the diameter. The reason of this is to facilitate the disengagement of the bubbles of steam as they are formed in the narrow annulus between the outer shell and the inner firebox. The two are united by means of a ring at the base—the foundation ring—or by flanging, and also by a ring encircling the firehole. In large boilers a few screwed stays also connect the two. The crown of the firebox is connected to the crown of the shell by means of an uptake, through which the smoke and products of combustion pass into the chimney. In the larger boilers screwed stays also connect both crowns. All boilers of this type, except the smallest, are fitted with cross tubes, ranging from one to three. These are set at angles with each other, and are often inclined slightly from the horizontal to lessen chance of deposit occurring. Mudholes are set opposite the tubes.

Generally the designs of tubular vertical boilers involve firetubes. There are many of these, varied in all conceivable fashions. Many are objectionable, because of the difficulty of cleaning and repairs. A novel design is that in **107**, in which water tubes are fitted, the flame surrounding them being distributed and broken up by the two cross tubes, assisted by the four *diffusion plates* [A] seen in plan and elevation. The circles of tubes increase in size towards the circumference where the heat diminishes. Eight of the outer circle are stay tubes. B is the firing hole, and C the ashpan opening. The drawing is largely self-explanatory.

Water-tube Boilers. These have been slowly winning their way to favour as rivals to the Scotch boiler for marine service, and to the Cornish and Lancashire for land power plant. They are used largely in central stations, and are as popular in America as in Europe. They are economical, and the furnaces can easily be designed for burning inferior fuel. Water-tube boilers are the type of the near future, both on land and sea. They satisfy the demand for high pressures with diminution in weight. This is chiefly due to the difference in confining water and steam in the body of a Scotch marine boiler, which is a casing of large diameter, measuring from 14 ft. to 16 ft., and confining it in many tubes of small diameter. The steel plates of which a large marine boiler are made range from 1¼ in. to 1½ in. in thickness, and this thickness is necessary to withstand steam pressures of from 150 lb. to 200 lb. to the square inch. But small tubes only ⅛ in. thick will endure pressures of 300 lb. or 400 lb. to the inch with absolute safety. A boiler, therefore, having water-tubes of 3 in. in diameter, and but ⅛ in. thick, is stronger than a cylindrical boiler the shell of which is $1\frac{1}{4}$ in. thick.

The Belleville boiler is the pioneer broad type on which many others have been designed, the main characteristic of which is the fact that the tubes are inclined within a few degrees of the horizontal. The methods by which they are made to communicate with the steam drum vary in different designs, and their method of fitting also. Some of these differences are of much practical importance; but the only point which we note here is that these boilers constitute a class by themselves, and that their value lies in their capacity for regular service, which renders them suitable for battleships and cruisers, as well as for the mercantile marine, in which they are largely used, and for land service. The boilers of this broad type include the Belleville, the Niclausse, the Babcock and Wilcox, the Dürr, and the Lagrafel d'Allest. The other main type of boiler is that which is used chiefly for torpedo-boats and destroyers. The best known examples are the Yarrow and Thornycroft, the Normand and the Du Temple Guyot. There the tubes are arranged in groups far removed from the horizontal position, being, in fact, sloped several degrees away from the vertical, which imparts to their casings an approximately triangular outline instead of the square, box-like form of the casing of the other types. This broad difference is most important. The nearly vertical slope of the tubes permits the steam to escape more rapidly into the collector or drum than the nearly horizontal arrangement does. Hence these boilers are very rapid steam raisers, and are thus admirably suited for torpedo-boat service. These boilers represent the very highest developments of the water-tube types. They are the nerves and sinews of the torpedo-boat and kindred craft. But the type which is best suited for this service is not the best for a battleship or on land. Not only in naval service, but also in the mercantile marine, these boilers are displacing the older types. Water-tube boilers predominate on the Continent over all other kinds, but they are not as yet great favourites in Great Britain, the exceptions here occurring chiefly in some of the modern works for producing electric light and power.

Half cross section

108. BABCOCK AND WILCOX BOILER

The Babcock and Wilcox. We can illustrate only one type here [108]. It is one of the few very successful kinds. From five to six millions of horse-power of these boilers are in use in various parts of the world. One of the land type is shown in the figures, encased in brickwork. From the firegrate A the heat passes up among and along the inclined tubes B. C is the drum which contains water and steam. The circulation is set up in the water by the heat, the steam generated in the water-tubes B is liberated, and rises to the upper part of the drum, and water from the lower part of the drum comes down to occupy its place. This circulation goes on through the headers D, D, which are steel boxes into which the ends of the tubes are secured by expanding. The brickwork is enclosed in a casing of sheet steel, and doors are provided to the furnace and to the ends of the tubes. The various valves, gauges, and damper will be noticed.

Combustion. The economical results of combustion are so different under different conditions that it will be well to state what goes on in a boiler.

In the most perfect combustion that can occur, the air supplied would be in the exact quantity requisite for the complete combustion of the carbon and hydrogen in the fuel, without leaving any surplus. A portion of the oxygen in the air would combine with the hydrogen liberated from the fuel to form water, gas, or steam, the remaining portion uniting with the gaseous and solid incandescent carbon to form carbonic acid. The steam, the carbonic acid gas, and the inert but heated nitrogen, dissociated from the oxygen of the air, pass on into the chimney, having their heat abstracted from them during their transit. This is a result achieved in few, if, indeed, any furnaces, unless perhaps for exceptionally short periods. The perfect diffusion and intermingling and chemical union of the elements in their combining weights results in intense heat, the heat due to chemical energy; while having no elements left unsatisfied, there is no waste and no thick smoke, the waste gases being nearly colourless. The more nearly practice can be made to approximate to this perfect combustion the better.

WORLD'S COMMERCIAL PRODUCTS

The Chief Commercial Natural Products of the World not Described Elsewhere in the "Self-Educator"

A large proportion of the natural products of commercial value have been dealt with in the SELF-EDUCATOR in the places in which they fall naturally, under the particular industry or manufacture in which they are used. But there remain many which must escape treatment on these lines or which are not themselves described as fully as their importance merits. An endeavour has been made to cover these deficiencies in the following pages. The information given in the previous pages will be found by consulting the names of specific articles in the General Index, beginning on page 6900

ABACA—See *Manilla hemp.*

Acacia—The acacia is a genus of thorny trees of which there are several hundreds of varieties. They flourish especially in Africa and Australia. There are several acacias that yield commercial products. The babul tree of India is the *Acacia arabica*, and its wood is a useful timber; its leaves are used as fodder, its bark is of value in tanning and in dyeing, and its gum is used as a substitute for gum arabic. The *Acacia senegal* of West Africa and India yields *Gum senegal* [see *Gums*]. *Acacia catechu* is the source of extract of catechu, which is prepared by boiling the wood chips in water and evaporating the decoction until the extract thickens. The dose of this extract, which is official in India and other colonies, is 5 grammes to 20 grammes; it is given as a tonic astringent in diarrhœa and intestinal hemorrhage. The catechu of the British Pharmacopœia is from another source, the *Uncaria gambier*.

Aconite—Aconite or monkshood [see also pages 352 and 731] is a poisonous plant (*Aconitum napellus*), and the root is now the only portion used, its sole employment being medicinal. It grows in England and in the mountainous regions of Central and Southern Europe. It is collected in autumn, after the leaves and stem have fallen. The roots are trimmed, washed, and dried. The active principle is *aconitine*, which, as an internal remedy (official dose, two grains), is used as a febrifuge and to relieve pain, and as an external remedy for the relief of pain. Aconite poisoning has been successfully treated by hypodermic injections of digitalis.

Alder—The alder (*Alnus glutinosa*) grows in Europe, North Africa, and the North of Asia. A humid soil is favourable to its growth. [For its botanical classification see page 355, and for its physical properties see pages 1260 and 1261.] In appearance the wood is of a reddish-yellow colour, and resembles birch, to which it is akin. It stands immersion in water well, for which reason it is used for pile work, but it decays when wet and dry in frequent succession.

Allspice—*see Pimento.*

Almonds—Almonds are the fruit of the tree *Amygdalus communis*, which grows in the countries bordering the Mediterranean, and in certain parts of Asia. There are two varieties of tree, one yielding sweet almonds and the other yielding bitter almonds. The best almonds are those from Malaga and known as "Jordan" almonds. They have nothing to do with the river of Palestine, and the name may be a corruption of the French word *jardin*, garden. Other varieties imported into this country are known as Valentia, Sicily, and Barbary, all being sweet almonds, used as a dessert fruit and in the manufacture of confectionery. There are also several varieties of bitter almonds—French, Sicily, Barbary, etc.—and from these essential oil is expressed. The bitter almond yields both an essential oil and a fixed or fatty oil; the sweet almond yields only a fixed oil. The best oil is obtained from Majorca almonds. Bitter almonds are generally used, as the cake that is left may be used by perfumers. The residue from the oil-press is steeped in salt water for a day, and the oil is distilled off. The crude oil is suitable for perfumers' use, but if it is to be used for medicinal purposes, the prussic acid contained must be removed. An artificial oil of bitter almonds, otherwise known as *essence of mirbane*, is made from coal tar [see page 4971].

Aloes—Aloes is the dried juice of the leaves of certain trees growing in Africa and in the West Indies. The best variety is Barbados or Curaçao aloes (*Aloe vera* and *Aloe chinensis*), and others are Socotrine or Zanzibar aloes (*Aloe perryi*), and Cape aloes and Natal aloes, the last two of which are not regarded as official by the British Pharmacopœia. The juice is evaporated by boiling to a solid mass or extract, in which condition it reaches our market. Medicinally, aloes is used as a purgative (dose. 2 gr. to 5 gr.), and is reputed to be the chief ingredient in many of the most popular patent medicines. It is prepared as pills, tinctures, mixtures, and other preparations. Its active principle is *aloin* (dose, ¼ gr. as an aperient and 1 gr. as a purgative).

Alum—Alum [see also page 1721, 4780, 5993] is found native as an incrustation upon rocks in volcanic regions, but the greater part of the alum of commerce is obtained from alum shale, a bituminous shale found in this country, in Norway and elsewhere. Rock alum, as the native alum is called, is found in the district around Naples, and in Hungary. It consists chiefly of sulphate of alumina and silica. It is reduced by roasting in kilns, and afterwards by being kept moist for some months, after which the alum is dissolved out and re-crystallised. Alum is used extensively in textile dyeing and printing [see page 5779], in sugar refining, in papermaking, in photography, and for many other industrial purposes. In medicine alum is used as an astringent.

Amber—Amber is a fossil resin, the chief source of which is the Baltic sea, from the bed of which it is detached and washed up. It is used chiefly for the mouthpieces of pipes and cigar-holders, for beads, and, dissolved in alcohol, it is made into varnish. The chips of amber are fused under pressure, making an artificial amber, which is stronger than the natural resin. It is also made artificially from copal, camphor, and turpentine.

Ambergris—Ambergris is a substance of waxy texture and consistency, streaked or veined, and of light grey colour, found floating in the sea. It is supposed to be a biliary secretion of the spermaceti whale. It is found in masses usually of only a few ounces, yet occasionally running up to 2 cwt. It has a pleasant odour and is used extensively in perfumery, not so much, however, for its own perfume, but because it makes other perfumes less fleeting than they would otherwise be. It is readily soluble in oils, and in ether and absolute alcohol. It owes its properties to the aromatic substance *ambreine*. Its market value is about £5 per ounce.

Aniseed—Aniseed is the seed of an annual plant (*Pimpinella anisum*), that grows in France, Spain and the Levant. *Star anise* is the seed of *Illicium anisatum*, a Chinese plant; it resembles European aniseed very closely. The two varieties are equally valuable, being almost indistinguishable in flavour, and both yield an oil by distillation. Aniseed is used as a flavouring ingredient in pastry and in liqueurs, and the oil is used medicinally (dose ½ minim to 3 minims), as a stimulant and carminative.

Annatto—Annatto is a dye in the form of a paste, which settles after macerating with water the pulp and seeds of *Bixa orellana*, a plant that is extensively cultivated in the French colonies in South America. It is used in dyeing [page 5907] and as a colouring for butter and cheese.

Apricot—The apricot (*Prunus armeniaca*) is a species of plum, supposed to have been native to Armenia. It is grown in all parts of Europe except the North, in Syria, Egypt, Eastern Asia, and America. In England the apricot is usually grafted on the plum, but the chief supplies for our market come from France. There are many varieties of apricots, and the *mush-mush* of the Levant is dried and compressed apricots.

Arachis—*see Ground-nut.*

Archil—When subjected to the action of ammonia and air, certain lichens of Ceylon and Portuguese East Africa yield the violet-blue dye known as *archil*. The dye is used for wool and silk. Archil is a liquid dye which, on evaporation, gives *cudbear*, and if further treated with ammonia and lime makes *litmus*, familiar to chemists as the agent for determining acids and alkalis.

Areca—Areca nuts, or betel nuts, are the seeds of *Areca catechu*, an Indian palm which grows also in Ceylon and the Malay Peninsula. The nuts are mottled brown and white in appearance, and are about one inch long. The natives chew the nuts, first cutting them into thin slices, adding lime, and wrapping in betel-pepper leaves. The habit has as strong a hold as has the opium habit upon the Chinese, but apparently has no evil effects. Areca nuts are used in Western countries as a medicine for dogs and as an ingredient in dentifrice. Cutch, used in dyeing, is made from areca [see page 5906].

Arrowroot—Arrowroot is obtained from the underground stems of a tropical plant, *Maranta arundinacea* [for botanical classification see page 355]. The finest arrowroot comes from Bermuda. The root stems are white in colour, and grow up to 2 ft. long. The starch which they contain is extracted by macerating and washing them, allowing the fibrous outside portion to be removed, and the milky liquid remaining to settle, after which the sediment is taken out and dried. Arrowroot is rich in starch, and is an easily digested food, hence its value for invalids, but it is low in nutritive value. It is extensively adulterated with potato starch. East Indian arrowroot is obtained from different varieties of *Curcuma*, a plant of the ginger family. Florida starch or Florida arrowroot is made from species of *Zamia*.

Ash—There are several scores of varieties of ash-trees. English ash (*Fraxinus excelsior*) provides the most valuable timber [for its physical strength see pages 1260 and 1261; for botanical classification see page 354, and for principal uses see General Index].

Aspen—See *Poplar*.

BAMBOO—The bamboo (*Bambusa arundinacea*) is the name applied to a group of grasses with woody stems that grow in tropical countries, notably India, China, Japan, and to a smaller extent in Africa and America. The common bamboo (*Bambusa vulgaris*) sometimes grows to a height of over 100 ft., with a base diameter of 1 ft. It flowers at intervals of some years, and the grain is used as a food in India. In the West Indies the young shoots are eaten. The hollow canes are solid at the nodes, and this makes them easily cut into vessels. They also serve as pipes and as curtain poles. Cheap tables and other furniture are made from bamboo, and bicycle frames were made from them a few years ago, but this was a fad which speedily expired. There are over 200 different species of bamboo, and several of them are hardy enough to be grown in English gardens. The young shoots of bamboo are used as a paper-making material, the older stems being useless on account of the silicious external coating which they have developed. [See also page 5724.]

Banana—During recent years the banana has advanced in favour in Great Britain until it ranks high among our imported fruits. Our chief source of supply is Jamaica and other West Indian islands. The cultivated banana is seedless, and is propagated by cuttings. The true banana is the *Musa sapientum*, the *plantain* or *pisang* being a subvariety. The Jamaica banana-tree is about 12 ft. in height, and is larger than the Canary or China banana, which grows about 6 ft. high. The plant has root stems which send forth leaves, the petioles of these leaves forming a hollow stem. The blades spread out from the leaf sheaths, and are 6 ft. long or more. The fruit-carrying stems, which spring straight from the roots, emerge from among the leaves. The fruit grows in huge clusters, such as may be seen in our fruit markets—a cluster weighing up to half a hundredweight. The fruit is gathered green, and ripens on its way to our market. The banana is an important article of food in the countries where it grows, but is generally despised by the higher classes. In Jamaica it is given to cattle. The dried flour of ripe bananas is made into bread and cakes, and has some nutritive value, containing about 20 per cent. of sugar and 5 per cent. of albumin, the remainder being nearly all water.

Basswood—See *Lime*.

Baywood—See *Mahogany*.

Bebeeru—See *Greenheart*.

Belladonna—The belladonna, or *Deadly nightshade* (*Atropa belladonna*) is a perennial poisonous plant that grows in Europe, Asia, and America. The root, the stems, and the leaves are used in medicine, being of value for the active principle *atropine*, which is isolated by distillation with alcohol and chloroform. The dose of the leaves is 1 gr. and of the root ½ gr. (official U.S.A.), but in this country the drug is administered only when prepared as an extract or tincture, or as a preparation of atropine, while externally it is used as a liniment, an ointment and a plaster. Externally, belladonna is applied for rheumatism, neuralgia and local inflammations. Internally it is given for spasms, heart failure, fever, acute sore throats, etc., and in the form of atropine is applied to the eye. The antidotes to belladonna poisoning are the stomach-pump and emetics, followed by stimulants, also apomorphine and pilocarpine injected hypodermically.

Benzoin—Benzoin, otherwise called *gum benzoin* or *gum Benjamin*, is a resinous balsam from the *styrax benzoin* of Java and Sumatra. The chief uses of benzoin are in the manufacture of perfumery; as an incense for church use; and in medicine. When lard is used as an ointment base, benzoin is usually added to preserve it sweet. As an external application benzoin is stimulating and antiseptic; compound tincture of benzoin, which is known as *Friar's balsam*, is in esteem as a dressing for wounds. Internally, benzoin is antiseptic, and a stimulating expectorant.

Betel Nut—See *Areca*.

Bibiri—See *Greenheart*.

Birch—The common birch (*Betula alba*) is the most graceful tree of our woods, and is one of the hardest. It can grow in the most exposed situations, and is the only tree found in Greenland. It flourishes throughout Northern Europe and Asia. It grows as high as 80 ft., and has small, serrated leaves, and its fruit is a small nut. The thin outer skin of the bark, which has caused it to be known in some districts as the *silver* birch, was formerly used as a writing material. The bark has been used extensively for canoes by the North American Indians, and in Lapland it is used as a roofing material—two evidences of its enduring qualities. It contains about 10 per cent. of tannin, and is used in leather manufacturing—both in this country and in Russia. Russia leather owes its characteristic properties to birch bark, which, in addition to its tannin, contains an aromatic oil which the leather absorbs. The oil is extracted from the bark and used in leather dressing, and also as an antiseptic for open wounds by Russians. Birch trees are easily propagated from seeds, which are sown in spring in a fine sandy soil, which should just cover them. The wood is soft but durable, with a close and even grain. It is largely used for chair and furniture manufacture, and much turned woodwork is made from it. Selected pieces with fine wavy markings on the surface are used in the form of veneer. There are numerous varieties of birch in Europe and America.

Black currants—See *Currants*.

Bog oak—See *Oak*.

Borax—Borax is biborate of soda and occurs naturally in several parts of the earth, although it is also manufactured from boracic acid obtained by evaporating the waters of the volcanic lagoons of Tuscany, and from borate of lime found in Peru. The oldest source of native borax is Tibet, and it is imported by way of India. It comes from the East under the name of *tincal*, and is frequently received refined, the operation of refining being performed by dissolving it in water and allowing it to recrystallise. The chief source of borax is now the Pacific slope of North America—the Columbus Valley in the State of Nevada, the largest known borax field (10 miles long and 7 miles broad), being a desolate and forbidding region, devoid of vegetation except small saline plants. The most important use of borax is as a flux in glazing pottery and in welding and brazing metals. Boracic acid, the valuable antiseptic and antiputrefactive, is obtained by the action of sulphuric acid on borax. It is used as a powder, as an ointment, a lotion, and in many other forms. Both borax and boracic acid are used to preserve milk and other foods; medical opinion is divided upon the value of this practice, many experts holding that, especially in the case of children, it is pernicious.

Boxwood—Common boxwood (*Boxus sempervirens*) is an evergreen shrub familiar as an edging for garden plots. It is propagated by cuttings, and is developed best by division. It grows slowly. Some varieties of boxwood may reach the height of 20 ft. The wood is hard and close, fine grained, and of even texture. It is most familiar as the material from which carpenter's rules are made, and it is also used for wood engraving and tool handles. Owing to the small supply of true boxwood, a substitute has been found in the West Indies, and is largely used. It is known as West Indian boxwood, or white cedar.

Brazil Nut—The Brazil nut that reaches our market is the fruit of a tree (*Bertholletia excela*) that grows in Brazil, Venezuela, and Guiana. The nuts or seeds—usually from 18 to 24 in number—are contained in a hard shell of round shape and about 6 in. diameter. This outer shell is broken, and the seeds are extracted and dried in the sun before being packed for export. The nuts are rich in oil, of which they can be made to yield 60 per cent. of their weight. The process of oil extraction consists in roasting the nuts and expressing the oil by pounding and pressing. The oil may be recovered also from the unroasted nuts. When fresh, Brazil nut oil, or *Castanha oil* as it is usually termed, may be used for culinary purposes; but as it soon turns rancid its use is chiefly for soap-making and burning.

Broom corn—The broom corn is extensively cultivated for the fruiting stalks, which are cleared of seed and used for carpet brushes or *carpet whisks*, as they are termed, and dandy brushes for stable use [see page 6106]. The plant is the grass *Sorghum dura*, which is allied to the sugar sorghum [see page 4354]. In America, broom corn is an important crop. It is sown as early as possible in rows about 3½ ft. apart. When the shoots appear, they are hoed and soon afterwards thinned. Then a shallow cutting plough is run between the rows. The corn tops are cut while the corn is yet green, and the seeds are removed by a machine. Then the "brushes," or panicles, are spread on racks to dry and are packed for transport or go into the factory to be made into brushes. The corn stalks after the removal of the crops are 5 ft. to 6 ft. high ; they are allowed to remain and are ploughed in the following spring.

Buckwheat—See *Millet*.

CAMEL HAIR—Camel hair is an important article of export from North Africa, Asia Minor, and Central Asia. It is the hair both of the dromedary or single-humped camel and of the two-humped camel proper. It has different degrees of fineness, and different colours according to locality, and to the age and individuality of the animal from which it is taken. One animal yields hair to the extent of about 10 lb. annually, the underside of the neck, the humps, and the upper legs being the places yielding hair sufficiently long to be commercially valuable. The hair from the younger animals is the finer. The Arabs weave it into cloth, making shawls, carpets, etc., with it. Some very fine cloths, which are both warm and soft, are made with it, and the modern prophet who followed the example of his ancient prototype in affecting "garments of camel's hair" would not necessarily lead a life of bodily discomfort. The so-called camel-hair brushes are made with the hair of squirrels' tails, and not with the hair of the camel.

Camphor — Camphor may be regarded as a resin as it is soluble in alcohol to the extent of 1 in 1¼, while it is soluble in water only to the extent of 1 in 700. It is a white crystalline substance obtained from the *Cinnamomum camphora* of Formosa and Japan. It reaches this country in the form of cubes of various sizes and of bells. Flowers of camphor is the powdered form. Camphor is used in wardrobes and museums to prevent the ravages of moths ; as an ingredient in varnishes ; in the manufacture of fireworks ; and in medicine. For external application camphor is of value in sprains, rheumatism, and inflammation, and internally (dose 2 to 5 grammes) it is sedative, carminative, and antiseptic ; and is given for nasal catarrh. It is also used extensively in the manufacture of celluloid or xylonite [see page 5470].

Carrageen—See *Irish Moss*.

Catechu—See *Areca* and *Acacia*.

Catgut — Catgut may be included among the natural products. It is made from intestines, but never from those of the cat, hence the name is entirely inappropriate. The intestines used are generally those of the sheep, and sometimes those of the horse, mule, and ass. The first process in manufacture is to clean the intestines thoroughly, after which the small ends are tied together and laid over the edge of the vat or tub, in which the greater portion of the intestine remains to soak for a few days, the water being frequently renewed. This treatment loosens the membranes. Now the intestines are laid on a sloping table and scraped with a steel instrument, which removes the external membrane, which is used for making the strings of tennis rackets and other purposes. The intestines from which the outer membrane has been removed are then steeped for one day and again scraped. The large ends are now cut away and sold for sausage skins. The small parts are again allowed to lie in water, and are then steeped in a bath of water in which potash and carbonate of potash have been dissolved (1 oz. of each to the gallon of water). Then they are drawn by hand or machine through a perforated thimble, which makes them uniform and smooth. After a final washing they are sorted according to size, and are ready for the market if to be sold unspun. If desired to twist them into cords, the lengths are sewn together, the external membrane removed at the first scraping being used as a thread. The sewn lengths are put in suitable numbers into a sort of rope-spinning machine, where they are twisted. They then go into a lead-lined chamber, where they are exposed to sulphur fumes, and are then dyed, smoothed, heated for a short time to make them firm, twisted into strands, and are ready for the market. The chief use of catgut is for musical instrument strings and for cords for clock-weights. It is also used as a cord for sash-weights in sliding window frames. The *silkworm gut* used for anglers' hooks is made by taking the silk glands from the body of the silkworm before it has begun to spin, by extracting therefrom the silk which is still glutinous, and by drawing it out into a thread.

Cedar—The cedars of Lebanon (*Cedrus libani*) are famous historically, and furnished the wood for the Temple of Solomon, but they have ceased to furnish timber for industrial use. The word cedar is now applied to the timbers of different trees which all have the qualities of yielding wood of even grain, light and soft and sometimes aromatic. Cedar used for lead pencils is chiefly the wood of *Juniperis bermudiana*, a red-coloured fragrant wood with the required properties. Red cedars of India and the West Indies are extensively used for cigar boxes. The Indian cedar, or *deodar* (*Cedrus deodara*), is looked upon as sacred, and is found around Indian temples. It is also used for sacred images, for coffins, and for railway sleepers. It is the chief tree of the Himalayas, and grows in forests. The different varieties of cedars are used for furniture—being valuable for the interiors of wardrobes, etc., on account of their immunity from attack by insects—and for wainscotting and turning. The consumption is so great that the market is always on the look-out for new sources or for woods with equally suitable properties. The cedar is one of the most imposing trees in an English landscape, its dense branches of dark leaves making it distinctive. Californian redwood (*Sequoia sempervirens*) is a red cedar, and its timber is the softest used in commerce. The mammoth tree of California (*Sequoia gigantea*) is another variety. It is found only in California, and specimens have been known over 400 ft. high and 110 ft. in circumference. One tree has had a tunnel made through its base, and a roadway goes through it. The *White Cedar* of the West Indies is used as a substitute for boxwood [see *Boxwood*].

Century plant—See *Sisal*.

Charcoal — Charcoal may be wood charcoal or animal charcoal, made by burning wood and bones respectively. In making charcoal intended for fuel, the usual practice is to pile the wood into heaps, usually in a dome-shaped kiln, and burn it until it is charred, the charred wood, which retains its original shape, being the charcoal. For the manufacture of charcoal for gunpowder special care is exercised in selecting the wood, which must be sound and free from adhering bark, and the heat is applied to the outside of cast-iron retorts in which the wood has been placed. Animal charcoal or *bone-black*, as it is also called, is made by heating bones in a retort or crucible, when gases are given off, some of which condense as a heavy oil, called *bone oil*. The chief uses of wood charcoal are as fuel in the manufacture of gunpowder, and as a non-conducting material for cold storage chambers. The chief use of bone charcoal is for decolorising syrups and in sugar manufacture. [See also page 4451.]

Cherry—The cherry is a small fruit of the plum family. There are many varieties of cultivated cherries, which have probably all evolved from *Prunus avium* and *Prunus cerasus*. Cherries are grown extensively in this country, although we derive some supplies from continental Europe and from Canada. Cherry trees should be planted in an open situation with a southern aspect. Standard cherry trees should be planted 24 ft. apart and bush cherry trees 6 ft. apart. Branches should be thinned in July and December every year. The late morello cherry, one of the best cooking varieties, grows best on a wall. Cherry brandy and various liqueurs, including maraschino, kirschwasser, and ratafia, are made with cherries. To make cherry brandy, fill a bottle half full of morello cherries —having cut off the stalks, wiped the fruit and pricked it with a needle. To each pound of cherries add twelve scraped bitter almonds and 3 oz. of sugar candy ; then fill the bottle with brandy and allow the whole to stand for not less than six months, after which the liquor may be strained off. There are numerous varieties of cherries, the chief of which are the late morello and the Kentish (both good cooking cherries), the early yellow Elton, the May Queen, the Archduke, and the Black Eagle.

Chestnut—The chestnut (*Castanea vulgaris*) is found in Europe, Asia Minor, and in temperate America. It is also known as the *Spanish* or *sweet chestnut*. The chestnut tree is hardy, but the fruit comes to ripeness only if the situation is sheltered. The tree must have not less than 20 ft. of space all round. The wood resembles oak in colour, being of various shades of brown, and is used for similar purposes. The roof of Westminster Hall is alleged to be chestnut. The wood of old trees is somewhat brittle, and when strength is wanted, younger trees are selected. The nut of the chestnut tree is edible, and is usually roasted. When the nuts are ripe and full, they should be gathered, taken from their husks and dried. The dried nuts are sometimes ground into flour, and made into bread or fritters. The Italians favour chestnuts as a food, and have several methods of cooking them. They make a porridge of chestnut flour, and call it *polenta*. They also sprinkle rose-water and grated cheese upon chestnut flour fritters, afterwards frying them in fresh butter. The chestnut is not particularly nutritious as a food, but roasting makes it much more easily digested. The nut of the horse chestnut (*Æsculus hippocastanum*) is too bitter for human food, but is sometimes given to cattle. It also contains an oil of a dark green colour, which is expressed, and in Continental countries is regarded as a specific for rheumatism and gout.

China Grass—See *Ramie*.

Citron—See *Lemon*.

Clingstone—See *Peach*.

Coca Leaves—Coca leaves, the source of the valuable local anæsthetic *cocaine*, are the leaves of *Erythroxylum coca*, a shrub that grows in Bolivia, Peru, and in some parts of Southern Asia. The Bolivian leaves are brownish green in colour, oval, and vary in size from 1¼ in. to 3 in. long, by from 1 in. to 1¼ in. broad, with a characteristic odour and a bitter taste. Peruvian coca leaves are smaller and more fragile. Coca has remarkable sustaining properties upon both the mental and physical organs, and the South American natives chew the leaves, mixed with lime and the ash of a local plant. The drug is insidious and intoxicating, and many men become slaves to the habit, which shortens life. The official dose of cocaine leaves is ¼ dr. to 2 dr. Of the various preparations of coca, the principal is coca wine, given as a nervine and muscular tonic. Of the alkaloids contained in coca, cocaine is the chief. It is used in dentistry as a local anæsthetic, being injected hypodermically into the gum; also externally for burns, insect bites, fevers, etc; and internally as a stomachic. The preparations from cocaine and its salts are very numerous. Antidotes to cocaine poisoning are amyl nitrite, nitroglycerin, digitalis, strychnine, ammonia, and strong coffee, and ether in hypodermic injections.

Cochineal—Cochineal is the name of a dye and of the insect from which that dye is made. This insect is the *Coccus cacti*, the chief sources of which are Guatemala and the Canary Islands. It lives upon several species of cactus, the principal being *Cactus nopal*. The insects are carefully reared, and the females are placed in gauze bags, which are hung around upon the leaves of the growing tree, the buds of which are removed as they appear, so as to give all the sustenance to the leaf growth. As the young insects are born they spread themselves over the leaves. When the time of spawning approaches they are collected into baskets, spread out on the ground or on trays for some time, then placed in heated ovens for a few hours, and finally thoroughly dried in the sun. Black cochineal and silver cochineal are the names given when differently prepared for the market. Cochineal is frequently impoverished or adulterated. Its chief use is in dyeing, although the coal-tar dyes have seriously impaired its value.

Cocoa—Cocoa, or cacao, is the pod fruit of an evergreen plant, *Theobroma cacao*, which grows in the West Indies, tropical America, Guinea, Ceylon, and elsewhere. [The manufacture of cocoa and chocolate has been described on page 6555.] The cultivation of cocoa demands care. The seeds are taken from the ripe pods, and are sown about 1 ft. apart in furrows 2 in. deep, and just covered with earth, on the top of which plantain leaves are spread. After two weeks, shoots will have appeared, and must be kept well watered until they are 14 in. or 16 in. high. Then they are transplanted to sheltered situations, where the soil is well irrigated. The cocoa-tree requires shade, and this is got by planting with them coral-bean trees, which grow much higher than the cocoa-tree. The trees must be pruned regularly, so as to develop a single stem with a full head. There are two harvests a year, in June and December; but in the tropics the fruit gets ripe throughout the year, and what is ripe is gathered fortnightly. The pods are detached with a knife on the end of a pole. The average yield is 6 ℔. per tree per annum. Before being exported the pods are cured [see page 6555].

Coconut—The coconut, generally miscalled *cocoanut*, is the fruit of *Cocos nucifera*, a tropical palm, and must not be confounded with the evergreen *Theobroma cacao*, whose pod fruit is made into cocoa and chocolate [see above]. The coconut palm is found in nearly all tropical countries, and there is no single tree, except perhaps the bamboo, which is so generally useful. In the Pacific Islands, in the East and West Indies, and in tropical East and West Africa, the tree grows abundantly. The trees are propagated from the nut, and are planted during the first four months of the year, or in August. The situation should have sun exposure, and the patch of ground should be elevated, so that it may be drained naturally. The nuts are planted about 1 ft. apart in trenches, which are kept moist, but not wet. The shoots are transplanted from two to twelve months after their appearance. About the seventh year the tree begins to bear fruit, and attains maturity about the tenth year, and continues to yield fruit until the seventieth or eightieth year. The annual yield of a tree is from fifty to a hundred nuts. The kernel of the nut contains about 70 per cent. of fat, which, in the form of coconut oil, is largely used in soap manufacture [see page 4832] and for candles. In the West Indies, coolies eat the oil, using it as we use butter. The coconut palm can be diverted from bearing fruit by cutting off the flower stalks; then, by making an incision in the stump and beating it, the juice, which is called *toddy*, is made to flow. This is an esteemed beverage, but ferments quickly, and becomes very intoxicating after standing a few hours. It serves as yeast, and is extensively used by bakers in Ceylon and elsewhere. A sugar known as *jaggery*, and resembling maple sugar, is made from toddy, the unfermented juice being boiled to a syrupy consistency and poured into buckets, where it crystallises. This jaggery is a valuable article of food in some districts; and it has also a limited use in the manufacture of a cement, being mixed with white of eggs and the lime from burnt shells. This cement is highly tenacious, and, when polished, resembles white marble. The fibre that encloses the coconut comes into our market as *coir*. The fibre covering is removed from the nut before the latter is fully ripe, as, if allowed to remain, it becomes more coarse. It is then soaked, preferably in salt water, from six to eighteen months, or for a shorter time if tanks wherein the water is heated by steam be used. The husks are then beaten or crushed in a mill, and finally "willowed," when the fibre is ready for export. The chief use of the fibre is for press bags, used in oil refining, and candle making, for mats and matting, for cheap scrubbing brushes, for a coarse cordage chiefly used in the harvest field, and as a stuffing for cheap furniture. The bark of the coconut palm yields a strongly cohesive gum.

Cod-liver Oil—Cod-liver oil is extracted from the liver of the common cod (*Gadus morrhua*). The chief sources of cod-liver oil are Norway and Newfoundland, the former drawing its supplies of fish from the North Sea, and the latter from the Newfoundland banks. Great improvements have been made in the methods of extracting the oil, with good results regarding the purity and quality of the product. The livers must be fresh, not more than twelve hours after the fish is caught. Good, healthy livers only are selected, others being rejected. They are placed in tubs or open barrels, and as the oil exudes it is ladled off. The livers are then subjected to heat not exceeding 180° F., and more oil exudes. The oil is then subjected to extreme cold in chambers furnished with cylinders or pillars containing brine and snow. The portion that remains after reducing the temperature is drawn off, strained, and filtered, and constitutes the finest medicinal cod-liver oil. After the livers have been subjected to the natural expression described above they are heated again, which causes a further expression, the result being a darker coloured and slightly inferior oil, which is still, however, used medicinally. After this treatment the livers are boiled down, and yield the dark brown cod-liver oil used by tanners and for fattening cattle. The refuse livers are used as manure, and are added to other refuse matter in the manufacture of what is called *fish guano*. Other fish besides the cod—the ling, the turbot, the haddock, etc.—yield oil, which is sold as cod-liver oil, but no oil other than that from cod livers is regarded officially as cod-liver oil. Cod-liver oil has nutritive properties, and is also an active alterative; it is extremely valuable in cases of phthisis. Some stomachs reject it or accept it with difficulty, hence it is frequently given as an emulsion made by mixing with yolk of eggs, water, and other ingredients.

Cola Nuts—See *Kola Nuts*.

Colocynth—Colocynth, or bitter apple (*Colocynthidis pulpa* of the British Pharmacopœia), is the dried pulp of the fruit of *Citrullus colocynthis*, a creeping plant of the cucumber family that grows in Asia, North Africa, and some parts of Europe. When fresh, the fruit is green, but is yellow-brown when dried. Turkey colocynth is considered better than Spanish colocynth, although its superiority has not been established. The official dose is 2 gr. to 8 gr. It is a frequent ingredient in aperient pills, and is a drastic cathartic. The active principle of colocynth is *colocynthin*, a glucoside in the form of an amorphous yellow powder (dose, fifteen minims of a 1 per cent. solution in glycerin).

Copal—Copal resins, much used in the manufacture of superior varnishes for outdoor use, include East African copals, American copals and Kauri, Cowrie or New Zealand copals [see page 1034].

Coral—Coral is formed by some of the marine animals known as *Cœlentera* (meaning hollow-bodied), which have the power of absorbing lime from sea-water, and of building up therewith limy skeletons. These limy skeletons in the mass form what we know as coral, of which there are numerous varieties. The delicate pink coloured coral is the most esteemed variety, and is the dearest. Then there are red, black, and dull-white corals, all of them divided again into several varieties, usually according to colour. The chief sources of commercial coral are along the coasts of Italy, in Dalmatia, and in Algeria. The sole use of coral is for purposes of ornament, particularly for manufacture into beads, which is an important Italian industry.

Cotton Wood—See *Poplar*.

Cudbear—See *Archil*.

Currants—The dried currants of the grocery shops are small seedless grapes, grown in Greece and the Levant; they are dried and trodden into casks. The name *currant* is a corruption of Corinth, from the district around which they have always come. The currant grape is also grown in Italy, and made into certain kinds of Italian wine. The currant of Greece must not be confused with the berries grown in English gardens, of which there are three varieties—the red currant (*Ribes rubrum*), the white currant (*Ribes album*), and the black currant (*Ribes nigrum*). Black currants make the most profitable market crop. The young shoots are those which carry fruit, and every year all the dead wood and much of the old wood should be cut away. Only as much of the young wood should be cut as will prevent overcrowding of the shoots. In red and white currants slightly different conditions prevail. The young wood should have much more cutting, and the old wood much less, as the latter carries the berries. In May the new shoots should be cut to five leaves, and in the following November to two buds, at which time also the leading shoots should be cut down to six inches long. Bushes without branches in the centre yield the best crop. All three varieties do best in fairly rich soil deeply trenched.

DAMMAR—Dammar is the name applied to a number of resins the chief of which is *Singapore dammar* or *white dammar*, the resin of the Amboyna pine (*Dammara orientalis*), of Java and Malacca. Dammars are used for varnishes and for making sticking plaster.

Damson—The damson is a small, hardy plum largely grown in England, and originally imported from the Levant. The name is a corruption of Damascus plum. It is used for cooking and preserves, and for a pressed conserve called *damson cheese*. The mountain damson, or bitter damson of the West Indies, is the *Simiruba amara*.

EBONY—The name ebony is properly applied only to the heartwood of the trees of the genus *Diospyros*, but it is frequently applied loosely to any hard black wood. The best black ebony comes from India, Ceylon, and the Malay Peninsula (*Diospyros ebenum*). The heartwood is quite black, while the sap wood is white; the latter is removed before the logs are shipped. *Green ebony*, so-called, comes from certain of the West Indian islands, and *red ebony* from Madagascar and Mauritius. Jet black ebony is the species most highly valued. It is used chiefly for inlaid work, and for small turned articles. [For the strength of ebony, see page 1260.]

Elm—There are many varieties of elm; four are found in Great Britain and two are abundant, the common elm (*Ulmus campestris*), and the wych elm (*Ulmus montana*). [For the physical properties and strength of elm see pages 53 and 1260.] Elm is largely used for piles and other work under water. Old water conduits are found to be elm trees hollowed out into cylindrical shape. Elm, however, decays where it is wet and dry frequently in succession. It is also a favourite wood for making coffins. *Spanish elm* is a West Indian wood (*Cordia gerascanthus*), the timber of which is also known as *Prince wood*.

Esparto— Esparto, or alfa (*Stipa tenacissima*), is a grass that is extensively used in paper-making in this country, although it is used for this purpose nowhere else. It grows in Spain, Portugal, Greece, North Africa and elsewhere. It is hardy and can be cultivated in England. The grass grows in tufts and the interior of the leaf sheath is hairy [see page 6280]. The best localities for esparto are on the sea coast facing south and at moderately high altitudes. Chalky soil is best and clay is unsuitable. It is twelve years after sowing before the plant becomes profitable. The most profitable propagation is by burning down the annual flower stems, and a good crop is got five or six years later; but this method is possible only on old esparto land. One acre may give ten tons of the grass. Harvesting can be done only in dry weather, when an experienced man can pull the leaves from the stems, leaving the latter uninjured to develop fresh leaves again. In addition to paper-making, esparto is used for cordage, sieves and baskets, and in upholstery.

FLAX—The uses of flax (*Linum usitatissimum*) have been discussed elsewhere [see General Index]. The seed of the plant—*linseed*—is chiefly used for the oil it contains, which is expressed from it, and which is used as a vehicle for paint, as a cattle medicine and in linoleum manufacture. The residue from the oil-press is made into cake and is a valuable cattle food. Crushed linseed—the *linum contusum* of the British Pharmacopœia—is used medicinally chiefly for poultices, and flax seed is also sometimes given internally for habitual constipation, a teaspoonful floating in water being taken before breakfast. Carron oil, used as liniment for burns, is a mixture of linseed oil and lime water in equal parts.

Freestone—See *Peach*.

GAMBOGE—Gamboge is a gum resin from a tree (*Garcinia morella*) that grows on the coasts of Ceylon, Cochin China, and elsewhere in Asia. The bark is incised as soon as the flowers appear and the resin exudes. It is imported in the form of solid and hollow cylinders, and in cakes; the most esteemed variety being Siamese gamboge in the form of pipes. The chief purpose of gamboge is as a pigment, but it is also used medicinally as a purgative. It is an official preparation in India and the Eastern Colonies.

Gooseberry—The gooseberry (*Ribes grossularia*) grows wild in temperate Europe and in Western Asia, and has of recent years been introduced and successfully cultivated in the United States. It is a hardy plant and grows better in the north of Britain than in the south. The soil should be fairly heavy, deeply dug, and well manured. Full grown bushes should be 5 ft. or 6 ft. apart. The plants are usually reared from shoots, which ought to be cut in September and should be not less than 12 in. long. Cut off the tops of the shoots and plant with about 4 in. showing above ground. Pruning should be attended to, old wood cut away as new shoots appear, and cross branches removed with the knife. The pruning should be sufficient to allow sunlight into the middle of the bush and to permit entry of the hand for picking. Young bushes will yield a crop of about three tons to the acre and after three years quite six tons.

Grape Fruit—See *Shaddock*.

Graphite—Graphite is frequently miscalled plumbago or blacklead, an error which has arisen from the supposition that lead was one of its constituents. It is a native form of carbon, and is found in the form of masses or sheets with mica schist, granite, and other minerals. Its geographical distribution is very wide, and it occurs generally throughout the globe. The only known deposit for many years was at Keswick, in Cumberland, and the mines there were worked to enormous profit for a long time. The chief sources at present are Siberia and Ceylon, the principal known deposit in the former country being in the hands of Faber, the famous German pencil-maker. Apart from the manufacture of lead pencils, graphite finds its most important use as a material for crucibles, and is also used as a dry lubricant, and as a stove polish. It is used also in electrotyping and as a conductor in electrical work. It is manufactured artificially by heating coke in the electric furnace.

Greenheart — Greenheart (*Nectandra rodiæi*) is a tree of British Guiana. It is highly esteemed for its strength, elasticity and enduring properties [see pages 57, 1260 and 6497]. From the bark, which is known as *bibiri* or *bebeeru* is prepared *buxine* or *pelosine*, a sulphate of beberine, used in medicine as a tonic and febrifuge (dose 1 grain to 10 grains).

Ground Nut—The ground nut, also known as the pea-nut, or monkey nut, is the nut of a low creeping plant, *Arachis hypogæa*, which is extensively cultivated in India and the Malay Peninsula, Africa, and America. The nuts are nutritious, and are much eaten in America, being usually roasted. The most economical method of extracting the oil is to clean the nuts, remove the shells, and winnow the kernels free from shells and dirt. The oil is then pressed out cold, after which the residue is finely ground and put under great pressure under steam heat, yielding an oil of an inferior quality. Sometimes there are three expressions yielding respectively a culinary oil, an illuminating and wool-dressing oil, and finally a coarse oil suitable for soap-making. Nut oil is often substituted for olive oil.

Guaiacum—See *Lignum Vitæ*.

Guano—Guano is the excretion of sea fowls, such as sea gulls, penguins, cormorants, and its value as a manure is due to the fact that it contains the most valuable constituents of plant food in a form that can be readily assimilated by the plants. The precise composition of guano depends upon the locality from which it has come, upon the animals or birds responsible for its production, and upon the food of these birds or animals. The chief constituents are nitrogen and phosphates. Nitrogenous guano comes from hot, dry countries, and phosphatic guano from damp countries; the former variety is the more valuable. The best supplies have come from the Chincha and other islands off the Peruvian coast, and less valuable supplies from Patagonia and West Africa. The known supplies of guano are fast becoming exhausted. Artificial guanos are manufactured chiefly from fish and fish offal. Norway has many guano manufactories, making guano from fish.

Guinea Corn—See *Millet*.

Gums—A gum is a substance obtained from plants, and capable of solution in water, so as to form a sticky fluid with more or less adhesive properties. Various so-called gums used in varnish-making and for other purposes are not gums proper, being soluble in alcohol and not in water; they are properly resins [see *Resins*]. The most common gums proper are gum arabic or gum acacia (which constitutes quite a class derived from several sources), gum tragacanth, agar-agar and Iceland moss. Gum arabic is the exudation from the stems and branches of *Acacia senegal* and of other species of acacia. It occurs in the form of round or ovoid tears or irregular masses, and is yellowish in colour or almost colourless. The trees which yield it grow in Egypt and the surrounding districts. The last variety is generally called *gum senegal*. The *mucilage of acacia* of the British Pharmacopœia is made by dissolving 4 oz. of gum acacia in 6 fluid ounces of water. It has a limited use in medicine, not for its medicinal effects, but because it enables other drugs to be held in suspension or in cohesion. Ordinary office gum is made with gum arabic, but is frequently adulterated with or replaced by dextrin. Gum arabic is also used extensively in certain branches of the textile trades. *Gum tragacanth* comes from Asia Minor and Greece. It is the exudation of *Astragalus gummifer*, and has stronger cohesive properties than gum acacia. *Agar-agar* is a seaweed (*Plocaria lichenoides*), found in China and Malaya and is used for jellies, paper varnish, and other purposes. *Iceland moss* is a lichen found in Iceland and North Europe, and is used for similar purposes.

HAZEL—The hazel (*Corylus avellana*) is a common British shrub. It is too small to yield timber of commercial value, but the wood is used for garden furniture, and forked hazel twigs are the common divining rods used by those with the mysterious ability to find water by their means. Hazel nuts are esteemed as a dessert fruit. They yield an oil by expression, and this oil has a limited use in perfumery.

Hemlock—The common hemlock is a native British plant (*Conium maculatum*), of the order *Umbelliferæ*. It is a tall plant having a smooth stem with purple markings, and finely cut, glossy, green leaves. It has a strong objectionable odour and is a poisonous plant. It is used medicinally, usually in the form of a tincture, its action being to paralyse the respiratory centres and the motor nerves. In addition to the hemlock plant which grows in this country, the name is applied to certain North American trees, which are used locally as a building timber. Hemlock bark, so-called, is obtained from one of these trees (*Abies canadensis*), and is a very important tanning material in Canada and the United States. It contains from 7 per cent. to 10 per cent. of tannin and produces a leather of reddish colour. Hemlock extract, containing about 30 per cent. of tannin, is made from the bark and is exported from Canada to the United States and to Europe.

Henbane—Henbane grows in England (*Hyoscyamus niger*) and throughout Northern Europe and Asia. It is a tall herb with large hairy leaves and a pungent odour. Extract of henbane is used in medicine (dose 1 gr. to 2 gr.), and is a hypnotic and narcotic. It contains the poisonous alkaloids *hyoscyamine* and *hyoscine*. The antidotes are the same as for belladonna [see *Belladonna*]. Numerous medicinal preparations are made from henbane.

Henequen—See *Sisal*.

Holly—The common holly (*Ilex aquifolium*) is a well-known hedge tree, growing very close, though slowly. The red berry makes the holly an esteemed decorative tree. From other varieties of holly, which are widely distributed throughout Europe and North America, the holly wood of commerce is obtained. It has a fine close grain, is tough and hard, and is used for cog-wheel teeth, and in cabinet-making.

Horn—Horns are important articles of commerce although many of the manufactures for which horn was formerly the sole material are now made of metal, celluloid and vulcanite or hard rubber. Horns are imported into Great Britain from many countries, the chief being France, Germany, and the Argentine Republic, although none of these supply so much as our own India. The most valuable horns imported and used in manufactures are those of the Brazilian ox, the Cape buffalo, and the Arnee buffalo of India. The most important uses of horn are for combs, for buttons, and for handles for cutlery, umbrellas, and walking-sticks. The horn is prepared for comb manufacture by being softened in water and then in acid; it is then split or sawn into thin pieces, which are subjected to hydraulic pressure. Pieces of horn may be joined together by pressure and heat, and no evidence of the junction will be revealed. Horn may be dyed as desired [see page 6767].

Hyssop—Hyssop (*Hyssopus officinalis*) is cultivated in the South of France. It is a hardy plant, aromatic and bitter. The leaves are used to flavour salads, and are one of the ingredients in the beverage absinthe. The dried flowers are medicinal. An essential oil is obtained by aqueous distillation.

ICE—Ice is a natural product, imported into this country in considerable quantities from Scandinavia. The imports have fallen since ice began to be manufactured artificially. When the ice on the Norwegian lakes is about 12 in. thick it is cut. First an ice plane drawn by horses is passed over it, and then parallel and equidistant grooves are cut with a hand plough, and deepened with an ice plough. A saw is used to remove the first few blocks and the remainder are detached with the help of special breaking bars. The blocks are then floated to the ice-house or to the place of transport, during which they are generally protected by pine shavings.

Indian Hemp—Indian hemp, the *Cannabis indica* of the British Pharmacopœia, is the dried flowering or fruiting tops of *Cannabis sativa*, which grows in Northern India. The herb is an annual, 8 ft. to 10 ft. high. The form in which it reaches the western market is a compressed mass, consisting of the stems, leaves, and fruit, matted together with the natural resin of the plant. The official dose of the bark is 5 gr. to 15 gr.; the pharmaceutical preparations made from it are an extract, a fluid extract, a draught, a tincture, and pills. It is narcotic and anodyne, and is given for hysteria, asthma, and migraine. Overdoses are poisonous, although no death from it is on record. The antidotes for it are the stomach pump, emetics, stimulant draughts, artificial respiration, and coffee. Indian hemp induces dreams; is the *hashish* of Alexandre Dumas; and the *bhang* of India.

Indigo—The uses of the dye indigo have been discussed elsewhere [see page 5781]. The cultivation of indigo is an important Indian industry, although the synthetic manufacture of indigo [see page 5463] has inflicted great injury to the cultivation of indigo. Many plants in many tropical and subtropical countries yield indigo; but the most important is *Indigofera tinctoria*. The best soil is rich loam, alluvial for preference. Ploughing takes place in October and November, and sowing in February, March, and April. The harvest is in July, August, and September, when the blossoms are full. The dye is generally prepared by the green leaf process. In this process the plants are cut down and put into tanks, being held down by beams placed on top of them and athwart the vats. They are covered with water and allowed to steep from ten to sixteen hours, the duration depending upon the weather. Men then go into the tanks and agitate the contents for from two to four hours, until the fecula begin to separate and settle and the colour of the water changes from green to blue. More water is added, and this hastens the deposition of the fecula, and after a few hours the water is run off from the top, leaving the deposited fecula, which is then taken and boiled for about six hours under continuous stirring. The contents of the boilers are run off into strainers, and after about twelve hours the remaining mass is pressed, cut, stamped, and dried, the final product being the indigo of commerce. Other sources of indigo, besides India, are China, Japan, Siam, the Philippines, Java, and some South American countries.

Ipecacuanha—The drug known under this name is the root of *Psychotria ipecacuanha*, a shrub growing in South America and the East Indies. Its uses in medicine are as an expectorant and an emetic. It is a favourite remedy for croup and other diseases of children, being given generally as ipecacuanha wine (adult dose 10 drops to 30 drops as an expectorant, and 4 drachms to 6 drachms as an emetic). The dose of the powdered root is ¼ gr. to 2 gr. as an expectorant, and 15 gr. to 30 gr. as an emetic. The drug contains two alkaloids, *emetine* and *cephæline*, and powders and other preparations from which the former is extracted, are given for dysentery. Extracts, tincture, syrup, and pills of ipecacuanha are also made.

Irish Moss—Irish moss, or Carrageen, is a seaweed (*Chondrus crispus*) the commercial sources of which are the west and north-west coasts of Ireland and a small part of the coast of Massachusetts. In America, whence comes the greater quantity, the moss is pulled from May to September, boats being used to reach the rocks. Spring tides are usually chosen for the pulling, as the ebb of the tide leaves more rock surface uncovered then. The moss is bleached in the sun, washed repeatedly in salt water, and dried. Irish moss is used medicinally for jelly for consumptives, and as a decoction flavoured with sugar and lemon juice it is demulcent and nutritive. It is also used for refining beer, and the poorer qualities for making size for cotton and paper. Sometimes it is fed to cattle.

Istle—See *Sisal*.

Ivory—True ivory is the tusk of the Indian and African elephant. When the elephant is tamed, the tusks decrease in size and deteriorate in quality, hence the tusks of the wild elephant form the best ivory. The African elephant usually possesses larger tusks than the Indian elephant. The former have yielded tusks up to 200 lb. weight, and even heavier, but the latter seldom show more than 70 lb. weight. The use of ivory has diminished for cutlery hafting, billiard balls, etc., since xylonite or celluloid appeared on the market. Tusks that are only slightly curved are preferred to those with sharper curves and twists. *Fossil ivory* or *mammoth ivory* is a true ivory from the ice-preserved remains of the extinct mammoth elephant *Elephas primigenius*, and is found within and near the Arctic circle of the three northern continents—notably in Siberia. The largest variety—supposed to be the tusks of the male—are about 9½ ft. long, and a smaller variety—supposed to be the female—about 5½ ft. long. These are true ivories; there are other so-called ivories that are not true ivories. *Walrus ivory* is the tusks of the walrus or sea horse, and is obtained chiefly in Alaska. These tusks are sometimes as long as 2 ft., and usually weigh about 2 lb. each. They are coarser than elephant and hippopotamus ivory, and commercially are of less value. *Hippopotamus ivory* is the tooth of the African hippopotamus. It is harder than elephant ivory, less liable to stains, and of delicate whiteness, but it is inclined to be brittle. The supply is small. Hippopotamus ivory is used for the handles of surgical instruments and for other purposes for which elephant ivory is employed. *Narwhal ivory*, sometimes wrongly called *swordfish horn*, is the tusk of the male narwhal or *sea unicorn*. It is obtained as long as 10 ft. It is the supposed *unicorn's horn* esteemed in medicine a few centuries ago. The supply is small, the quality coarse, and the value low. *Dugong ivory* is the tusk of the Australian dugong or sea cow. Only the male has tusks, and these have a value as ivory. The supply is small. *Vegetable ivory* is the albumen of a South American nut [see page 812].

JACARANDA WOOD—See *Rosewood.*

Jalap—Jalap is the tuberous roots of *Ipomœa purga*, a Mexican plant, which also grows in Jamaica and India, and even in the South of England. The roots are dug up and dried, the larger ones being sliced open to hasten the drying process. The dose of the powdered root is 5 gr. to 20 gr. Its effect is purely purgative, and it is much less used than it was a generation ago. It is also administered as a tincture, as a compound powder, and as an extract.

Jarrah — Jarrah (*Eucalyptus marginata*) is the best known of the West Australian hard woods, and is extensively used in this country for paving blocks. It is also used for piles and railway sleepers, as it is very durable, and has the property of resisting attack by animal organisms that destroy most other woods. The tree grows to a great size, so that large planks can be obtained. The Karri (*Eucalyptus versicolor*) is closely allied to Jarrah, and is also from Western Australia. It has similar uses.

Jet—Jet is a variety of lignite or brown coal which has turned black by fossilisation, and it was formerly extracted from the Upper Lias shales near Whitby. It occurs also in other countries—notably Languedoc in France, Galicia, and Massachusetts. The harder pieces are the jet, which is cut into beads and other ornaments. These are intensely black, and take a high polish. Jet, as a material for ornaments of personal adornment, used to be much more fashionable than it is to-day.

Job's Tears—See *Millet.*

Juniper—The common juniper is an evergreen shrub (*Juniperus communis*) which is indigenous in Great Britain and North Europe. The fruit of the juniper—juniper berries—is used in the manufacture of gin. Raw grain spirit is flavoured with the ground or crushed berries, or bags containing juniper berries may be suspended in the still, this being held to yield the better product. Holland is the chief seat of gin manufacture, the centre of the industry being Schiedam, where the world-famed schnaps is distilled. British gin—so-called—contains no juniper berries, being merely grain spirit flavoured with turpentine. Oil of juniper is a volatile oil obtained from the berries by distillation, and is of greenish-yellow colour, and of a turpentine taste. It is given medicinally (dose 5 min. to 20 min.) as a diuretic and for kidney troubles. A variety of juniper (*Juniperis oxycedrus*) yields oil of cade, which is used as an external application in diseases of the skin, including eczema. Sandarach [see *Sandarach*] is frequently erroneously called *gum juniper*. The so-called cedar wood used for lead pencils is the wood of *Juniperus bermudiana* [see *Cedar*]. Virginian red cedar is the timber of *Juniperus virginiana*, and is much used for furniture on account of its immunity from attack by insects.

Jute—The treatment of the jute fibre in the textile industries has been considered elsewhere [see General Index], and the remarks in this place will concern only the cultivation of the plant. The two jute plants cultivated for the fibre are *Corchorus capsularis* and *Corchorus olitorius*. The chief seat of the jute cultivation is India, especially Bengal, although China and the Malay Peninsula are also not unimportant sources. The former plant is the larger, although both are of equal industrial value. They are annuals, and are most successfully cultivated in a loamy soil and in a hot damp climate. The sowing season is from the middle of March to May. The flower is yellow. When from 5 ft. to 10 ft. high, and in flower, the plants are cut down, the harvest being from July to October. In cutting, a sickle may be used, or the plants may be uprooted entire. Bundles of stalks are immersed in stagnant water to rot, and remain there from a few days up to a month. This separates the inner bark from the rest of the stem, and the inner bark is that used industrially. The final separation of extraneous matter is effected by manual labour, a man standing in the water and pulling off the bark in long lengths. After washing the fibres, the water is wrung out, the fibres are hung up to dry, and are finally packed in hanks and bales for export or for the factory.

KARRI—See *Jarrah.*

Kauri Pine, or Cowrie Pine—This timber (*Agathis australis*), is the most important exported from New Zealand, and constitutes the greater part of the timber exported from the new Dominion. It is found in the extreme north of the colony, and also in the district around Auckland. It is a tall tree, growing to the height of 160 ft., with a straight, smooth trunk rising 100 ft. before the first branch is reached. Its diameter is from 5 ft. to 15 ft. The grain of the wood is straight; the wood is easily worked, is sound, and free from knots, and can be highly polished. The great length and breadth of the planks obtainable from the tree added to the qualities mentioned, make it a very valuable wood for many purposes. Its length makes it fitted for ship masts, and it is also used for ship decks, flooring, and general house work, vehicles, furniture, and paving blocks. It has also been used for church fittings. [For its strength compared with other woods, see page 1260.] Kauri gum [see page 1034 and 5123] is a valuable resin used for varnishes and in linoleum manufacture. It is found chiefly as a fossil gum in ground where the tree has grown during thousands of years. A small quantity of the gum is obtained from growing trees.

Kola Nuts—Kola or cola nuts are valuable on account of their active principle, the alkaloid *caffeine*, which is also found in coffee. There are two trees that yield kola nuts, the *Cola acuminata* and *Cola vera*, both being native to tropical Africa and the latter being the more valuable. The nuts are chewed and eaten by the natives on account of their sustaining and stimulating properties. The alkaloid caffeine stimulates the heart, raises arterial tension, and keeps off fatigue; it is given as a diuretic, and for kidney troubles and typhoid (dose 1 gr. to 5 gr.). Antidotes to caffeine poisoning are the stomach pump and emetics.

LARCH—The larch (*Larix europæa*) is a valuable timber. [For its cultivation, see page 4679; for its properties and uses, see page 55; and for its strength, see page 1260.] The bark of the larch is used as a tanning material, and is valuable for light leathers. It contains about 11 per cent. of tannin. *Venice turpentine* is the exudation of the larch. Incisions are made through the bark of the tree, usually about the end of March, and the turpentine flows during the summer.

Lavender—Lavender is the flowers of a hardy perennial herb (*Lavandula vera*), cultivated at Mitcham and elsewhere in the South of England, and in Southern Europe. The dried flowers constitute the lavender of commerce. They retain their perfume for a long period, hence their value. Oil of lavender is made from the female flowers by distillation. English oil of lavender commands a much higher price than foreign oils, due to the care with which the plant is cultivated and the oil expressed. The first oil expression is used for the manufacture of lavender water, and the later expression for soap perfumery. The oil from the male lavender (*Lavandula spica*) is known as *oil of spike*, and its chief use is for artists' colours.

Lemon—The lemon is the fruit of *Citrus limonum*, a small tree of the orange family. The tree is about 12 ft. high, and thorny; it carries numerous branches, bearing oval leaves and five-petalled flowers. There are several varieties of lemon, including the citron, or Median lemon (*Citrus medica*), the pearl lemon (*Citrus margarita*), and the sweet lemon (*Citrus lumia*). The juice of the lemon has a distinct medicinal value, due to the citric acid contained. It is valuable in malaria and in scurvy, and has been given with good results in chronic rheumatism. Oil or essence of lemon is expressed or distilled from fresh lemon-peel. [See pages 4968 and 4969.]

Lignum Vitæ—Lignum vitæ is the heartwood of a West Indian tree (*Guaiacum officinale*), and is the heaviest and hardest wood known. The tree grows to a height of about 40 ft., and to a circumference of 4 ft. or 5 ft. Its branches are numerous and knotted. Jamaica is the chief source of the lignum vitæ imported into England. The wood is of a dark green or brown colour, freely streaked, and is so cross-grained that it cannot be split, and must be sawn or turned. Its chief use is for pulley blocks and rollers in machines of various kinds. [For its strength, see page 1260.] The resin of the tree—*guaiacum resin*—is used extensively in medicine (dose, 5 gr. to 15 gr.). It is used for rheumatism, lumbago, and diabetes. It is also administered as a tincture, a mixture, and in the form of tablets and capsules.

Lime—The lime tree (*Lilia europæa*) of North Europe must not be confounded with the fruit-tree described below. Our lime tree, the linden of Germany, is of rapid growth, and flourishes even in the dust-laden atmosphere of cities and towns. The trunk is thick, and the branches are slender, close, and upright. The leaves are large and flat, coming to an apex. The tree attains a great age, frequently over 1,000 years. The flowers are sweet-smelling, and contain honey, which attracts bees. The timber is white and close-grained, and makes a good carving wood. Acetic acid is obtained from it by distillation [see page 5465]. Basswood is the timber of the American lime-tree, and is common in Canada and in the eastern portion of the United States. Its nature and uses are similar to those of our lime tree.

Lime—The lime (*Citrus medica acida*) is a valuable fruit of the orange family that is extensively cultivated in the West Indies, and to a less extent in India and Burma. The common tree is very spiny, although one variety is spineless. It grows in poorer soil and in more exposed situations than the lemon, and the fruit is small—about one-third as large as a lemon. Lime-juice has anti-scorbutic properties, and by English law every ship must carry a supply, a precaution which has banished scurvy from our mercantile and naval marine. The juice is expressed by pressure, and is afterwards filtered and clarified. Sweet limes (*Citrus medica limetta*) grow in Southern India, and are not so highly esteemed as the common or sour variety.

Linseed—See *Flax*.

Liquorice—Liquorice is the root of *Glycerrhiza glabra*, a plant that is widely distributed throughout Southern Europe and Asia. The root enters our market in a dry state, and is sweet, mucilaginous, tough, and flexible. The root is manufactured into extract of liquorice, being crushed, boiled, and evaporated. The condensed juice—black or brown in colour—is rolled and stamped with the maker's name, and in this form comes to our market. The most esteemed brand is *Succus solazi*. The powdered root is the chief gredient in compound liquorice-powder, and several other preparations are used medicinally. Liquorice is a mild and agreeable laxative.

Litmus—See *Archil*.

Locust Beans—Locust beans are the pod fruit of the *Ceratonia siliqua*, or carob tree, common in Southern Europe and the Levant. They are the reputed food of John the Baptist in the wilderness, and are hence known as St. John's Bread. The chief sources of the locust beans imported into this country are Sicily and Southern Italy.

Logwood—Logwood is a tree (*Hæmatoxylon campechianum*) that grows in Central America. The heartwood is cut into chips, moistened and exposed to the air, when it undergoes fermentation and turns a deep red, and is then suitable for use as a dye [see page 5905]. A decoction and an extract of unfermented logwood are given medicinally for diarrhœa.

Loquat—The loquat (*Eriobotrya japonica*) is the Japanese medlar or quince. It grows in England in sheltered situations, but as it flowers in autumn it must be grown under glass if the fruit is to ripen. The fruit is of an orange yellow colour, small, round, or pear-shaped, and clustered. The flowers are white.

MAHOGANY—Mahogany (*Swietania mahagoni*) ranks pre-eminent among high-class timbers, in spite of many rivals to favour. There are two varieties of true mahogany—Spanish and Honduras mahogany [see pages 56 and 1260]. When the tree is cut, the wood is of a light reddish colour, but exposure to light darkens it. Honduras mahogany, known also as *baywood*, is not figured like Spanish mahogany, and is more brittle. The best Spanish mahogany is now used only as a veneer. The largest mahogany logs come from Mexico, but this variety is apt to be soft in the centre, and to develop star shakes. Other varieties of so-called mahogany come from India, and Africa. The mahogany-trees are cut in the height of the dry season—April and May—and after being squared and freed from branches and hauled to the rivers by oxen, are launched, made into rafts, and floated to the sea for shipment.

Maize—Maize is also known as Indian corn, and as mealies. It is the grain of a tall grass, *Zea Mays*. [For its cultivation, distribution, and food value, see the pages indicated in General Index.] Maize starch or cornflour is used as a substitute for arrowroot, and starch for laundry use is made from it by crushing it and allowing the starch to settle in water. Maize straw is used for paper-making. Maize oil is extracted from the grain by hydraulic pressure, and is used as a salad oil and in soap manufacture.

Manilla Hemp—The use and prospects of abaca or Manilla hemp (*Musa textilis*) have been discussed in the course on Textiles [see page 719]. The fruit of the plant is a non-edible banana, and the leaf sheaths furnish the fibre. The plant flourishes best on hillsides, and the atmosphere must be humid. The plant is propagated from root suckers or from seeds, the former taking three years to mature, and the latter about double that time. As the buds appear, the plant is cut down, the leaf sheaths are detached and split into layers and then thinned into strips about 2 in. wide and ¼ in. thick. Scraping removes the pulp, leaving the white strips ready to be baled for export. Owing to its strength, Manilla hemp is of great value as a cordage material.

Manna—Manna, a saccharin exudation from *Fraxinus ornus*, or the manna ash, comes to our market chiefly from Sicily, although it is also obtained in Southern Europe and Asia. It is obtained by incising the tree, when the manna exudes and hardens—at first, brown, but turning harder and whiter. Manna reaches us in the form of flakes, and indeed is known as *flake manna*. As a drug, it has mild laxative properties, but is not an official remedy in this country, although it is official in the United States. Dose, ¼ oz. The manna of the Old Testament was probably the honey-dew of a Mediterranean scale insect.

Maple—The maple tree has many species. The common maple of our country (*Acer campestre*) is of no use for its wood. The maples of commerce come from North America, and the maple leaf is the Canadian national emblem. The beautiful deep and variegated hues taken on by the maple leaf in autumn give the Canadian woods a wonderful wealth of colour. The most important species of maple is the sugar maple (*Acer saccharum*), which yields maple sugar [see page 4351], the red maple (*Acer rubrum*), the silver maple (*Acer saccharinum*), and the broad-leaved maple (*Acer macrophyllum*). [For the uses of maple, see page 57, and for its strength, see page 1260.]

Mastic—Mastic is the resinous exudation from a shrub (*Pistacea lentiscus*) growing in the countries bordering the Mediterranean Sea. It is imported in yellowish or greenish tears and is used for varnish manufacture. It is also used, dissolved in alcohol, by dentists, being placed on cotton-wool to apply to the mouth during the application of an antiseptic. There are also an Indian and a Cape mastic of less importance.

Medlar—The medlar (*Mespilus germanica*) was once a more popular fruit than it is to-day. The flowers are large and white, with five-cleft calyxes and corollas, and the fruit is lemon-shaped. The tree grows best in heavy, moist soil, somewhat sheltered. The medlar is generally grafted on seedling medlar stock, or on pear, quince, or whitethorn stock. The fruit should be gathered at the end of October, and kept a few weeks before being eaten. The *loquat* is the Japanese medlar [see *Loquat*].

Meerschaum — Meerschaum is an earthy mineral, white or yellow in colour, and consists of hydrous silicate of magnesia. It occurs in veins or nodules, and the chief commercial source is Asia Minor. Before being exported, meerschaum is scraped to free it from the earth with which it is usually associated, then dried in the sun or in ovens, scraped again, and finally polished with wax. The common qualities are used in the manufacture of porcelain, and the best pieces are made into meerschaum pipes, principally in Vienna and Paris. The absorption by the meerschaum of oil from the tobacco causes the colouring of meerschaum pipes.

Millets—Certain cereal and forage grasses are known as *millets*. The importance of millets as food may be judged by the fact that about one-third of the world's population—chiefly Asiatic—eat it regularly. Sorghum, also known as *Guinea corn*, and in Egypt as *dhurra*, is a variety of millet. It is used in sugar manufacture [see page 3652], and as a cattle food. Young sorghum should not be given to cattle, as it has been proved to be poisonous, but the mature plant is free from poison. Job's tears, the fruit of *Coix lachryma*, which grows in India and Japan, is a variety of millet, and is used for ornamental purposes, chiefly for beads and mats. *Buckwheat*—erroneously named, for it is a small nut, not a wheat—is another millet, and is used as a food chiefly in Russia and in the United States.

Mother-of-Pearl—See *Pearl*.

Mulberry — The mulberry (*Morus nigra* and *Morus alba*) is a small tree of the stinging-nettle order. The black mulberry yields a black, luscious berry. Planting should be done at the end of October or the beginning of November in well-drained soil. The young branches should be cut, leaving only four, and these should be cut back to 3 in. or 4 in., and to an outer eye.

Muscatel—See *Raisin*.

Mush-Mush—See *Apricot*.

Mushrooms—Mushrooms are a species of edible fungi of our woods. They can be cultivated in any situation with a uniformly warm temperature. Underground cellars make admirable mushroom beds, and in one case, at least, highly successful results are got by utilising a disused railway tunnel for the purpose. The temperature should be kept at about 50° F. The mushroom beds may be made in boxes or shelves, 2 ft. or 3 ft. wide, and ranged above each other against the walls. Dried horse manure, either alone or mixed with 25 per cent. (by measure) of loam, forms the best material for the beds. This is placed on the shelves or in the boxes to the depth of about 1 ft., and is pressed firmly down. The beds of manure will develop heat, and when this is subsiding, and is about 90° F., the spawn should be broken up into pieces about the size of walnuts, and placed in the bed about 6 in. apart. Eight days afterwards, a layer of heavy loam, 1 in. thick, or more, should be put on the surface and beaten down hard. About a month later the mushrooms appear. There are many more edible fungi in our woods besides the mushroom, but fear of the poisonous varieties prevents their use. Mushrooms, though edible, have no highly nutritious properties, and are therefore of small sustaining value as a food. *Truffles* are a variety of fungi that we import from Italy, preserved in oil. They are used for poultry stuffing and for sauces and soups. The *Morel* is another fungus used in sauce manufacture; it grows in England to a limited extent, but is cultivated in Italy, whence our supplies come.

NECTARINE—See *Peach*.

New Zealand Flax—See *Phormium*.

Nux Vomica—A small tree (*Strychnos nux vomica*) that grows in India, Ceylon, Persia, and North Australia yields the seeds known as *nux vomica*, which play an important part in medicine. The seeds are flat, circular, smooth, and drab coloured. From three to five are embedded in the pulp of the orange-like fruit. They are extracted, washed and dried in the sun before being exported. They are strongly poisonous. They are used for dyspepsia, heart weakness, as a general tonic and stomachic, and to increase nervous energy. The official dose of the powdered nut is 1 gr. to 4 gr., but the drug is usually given as a tincture or as an extract in pills. The alkaloid which is the active principle is the strong poison *strychnine*. It is so rapid in its action that antidotes are seldom of value. The antidotes recommended are emetics, followed by washing the stomach with permanganate of potash solution or Condy's Fluid and by 4 dr. doses of bromide of potassium. Artificial respiration should also be tried.

OAK—There are numerous varieties of the oak [for which see the pages indicated in the General Index]. The species of highest importance is the British oak (*Quercus robur*), which is found in Europe and Asia and grows almost as far north as the Arctic circle. As a timber, oak combines hardness and toughness, hence its value. The "wooden walls of Old England" were the battleships built of oak. The introduction of iron and steel for ship hulls deposed oak from its supreme position in shipbuilding work. The durability of oak, even under water, is remarkable. The oak grows to great age and attains great size. The Newland oak, in Gloucestershire, had a circumference of 45 ft., and the extent of the spread of the oak is proverbial. Oak is extensively used for furniture and for wainscotting. It darkens with age, due to the action of the atmosphere upon the gallic acid which it contains. The darkened effect may be produced very quickly by exposing the wood to the fumes of ammonia. Wood so darkened is termed *fumed oak*, and the process is common in furniture manufacture. Oak is given to warping, but all varieties do not warp equally [see page 53]. It rusts when in contact with iron. The wood contains acetic acid, and 7·9 per cent. has been distilled from it [see page 5465]. Oak bark has an extensive use in tanning. *Bog oak* is oak which has become blackened by the action of iron salts in peat mosses where it has lain. Its enduring qualities in such a condition excel those of the natural wood. There are numbers of so-called oaks found over the world—Indian oak applied to teak, African oak, a hardwood of tropical Africa, and others.

Olives—The olive tree (*Olea europæa*), of which there is over a score of varieties, flourishes in warm but not in tropical climates. Extreme heat is as fatal to its successful cultivation as is extreme cold. The chief centres of olive cultivation are the countries bordering the Mediterranean, and from these we import preserved olives and the olive oil of commerce. Olive trees have, however, been introduced into America, Australia, and other countries held to be suitable to the cultivation, and moderate success has attended these enterprises. The olive tree grows on poor soil, and may be successfully cultivated on ground quite unfit for other crops. The soil should be dry, calcareous, and rocky, and drainage must be good. Hillsides are favourite situations for olive trees, and they are frequently cut into terraces. Propagation is effected by cuttings, by planting the root suckers, by seeds, and by grafting. Good strong manures should be used in olive farming, and should be applied annually if the soil is very poor, or biennially if it be of fair quality. Fruit is borne in the third or fourth year if regular pruning has been practised during the preceding years. The olive is a small, fleshy fruit, about the size of a grape, and contains one large hard-shelled seed. The best olive oil is procured from olives that are gathered before they are fully ripe. Fully ripe olives yield more oil, but of a lower quality. In its wild state, the olive tree bears fruit only every two years; but by careful cultivation, and by gathering the fruit regularly before it is fully ripe, annual crops can be secured. The fruit should be gathered by hand. The practice of beating the tree to cause the fruit to fall is common in some places, but it does serious injury to the branches, and impoverishes the succeeding crop. The yield of oil is from 25 per cent. to 50 per cent. of the weight of the fruit. The fruit is crushed, the stones or kernels being sometimes broken, and sometimes not, and then put into bags, which are put under presses in a warm room, where the oil is squeezed out. The marc, from which the oil has been pressed, is mixed with boiling water, and again pressed, the second expression yielding an oil of inferior quality. Olive oil is also known as *salad oil*, although many inferior oils are also sold under the latter name. Olive oil is sometimes given as a medicine, on account of its nutrient and laxative properties. It enters into the manufacture of Castile soap. The residue, or marc, after the oil has been extracted, is a valuable cattle food, and is also used as manure.

Opium—Opium is the dried milky juice from the unripe seed capsules of the opium poppy (*Papaver somniferum*). The cultivation and preparation of opium is an important industry in India, but it comes also from Turkey, Persia, and China. Attempts have been made to cultivate the plant in Europe, especially in France, and some of these attempts have been successful, although not commercially so. Incisions are made in the unripe seed capsules with an instrument that will not injure the seeds, and the juice flows out and coagulates. After a few hours it is removed with a knife and placed in inclined trays to drain. It is then dried somewhat in the sun, and comes to the Western market as a stiff, cohesive mass of dark brown colour. Upon the awful results of excessive opium eating and smoking we need not enlarge. The habit is the curse of China, and even in this country excess in drinking laudanum and preparations of morphia is too common. The drug (dose ½ gr. to 2 gr.) is a valuable remedy for pain, checking inflammation and nervous diseases, and benefits sufferers from cough, diarrhœa and dysentery. The liniment is use for rheumatism, neuralgia and sciatica. Internally it is given in numerous forms, chiefly as a pill and as a tincture known as laudanum (dose 20 to 30 minims.). For smoking, opium must be specially prepared. Of the three alkaloids of opium—morphine, narcotine, and codeine—the first is the most important (dose $\frac{1}{16}$ gr. to ½ gr.). It is administered in over a score of different preparations in addition to the powder. For an overdose of opium or morphine the antidotes are the stomach pump and washing out the stomach with a solution of permanganate of potash, also hot coffee, ammonia, or ether. The patient should not be allowed to succumb to the sleep induced by the drug, but should be made to walk until the narcotic effect has subsided. To cure the morphine habit it is recommended that the morphine solution should be replaced gradually by sparteine sulphate, ½ gr. increased to ¾ gr. four to six times a day. *Poppy oil*, or *maw oil*, is expressed from the seeds of the opium poppy. It is used for artists' paints, as a salad oil, and as fuel and for soap manufacture.

Oranges—The common or sweet orange (*Citrus aurantium*) is native to China, and was introduced to Europe by the Portuguese in the sixteenth century. The best orange of the common varieties purchased in English shops is the St. Michael, which is thin-skinned, pale, and juicy, and has very few stones. The orange tree is very prolific in fruit; a tree fully mature may bear 12,000 oranges in one year, and cases are on record where over 20,000 have come from one tree in one year. Orange blossoms are white and fragrant, and from them is extracted the essential oil—oil of neroli; but the natural oil has been displaced by synthetic oil of neroli [see page 4971]. Orange trees attain a great age, living for over 150 years. They have been successfully reared in the South of England in protected situations, but the expense attending such ventures and the poverty of the results have discouraged their further prosecution. The best flavoured oranges do not reach this country, because imported oranges must have been pulled when not fully ripe, and before they have reached their highest excellence. The mandarin, or Maltese orange (*Citrus nobilis*) is grown in China, in Malta, in the Azores, and elsewhere. It is a small fruit of oblate spheroid shape, with a loose skin, which, when fully ripe, may become spontaneously detached from the interior, allowing the latter to be shaken about loose within it. The fruit is exceedingly sweet, but does not keep so well as other varieties. Tangarine oranges are a variety of mandarin oranges. They are suitable for hothouse cultivation, and are prolific. The tree is small, being seldom higher than 7 ft. even in North Africa, the headquarters of their cultivation. Other varieties of the sweet orange are the Maltese blood oranges, a fine, large oval, rich blood fruit with dark red pulp; Majorca oranges, a seedless variety; Jaffa oranges, and a small kind known as *Kum-quat*, and coming from China and Japan. Seville or bitter oranges (*Citrus aurantium bigaradia*) are chiefly used for making marmalade. They are bitter, especially the rind, which is rugged and uneven. The fruit is round and dark coloured. The liqueur *Curacao* has bitter orange as one of its chief ingredients. The peel is pounded in a mortar under water, and after standing some time is distilled with alcohol. Sugar is added, and to some brands a special variety of rum. The rind of the bitter orange is also used for making candied peel [see page 4848]. Another bitter orange (*Citrus aurantium bergamia*) is grown in the South of France and in Sicily. Its only present use is for the expression of oil of bergamot [see page 4970].

PEACH—The largest and most delicious fruit of the plum family. In the English peach this fruit reaches its highest excellence, due to the care expended on its cultivation in this country. It grows best in loamy and calcareous soil, and benefits by the application of vegetable manure. The wall upon which peaches are trained should have a south-eastern exposure. Planting should be done about the end of November, and pruning should be regular in January or February. The trees should be about 14 ft. apart, and the fruit should not be closer than 6 in. There are three varieties of peaches—*clingstones*, *freestones* and *nectarines*.

Pea Nut—See *Ground nut*.

Pearls—Pearls are produced in the shells of several varieties of molluscs upon the introduction of a grain of sand or other foreign particle within the shell. Chemically, pearls are carbonate of calcium, and are built up in exceedingly thin layers, which show their characteristic iridescence by the interference of light. Attempts have been made to cultivate pearls by introducing a particle of sand within the pearl oyster shell, and leaving the animal to do the rest; but these experiments have not been crowned with conspicuous success, and practically all the pearls of commerce have been produced without the assisting agency of man. The chief sources of the salt-water pearls, which are the most valuable variety, are the *Aviculidae*. The most famous pearl fisheries in the world are in the Gulf of Manaar, in Ceylon, and other fisheries are in the Persian Gulf, in Queensland, and in California. Fresh-water pearls are of minor importance, commercially. They are formed by the *Unionidae*, fresh-water molluscs. The rivers of Scotland were formerly of some importance in supplying pearls, and a few come from there now; but fresh-water pearl fishing is not a regular industry as marine pearl fishing is. Taking the Ceylon pearl fisheries as illustrative, the fishing lasts for only a few days annually, and native divers descend from boats, relieving each other frequently. The pearls are sorted out into well-defined classes, according to lustre, shape, and size. Some oysters have the interiors of their shells lined with the pearlous substance known as mother-of-pearl, and many of the fisheries are conducted for the mother-of-pearl only, although pearls are also got in these places in small quantities. The best mother-of-pearl comes from the fisheries of the coast of Queensland, and other important sources are the seas of the Indian and South Pacific ocean. Commercially, mother-of-pearl has a wide use in the manufacture of buttons, studs, fans, and other articles as well as for inlay work. Artificial pearls are now an important article of commerce, and the best of them are made from the scales of the bleak fish.

Phormium—Phormium fibre, or New Zealand flax, is an important cordage fibre which will attain a higher place industrially than it holds to-day. It is soft, white, and lustrous, and its strength is said to be greater than hemp or flax. The percentage of fibre yielded by the plant is high, being as much as 15 per cent. of the green plant. The preparation comprises crushing between heavy rollers, pounding of the crushed leaves by beaters on a revolving drum, washing in running water, and drying and bleaching in the sun. [See also page 817.]

Piassava--Piassava, or piassaba, is the "bass" of our broom manufacturers, and is the most important material used for stable and street brushes. The fibres are black or dark brown, and reach this country in bundles. They come from the leaf stalks and leaf sheaths of large palms that grow in South America and tropical Africa; the best is Bahia piassava. The tree grows wild, and is propagated naturally by its nuts. It is not cultivated. The unopened leaves are enveloped by coarse fibres of chocolate colour, which the natives remove with axes. The fibres are then combed out, straightened, and cleaned—all simple manual processes—and finally packed in bundles of about 30 lb., which again are made into bales of 80 lb. to 100 lb. for shipment. Locally a rope is made from the fibre, but its only use in Europe is for brushes. Para piassava is another variety from Para. African piassava and Madagascar piassava are coarser. [See also page 6106.]

Pimento—Pimento, or allspice, is the dried unripe fruit of *Pimento officinalis*, a tree that grows in the West Indies, Mexico, and South America. The chief source is Jamaica. An illustration of pimento appears on page 4720, and a brief account on page 4722. The fruit consists of black or deep purple berries with a smooth and glossy exterior. It is picked by hand when fully grown, but before it is ripe, and is spread out on floors to dry, a process which takes about a week. The popular name of allspice arose from the fragrance of the berry being thought to resemble a blend of various other spices. The wood of pimento is used for walking-sticks and umbrellas.

Pineapple—The fruit known as the pineapple grows on a tree (*Ananas sativa*) native to tropical America. To successful cultivation a long hot summer and absence of frost in winter are essential. Most of the pineapples entering the British market come from the Azores. The fibre of the plant has a limited value for textile fabrics [see page 818]. The inhabitants of Formosa and China use it for a coarse fabric, and the Piña cloth of the Philippines is also made with it. The leaves of the plant are scraped with a piece of sharpened bamboo, or with the edge of a broken piece of pottery. The fibre is then washed and sun dried, issuing soft, white, flexible, durable, and water resisting. It is then spun and woven.

Pisang—See *Banana*.

Plane — The plane tree (*Platanus orientalis*) is a hardy tree, growing well in a city atmosphere. It has a smooth, grey trunk, with a bark that scales in flakes, and large five-lobed serrated leaves. The Western plane (*Platanus occidentalis*) is not quite so hardy. It is called *sycamore*, and sometimes *buttonwood* in the United States; but it is not the same tree as our common sycamore (*Acer pseudo-platanus*), which is abundant both in Europe and North America. All varieties yield a fine, easily-worked white wood, extensively used for general purposes.

Plantain—See *Banana*.

Plumbago—See *Graphite*.

Podophyllin — Podophyllin is the resin of the root of *Podophyllum peltatum*, a plant that grows in Canada and the Eastern States. It is the American mandrake, or May apple, and is sometimes called *vegetable mercury* from its value as a biliary purgative. It is given also as a laxative and as an aperient. Podophyllum comes to the drug market as flattened root stems, and the resin is extracted in the drug shops by precipitation by means of acidulated water from an alcoholic solution. The result is a greenish brown powder of a decided odour and acrid taste, soluble in aqueous ammonia and almost entirely in alcohol. The dose is ¼ gr. to 1 gr. It is made into pills, tablets, tincture, and extract.

Poplar—The most common varieties of poplars are the white poplar (*Populus alba*), the black poplar (*Populus nigra*), and the aspen (*Populus tremula*). The wood of the poplar is soft, has a fine grain and a silky appearance, and is easy to work. For strength of the wood, see page 1260. The *cotton wood* of the United States is a variety of poplar, and *yellow poplar* is a name applied to white wood.

Poppy Oil—See *Opium*.

Prince Wood—See *Elm*.

Prunes—The prune is a variety of plum. It is cultivated in America, France, and several Mediterranean countries. It is a hardy tree that flourishes in a rich, moist soil, but by suitable grafting it can be grown on other soils. Sun-dried prunes are picked when fully ripe; they are peeled, strung upon twigs, put into straw frames, and suspended in the sun. After a preliminary drying the stones are removed, and the prunes are then made thoroughly dry in the sun. In France, prunes not yet fully matured are placed in boiling water, then transferred to baskets, and agitated till cool, then completely dried by exposure to sun heat.

QUINCE—The quince (*Cydonia vulgaris*) is a fruit similar to the medlar. It has been grown in the Mediterranean countries since pre-Christian times, and, while not edible on account of its bitterness, is extensively used in the manufacture of jelly. The word *marmalade* is said to be derived from *marmelo*. the Portuguese word for quince. It is also cooked with apples and other fruits. The tree is used as stock for pear-trees in this country.

RAISIN--Raisins are dried grapes. Sultana raisins come from Smyrna, and Damascus raisins from Damascus. Both are stoneless varieties, the latter being the larger. The ordinary raisins of commerce come from Valencia. The usual method of drying these varieties is to expose them to the sun and air, and then to spread them out in rooms, sprinkling them with aqueous solution of potash or soda, which causes the formation of grape sugar, the small sweet accretions found on the fruit as purchased. *Muscatels*, which come from Malaga, are a variety of raisin that are dried while still hanging from their branches, the leaves being pulled off and the branch cut half through until the fruit is dry and ready for packing.

Ramie—The three names *ramie*, *rhea*, and *China grass* are used commercially without distinction for two fibres. Rhea, or ramie, is the fibre from the stems of *Boehmeria nivea tenacissima*, a large plant of the nettle order. It grows only in hot climates. The related plant, *Boehmeria nivea*, grows in temperate as well as tropical climates, and is properly *China grass*. In China, China grass is prepared for the market by manual labour, the outer skin being scraped and washed. The process of degumming—the need for which has prevented ramie from taking a very high place among textile fibres—is usually carried out at the mills whither the fibres are sent. [See page 1390.]

—The raspberry (*Rubus* a well-known fruit that grows wild in temperate Europe and is also extensively cultivated. Shoots spring from the root every spring, bear fruit in the summer of the following year and die in the autumn. The soil should be well manured and deeply trenched. The plants are usually 2 ft. apart in rows, each row being about 5 ft. from its nearest neighbour. They may be tied up with stakes or trained to a trellis of wire running along the row. Pruning consists in removing the excess stalks, leaving from three to five of the best and in cutting off the growths that are not in a position to be supported. The canes are cut short, but not too short, in spring, and any side branches induced to carry fruit. Autumn fruiting raspberries are pruned differently; in January the canes are cut to the ground and in spring those that have sprung are cut, leaving not more than four. Do not shorten the canes at all as only the upper portion bears fruit.

Red Currants—See *Currants*.

Redwood—See *Cedar*.

Resins—Resins are thickened plant juices insoluble in water, but soluble in alcohol and oils. Substances from kindred sources and soluble in water are known as *gums* [see *Gums*], although many resins are known as gums. Resins are usually found in plants that yield essential oils; for instance, common resin, or rosin, is found in pine trees, the essential oil of which is turpentine. The principal resins of commerce are as follow: Resin, rosin, or colophony [see page 1034], amber, gamboge, copal, sandarac, camphor, dammar, mastic, benzoin, and tolu. Particulars of these are given under their respective names. Shellac is also a resin, although it is produced as an incrustation upon certain trees by the help of an insect [see *Shellac*].

Rhea—See *Ramie*.

Rhubarb—Rhubarb is a perennial plant cultivated for its leaf stalks, which are used for making jam and wine. It is usually propagated by division of the root, and flourishes best in rich, deeply dug soil. It is often forced by being covered with flower-pots, which are covered with stable manure which ferments and supplies heat. The rhubarb of medicine is the root of a plant (*Rheum palmatum*), larger than our garden rhubarb. It is grown chiefly in China and Tibet, and although the most esteemed variety is known as Turkey rhubarb the name has nothing to do with its source. Attempts to grow medicinal rhubarb in Europe have met with some success. As a drug it is given in powder form (dose 15 gr. to 30 gr., or if repeated, 3 gr. to 10 gr.). Compound rhubarb powder is generally known as Gregory's powder. Rhubarb is also administered as extract, as pills, as a syrup, and as a tincture. Its effect is laxative, and it is freely given for stomachic disorders.

Rice—For the cultivation, preparation and food value of rice the pages referred to in the General index should be consulted. Here we shall mention only some of the uses of rice which are not mentioned in other pages. In Japan, rice straw, besides being used as cattle fodder, is plaited into hats and shoes for men and horses. The bran and dust are also used as cattle foods, as stated elsewhere. The chaff from rice forms a good manure. Rice powder, or *poudre-de-riz*, is sometimes deceptive as it is frequently merely finely powdered soapstone, although a genuine rice powder is also sold as a complexion powder. The Japanese make an alcoholic drink named *saké* from rice by soaking it and inoculating with the fungus *Aspergillus oryzal*, which produces a ferment, and after several processes of fermentation yields a beverage named as above, and containing about 13 per cent. of alcohol. The Chinese and the Malay natives also manufacture alcoholic beverages from rice. *Wild Rice* (*Zizania aquatica*), is a wild plant that is extensively found in America as well as in Asia. It flourishes in muddy soil under shallow water. Attempts to cultivate it by Americans have not been conspicuously successful, but, under the ægis of the Department of Agriculture, experiments are proceeding.

Rosewood—The rosewood of the cabinet-maker has nothing to do with the English garden rose, and derives its name from the odour resembling that of the rose to some extent. It is the timber of certain Brazilian trees, notably *Dalbergia nigra*. Other varieties of so-called rosewood come from Jamaica, Dominga, Burma and New South Wales. *Jacoranda* wood is a name sometimes applied to the Brazilian *Dalbergia*. Rosewood is hard and even in the grain, has a fragrant odour, and a colour ranging from purple-brown to black. It is a high-class wood in furniture-work and for piano cases.

SANDAL-WOOD — Sandal-wood is the heartwood of several species of *santalum*, and is esteemed for its aromatic properties and for the essential oil that it yields. The chief source is India, but it is also found on some of the Indian and South Sea Islands, and in Western Australia. The Indian tree is the *Santalum album*, and the forests where it is cultivated are usually Government reserves. After the tree is felled it is allowed to lie for some months, during which time white ants devour the sap wood, which is of no value. The heartwood is then cut up and conveyed into the stores. The chips from this cutting-up and the sawdust is used for essential oil distillation [see page 4970]. Sandal-wood is made into trinket-boxes in India, and is easily recognisable from its fragrance and dark cedar colour. It is also burned as incense in religious ceremonies. Sandal-wood oil is extensively used in medicine for chronic bronchitis and other diseases. It is given in a variety of forms.

Sandarach—Sandarach, also known as gum sandarach and erroneously as *juniper gum*, is the exudation of the North African tree (*Callitris quadrivalvis*), and is much used for fine varnishes. It is used as a varnish for coating pills.

Satinwood — Satinwood (*Chloroxylon swietenia*) comes from both the East and West Indies; that from the East is figured, while West Indian satinwood is not. It is a beautiful hard wood, of yellow colour, and is valued in cabinet work. It is not obtainable in large pieces, the usual size of log imported being about 10 ft. long and 7 in. or 8 in. square.

Senna—The leaves known as senna are used in medicine as a purgative. There are two varieties—Alexandrian senna, the leaves of *Cassia acutifolia*, which are collected by the Arabs in the neighbourhood of Suakim, and East Indian or Tinnivelly senna, the dried leaves of *Cassia augustifolia*, which are cultivated in Southern India and are longer, narrower, and lighter in colour than the Alexandrian senna. Senna is administered as an infusion, an elixir, a confection, and in other preparations. Compound liquorice powder is one-sixth part senna. The American medicinal drink known as Garfield tea contains senna.

Shaddock — The shaddock (*Citrus decumana*) is a large fruit of the orange family, and is largely cultivated in the Malay peninsula and Southern Asia, and in some of the Oceanic islands. It has a smooth, pale yellow skin, and a white or reddish pulp. It sometimes weighs from 10 lb. to 20 lb., the flavour resembles that of the grape, and hence it is often called the grape fruit. The West Indian grape fruit is another variety of the Asiatic shaddock.

Shellac—Shellac is the most common resin used for varnish manufacture, and is also used for sealing wax and forms an excellent natural cement. It is formed on the branches and twigs of a large number of Indian trees by the lac insect (*Coccus lacca*). The incrustations are removed and melted in boiling water, afterwards being poured upon a cold surface, where they take the form of thin, irregular flakes. *Ground shellac*, also known under half-a-dozen other names, is the resin of the Australian *Xanthorrhœas.* It is used for varnish, for staining wood, and also in the manufacture of picric acid.

Sisal—The fibre known as sisal hemp ranks second only to Manilla hemp as a strong cordage fibre. There are two varieties of sisal, the *Agave rigida elongata* of Yucatan, and the *Agave rigidi sisalana* of Florida, Cuba, and the Bahamas. The latter is the more important, and is known also as *henequen.* The sisal has recently been introduced into India and British East Africa, and the foundations of new industries laid in these colonies. The plant flourishes in any stony soil rich in limestone. The treatment of the growing plants and of the fibre-yielding leaves is similar to that of Manilla hemp. After preparation, the fibre is a straight, pale yellow ribbon from 2 ft. to 4 ft. long. Other plants of the same order are the *American aloe* or Century plant, the *Istle* or Mexican fibre, and Mauritius hemp. These are inferior to the true sisal.

Slate—Slate is a clay that has been folded and compressed in its bed, so that it can be split readily into thin and uniform plates. Slates differ in colour according to locality. The slates of the Lake District are greenish; Cornwall slate is grey. The best known slate quarries in this country are the Penrhyn quarries near Bangor, in North Wales; in Scotland the most important source is Ballachulish, and in Ireland, slates are obtained at Valentia and Killaloe. Slate is obtained by sawing large blocks in their beds, and these are sawn up into lengths, either machinery or hand saws being used. Slate splitting is done by hand, the tools employed being thin, broad-faced wedges and wooden mallets. In winter-time slates may be split by the natural action of frost, water being poured over the blocks, and when this expands by freezing fracture occurs along the natural plane of cleavage. The chief use of thin slates is for roofing purposes, and they are the most widely used roofing material in this country. Superior qualities are used for writing-slates; and the manufacture of writing-slates is an important industry in North Wales. In thick slabs slates are used for the beds of billiard-tables and for cisterns, and when painted with special enamels and fired, slate forms chimney-pieces made to resemble the different veinings of marble. The hones used for sharpening knives and edge tools are varieties of slate. Much of the supply of hones comes from abroad, Turkey hones, esteemed for edge tools, coming from Asia Minor. Of recent years the chief supplies of hones have come from the United States.

Sponges — Sponges are the elastic skeletons of marine animals, *Porifera,* which inhabit the seas of Europe, America, Africa, and Asia. Sponges grow in seas where the temperatures of summer and winter do not vary much, and in the zone where they are found the best are those where the climate is most nearly uniform and warm throughout the year; those which are on the outer edges of this zone, and which, therefore, are in a climate varying towards the temperate, are coarse and poor in quality. Sponges are most prolific along the shores of islands, and where there are fairly strong ocean currents, which seem to convey to the animals the materials of sustenance. Attempts have been made to improve the culture of sponges by cuttings, but it has not been proved that this increases the number of sponges beyond that produced without cutting. Sponges always grow on hard substances, such as rocks, reefs, and the stems of marine plants. The best are in deep water, and the poorest qualities in shallow water near the shore. The sponges are collected by the use of "harpoons," or thin long poles, with which they are dislodged by divers; or by dredging with a drag net. Sponge divers sometimes work naked, and some times in a special dress. If the former, they carry a block of stone to enable them to descend. A diver can remain below for 3½ minutes, but not longer, and usually descends about 20 fathoms. Sponges, when collected, are alive; they die within 24 hours of having been exposed to the air and then the animal remains must be removed so as to leave only the skeleton sponge. The skin is removed, sometimes with a knife, and kneading them, or stamping them out with the feet, gets rid of most of the other animal matter. Then they are washed and dried; they must not be packed before they are dry, or they will spoil. Sponges may be bleached, but the process impaires the durability and purchasers should avoid bleached sponges. There are many varieties of sponges due to different localities. The chief varieties sold are named Turkey and honeycomb—the former being the small-holed, close variety of flat or cap shape, and the latter being the large-holed variety, which is also usually of a paler colour.

TEAK—Teak is the chief wood exported from India and Burma. It is found also in Siam, Java, Cochin China, and in some of the islands of Dutch East India. Teak is the timber of trees of the genus *Tectona* or *Theca,* the Indian teak being *Tectona grandis.* The trees are very large, having trunks 80 ft. to 90 ft. high before the first branch is reached, and a circumference of 20 ft. to 25 ft. The timber is hard, and brown or yellow-brown in colour. Its water-resisting properties make it valuable in shipbuilding. [For strength of teak, see page 1260.]

Tolu—Tolu is the resinous balsam of *Myroxylon toluifera,* a tree that grows in most South American countries. It is bronze yellow in colour and is syrupy when collected, but becomes hard and brittle. It is used in perfumery; and in medicine in its natural state (dose 5 grammes to 15 grammes), and as a syrup, and a tincture. Its chief value in medicine is for coughs and bronchial irritation.

Tortoiseshell — Tortoiseshell is the horny back covering of the *hawk's bill turtle* [see *Turtle*]. The shell from a single animal may weigh up to about 8 lb. For ornamental purposes tortoiseshell has a wide use, and is made into combs and other articles of use and ornament. In its natural state it is very thin, and it is necessary to join together several shells so as to attain thickness. The shells are boiled or are heated in oil, when they become soft, and may then be moulded to any desired form or welded together into intimate union.

Turtles—Turtles are marine animals belonging to the order *Chelonia.* Two of the species are commercially important—the hawk's bill turtle (*Chelone imbricata*), which inhabits tropical seas, and which furnishes tortoise-shell [see *Tortoiseshell*], and the edible or green turtle (*Chelone midas*), which is found throughout the Southern oceans, and particularly near the Bahamas. The green turtle sometimes weights up to 5 cwt. or 6 cwt., and may be as long as 5 ft. Its fat is of a green colour, hence its name. Its use is for the turtle soup, and the consumption is large, especially in London. In the Bahamas, when the turtles land to deposit their eggs, they are simply turned on their backs and are incapable of turning over again. The Chinese catch turtles with a sucking-fish, to the tail of which they attach a string; the fish fastens upon a turtle, and both turtle and fish are drawn into the boat.

VANILLA—Vanilla is the cured pods of *Vanilla planifolia,* a climbing plant native to Mexico, but now grown in Ceylon, Mauritius, and other parts of the globe. Other varieties of plants contribute to the supplies of commercial vanilla, but that mentioned is the chief. The pods are developed only after the flowers have been fertilised, and artificial pollination is practised to increase the yield. The pollen is placed by hand upon the stigma, a small pointed cane being used for the purpose. The pods are cured, and this develops the flavour, the curing process consisting in immersing them into water almost at boiling point, and immediately withdrawing them and putting them into baskets lined with blankets, afterwards drying them in heated rooms. The active principle is vanillin. An artificial vanillin, made from sugar, is one of the recent triumphs of modern chemistry.

WALNUT—The walnut tree (*Juglans regia*) grows extensively in North Europe and Asia. For uses and strength of the timber, see pages 57 and 1260. Great Britain imports the walnuts from Italy, Germany, and France. Before being packed they are dried in a kiln, a process that preserves them but injures their flavour. American walnut, or black walnut (*Juglans nigra*), is valued for its appearance, and is used for furniture, both solid and as veneer.

Whalebone—Whalebone is not bone, but is the substance of the nature of bristles with which the mouths of certain varieties of whales are furnished in order that they may catch and crush the small fish and sea animals on which they feed. Whalebone resembles hardened hairs cemented together, and in its characteristics is more like horn than bone. There are several species of whalebone whales both in the Northern and in the Southern seas. A Greenland whale of full maturity provides about a ton of whalebone. The sides of the upper jaw are the places where the whalebone is found, and each side usually has about 300 blades, which are from 12 ft. to 15 ft. long, being longest in the middle, and 10 in. or 12 in. broad at the base, with a thickness of not quite half an inch. Before being cut up, the blades are cleaned and softened by being boiled for a few hours, and are then, while still hot, planed or shaved by hand, the tool used resembling a spokeshave. After being planed, the whalebone is polished, usually with the edge of a piece of glass or a steel scraper, then with emery powder, and finally with powdered rottenstone. Commercially, the value of whalebone lies in its elasticity, flexibility, and strength. The roots of the blades, where they are thickest are used in the manufacture of walking-stick and umbrella handles, and other purposes. The use of whalebone as a material for the ribs of corsets is practically a thing of the past, as it has been superseded by steel.

THE SELF-EDUCATOR AT A GLANCE

A CONSPECTUS INDEX ARRANGED IN ORDER OF THE GROUPS, BEING A READY GUIDE TO THE WHOLE CONTENTS OF THE SELF-EDUCATOR

All the Articles in the Self-Educator are briefly summarised in the following pages, under the groups, sub-groups, and sections to which they belong and in order of publication. This affords a brief general survey of the branches of knowledge and also gives an easy means of obtaining a general idea of the scope and nature of the artic'es. Sections of the groups are indicated by side-headings in italics. For particular subjects or items of information, reference should be made to the General Index, beginning on page 6900. A list of plates and frontispieces is given on page 6892.

South and West Australia, Tasmania, New Zealand and Pacific Islands 3899
Geography of North America .. 4061
Canada 4065
United States, Mexico 4172
Central America, West Indies .. 4176
South America 4282
Commercial Geography : Earth as the home of man 4493
Adapting the world to man's needs, transport, towns and ports, maps 4514
Forest products . .. 4657, 4873
Cereals, fruits 4873
Root crops, stimulants and narcotics, tea, coffee, cocoa, pulses, sugar cane 4959
Fibre plants, meat and dairy industries, animal products, fisheries 5117
The world's minerals 5302
Economic conditions and trade of tropical and sub-tropical countries 5379
Conditions and trade of temperate lands : Far East 5658
Temperate lands under European control : southern lands, and North America 5660
Europe in development .. 5707, 5822
Europe industrially developed .. 5824
Great Britain ; industries ; exports and imports ; carrying trade 5999

Astronomy

The stars ; constellations ; earth's motions 6115
Planetary motion laws ; astronomical measurements, ecliptic, telescopes, spectroscope, the solar system, the sun, sun-spots 6241
Mercury, Venus, the Earth .. 6402
The Moon, Mars, asteroids, Jupiter, Saturn, Neptune, comets 6564
Shooting stars, the fixed stars, nebulæ, cosmic evolution .. 6695

GROUP 14

Geology

Geological history of the earth .. 617
Minerals 624, 765
Rocks, igneous rocks, sedimentary rocks 896, 1006, 1071
Earth's crust changes : volcanoes, earthquakes, secular movements, chemical action .. 1206, 1352
Atmospheric, aqueous, glacial, and organic agencies .. 1499, 1633, 1813
Formation of strata 1815, 1921, 2065
Geological map of British Isles .. 1921
Extinct monsters 2064
Geological periods 2253
Dictionary of geological terms .. 2257

Mining

Mining and quarrying, deposits .. 2375
Prospecting, boring .. 2380, 2581
Boring 2582, 2665, 2845
Dictionary of mining terms 2588
Quarrying, dredging, hydraulicing 2955
Underground mining : wells, pits, stoping, bed mining (coal), shaft-sinking 2960, 3190, 3304, 3457
Surface and other works 3766
Mine treatment of minerals 3769
Distribution of minerals 3771

Metals

Metallurgy, processes, properties of metals 3835

PAGE
Metallography, alloys, refractory materials 3937
Furnaces 4125
Copper, lead, silver, gold, platinum, nickel, aluminium, zinc, antimony, etc. 4126, 4303
Iron 4464, 4635
Steel 4746, 4907
Wire, wire-work 5013
Tube manufacture 5319
Cutlery 5474
Art metal-work 5521, 5687
Gold, silver, platinum, coinage, precious stones, jewellery.. .. 5847
Nickel, lead, aluminium 5981
Tin, zinc.. 6161
Copper, brass, bronze 6305
Welding, soldering 6453
Painting, cleaning, polishing, bluing, enamelling, colouring metals, Barfling, electro-plating 6730

Minerals

Tables of the principal minerals . 6730

Gas

Varieties, manufacture and distribution 6817

GROUP 15

History

Dawn of History, Babylon.. .. 16
The Early East : China 215
India, Egypt, Assyria.. .. 417, 500
Phœnicia, Medes, Persians .. 501
Hebrews 665
The Rise of Greece, Alexander the Great, Greek philosophers 667, 772, 972
Rome : Legend and history, plebeians and patricians ..1135, 1201
Pyrrhic wars, Punic wars, the Gracchi, Marius, Sulla ..1203, 1381
Julius Cæsar 1513, 1670
The Cæsars (Augustus, Tiberius, Claudius, Nero).. 1671, 1830, 1937
The emperors following, the Decline and Fall 1939, 2068
Middle Ages.. 2241
Development of Europe : Birth of States, Arabia, Mahomet 2241, 2353
British Islands, Alfred, Canute, William 2354
Scotland, Ireland and Wales in early times 2607
William Rufus to John 2674, 2913
Early history of France and other European States ..2915, 2945
England : The barons' war, the Edwards 3073
Richard II., the Henrys 3249, 3463
Wars of the Roses, Edward IV., printing, gunpowder, the New World 3603
Henry VII., Henry VIII., the Renaissance 3649, 3832
Luther, Edward VI., Mary, Elizabethan Age 3997
Mediæval Europe : France 4101, 4320
Italy, Spain, Netherlands, Germany, Switzerland, Hungary 4320
England : James I., Charles I. .. 4551
Commonwealth, Restoration .. 4761
James II., William and Mary 4841
Anne 4950
Europe : France, the Louis, the Revolution, Napoleon, the Republic 5110, 5238
Independence of Sweden, decline of Spain, Portugal .. 5396
England : the Georges ..5554, 5685
William IV. 5686
American Revolution, U.S.A. .. 5844
Irish Rebellion 5973
United States : John Adams, 1812, Slave war, Spanish war 5973
Europe : Russia, Ivan II. to Japanese war . .. 6200, 6301
Prussia, Italy, Spain, Holland . 6302
Germany, Norway and Sweden, Denmark, Turkey, Greece .. 6445
India, Australia 6548
Great Britain to 1907, Japan .. 6690

SELF-EDUCATOR GUIDE TO KNOWLEDGE

A COMPREHENSIVE INDEX TO ALL THE SUBJECTS TREATED IN THE SELF-EDUCATOR

This Index is entirely alphabetical and unclassified, so that reference to it is a simple matter. Any item of information in any subject should be looked for as if the Index were an index to that subject alone, French adjectives, for example, under "Adjective," not under "French"; dynamo brushes under "Brushes," not under "Dynamo." This principle has been followed as far as possible, though, of course, general information in regard to the French language or dynamos is indexed under "French" or "Dynamo." For general surveys of the subjects treated in the Self-Educator, see the Group Index, beginning on page 6893. Page references in italics indicate illustrations. Chemical compounds are indexed under their exact names—e.g., Sulphate of Copper under "Copper Sulphate," with a cross reference for the popular name, Blue Vitriol. Owing to exigencies of space, the numerous dictionaries in the Self-Educator have not been separately indexed. They will be found by reference to the particular subjects.

A: *see* Alphabet
A (= on) in English words, 756; in prepositions, 1336
A (French preposition), with numerals, 1773, 6089
A (Italian preposition), use, 5368

Algebra, binomial theorem, 4046; books on, 6790; brackets, 1993; combinations, 4045; expressions, 2149; factors, 2747, 2890; fractions, 3026, 3198; indices, 3412; remainder theorem, 2890; substitutions, 1818; surds, 3521; variation, 3696
Algeria, geography of, 3279; trade, 5822, 5824
Algerite, characters, 6731
Alhambra, Granada, 1133, 2234; foundation, 2946; architecture, *3091*
Ali, stepson of Mahomet, caliphate, 2353
Alidade, surveying instrument, 710
Aliens, naturalised, admission to Civil Service (U.K.), 2249
Alignment, of shafts, etc., testing, 3964
Alimentary canal, structure, *756*
Alióne layette set, *3745*, 3746
Aliphatic compounds, in essential oils, 4968
Aliquot parts, defined, 886
Alisma: *see* Water plantain.
Alizarin, artificial dye, 5953; in cloth, test, 5599; dyes, 5468, 5953, 5956; as madder substitute, 5906; synthesis, 5908; in textile printing, 4502; yellow, pigment, 871
Alkali, in digestive process, 675; refined, manufacture, 4771; in rice-starch manufacture, 5364; in soap, 3485; waste, sulphur recovery, 4625
Alkali Works Act, hydrochloric acid in air, 4634
Alkalies, effect on nerves, 1943; as electrolytes, 3260; manufacture, *4770–4782*
Alkaline earths, in chemistry, 843
Alkalinity of blood and katabolism, 3016
Alkaloidal salts, formation, 3825; antagonistic isomers, 4013
Alkaloids, animal, 3826; in beverages, 3378; chemistry of, 1600, 3824; poisoning by, 3826; spelling rule, 3825; vegetable, properties, use, abuse, 4006; *see also particular alkaloids—e.g.*, Atropine
Alkoran: *see* Koran

Alkyls, preparation of ethers, 3138
Allactite, characters, 6731
Allah, in Mohammedan creed, 2243
Allegories, early English, 2962, 2963
"Allegory of Spring," picture by Botticelli, 3793, *3794*
"Allegro" (Milton), 991, 995
Allemontite, characters, 6731
Aller (French verb), conjugation and idiomatic uses, 4507
— river, Germany, 1976
Allier, river, France, 1684
Alligator, description, 2798
— leather, grain, *plate facing* 3217
Allingham, William, Irish poet, 1438
Allium, garden culture, 6490
Allotment of shares, 3186
Allotments and small holdings, agricultural, English and Continental, 24, *25*
Allotropy, in chemistry, 1046
Alloying, effects on metals, 3939
Alloys, metallic, 3939, 5523; compounds or mixtures, 1722; electric resistance, 672; formation by compression, 3837; fusible, 360: *see also* Fusible metals; furnaces for melting, 2862-7; liquid state, 3939; mould-making precautions, 2698; preparation, 3930, 5523; properties, 3939; remelting, purpose of, 2547; strengths, 1396
Allspice: *see* Pimento
Alludere (Italian verb), conjugation, 4792
Alluvial deposits, formation, 844; in mining, 2665, 2666; table of, 535
— soil, deposited by rivers, 1634
— — in foundation, 332
Alluvium, formation, 255
Allyl, in turpentine, 5466
Allyl isothiocyanate, formation and preparation, 4721
Almandine (garnet), 5853, 5855, 6731
Almandite, characters, 6731
Almond oil, in sculpture, bronze colouring, 1675; source, properties, 4831
— rock, in mining: *see* Banket
Almonds, 6880
— bitter, oil of, formula, 3710; production and substitutes, 5468
Alnus: see Alder
Aloes, 6880; medicinal use, 4013
Aloin, principle of aloes, 3825, 4013
Alopecurus pratensis: see Meadow foxtail
Alpaca goat, source of wool, 220
— wool, *70*, 72; warp of, 2594
Alpha particles of radium, 1916, 1917, 2028; size, 2029; heat production, 2393
Alphabet, Babylonian, 17; English, 121; Esperanto, 4511; French, 123; German, 249; Greek, 5374; Italian, 2043; Latin, 118; Phœnicians and, 501; shorthand, 48; Spanish, 2040
Alps, European, 1836; bird's-eye view from, 1835; Hannibal crosses, 1204; limestone formation, 1815; strata inverted, 1923
Alsace, German province, relation to Rhine and annexation, 1975
— and Lorraine, tours in, 393
Alsike, grass, 941: seed statistics, 877, 940
Alsing cylinder in pottery manufacture, *5236*, 5336
Alstonite, characters, 6731
Altai mountains, Mongolia, 2562, 2977
Alterations in tailoring, 3014, 3015
Alternanthera, culture, 6320, 6491
Alternating current: *see* Current, alternating
Alternation of generations (biol.), 382; in ferns, mosses, etc., 1311; in jelly-fish, 4086
Alternator, electric, sizes and types, *1357*, *1358*; phase coils, 1363; power-factor, *1363*; windings, three-phase connections and groupings, 1907, *1908*
Althæa: see Hollyhock
Altitude, balloon observations, 3982; determination, 6245; influence on temperature, 4494; of the sun, 1016
Alto clarionet: *see* Basset horn
— clef, in musical notation, 1059, 1060
— part, in harmony, 364
— in singing, characteristics and compass, *6050*, 6051
Altruism, ethical and sociological value, 4278; in nature, 4133
Alum, definition, properties, and uses, 1721, 4780, 4781, 5993, 6880; in washing, 2912; natural sources, 4780; use by dyer, 5779
— chrome: *see* Chrome alum
— potash, composition, 4780, 5989
— tannage, 3163, 3164
Alumen, ancient use, source and kinds, 4780
Alumina, chemistry, occurrence, etc., 1043, 3941; in cement manufacture, 1857; in clays, 3942; extraction processes, 4780; in firebricks, 1285; for metallurgical furnaces, 232, 359, 3941, 3942
Aluminium, 359, 1042, *4306*, 5756, *5988*; alloys, Cowles' process, 5989; alloys, production, 5992; annealing and welding, 5991; books on, 5993; cast, showing dendrites, 3939; *plate preceding 3937*; casting, 2699, 3991; casting, shrinkage, 2342; chemistry of, 517, 1042; for cooking utensils, 1043; cost compared with other metals, 5990; crucible furnace, 2862; electric conductivity, 3839; electric resistance, 672; electricity in production, 3032, *5756*, *5989*; extraction, 4306, *5756*, *5989*; impurities, 5990; in earth's crust, 239, 624; in machinery, 209; metallurgical uses, 5992; occurrence, 4306, 5308, 5988, 5990; properties, 3837, 3838, 4306, 5990; reagent and test, 4409; reduction, electrolytic, 5989; salts, uses, 5993; soldering, 5991, 6460; specific gravity, 799, 3839, 5990; in steel manufacture, 4748, 5015, 5992; sources, 5308, 5988; strength, 1396; strength, comparison with other metals, 5991; symbol and atomic weight, 517; uses, 5993; weight compared with other metals, 5990; acetate, uses, 4781; brass, composition, 3940, 5992, 6310; bronze, properties and uses, 360, 1043, 5992, 6309; hydroxide, precipitate, *4405*; oxide, 768; salts, use by dyer, 5779; silicate, in clay, 1279; sulphate, manufacture, 4780, *4781*; properties and uses, 4781, 5993; purification, 4781
Aluminoferric, uses, 4781, *5764*, 5766
Aluminography (lithography), 6635, 6638
Aluminothermy, 6456
Aluminum: *see* Aluminium
Alumstone: *see* Alunite
Alundum wheel in glass-cutting, 4932
Alunite in alum manufacture, 4780; characters, 6731
Alva, Duke of, share in French religious civil war, 4102; rule in Netherlands, 4398
Alva, upholsterer's material, 6716, 6718
Alveoli, air-cells, anatomy, *1299*, *1301*
Alytes: *see* Toad
Amalekites, under Hebrew rule, 666
Amalgam, contrasted with alloy, 1722; defined, 3939; filtering bag, 5847, *5849*; retorts, 5847, *5849*; tooth-filling material, 5553
Amalgamation in gold and silver extraction, 4303, *4304*, 5847, *5849*
Amanuensis, duties, 6480
Amaryllidacæ: see Snowdrop order
Amazon, river, course, products and towns on, 4282, 4284
Ambassador, British, salary, 2935
Amber, 1034, 5856, 6731, 6880; density, 1704, 5856; hardness, 5856; sources, 1034, 5147, 5856; use in varnish, 1034, 5147, 5835
Ambergris, 4971, 5121, 6880
Ambidexterity, effect on physique, 4387
Ambition, social conditions fostering, 4370
Amblygonite, characters, 6731
Amentales: see Catkin-bearing group
America, aborigines (ethnology), 1789, colonisation by Europeans, 3606, 5844; cotton industry statistics, 225, 383, 384, 390; craniological measurements, 1786; discovery by Columbus, 3606; electricity development, 131; engineering progress, 5594; fossil horses, 1177; literature, 3780; North: *see* North America; railway construction, 3434; South: *see* South America; touring directions, 1648; tramway enterprise, 2274
— *see also* Central America, Mexico, North America, South America, *and* United States
American ash in vehicle construction, 2827
— cedar: *see* Red cedar
— cloth, manufacture, 1166; use, 6716
— Indians: *see* Indians, American
— oak, use in vehicle construction, 2827
Amethyst, precious stone, 767; characteristics, 5852, 5853, 6731
— imitation, 5852
— Oriental (violet sapphire), 5855; *see also* Sapphire
Amia: *see* Bow-fin
Amianthus, mineral, 812
Amides, ammonia compounds, 1721, 3536
Amido acids, characters, 3536, 4134
Amido-azo benzene, composition, 5468
Amidol, formula for, 6683
Amiens Cathedral, 3374
— treaty of, 5238
Amine, formula, 1721
— compounds, 3141, 1721
Amines, primary products of coal-tar, 5953
Ammeter, 291; calibration, 790; use in testing, 3967
Ammonia, amount in air, 3720; chemistry of, 1599, 1600; compounds, place in economy of Nature, 277; derivatives, 1721; in dyeing, 5781; gaseous, 60, 1599; gaseous in refrigerating machines, 5404, 5406; laundry use, 2477; liquefied, in shaft sinking, 3460; liquefied, use and preparation, 4775; as plant-food, 276; plant production, 1599; preparation, 1599; properties, 1599; reaction on living matter, 1600; recovery in Solvay process, 4772; relation to alkaloids, 1600; solution, 1599; sources, 1599, 4774; stimulative uses, 1599
— muriate of: *see* Ammonium chloride
Ammonia-soda process, in alkali manufacture, 4771, *4772*, 4773
Ammonites, compared structurally with sea-urchins, 1179
Ammonium, chemistry of, 1599, 1722
— amalgam properties, 1599
— carbonate, in dyeing, 5781; formation, 1599, 4776; yielding urea after heating, 3703
— chloride, bronze colouring, 1675; manufacture, 1037, 4776
— cyanide, synthesis, 3538
— fluoride, etching glass, 4932
— salts, nitrogen estimation, 5588
— sulphate, as manure, 589; use and manufacture, 4775, *4776*, 6150
Ammunition manufacture, 6616, *6757–6765*
Amœba, 278, 4087, *4088*; assimilation, 199; movement, 200, 954
Amorphous, in chemistry, definition, 1046
Amoy tea and coolies, 2976
Ampelopsis Veitchii, 353, *505*, 6316, *6317*; *see also* Virginia Creeper
Ampere, electrical unit, 291, 670; British standard, 789
Amperemeter: *see* Ammeter
Amphibia, characteristics, 29, 30, 2155, 2799, 2800, *2801*, *2802*; economic uses, 2802; extinct and living, 2799; tailed and tailless, 2799

Amphictyonic council, 775
Amphioxus : see Lancelet
Amphiprostyle, temple style, 2859
Amplitude, in navigation, 6661, *6665*
Ampulla : *see* Starfish
Amrad, gum from, 810
Amsterdam, canal, end-lock type, 5486; diamond cutting, 1836; manufactures, 1836; touring, 858
Amusement for children, problems, 641
Amusements, business side of, 6866
Amygdalin, decomposition, 3818; source of oil of bitter almonds, 5468
Amyl acetate, pear essence, 5469
— alcohol, preparation and properties, 2877, 3020
— nitrite, properties, 1719
— salicylate, in perfumery, 4971
— valerate, apple oil, 5469
Amylopsin, pancreas ferment, action, 675; action on starch, 3706
Amyntas II., King of Macedonia, 774
"Anabasis," Xenophon's, 774, 6384
Anabolism in human body, 2661; of living tissue, 437; in women, 4827; of vegetable kingdom, 3110
Anæmia, cause, 866, 3800; red corpuscles present in, 953; causes, symptoms, and remedy, 6037
Anaerobes, bacteria, 4742, 6438, 6440
Anaglypta wall covering, 5828, 5830
Anahuac plateau, Mexico, 4175, 4176
Analogy, in animal structures, 379, 1492
— argument from, value in science, 3230
— in biology, 379
Analysis, in bookkeeping, 2269; in petty cash, 2202; of expenses, 2755
— chemical : *see* Chemical analysis
— English grammar, 760; complex sentences, 1618
— in pianoforte study, *2025*, *2026*
— in psychology, 2803
Analyst, public, duties, etc, 82, 320, 786; openings in colonies, 3743
Analytic languages explained, 117
Analytical chemistry, defined, 237; *see also* Chemical analysis
Ananas, sugar cane pest, 3654
Anapaest, definition, 305, 328; prosody, 1766
Ananassa sativa : see Pineapple
Anaphora, grammar, 1616
Anarchy, the social ideal, 5245
— of United States, 5534
Anastaaca hierochuntica : see Roses of Jericho
Anatidæ : *see* Ducks
Anatomy, definition and scope, 138
— of man, 97; bones, 1708-*1709*; book on, 5422; joints, *1709*, *1710*; locomotor system, 1797; muscles, *1710*; nervous system, 1941; spinal cord and brain, *2143*; skeleton for modelling, 1347, *1348*; skeleton, *1603*; the skin, *1419*; tissues, 196, 435
"Anatomy of Melancholy" (Burton), 1642
Anbury : *see* Finger and toe disease
Ancaster stone, 533, 1518
Ancestor worship, 216, 6772; effect on family life, 4665: in Egypt, 419
Anchor plate, in structural ironwork, 5791, 5793
Anchor smiths, employment conditions, 2644
Anchors, fitting apparatus, 5924; in launching ships, 5924
Anchovy, fishing grounds, 5121; shoal movements, 5188
— sauce, recipe, 2004
"Ancient Mariner" (Coleridge), 1307
Ancona fowl, 5090
Anconeus, human muscle, *1350*, 1351
Andalusia, Spanish province, 2232, 2234; map of products, *2234*
Andalusians (fowls), points of breed, 4955
Andalusite, characters, 6732
Andaman Islands, craniology, 1785, 1786
Andaman redwood, 6880
Andes, mountains, 4282; influence of slope on rivers, 4495
Andesite, mineral, 1009, 6732
Andradite, characters, 6732
André, Major-General J., trial and hanging, 5846
Anemometers, construction, *6131*
Anemone, sea, 4083; *plate fac ng* 4081
— in woods, 504; garden culture, 6490
Anergates : see Ant
Aneroid barometer, *592*; use in surveying, 159, *592* : *see also* Barometer
Aneurism, detection by Röntgen rays, 4093
— disease, cause and symptoms, 6036
Angel, in Assyrian architecture, 2658
Angelico, Fra : *see* Fra Angelico
Angelo, Michael (works in Rome), 948; statue of David, *1345*
Angina pectoris, psychological symptoms, 2696; seat of spasm, 957; symptoms, 6039
Angiosperms (definition), 165; subdivisions, 350
— geological period, 1116
Angle, in geometry, bisection, trisection, and other problems, 472, 4331; complement, 285, *286*, 6665; definitions, 285, *286*, 4207, 4208; alternate, exterior, and interior, 4477; formed by parallel lines, 4477; in a segment, 5043; supplement, 285, *286*, 6665
— of circle, 5044
— critical, in light, 2734
— of crystals, measuring, 766
— friction, 959, 3813
— of incidence in light, 2734
— of intersection, in railway surveying, 801
— in navigation, *6665*
— of repose : *see* Angle of Friction
— of rotation, defined, 4554
— in traversing, 367; positive and negative, 711; surveying by vertical angles, 711; measured by sextant, 1016; in marine surveying, 1018
— in trigonometry, compound, 6499; measurement, 6085; ratios, 6231, 6373, 6499; terminology, 6086
Angle-bevelling machine, 3107
Angle-board use, 3386
Angle-brace of hipped roof in carpentry, *4253*, 4254
Angle-bricks (mitred), *1948*, 1949
Angle-irons in building, 3107; in chimney construction, 2388, *2389*; furnace and shears, 3107
— smiths, function, *3096*, *3097*
Angle-plate, in cutting processes, 3322
Angle-section, in plating shop, *3096*
Angler-fish, its lure, 3069, *3071*
Angles conquest of England, 146; invasion of Britain, 1769; in Northumberland, 2242
— in girders, 544
— plastering, 5500
— in walls of building, 3033, *3035*
— in workshop practice (test pieces and faults), 3961, 3962
Anglesey, island, geography, 1277
Anglesite, mineral, 5985, 6732
Anglo-Saxon language (cases), 246; in England, 1769, 1770; past participle in *ge*, 757; prose, 1608; relation to English, 117
Anglo-Saxons, effect on British trade, 146; sanguine temperament, 5701
Angola, geography of, 3584
Angora goat, wool, 220, 6426
Angostura bark : *see* Cusparia
Anguilla cotton manufacture, 386
Anguis fragilis : *see* Blindworm
Anhydride, in chemistry, 840, 1158
Anhydrite, mineral, 768, 6732
Aniline, characters and manufacture, 3710; preparation, 5953; as rubber solvent, 5309; benzene product, 5463
— black, discovery, 5908
— dyes (Perkin's discovery), 641, 5908; manufacture, 3710, 5145, 5908; preparation, nomenclature, 5953; *see also* Coal-tar colours
— oil, production and properties, 5468
Animal and bird dealing, 890
Animal alkaloids : *see* Alkaloids, animal
Animal diet, chemical composition and functions, 3110
— foods, dietetic value and preservation, 3112
— heads, mounting, *6328*, 6329
— kingdom, compared with vegetable, 275, 1491
— labour, 6631
— life, definition, food, distinguished from vegetable, 96
— magnetism, Mesmer's theory, 4449
— products, list and sources, 5119
— psychology : absence of self-consciousness, 2373; homogeneity of human and animal instincts, 2694; evidence of consciousness in lowest forms, 3117
Animalculæ, characters and classification, 4087, *4089*
Animals in Assyrian art, 2657, *2659*; backboned, orders, 1493; breeding, 4515; purpose and countries of breeding, 5119; classification, biological, 29, 1492 : *see also* Zoology; distribution, 628; evolution, 1491; food, chemistry of, 4133; function change, 1491; fur-bearing, 6426; geological agency, 1814, 1817; marriage, 4538; morality in, 6773; pastoral, products and uses, 5119; and plant reproduction, seed dispersal, 912; plants, relation to, 1491; prehistoric footprints, *1817*; primitive backboned, 3070, *3072*; stuffing and dressing, 4056, *6326-6329*; synthetic chemical processes, 2712, 4014, 4133; trade in : *see* Animal and bird dealing; weapons and colours, *2155*
Anime, varnish resin, 5147
Anion, in electricity, definition, 3260; direction in electrolysis, 4022
Aniseed, 6880
Ankle, human, bones, *1709*
Ankylostomiasis : *see* Miner's worm
Anna (Indian coin), value, 410
Annatto, 6880; in margarine manufacture, 4833; source of colour, 5145; use in dyeing, 5907
Anne of Cleves, marriage and divorce, 3651
Anne, Queen of England, descent, 4842; accession, 4843; life and reign, 4950
Anne of Austria, regency of France, 5110
Annealing, in hand flanging, 3102
— of glass, process, 4531, 4534
— furnace, 3107
— metals, process, 3838, 3938, 5524
— in smithy work, 3107
— steel, 1045, 3938
Annelids : *see* Ringed worms
Annual rings of plants, *168*, *169*
— — of trees, 51
Annuities, relation to insurance, 3224; — *see also* Life assurance
Annular tread, in casting, 2337, *2339*
Annular ligament, position, *1350*
Annulus of spore-case, 1116
Anobium : *see* Death-watch
Anode, definition, 466, *3260*
Anodonta : *see* Mussel
Anōgeōn, declension in Greek, 5376
Anomalopteryx parva : see Moa
Anomma : *see* Ant
Anorthite, mineral, 768, 6732
Anorthic system, in crystallography, 766
Anselm, Archbp. of Canterbury, 2675
Anser cinereus : see Lag, grey
Anseres : *see* Duck, Goose, Flamingo
Anconas, fowls, points of breed, 4956
Answering jack, of telephone, 5683, *5684*
Ant, classification, description and habits, 3722, *3725*; influence in seed dispersal, 912
— red, parasite of, 3727
— white : *see* Termite
Ant-eater, description, 1765, 1871, 2155
— great, *1493*
Ant-guards, habits, 3726
Ant-hill, communal type of society. 5248

Ant-lion, 3365, 3366; larva, *3366*
Ant-plant, East Indian, ant nest, *3727*
Antananarivo, Madagascar, 3587
Antarctic Ocean, direction of, 460
Antarctica, theory of, 460
Antecedent, grammar, rules, 606
— in mathematics, 996
Antelope, structure of horns, 811; even-toed foot, 1870; markings, 2157; stuffing, 6327
Antennæ of crayfish, 3807
— of insects, 3362
Antennaria, carpet bedding, 6491
Anthemion, in design, *5818*, 5820, 5821
Anther, of flower, 346, *347*
Antherea, worm food, distribution, 583
Anthers of foxglove, *plate facing* 728
Anthomigia betæ: *see* Beet fly
Anthozoa: *see* Sea-anemone
Anthracene, basis of dyes, 5468, 5953
— dyes, 5956
— oil, dye products, purification and yield, 5464, 5953
Anthracite, chemical composition, 1157, 6732; geological classification, 1073; properties, 5302; U.S. deposits, 5305; weight, 1704
Anthrax, bacillus, *6540*, 6781; in cattle, symptoms and treatment, 2622; Pasteur's cure, 203, 3274; in sheep, 2624
Anthropoid ape, comparative anatomy, 1603, *1604*
Anthropology, relation to biology, 137; scope, skull measurements and stature, 1785
Anthropometric tables, 1785
Anthus pratensis: *see* Pipit
Anthyllis vulneraria: *see* Kidney vetch
Anticipation, in harmony, 567
Anticipations, in logic, Bacon's argument, 6000
Anticline, in geology, definition, 1923
Anticyclone, forecasts, 986
Anti-friction metals, 5988, 6162
Antilles, Greater and Lesser, 4178
Antimony, chemistry of, 240, 517, 1162; analysis, 4408, 4414; distribution, 3772; extraction, 4307; metallurgy of, 3837, 4307; occurrence, 839; physical properties, 1396, 3837, 4307, 6732; in pottery colouring, 5382; a protoplasmic poison, 3017; reaction and test, 4408; symbol and atomic weight, 517; uses, 360, 4307
— potassium oxalate, in dyeing, 5781
— potassium tartrate: *see* Tartar emetic
— vermilion, composition and manufacture, 5144; use, 5832
Antipyretics, 5469
Antipyrine, uses and production, 5469
Antirrhinum: *see* Snap-dragon
Antisepsin, composition, 5469
Antiseptic treatment, origin and importance, 202
Antiseptics: *see* Disinfectants *and specific substances—e.g.*, Boracic acid
Antitoxin, 6544, 6781; diphtheria, 5411
Antlers as weapons, 2155
— deer's, *2156*; evolution of, 825
Antoinette, Marie, marriage, 5111; guillotined, 5112
Antoninus, wall of, building, 2607
Antoninus, Pius, Roman emperor, reign, 2070
Antony, Mark, and Cleopatra, 1672; and death of Cæsar, second triumvirate, 1671, 1672
Anu, Assyrian god, 501
Anvil, described, 2983, *2985*; in smiths' work, 3107
— block, of mechanical hammer, *2019*, 2022
— bone, of ear, *2533*, 2534
— chisels, *4151*, 4152
— fuller, 2983, *2985*, 2986, *2897*
— swages, described, 2983, *2985*
Antwerp, Belgian port. 1835; cathedral, 3374; trade, 4520
Antwerp blue, 871
Anxiety, effect on health, 2664
Aorist tense, Greek, 6809
Aorta, structure, *953*, 955
Apaches, ethnology, 1789
Apartments, seaside, catering, 5720
Apatite, 768, 1041, 6732; in phosphate manufacture, 4779; as manure, 5586
Ape, brain, size, 2145; characters of, 1493
— anthropoid, cranial capacity, 1785
Apelles, Greek painter, 2931
Apennines, Italian, 2230
Aphalostachyum: *see* Bamboo
Aphelion, defined, 6405
Aphides, larch and spruce, forest pests, destruction, 4296, *4297*, 4298
— *see also* Plant-lice *and* Green-fly
Aphis, Chinese, cause of galls, 5366
Aphis-lion, description, 3366
Aphonia, cause, 6133
Aphrodite, temple at Corinth, 1526
Aphrodite: *see* Sea-mouse
Apiary, arrangement, 5958
Apiculture, *5957–5963*
Apis, bull, in Egyptian worship, 419
Apis mellifera: *see* Bee
Apnæa, in respiration, 1303
Apoda: *see* Cæcilians
Apolar, nerve cell, in anatomy, 1942
Apollo, Greek god, 668
— Belvedere, statue, 2930, *2931*
Apollodorus, Greek artist, 2931
"Apologia," Justin Martyr's, 2070
Apomorphine, use, preparation, 3825; in opium poisoning, 4006
Apoplexy, causes, treatment, 6261
Aposiopesis, in grammar, 1616
Apostrophe, in correspondence, 6352; in French, rules, 449; in Italian, 2044
Apothecaries' weight, table of, 226
Appalachian Highlands, 4061, 4064
— oil-fields, 6007, 6014
Apparire (Italian verb), conjugation, 5946
Apparitions and imagination 3625; instances in psychical research, 3625; *see also* Visions *and* Ghosts
Appendicitis, curative symptoms, 5539; cause, Treves on, 5843
Appendix, in physiology, *576*, 579
— in zoology, origin, 2157
Appenzel railway, construction, 3804
Appian way, length, 1977
Appius Claudius, story of Virginia, 1201
Apple, choosing, 1228; amber, recipe, 2002; Australian, 3236; cider manufacture, 6356; culture, *6676*, *6677*; essence, source, 5469; European cultivation, 855; fritters, recipe, 2001; fruit, sources, 4875; in season, 1531; market prices, 2530, 2532; paring machine, *4845*, 4848; preserving, 4846; rings, preparation, 4845; storing, 6678; tree, use of timber, 57, (varieties) 6676; Tasmanian cultivation, 3469, 3900
Applied botany: *see particular branches—e.g.*, Forestry, Rubber, *etc.*
Applied chemistry, books on, 6389; dictionary of, 4316; *see also specific subjects—e.g.*, Alkalies, *etc.*
Applied education: *see* Education
Applied mechanics, 85
Appliqué wood-carving, 6136
Appoggiatura, in music, 271
— in violin playing, 2508, 2509, 2510
Apposition, in grammar (English), 247
Apprentices, dressmakers', 2438
Apprenticeship, in various trades, wages, etc., 46, 47; decay of, 2641; engineering, 5594; railway, 4380; *see also separate trades*
Apricot, 6880; canning, 4846; cream, recipe, 2001; dried, preparation, 4845; fritters, recipe, 2001; jam manufacture, 4845; pulp, use, source, and preparation, 4846; tree, culture, 6677
April, origin of name, 1182
Aprons, of vehicles, use, 3623
Aptera, wingless insects, 3362
Apteryx: *see* Kiwi
Apus, in zoology, description, *3809*
Aqua regia, 5528; gold solvent, 1448
Aqua-thruster pump, Bailey's, 1825
Aquamarine, 5853, 5855, 6732
Aquatint etching, 6113
Aqueous humour of eye, 2953
Aquilegia: *see* Columbine
Aquinas, Thomas, place in psychology, 2013; on life, 2032; Aristotelian philosophy, 4883; logic, 5999
Arabi Pasha, Egyptian affairs, 6692
Arabia, geography of, 2817
— history, rise of Mohammed, 2243, 2353; Spanish settlements, 2946
Arabic, English importations, 1770
Arabin, in gum arabic, 5363
Arabinose, production, 5363
Arabs, art, 3092; ethnology, 1790; in Portugal, 2946; keen vision, 2403
Arachis nut, 4658
— oil, 4830, 4831, 4833
Arachnida: *see* Scorpion *and* Spider
Arachnoid membrane, anatomy, 2145
Arago, magnetism experiments, 562; scientific discoveries, 3850
Aragon, joined with Castile, 2946
Aragonite, 768, 843, *plate facing* 1345
Araucaria: *see* Monkey tree
Arbela, battle of, 972
Arbitration, international, project of Henry of Navarre, 4320
Arbor, use for, clock collets, 5883; verge watch, 6082
— barrel, of watch, 6083
— vitæ, in cerebellum, *2144*
Arboring, boring machine, *8317*, 3319
Arbors of clocks, American, 5711; pendulum, 5714; repairing and making, 5718
Arbaces, revolts against Sardanapalus, 502
Arc, of circle, 285, *287*, 4208; complement and supplement, 6665
— electr
241
Arc-lam
current supply systems, 2245, 2417
Arc-light, Davy's discovery, 129
Arcade, Gothic, horizontal line in, *2283*
Arch, in architecture, shoring method, 920; designs, *2131*, 2134, 2567, *2569*, 3092; in Etruscan and Roman architecture, 2931; in Saracenic art, 3092
— brickwork, *1850*, 2385, 2387
— in building, brick, 2385, *2387*; materials, forms, strength, voussoirs, and keystones, 3143; stability, 2760, *2761*, 2762, *2763*, 2764; trimmer, 2388, *2389*
— in geology, stratified rocks, 1923
— Gothic order, 3144
— hearthstone construction, 4446, *4467*
— pointed, 3373
— Romanesque period, 3231
— in vehicle construction, 2559
Arch-panel of brougham, 2829, *2831*
Arch-ring, minimum depth, 2760, *2761*
Arch-stone, forces acting on, 2760
Archæan rocks, 2067, 2253
Archæopteryx, extinct bird, 2214
Arched roof, in carpentry, *4253*, 4254
Archidere, Italian verb (conjugation), 4792
Archil, 6880
Archimedean spiral, drawing. *1413*
Archimedes, discoveries, 34; specific gravity law, 798; law of immersion, 1078; system of levers, 1797
Architect, duties, 140, 141, 1910-1912; charges, 1911; examinations, schedule, 161, 1912; control over work, 307; equipment, *1910*, *5419*, 5420, *5421*; municipal service, 785; office experience, 2036; study, pupilage, 2034, 2036
— assistant, 2036
"Architect of Tello," statue, 2657, *2658*
Architectural design, 2128, 2283
— drawings, scale, 1910
Architecture, the profession, 1910, 2033; the art, *2128*, *2283*; Assyrian, 2657, 2658, *2659*; books on, 2033, 2034, 2287; Byzantine, 3089; Chaldean, 2657, *2658*, *2659*, *2660*; Christian, 3089–3092; day schools in London, 2036; design, *2133*, *2283*; dictionary of: *see* Building

Architecture—continued
Egyptian, 420, 2133, *2520*; Elizabethan, 3946; five orders, *2035*, 2135; Gothic period, 3373, 3374, 3375; (books on), 2034; Greek, 2133 2857; Jacobean, 3946; Moorish, 2133; Renaissance, style, *2134*, 3520; (masters), 3675; Northern Europe, 3946; Roman orders, 2133, *2035*, 2931; Romanesque period, 3231
Architrave of door, *5181*, 5182
Arco, violin music, 5727
Arctic circle and the sun's altitude, 293
— Ocean, direction, 460; arm of, 853
Arcturus, movement, 2028, 6698
Ardeidæ: *see* Heron
Ardennes, Belgium, 1835
Ardere (Italian verb), conjugation, 4792, 6378
Are, unit of surface, 537, 1148
Area, arithmetical problems, 1411
— of plane figures, 285, 1251
— of rectangular surface, 1548
Areas, geometrical ratio of similar figures, 5635; proportional division, 1251; properties, 1443; definitions, propositions, 4905; in surveying, 1147
Areca, 6880; Bombay cutch from, 5906
Arenaceous rocks, geology of, 1072
Areopagus, Athens, 1525
Argand burner, construction, 6026
Argentina, coins, weights, and measures, 409; commercial opportunities, 6212; geography, 4282, 4288, *4289*, 5660; economic conditions, 5660; population, 628; trade, 5824, 5825; wheat export, 3282; wools, *70*, 72, 3990
Argentite, characters, 6732
Argillaceous iron ore, 231
— rocks, composition, varieties, 1072
Argol, manufacture, 3704, 4782, 6355; in dyeing, 5781
Argon, element, 401, 517, 1296; in periodic system, 1446
Argonaut, care of eggs, 3116
Arguing in a circle (logic), 6100
Argüir (Spanish verb), conjugation, 4509
Argument, fallacious, and a fallacy, 6099
Ariadne, in Chaucer, 326
Aridæus, succession dispute after Alexander the Great, 975
Aries, Zodiac sign, 6251, 6665
Arillus: *see* Mace
Ariosto, Italian poet, 538, 678
Aristophanes, dramatist, 774
Aristotle, life, 976; animal classification, 29; his "elements," 516; preceptor of Alexander, 972; anthropology, 1788; air-theory, 1801; on habit, its ethical value, 2860; comparison with Spencer, 3986; founder of logic, 5998
Arithmetic: *see Group Index, and separate headings—e.g.*, Addition
Arithmetical progression, 3913
Arizona, surface and climate, 4174
Arkwright, Sir Richard, and cotton industry, 223, 1398; carding engine, 1542; spinning frame, 2441;
Arm, human, physiology of, 98, *1195*, 1196; bones, 1708, *1709*, 1710, 1797, *1798*
— of pulleys, *3423*
— in sculpture, *1351*; casting, 509
Armada, Spanish, defeat of, 3999
Armadillo, digging claws, 1871; protective bony plates, 2156, *2157*
Armature of converter, 2248
— dynamo, 1105, *1106*; (books on), 4298; core, 1106; winding, 1107, 1323; alternator, 1358, *1361*, 2248
— of electromagnet, definition, 564
— electromotor, 1590, *1593*; windings, *1593*, *1905*
— in sculpture, figure modelling, *1346*; for head, *1510*; making, 1675
Armchair, wicket, *5563*, 5564
Armenia, ethnology, 1790; geography, 2719; highlands, 2564
Armlet, goldsmithing, *5687*
Armorican language, classification, 1771
Armour, protective, of mammals, 2156
Armour-plate, grinding, 5456; manufacturing processes, 4750; nickel steel, 5984; planing, 5002
Armoured concrete: *see* Reinforced concrete
Armourer, Army, 3840; service, 3841;
— Navy, service, 4265, 4269
Armourer-sergeant, promotion, 4031
Arms, manufacture, *6610*, *6615*, *6757–6765*
Arms, of spur wheel, drawing, 3658
— moulding process, *2544*
Armstrong hydraulic accumulator, 1080
Armstrong works, Elswick, gun-mounting shop, 833
Army, Accounts Departments, appointments, 3195; as a career, 161, 3840, 4032; Civil Service posts, 2575; Commissioners, 4197; discharge, cost, 4032; Medical Service, appointments, 5427; non-commissioned officers, 4030; Ordnance Corps, service in, 3840, 4031; and Post Office berths, 2809, 2811; service in, 3841; Service Corps, service in, 3840, 4199; technical branches, 4030; Veterinary Department, service in, 5432; War Office clerical appointments, 3195
— *see also* Navy
Arnold, Matthew, poetry, 1437; on true education, 2138; works, 2616; monographs on, 2618; portrait, *2619*
Aromatic chemical products, kinds and uses, 4969, 4971
Arpeggio, term in music, 270, 3399; harp music, *3529*, 3530; in pianoforte playing, 1507, *1758*, 1888; violin bowing, 2743, *2744*; violoncello playing, *2969*, 2970; orchestra scoring, 5885, *5890*, *5891*
Arrack, where obtained, 2879, 4875
Arrhenius, Prof., on osmotic pressure in solutions, 4562
Arrises, in boiler-work, 3100
Arroba, Chilian measure, 409; Philippine measure, 410
Arrowhead classification, 355
Arrowroot, 6881; classification, 355, 6881; sources, 4959; adulteration, 3717; dietetic value, 3312
— Jamaican, 4178
Arrowroot starch, micrograph, 5365
Arschine, measure, 410
Arsenic, element, 517, 1162, 6732; occurrence, 839; protoplasmic poison, 3017; physical properties, 3837; analysis, 4414; reagent and test, 4408; Marsh test, 4630; in steel, 4747; in wallpaper, 5051
— metal, occurrence, 362; properties, ores, and extraction, 4307; in shot manufacture, 5988
Arsenious acid, test, 4410
Arsenolite, characters, 6732
Arsenuretted hydrogen, production, 4630
Arson, and fire insurance, 4849

Athens, history, 668, 772; philosophic schools, 976; sculpture school, 2929; temples, *141*, *2858*, *2859*; tourist description, and directions, 391, 1525, 1526
At-homes, catering charges, 5582
Atheroma, causes, symptoms, 6036
Athletic goods, sale, 5344
Athletics, abuse and value, 4387; effect on women, 4828; training system, 4389
Atlantic Ocean, climatic influence, U. K., 853, 984; effect on coastline, 980; currents, *557*; greatest depths, 555; continental shelf, 299; size, 460; temperature, 555
Atlas mountains, 3275
Atlas moth, 583, 3516
Atlas vertebra, human, *1605*, *1606*
Atmosphere, chemistry, 239, 1296; composition, 239, 621; compensating actions, 1298; geological work, 1499; height and weight, 621; history and future, 1297; humidity, 1899; pressure, *293*, 1741; (diminution and anticyclones), 986, 1801; (influence on weather), 1899; sulphuric acid in, 4632; temperature, *293*, *294*
Atmosphere, English standard, 1140; as pressure unit, 24
Atmospheric pressure, general account, *293*, 1140, 1141, 1741
— pump, 1081
Atoll, coral, *558*
Atom, ancient and modern views, 487, 2081, 2082, 6259; chemical properties, 2296; complexity, 2081, 4131; corpuscular theory, 2297; Darwin on, 239, 487; disintegration, 2391, 2394, 2554; duration of, 2083, 2295; electronic theories, 2294, 2297, 2554; evolution of, 239, 1916, 2030; Kelvin on, 4131; in heavenly bodies, 4135; instability, 2391, 2554; inter-atomic and intra-atomic processes, 2083, 2393; molecule, 134. 692; relation to solar system, 2028; to universe, 2552; size, 2028; spectroscopic investigation, 3370; stereo-chemical representation, 2714; unity and divisibility of, 1596; valency, 2296
— *see also* Electron *and* Element
Atomic theory, in chemistry, 692; discovery, 61; in physics, 312
Atomic weights, in chemistry, 401, 517; and molecular weight, 694
Atomism, history of doctrine, 34
Atopite, characters, 6732
Atrium, in architecture, 2932
Atropa belladonna: *see* Nightshade, deadly
Atrophy, in theory of heredity, 1484
Atropine, chemistry of, 4009; effect on eye, 2401, 3179; physiological effect, 4010; prussic acid antidote, 3537
Attaché, appointment and salary, 2934
Attainder Bill, 3832
Attenant (French preposition), 6089
Attention, importance of, 1883; psychological explanation, 2258; educational importance, 2306; *see also* Observation, Concentration
Alteratives, chemical action, 1445
Attic, classic form of Greek, 5374
Attila, the Hun, invasions, 2241
Attle, in mining, definition, 3194
Attolens auris, muscle, *1350*, 1351
Attrahens auris, muscle, *1350*, 1351
Aubépine, in perfumery, 4971
Auction bill, drawing up, 4984
— expenses account, 4986
Auctioneer, duties at sale, 4985; earnings, 1912; licence, 5284
Auctioneering, training, salaries and duties, 4983; as a career, 161, 5155
Audit office, appointments, 3195, 3382
Auditing, practice of, 3919, 8920; profit falsification, detection, 2421
Auditors, examination, 149
— local councils, appointment, 316
Auditory canal, of ear, *2533*
— nerve, complex function, 2118; and sound interpretation, 2534
— ossicles, function, 2316
Augers, varieties, 4479, *4481*, 6756
— clay boring tool, *2666*, 2669, 4480
Auger-stem, in rope boring, 2845, *2846*
Augite, mineral, 768, 1009, 6732
Augmented chord, in music, 364
— intervals, in music, 274, 567
August, origin of name, 1182
Augustan age, history, 1829
Augustin silver recovery process, 4304
Augustus Cæsar, emperor, life and reign, 1670, 1829; statue, *2932*
Augustus II., of Poland, dethroned, 5397
Auk, description, 2212
Auker, measure, Danish, 400; Russian, 410
Auramine, dye, 5955; use, 6766
Aurantia, dye, manufacture, 5953
Aurelian, Roman emperor, career, 2071
Aureolin, pigment, 871, 5144
Auricle of heart, 102, *955*, *956*
Auricularia larva of sea-cucumber, *4082*
Auriga constellation, *6116*, *6117*
Aurora borealis, possible cause, 2027; Arrhenius' explanation, 4700
Austen, Jane, novelist, definition of novel, 2961; works, 3132
Austerlitz, battle of, 5238
Austin, Alfred, 1438; essays, 2785
Australasia, coalfields and coal ports, 5304, 5305; medical profession, 5428; size, 850
Australia, aboriginal skulls, measurement, 1785, *1787*; aborigines, ethnology of, 1788; commercial opportunities, 6552; farming, 3235; fauna, 628, 3698; forest trees and vegetation, 626, 627; geography of, *3697–3702*; history, 6552; isotherms, *3698*; labour supply, 6629; mineral production, 5307, 5308; police forces, 3550; railway employees, 3549; sea fishing, 5318; size, 460; wool industry, *70*, 72, 221, *224*
Australian Alps, 3697, 3702
Austria, craniology, 1786
— geography of, *2162*, 2165, 5710
— history, mediæval, 4398; at time of Spanish succession, 4951; Napoleon's victories, 5238; modern, 6445
— medical profession, 5429
— touring directions, 394, 1248
Austria-Hungary, coalfields, 5302, 5304
— coins, weights and measures, 409
— geography, 628, *2162*, *2163*, *2165*, 5381, 5710, 5825
Austrian Gate, Danube valley, 2162
Autoclave, in candle manufacture, *4835*; in hardening bricks, *5767*
Autocracy, Russian, nature, 4370; democratic aspect, 5534
Autogenous soldering: *see* Soldering
Autoharp, musical instrument, 4312
Automatism, of Descartes, 2012; evolution of reflex action, 2118; relation to habit, 2860
Automobile, etc.: *see* Motor vehicles
Autoplate printing, 5558, *5559*
Autosepsis, cause and effects, 5842
Auto-suggestion, in relation to will, 2549; psychic remedies, 5699
Autumn, astronomical cause, *15*; fall of leaf, 728
Auxiliary verbs, English, compared with "notional," 902; use and conjugation, 758, 903
— French, 751, 2022, 5498
— German, 745, 1342, 2926; of mood, 3355
— Italian, indicative mood, 2193
— Spanish, conjugation, 3348

Avalanches, cause, 1636
Avebury, Lord, in literature, 2785; hundred best books, 3783
Avens (bot.), seed-dispersal, *911*, 912
Aventurine glass, recipe, 4930
Avesta, Persian sacred book, 501
Avignon, cathedral, architecture, 3232
Avogadro's law in chemistry, 696, 1914; application to solutions, 4562
Avoir, French auxiliary verb, 5948
Avoirdupois weight, table, 226
Avon, river, course, 1276
Awl, in basket-making, 5489
— in harness manufacture, 4784
— shoemaker's, *3875*, *3876*
Awn, of grass, 875; of wheat, 913
Axe, mason's tool, *1837*, 1838
— in quarrying, 532
— for timber, 4149, 4150, *4151*
— scutch, in building, 1950, 1951
Axe-head, cave-dweller's stone, *2478*
Axed work, in building, 1950, 1951
Axinite, characters, 6732
Axioms, in geometry, 4207
Axis of a conic, 5783; cylinder, of nerve fibres, 1942, *1943*; in drawing, 496, 1747, *1749*; of ellipse, 1411; of flotation, in hydrostatics, 1080; of parabola, 1412
Axis vertebra, human, *1606*
Axle, of under-carriage, 3123, *3124*; railway, drawing, *3135*; steel, 4747; tests, 3962; of vehicles, *3325–3328*
Axle-bed, of van, *2829*; of light waggon, 2829, *2830*; of under-carriage, *3123*; of elliptic spring fore-carriage, *3125*
Axle-box, railway, 209, *3265*, *3266*; cap, etc., of wheel, brougham, 2830
Axle-flap, of brougham, 2830, *2831*
Axminster, industry, 1276; carpet manufacture, 3358
— carpet, weft of, 3157; principles of design, 3357, *3358*
Axode, in mechanics, 88
Axolotl, description, 2800, *2801*
Aylesbury duck, points, 5704,
Aylmer, Rose, and Landor, 1307
Ayola, Pedro Lopez de, Spanish poet and historian, 2042
Ayrshire cattle, 2236, *2237*, 3667
— coalfield, 1066
Azalea, classification, 354; culture, *6530*, 6531
Azimuth, defined, 709, 6245, 6661, *6665*
— compass, 6658
Azimuthal arc, in surveying, 709
Azo blue, dyebath, 5955
— colours, 6194, 6195
Azores Islands, discovery, 2947
Azurite, composition, 4127, 6732

BAAL, Phœnician god, 501
Babbitt metal, 2545; use, 3266, *3268*
Babcock and Wilcox boiler, 6879
Babingtonite, characters, 6732
Baboons, courtship coloration, 2157
Baby, brain weight and size, 2144; care and feeding, 4681; clothing, *3744–3746*, 4683; diet, 3381
— bonnets, *5939*
— carriages, hiring, 927; suspension, 3126, *3127*: trading in, 926; *see also* Perambulators
— foods, dietetic value, 3312
— linen, trade and profits, 927, 928
Babylon, Babylonia, art, *2657*, *2658*; bricks on walls, 1278; captivity of Jews, 667; ethnology, 1790; history of, 16; woollen manufacture, 68
"Babylonian Marriage Market," *19*
Bach, John Sebastian, fugues, 634; use of pedal, part playing, 1891; study of, 2023; "Preludes and Fugues," 3860, 3866
Bachofen, theory of matriarchy, 4825
Bacillus, 6437, *6439*; reproduction by fission, *381*, 6437, *6439*; cholera, 5410
— enteritidis, 3826
— erodiens in puering leather, 3011
— influenza, 5412
— lactis, Lister's discovery, 3534
— malleus, 2620
Bacillus subtilis, in glue, 5360; culture, *6540*
— tubercle, 5409, 6134
Back, brewing, 6057
Back, in slating, 4866, *4867*
Backband, of harness, 4886, 4890
Backboard, in taxidermy, 6328, *6329*
Backbone: *see* Spine
Back-flow, in drains, discussed, 572
Backing deals, in mine shafts, 3193
— photo, use, 6684
— sheet, in typewriting, 1697
Backlash, in spur-wheel driving, 3639
Back-plate, in foundry work, 2545
— of locomotive fire-box, *3101*, 3103
— of roof iron work, 5792
Back-pressure, in steam engine, 5643
Backs, in cabinet-making, 6586, 6587
Back-shaft, of lathe, *4913*, 4920
Back-sight, in levelling, 374
Backstay, pier, tension on, *2763*, 2764
Back-stitch, milliner's, *4565*, 4566; needlework, *150*; in tailoring, 1110, *1111*
Backward bearing, in surveying, 267
Bacon, Francis, Lord Verulam, physical science, 36; on reading, 104; as essayist, 1341; as logician, 5999, 6001
Bacon, Roger, early chemistry, 59
Bacon, choice, 1228, 3717; curing, 2370; slicing machine, 3042
Bacon beetle, classification, 3511
Baconer, feeding, 2369
Bacteria, 6437, *6439*; in butter and cheese-making, 3553; and cell life; in cheese-making, 4492; classification and main characteristics, 166, 6437; cultures, 6438, 6439; Davis's diagram of, *277*; disease-causing, 6439, 6540–6543, 6780; evidence of consciousness, 3117; evolutionary agent, 6781; in food, 3820, 3826, 5403; immunity from, 6542; inoculations, 6439; Metschnikoff's theory, 953; in milk, 3534, 3821, 6441; nitrifying, 238, 256; reproduction, *381*, 6437, *6439*; sewage purification, 4742, *4744*, 6541; water contamination, 4159, 6440; in surface soil, 5273; *see also* Bacillus
Bacteriology, dictionary of, 6545; and racial evolution, 6782; investigation, 6438; terminology, 6437
Bacterium, defined, 6437
Bad debts, in bookkeeping, 1568; account, in balance-sheet, 2881; ledger, 3569
Badger, 1764; skins, 6429, 6430; warning coloration, 2157
Badger-softener, painters', *5829*, 5831
Badger, in drain laying, 734
Badges, die-sinking, 5529
Baedeker guides, value of, 1812
Bag and trunk dealing, 928
Bagasse, use as power fuel, 5127
— in sugar manufacture, 3827, 4164
Bagdad, city, 2353; trade, 2719
Bagging machine, boot-making, 4434, 4436
Baggage, touring: *see* Luggage
Bagpipes, Highland, 3400, *5059*, *5060*
— Irish, 5063, 5064
Bags, coal-dealer's, cost, 1989, 1990
— saddler's side line, 4890
Bahamas, islands, geography, 4178
Bahr Ghazal, confluence with Nile, 3450
Bahr Zeraf, branch of Nile, 3451
Bailiff, farm, duties, 5287
Bailing, extracting oil, 3191
Bain, A., psychological theory, 2014; work on emotions, 2694
Bain-marie, cooking utensil, 1225
Bakehouse: *see* Baker
Baker, in ancient times, 3281
Baker and confectioner, wages and capital, 46; trade of, 930; technical education, 931; barrow, *2463*; refreshment catering, 5582
Baker heaters in trains, 3025
Baker's blower, principle, 1686, *1687*
Baker's oil-separator, water, 5764, *5765*
Bakers, employment conditions, 2655
Bakery, model, *3394*
Baking, in cookery, 1487, 3314
Baking-powder, preparation, 4774; tartaric acid in, 4782
Baku, Caucasia, oil region, 1164, *2719*, 5306; oil wells, 6009, 6011, 6014
Bala, lake, N. Wales, 1277
Balance, American clock, 5712, 5714
— in architectural design, *2283*, 2284
— banking, commission, 3482
— in bookkeeping, 2501; ledger, 1867; *see also* Trial balance
— chemical, description, *61*, 312
— in design, 5819
— petty cash book, 404
Balance-sheet, relation to trial balance, 2502; rent, rates and taxes, allowance for, 2882; of profit and loss account, analysis, 2755; doubtful debts, 2881; final form, *2757*; businesses with branches, 3418; single entry, profit and loss, 3917
— — bank, 4438, 4443
— — company, 3189
— — contractors' business, 3420
— — in partnership concerns, *2979*
Balance spring, watch, 6084
— verge watch, *6081*
— wheel, verge watch, *6081*
Balancer, in three-wire electric supply system, *2246*, 2247
Balaninus glandium: *see* Nut-weevil
Balanoglossus: *see* Worm
Balas ruby: *see* Spinel
Balata, sources, manufacture, 5313
Balayeuse, in dressmaking, 187
Baldness, causes, 4255
Bâle: *see* Basle
Bale, of tobacco, 4274
Bale-breaker, cotton, 1241
Baleu, of crayfish, use, 3807, 3808
Balfour, A. J., on matter and ether, 935; philosophic works, 2786
Baling, in cotton, 388
Baling press, 1223; for cotton, 390; hydraulic ram, 1220
Baliol, John, Scottish Pretender, 3074
Balkan Peninsula, 2165, *2166*, 2167
Balks, for sea barriers, 4644, *4645*
— timber, 3542, 3544; joints for, *4115*, 4116; test, 6266; transport, 4646; in trestles, 1173
Ball-bearing, 964, 3328
— — hub, construction, *4327*
— — worm-gear, *3925*
Ball-mills, cement manufacture, *1583*
Ball-and-socket joint, human, 1709, *1710*
Ball trap, in drainage, *571*, 572
Ball-valve, pump, 1081; in cisterns, *5629*, 5632; water-waste preventer, *5631*, 5634
Ballad, Irish, poetry of, 2616
Ballast, in building, 643, 647
— in foundations of buildings, 332
— in railway construction, 3429, 3430;
— of ships and steamers, 1089, 5402
Ballast-bags, of balloon, 3979, *3981*
Ballistite, manufacture, 6763
Balloons, as means of transit, 2279, 3979, *3981*; military use, 6274; scientific observations, 3982
— captive, uses, 3983
— dirigible, history and problems, 2279
— hot-air, construction and use, 3983
Balls, Hoffmann, in thrust bearings, 4325, 4327
Balsam, classification, 353; pollen protection, 1114; seed vessel, 910, *911*
— Canada: *see* Canada balsam
Balsam fir-tree, resin, 1034
Balsam of Gilead, oleo-resin, use, 4969
— Peru: *see* Peru balsam
— of tolu: *see* Tolu balsam
Balsams, 1034
Baltic fir and pine: *see* Scotch fir
— Provinces, ceded to Russia, 6201
— Sea, current, 558; gulfs, 583; Russian ports, 2406
Baluchistan, British, 2818; ethnology, 1790
Baluster, forms, 3241, *3247*; construction, *5301*
Balustrade, iron, 3242, *3247*, 5795, 5797
Balzac, works, 3783
Bamboo, cultivation and uses, 5724, *5725*, 6881; varieties, 355, *5724*

Banana, 6881; African flora, 3276; bottling, 4846; classification, 355; cultivation, 4493, 4876; market price, 2532; sale, 4844; in season, 1531; staple food, 4875; West Indies, 2532, 4178
Banana trifle, recipe, 2002
Ban ochra, plant, use of fibre, 818
Ban rhea, plant, uses of fibre, 817
Bances, buttresses of gutta-percha trees, 809
Band brakes, mechanism, 3128
— military, pitch of instruments, 1058

Bandeaux, in millinery, *5332*, 5505
Band-nipper, bookbinding, *6776*
Bandsaws, woodworking, horizontal, *5994*, *5997*, *6357*, *6449*, 6450; feeding devices, 5996; loading appliances, 5997; vertical log, 5996, *5997*
Bandsmen, navy, 4269
Band-wheel, use in mining, *2845*
Banjo, construction and playing, *4310*
Bank accounts, bookkeeping, 1866, 1966
Bank Act, objects and provisions, 4168
— bookkeeping, 4438
— cash book, use, 779, 977, 1468; entry of partner's drawings, 1570
— clerks, 4587; wages, 44, 161
— credit without recourse, issue, 4294
— drafts, foreign, 3683
Bank of England, 4167; clearing accounts, 3972
— officials, 4587
— pass book, 778
— rate, fluctuations, 4170
— river and sea, protection from erosion, *5578*, 5579, 5580
Banka, island, tin supply, 5308
Banker, commercial functions, 3973
— examinations, 4589
Banker's discount (explained), 1319
Banket, in mining, 3770
Banking, 3960, 4167, 4291, 4438, 4587; bank rate and discount rate, 4170; books, 4590; branch banks, 4171; clearing house transactions, 3971; commercial functions, 3973; continental branches, 4590; correspondence and inquiries, 4293; credit, 3970; deposits, 4167; discount, 4292; documentary bills, 4295; examinations, 4590; future, 4590; head office work, 4295, 4438; Institutes of Bankers, 4589; interest, 4292; ledger loans, 4292; lending at interest, 4167; loan and remittance, 4167; note issues, 3970; overdrafts, 4292; passbooks and paying-in books, 1966; remittance business, 4293; securities and periodical payments, 4293; Scottish system, 1466, 4291; valuables, custody, 4167; advice to depositors, 3482
Banking, in drain laying, 733
Banking up, forge fire, 3107
Banknotes, Bank of England, 4169; forgery precautions and re-issue, 4438
— Scottish, 4291
Bankrupt, adjudication, 3750; public examination and discharge, 3571
Bankruptcy Acts, 1883, 1890, 3569
— law of, 3569–3571
Banks, arrangement of premises, 4589
— branch, balance work, 4443; function of, 4171
— continental British branches, 4590
— country, issue regulations, 4168
— joint-stock, 4171
— liabilities and assets, 4438, 4444
— private, decadence, 4171
— Scottish, 4291
Bann, river, watershed, 984
Bannockburn, battle of, 3075
Bantam, fowls, 4660; breeding, 4859; varieties, 4958, *5625*
— booted, points of breed, 4958
— Pekin, points of breed, 4958
Bantry Bay, comparison with Norwegian fiord, *980*
"Baptism of Christ," picture by Francesca, 3794
Baptist Church, ministry, 162, 6602
Baptistery, architecture of, 3089, *3090*
Bar, the (law), study and call to, 6746, 6747
Bar, use in mining shaft, 3457
— bulkhead bending, 5739
— of metal, bending process, *2987*, 2988
— reversed, of ships, bevelling and bending, 5738
— splinter, leather trimming, 3622
— test, limitations of use, 3961
Bar-boy, of railway locomotive, duties, *4593*, 4595
Bar-stays, in vertical boilers, 3099, 3105
Bar-straightener, use, 5214
Bar-tack, in finishing pockets, 1551
Barbados, cotton industry, 225, 383, 385; golden syrup manufacture, 3831
Barbary States, geography of, 3279
Barber, trade, 46, 1095, 3295, *3297*; side lines, 3296; *see also* Hairdresser
Barber-surgeons, ancient practice, 1895, 3295
Barberry, classification, 352
Barberry bark, source and use, 6068
Barberry blight, 1372, *1373*
Barbet, description, 2210
Barcelona, Spain, capture by Earl of Peterborough, 4951; manufacture and trade, 2234, 5823; touring, 1133
Barcramp (tool), use, *3388*
Barfling (iron coating), 6577
Bargains, law of, 6752
Barge builders, employment conditions, 2645
Barges, dredging, 5336
Barilla, form of soda, 842
Baritone voice, characteristics, 6050, *6182*
Barium, chemistry of, 517, 1041, 4409; proportion in earth's crust, 239
— carbonate, in hardening stonework, 3244
— oxide, chemistry, 1041; use in glass manufacture, 813
— sulphate, formation, 4632; precipitates, *4405*, 4412: *see also* Barytes
Bark, dyeing, 5907; economic products, 4658; medicinal, *6067*, *6068*; tanning, 1165, *6065*
Bark-beetle, wood destroyer, *3512*, 3513
Bark-mill, use, *3012*, 3013
Barker's mill, prototype of reaction turbine, 1692
Barley, cultivation and yield, 873, 1229; climatic limitation, 4493; digestibility of, 3314; English growing counties, 874; European cultivation, 855; fermenting, 3085; fungous pests, 1669; germination, 635; harvesting, 1663; as livestock food, 2704, 2908; as poultry food, 5435; Scottish yield, 874; world's cultivation, 4874; dietetic value, 3312
— Chevalier, 873
— meadow, weed, 883
Barley-starch, micrograph, 5365
Barley-straw, as livestock food, 2909
Barley-sugar, production, 3652
Barley-water, as infants' food, 4683; recipe, 2334
Barlock typewriter, 1528
Barm: *see* Yeast
Barmecides, history, 2353
Barn, in farming, construction, 2998
Barnacles, *3806*, 3809; attachment to vessels, 5260
Barnet, battle of, 3603
Barnsley, industry, 1272
Barographs, 6131
Barometer, aneroid, 1139, *1140*, 6129, *6130*; in ballooning, 3980, 3982; in surveying, 159; cistern, 6129, *6130*; manufacture, 6129; mercurial, in determining heights, *592*; Torricelli's and modern forms, *1139*, 6129; prices, 4995; relation to tidal height, 6219
Barons' Wars, 3073: William Rufus, 2374; Henry I., 2675; Richard II., 3250
Baro-thermo-hygrometer, in ballooning, 3982
Barouches, described, 2465
Barque, type of rig, *5399*, *5400*
Barquentine, type of rig, *5399*, *5400*
Barrancas, description, 4175
Barraque, used in shaft sinking, 3460
Barratry, in marine insurance, 4854
Barré, in banjo music, 4312
— in guitar playing, 5761
Barrel, boiler, 3098, 6514, *6515*
— piers of boat bridges, 6266
— of verge watch, *6081*, 6082
Barrener, in agriculture, 2238
Barrett, Elizabeth: *see* Browning, E. B.
Barretter, electric, Fessenden's, 3898
Barrie, J. M., novelist, etc., 2686, 3558
Barrier Reefs, general account, *558*, 3700
Barristers, average income, 163; study and career, 6746, 6747
Barrow, hand, construction, 2558; spring, 3328
— in mineral extraction, 2847
Barrow, river, Ireland, course, 1366; watershed, 984
Bars, of boring machines, action, 5008
— of brougham, 2830, 2831
— engine cylinder connecting rod, 5641
— geological formation, 1816
— iron, rolled, shapes, 4638
— lace loom, 4880, *4978*, 4979
— moulding, 5298, *5299*
— in music, explanation, 40
Barter, early system of trade, 145, 3969
Bartolommeo, Fra, painter, 3796
Barton, Dr., air-ship, 2279; aeroplane, 2280
Barwood, in dyeing, 5906
Barylite, characters, 6732
Baryta: *see* Barium oxide
— glass, recipe, 4533, 4736
Barytes, chemistry of, 1041, 6732; in rubber manufacture, 5203; Shropshire deposits, 2379
— paint, manufacture and use, 5143
Basalt, classification, composition, occurrence, 528, 535, *1008*, *1009*; jointing, 1925
Basaltine stone, concrete, 534
Bascule bridges, 828, 2886, *2887*
Base, in chemistry, 59, 240, 839; state in solution, 4407
— in logarithms, 6500
— of triangle, 285, 4330
— pigment, kinds and uses, 5832
Basebed, quarry bed, 2836; stone, *533*
Baseboard, in duplicating, 1698
Base-line, in surveying, 159, 594, 1018; in mine surveying, 804; of Ordnance Survey, 1145
Base-plate, of columns and stanchions, area, 5791
— — of crane, casting, *2111*, 2113
Basel: *see* Basle
Basic slag as manure, 590
— steel: *see* Steel
Basil, classification, 354
Basiliar membrane of ear, 2534, *2535*
Basileus (Greek noun), declension, 5655
Basilica, in architecture, Roman, 2932; in Christian worship, 3089; influence on Romanesque architecture, 3231
Basket-makers, employment conditions, 2656
Basket-making, 5488, *5489*, *5561*
Basket-worm, larvæ, 3515
Baskets, 5488, *5564*; cane, 5563; dress baskets, 929; double-lid, manufacture, 5563; fancy shapes, *5564*; flat fruit, 5563; greengrocer's, cost, 2870: oval, 5563; Parker's patent, 5563; round, 5489, *5490*; square, *5561–5564*
Basle (Basel), trade, silk manufacture, 1837, 1839; touring, 946, 1811
Basques, ethnology, 1790; nasal index, 1786
Bass, brush fibre, 6106, *6107*
Bass, musical instrument, *2745*
— figured, in music, 631
Bass-bar, violin, 2122, 2123
Bass clef, explained, 38; use in transposing, 1060
Bass clarionet, structure, use, and score, 4785, 4790, *5730*
Bass-drum, 5567
Basset horn, structure, use, 4790, 5730
Bassinette, basket work, *5564*; hood construction, *3623*; trade in, 926
Basso, in singing, 6050, *6182*

Bassoon, construction, use and playing, 4896, *4898*, 5887, *5893*; manufacture, 6624
— double, compass, *5730*, 5731
Bast, description and functions, *169*, 170
Bast-fibres, flax, use, 353
Baste, in tailoring, *3014*
Bastian, Dr. Charlton, experiments on sulphur and living matter, 1444; on origin of life, 2030
Basting, in dressmaking, method, 191; stitch, milliner's, *150*, *4565*, 4566
Bat, *plate facing* 1491, 1763; flying apparatus, 2037, *2038*, 2155; as pollen carrier, 730
Bat-engine, structure, *1996*, 1999
Batching, in cotton manufacture, 1242; of jute fibres, 1389
Bateson, biologist, on "Discontinuous Variations," 1181, 1484; on heredity, 1760
Bath, in technical drawing, *5165*, *5349*
Bath-coating, flannel, use, 3094
Bath-metal, properties, 3940
Bathstone, distribution, varieties, 533
Bathing-gown, child's, 4476
Bathmic theory of evolution, 652
Baths, children's, 4864, 6288
— medicated, 6283
— outlet and overflow, 5634
— plunge, swimming, and shower, 4256
— Turkish, 1896; use, 4255
— varieties and uses, 6287
— zinc, in laundry work, 2476
Bating, in leather manufacture, 2856, 3010
Baton, in music, conductor's, 5892
Batt frame, in felt manufacture, *1995*, 1999
Batten, of brougham door, 2829
— drawing apparatus, in ship drawing, 5610; *see also* Curves
— frames, in seasoning linoleum, 5125
— of hand loom, 3492
— in holding boards together, 3844, *3845*, 3847
— in joinery, 5296, *5299*
— timber, size, 3544
Batter, implement, use, 3255, *3256*
Batters, in cookery, making, 1530; for fried fish, 1873
"Battersea Bridge," Whistler's picture, *4302*
Battery, electric, 462, 464; energy, 467; discoveries, 129, 130: *see* also Cell
— storage: *see* Accumulator
— telegraphic, 5535
— telephone, 5682
Batting, in cotton manufacture, 1386
— machine, in pottery manufacture, 5233, *5234*
Baudot type-printing in telegraphy, 5394, *5395*
Bauxite, 5989, 6733; aluminium ore, 359, 5756, 5989; for glass-cutting wheels, 4932; refractory material, 3941; source of alum, 4780
Bavaria, political condition, 1974; beer consumption, 3377
Bay oak, timber, *56*
Bay rhum, recipe, 4972
Bay salt, source, 1600
Bayeux tapestry, 715, *3234*
Bayonet engine: *see* Semi-girder engine
Be, to: *see* Auxiliary verb
Beach, tidal formation, 1813; marine deposit, *1814*
Beacons, construction and use, 6498
Beaconsfield, Lord, novels, 3440, *3441*
Bead, in joinery, 5179, *5181*; in moulding of panelled door, 5180, *5181*; stop mitred, *5183*, 5186
Bead tools, *2457*, 2458
Beading, in boiler work, *3101*, 3107
Beads, glass, manufacture, 4931
Beak, of bug, 3364
— of fish-eating bird, 2493
— of smith's anvil, 2983, *2985*
Beak-iron of anvil, 3107, 5321; *see also* Mandrel
Beaker, goldsmithing, 5687, *5690*
Beakers, chemical, *4407*, 4412, 4993
Beam, carrying capacity, *1987*, 1988; stability, 1984, *1987*; strength of, 2197, *2199*, 2200
Beam, of barque, 5400
— braced: *see* Braced structures
— in carpentry, flitching and trussing, 4639, *4641*
— deck, erection, 5742
— of engine frames, load calculation, 4206
— engine, *828*, 5748
— in leather manufacture, *2854*
— in reinforced concrete construction, 1643, *1645*
— roof, 4247, *4249*
— of ship, *5741*, *6223*, 6673
— of steamer, 5402
— in weaving cloth, 3686
Beam-bar, of ship, *5741*
Beam-bending machine, of ship, *5741*
Beam-compass, in plotting surveys, 370
Beaming, in textile weaving, *3491*
Beam-knees, of ship, *5741*, 5742
Bean, common, varieties, uses, cultivation, 874, 1230, 4962; as cattle food, 874, 2908; culture, 6673; dietetic value, 3312; digestibility, 3314; as livestock food, 2704, 2908; English cultivation, statistics, 874; harvesting crops, 1663; market garden returns, 6836; nutritive value, 3381, 3599
Bean-meal, cattle food, 2908, 3892; poultry food, 5436
Bear, *plate facing* 1491, 1764; aggressive coloration, 2157; skins, 6426, 6430
Beard, Dr., evolution theory, 1180; on real facts of heredity, 1315,
Beards, evolved for courtship, 2157
Beardsmore armour plate, 4750
Bearers, in printing, 5867
Bearing, in architecture, definition, 1984
— engine, *4425*, 4427
— in surveying, calculation, 368; with cross-staff, 263; finding, 265; with prismatic compass, 266; reduced, 369; in tacheometry, 711; by theodolite, 267; in traversing, 367
Bearing-metal, composition, 3941, 6162
Bearing-plate, railway, 3432
Bearing-rein, of harness, dimensions, 4886
Bearings, of machinery, principles, 208
Bearings, ball, 9641, *4327*
— bronze alloy in, 360; centring, *3689*, 3692; cycle, types and adjustment, 3778; eccentric, construction and action, *4326*, 4328; engine, in drawing, *4201*, 4203, 4205; plain footstep, *4325*; roller, construction, 964, 4327; shaft, various types, *3263*; swivel roller, construction and use, *4329*; waggon, roller, *4328*
Bearnaise sauce, recipe, 2004
Beat, in music, 40
Beaters, in churning, 4279
— in paper-making, *6282*
Beattock, height, 1066
Beaufort phaetons, *2464*, 2466
Beaumont, Francis, dramatist, 846, *847*, 849
Beauty, place and influence in life, 180
Beaver, 1762; diversion of water channels, 1814; skins, 6426, 6430
Because, conjunction, derivation, 1337
Bechuanaland, ethnology, 1790; geography, 5660
Becker's electric furnace, *4533*
Becket, Thomas à, shrine at Canterbury, 326; influence on wars between Stephen and Matilda, 2676; quarrel with Henry II., 2913
Becquerel rays, discovery, 4104
Bed, in geology, *2376*; detecting, 528
— invalid's, 6174, 6176
— of lathe, types, *4912*, 4914
— of machinery, general account, 205
— in slating, 4866, *4867*
— of steam engine, with self-contained bearings, *5911*; semi-girder, *5912*
Bed-bath, description, 5491
Bed-charge, in cupola furnace, *2862*
Bedding, in building, slate, 530; of building stone, 1838
— in geology: *see* Stratification
— manufacture, 6720
Bedding-in, moulding process, *2458*; moulding box used, *2697*
Bede, the Venerable, 1608; Alfred the Great translates works, 2356
Bedeguar, cause, 3722
Bedfordshire, geography, 1273
Bedmaking, method, 1004
Bedplate, engine, in drawing, *4201*; marine, 6295
Bed-room, air analysis, 3801; cleaning and maid's duties, 1004; ventilation, 4390
Beds, in mining, proving deposits, 2666, 3307, 3310
— under-carriage, construction, 3126
Bedsores, causes, treatment, 6175
Bedstead makers, employment conditions, 2646
Bee, varieties, *3723*, *5957*; devices to obtain nectar, 1114, 1115; eggs, 5957; larvæ, *3723*, 5957, *5963*; as pollen carriers, 731
— gregarious, habits, 3723
— honey, *3723*, *3724*, *5957*; diseases, 5963; wax: *see* Beeswax
— humble, *plate facing* 3361
Bee-eater, classification, 2211
Bee-keeping, *5957–5963*
Bee-house, habits, *3512*
Bee-pest, symptoms, treatment, 5963
Beech, tree, classification, 355; culture, 4678; distillation products, 5466; rate of growth, 4676; husk, function, 1116; pests, 4926, *4927*; timber, *56*, 1260
— wood, originated by natural regeneration, *4679*, *4680*
Beef, carving, *5935*, 5936; choice, 1228, 3717; cutting up, 1429, *1432*; digestibility, 3314; dressing and canning, 5119; nutritive value, 3599; roasting, 1487, 1737
— miroton of, recipe, 2336
— salad, recipe, 2004
Beef-tea, food value, 3381; how to make, 3313
Beegerite, characters, 6733
Bee-hive, *5960*; as sociological type, 5248; ventilation, 4020
Beer, adulteration, 3718; alcohol in, 1035, 2880; brewing, 6057; consumption, 3377; fining, 6230; licences, 5790; water for, 6059
Beerhouse, trade, 3735
Beesting, remedy, 5958
Beeswax, 1033, 4834; manufacture, 4834; use, 5120, 5860
Beet, 942; classification, 354; sugar manufacture, 3627, 4160
— sugar: *see* Sugar, beet, *and* Sugar-beet
Beet-fly, in beetroot, 4048
Beethoven, L. van, study of, 2023
Beetles, 3362, *plate facing* 3361; pests, 1666, *1667*, *3512*, 4926; metamorphosis, *3510*
Beetling, linen, *4345*
Beetroot culture, 6673; market garden returns, 6836
Begging the question, in logic, 6100
Begonia, 353; culture, 6489, 6492, 6531
Behn, Mrs. Aphra, fiction works, 2963; Southerne's plays, 1150
Behring's Straits, ethnology, 1789; width, 4061
Bel, Assyrian god, 501
Belemnite, fossil, 620, *621*, *897*
Belfast, industries, 1025, 1365, 1366; trade, 6006; water supply, 4027
Belgæ, and Julius Cæsar, 2948
Belgian granite, *plate facing* 481
Belgium, architecture, 3374; beer consumption, 3377; coalfields, *1835*, 2378, 5302, 5304; coins, weights, and measures, 409; Dutch trade, 5826; forestry, 4603; French trade, 5824; geography, 1835; history (to 1385), 2948, 4398; Indian trade, 5381; industries and manufactures, 1835, 5825; iron manufactures, 1835; meat consumption, 3381; population, 3, 628; Spanish trade, 5823; trade, 5825; travel in, 394, 713, 714
Belgrade, history, 6447; touring, 1250, 2167

Belief, contrasted with knowledge, 28
Bell, Graham, telephone, 5680, 5681
Bell animalcule, *4088*, 4089
— church, imitation in orchestral music, 5734; ringing, 5571
— crank, in bell-hanging, *5795*, 5799
— lever, forging, *2987*, 2988
— electric, cell, 464, *465*
— hanging, system, fittings, 5799
— metal, 3940, 6309; physical data, 1396; strength, 1396
— musical instrument: *see* Bell-ringing
— notes, in guitar playing, 3765
— pull, forms, 5799
— ringing, hand and steeple, 5571
— skirt, 861, *862*
— wire, fixing, 5799
Belladonna, 6881; standardisation, 4009; poisoning by, 4010; *see also* Atropine
Belle Isle route, for Canadian tourists, 1649
Belles-lettres, defined, 2139
Bellied jibs, in cranes, 542
Bellini, Gentile, and Giovanni, painters, 3795
Bellis compound engine, *5750*
Bellows, foot, in chemistry, 4415, *4416*
— in foundry work, 2545
— organ, function, 3857
Belshazzar, son of Nabonidos, 20, 502
Belt, chain, drawing, 4002
— conveyer, in cement manufacture, 1854
— drive, pulley, calculations, 3424, *3426*
— driving, materials, size, speed, power, tension, 3268
— flannel, use in dress, 4529
— leather driving, 3531, *3532*, *3533*; leathers used for, *3712*; manufacture, *3713–3715*; relation to pulley, 3533; slipping, 3533; strengths, 1701, 3532; transmitting power, *3532*, *3533*; velocities, 3532
— link, power transmission, 5354
— machine, open and crossed, *3427*
— manufacture, 3162, *3713*; scope of trade, 3531, 3712
— shaft, 5353, 5354
— substitute for trusses, 5493
Belting, in dressmaking, 185
[illegible]
— power transmission by, 5353
Beluchistan: *see* Baluchistan
"Belvedere Apollo" statue, realism, 2930, *2931*
Benares, India, industries, 2821
Bench, carpenter's, 3385, *3387*
— fitters', use and kinds, *3688*, 3690
Bench-hook, use, 3386
— marks, in surveying, 158, 372, 1146; trustworthiness, 375
— rammer, use, *2457*, 2458
Bend, in coppersmithing, 3884, 3886, *3887*
Bending-block, in coppersmithing, 3884, *3885*
Bending, in forging, *2987*, 2988
— machines, hydraulic, 1223
— moment, in beams, 1984, *1987*; beams and girders, 2197, *2199*
— in plating shop, *3096*, *3097*
— rolls, in boiler-making, *3099*, *3100*
— in sheet-metal work, 4521
Bengal, province, India, 2822; cotton statistics, 384; products and trade, 5380, 5381
Benguela cotton, strength, 1701
Benjamin: *see* Gum benzoin
Benson, A. C., "From a College Window," criticism, 2686
Benzaldehyde, manufacture, 3818, 5486; use in perfumery, 4971
Benzene, chemistry, 1164, 3708; colour material, 5953; derivatives, 3709, 6765; Faraday's discovery, 949, 6824; preparation, 2711, 5461, 6147; rectifying, *5462*, 5463; uses, 5148, 5463
— ring, graphic formula, 3708; alkaloids substitution products, 3824
Benzine: *see* Benzoline
Benzoic acid, chemistry of, 3709 3818; reagent and test, 4411
Benzoin, gum benjamin, 810, 4969, 6881
Benzol: *see* Benzene
Benzoline, production and uses, 1164, 6148, 6329; sale, 4059
Benzopurpurine dyes, 5954
Benzyl alcohol, formula, 3818
— acetate, use in perfumery, 4971
Berbers, ethnology, 1790; in Morocco and Algeria, 3279, 3280
Bergamiol: *see* Bergamot oil
Bergamot, oil expression, 4969
Bergamot oil, source, 5469
Bergen, fishing port, 161
Berkefeld filters, advantages, 3380
Berkeley, G., philosophy of, 2054, 6468
Berkowitz, measure, 410
Berkshire pig, *2365*, 2368
Berlin, communication and industries, *1976*; tourists' description, 857
Berlin black, preparation, 1163
— wool shops, trading, 1095
Berm, in railway construction, 3430
Berri, measure, 410
Berry pomeroy marble, 533
Berthelot, Marcelin, food-tablets, 203; founder of synthetic chemistry, 2711; petroleum formation hypothesis, 5915; syntheses, alcohol and acetic and formic acids, 2711
Berwick-on-Tweed, "county rights," 316; Edward I. captures, 3074; situation, 1066
Beryl, precious, 5855, 6733
Berzelius, dual theory of chemical constitution, 4407; on synthesis of organic products, 2711
Besant, Walter, novelist, 3442
Bessemer, Sir Henry, inventor of Bessemer process, 1045, 4907
Bessemer converter, construction and working, *233*, 234, 1045, 2864, *4908*; use in copper reduction, 4127
— pig-iron, 232
— steel, production and use, 234, 1045, 4907, *4908*, *4909*; influence on machinery design, 209
Beta-naphthol, use in dyeing, 5955
— solution for bees, 5961, 5962
Beta-rays of radium, size, 2028, 2029; ultimate units of matter, 2395
Bethell's process of preventing disease [illegible]
Beton concrete, in construction, [illegible]
Betula: *see* Birch
Between-maid, duties, 1005
Bevel, in joinery, 4115; mason's tool, *2837*; use, 3386, *3387*; measuring tool, 4701, *4703*, 4706; in technical drawing, 3922, *3933*
— gears, foundry ladles, *2865*
— wheel, casting, 2337, *2339*; moulding machine process, 2543
Bevellers, saddlery, 4784
Bevelling machine, in stereotype foundry, 5556, *5557*
Beverages, adulteration, 3718; dietetic value, 3314, 3377; recipes, 2333, 2334; temperance, 3379; *see also specific names—e.g.*, Alcohol, Cocoa, Tea, etc.
Bewick, wood-engraver, 6291
Bhang (Hashish), narcotic, 718
Bhutan, state, government and race, 2822
Bias, political, social and theological, Spencer's views, 4121
Bib-cock, use with service pipes, *5629*, 5 33
Bible, ancient poetry, 304; Eastern influence, 667; 16th century influence on England, 1640; English versions, 1639; predominance of Anglo-Saxon words, 1771
Biceps, *1350*, 1351; of arm, 1712
Bichir, fish, classification, 3066, *3067*
Bichromate of potash: *see* Potassium bichromate
Bicuspid, human, 576, 578, *1605*
Bicycle, types, construction, 2095, *3773*; accessories, 2095, 3779; books and periodicals, 3908; brakes, 3128; driving gear, 5354, 5682; hiring, 2095; as means of transit, 2153; plating, repairing, 2095; trade in, 2093; tyres, waste, 5309
Bicycle dealers, business of, 2093
— motor: *see* Motor-bicycle
Biennial plants, defined, 728
Bigotry, in religion, 5532
Bile, action on food, 675; cause of jaundice, 5842; formation, 580
Bile-duct, definition, 102; uses, position, *576*, *579*, *580*
Bilge, of vessel, form, 5609
Bilge-blocks, in shipbuilding, 5736
Bilgram, bevel-gear cutter, 3631
Biliousness, cause, remedy, 580, 5842
Bill of Attainder, practice and effect, 3832
— book, in bookkeeping, function, 778, 1319, *1320*; loose-leaf, 6521
— brokers, bills of exchange, 1318; deposits and interest, 4590; foreign, 3682
— discounting, 4292
— of exchange: *see* Exchange, bill of
— of lading, 6362, 6806
— posting, 6860
— of quantities, architect's and builder's, 1910, 1911, 6505, 6342
— registers, bank bookkeeping, 4442
Billet, harness, dimensions, 4886
— in tube manufacture, 5322, *5323*, *5324*
— in wire manufacture, 5167
Billiard players, professional, 6870
Billingsgate, fish-sale, 5316
Billion, explained, 89
"Billot," in feeding chickens, 5093
Bills, private, before Parliament, regulations, 1237
— acceptance by banker, 4293
— discounted, bank bookkeeping, 4440
— returns, bank bookkeeping, 4444
Bills of Exchange Act (1882), provisions, 1317
— *see also under* Exchange, etc.
Bin, in cement manufacture, *1853*
Binder, baby's, *3744*, *3745*, 4683
— in floor construction, 4445, 4447
Binding of books: *see* Bookbinding
— of brick walls *2168–2178*
— in carpet manufacture, 4341
— in dressmaking, materials for, 185; for skirt, 656
— in textile industries, 3154
Bindweed, perennial weed, 504, *883*, [illegible]
Binomial, in algebra, 1818; cube of, 2150
— nomenclature in botany, 136
Binoxalate of potash: *see* Antimony potassium oxalate
Bio-chemistry, meaning and scope, 2712; principles of, 4132
Biogen theory of molecular catalysis, 4135
Biogenesis, in biology, explained, 28
Biography, bibliography of 19th century, 2617; importance in 19th century literature, 2309
Biology, definition, scope, subdivisions, 27, 95, 134, 357; acquired characters, 485; animal and vegetable kingdoms compared, 275; books on, 1785, 5422, 5817; dictionary of, 32; evolution: *see* Evolution; forms of living matter, 275; glossary, 32; homology and analogy, 379; conditions of plant life, 503; reproduction, 381, 484; vegetable kingdom, 275
— *see also specific subjects—e.g.*, Anthropology, Evolution, Geology, Heredity, *etc.*
Biotite, mineral, 768, 6733
Bionomics, meaning of term, 138
Bipinnaria larva, of starfish, *4082*
Birch tree, 355, 6881; acetic acid yield, 5465; bark as tanning agent, 3013; timber, *56*; in scaffolding, 1170; strength, 1260; in vehicle construction, 2827
Birch-weevil, egg-laying, 3513
Bird of paradise, 2210; *plate facing* 2209
Bird cherry wood, use, 57
Bird's-eye maple, timber, 57
Bird's-eye tobacco, manufacture, 4373
Bird's-foot trefoil, *881*; cross pollination, 732; flowers, seed statistics, 940

Bird-spider, *3805*
Birds, general characteristics, 29, 30, 2209; blood corpuscle, *953*; blood temperature, metabolism, 439; bones, construction, 436; brilliant plumage, *plate facing* 2209; circulation and respiration, 2155; classification, 2209; clothing, colour, courtship, 2505; digestive process, 578, 2493; eggs, *plates between* 2594 and 2595; feathers, *2495*, 2496; food, 2493; in hat trimming, 5506; movement and adaptation to flight, *2494*; nesting habits, 2506; nests, *plates between* 2594 and 2595; orders, 2155, 2209; ornaments in dress, 6608; as pollen carriers, 729; protection against cold, 2505; as seed carriers, 912; stuffing, 6326, *6327*; trade in: *see* Animal and Bird Dealing; toothed, 2214
Birdsmouth joint, of lean-to roof, 4247, *4249*
Birmingham, afforestation, 4603; industry, 1274; sewage purification, 4742; toy trade possibilities, 641
— U.S.A., steel manufacture, 4174
Birrell, Augustine, as literary critic, 2785; advice on reading, 4577
Birth, physiological definition, 96
Birth-rate, decay, 4667; psychological importance, 3120
Bis bigliamento, harp, *3529*, 3530
Biscuit cutters, 3596, *3597*
— factory, plan, *3598*
— firing, in pottery manufacture, *5236*; application of colour, 5383; English china, 5606
— forcer, continuous, *3596*
Biscuits, English trade (future), 1155; hand made, 1155, 3597; manufacture, processes and machinery, 3592, *3593*; recipes, 2333; packing, 3598
- in rubber industry, preparation, 5047
Bisection, in geometry, definition, 4208
Bismarck, Prince (German history), 6445
Bismarck brown, dye, 5953, 5954
Bismuth, 1162, 4307, 6773; alloys (table), 360, 3941; extraction and refining, 4307; a metalloid, 240; occurrence and use, 362, 839; properties, 1396, 1397, 3837, 3839, 4244, 4307; reagent and test, 4408; strength, 1396; symbol and atomic weight, 517
Bison, distribution, 628
Bit, harnessmaker's, varieties, 4885
— *see also* Chisel
— soldering iron: *see* Soldering iron
Bitter almonds: *see* Almonds
Bittern, classification, 2213
Bitterspar, 768, 6733
Bits, tools, varieties and forms, 3386, *3387*, *4263*, 4479, *4481*
Bitumen, occurrence and use, 1163,
as cement, 1952; pigment, 871; weight, 1704
Bituminous coal, 1163
Bituminous substances, Hatchett's classification, 6010
3113;
ment, 1159
y, geography, *1274*
tion process, 4770
— dyes, 5905
— Hole of Calcutta, 6549
preparation, symbolism in art, 725;
— pottery colour, preparation, 5382
— quarter, in cattle, 2622
— Sea, Russia, 558, 2406
— spruce, timber, 55
— wash, in laundry work, 2545; in moulding pipes, 5319
Blackband, iron ore, 1044; composition, 4466; distribution, 231
Blackbeetle, description, 3263
Blackberries, for jam, 4847; for preserving, 4846; in season, 1532
Blackberry, growth, 504
Blackbird, classification, 2210; nest, 2506, *plate following* 2496
Black-currant pulp, source, 4846
Black earth, formation, 1815, 2408
Black-faced sheep, 2362, *2363*; wool, 72, 221
Blackgame, in season, 1531; shooting period, 4712
Blacking, boot, constituents and recipes, 5150; charcoal in, 1157
— in bootmaking, 4545
Blackleading, in foundry work, 2545
— in electrotyping, *5559*
Blacksmith, employment conditions, 2645
— navy, service, 4265, 4269
Blackstone, Sir Wm., lawyer, 2141
Blackwall tunnel, driving, 3462
Blackwater, river, watershed, 984; course, 1367
Bladder, human, *1602*
Bladder campion, defence against bees, *1114*, 1115
Bladder-worm, description, 3960
Bladder-worts, carnivorous, 507, 508
Bladder-wrack, description, 1368, *1369*
Blade, of leaves, structure, *169*, 170
— penknife, manufacture, *5474*, 5475
— table knife, manufacture, 5476
— scissors, smithing, 5478
Blades, in brickmaking, 1284
— of centrifugal pumps, 1687, 1688
Blake sewing machine, in bootmaking, 1328, 4542, 4544
Blandite, artificial rubber, 5309
Blank verse, English, 306, 328
Blankets, washing, 2688
Blast, of furnace, 4468; action, 4470
— furnace, *231*, 232, 1044 *4125*; Cleveland and Pittsburg types, 4470; cupola, 4909; hoist ways, 209; lead smelting, 4303, *5986*; modern and old English types, 4467, 4469, *4470*; use of slag from, 639
— — gas, 6818, 6829
— pipe, trunk, in brickmaking, 1283
Blasting, for brick clay, 1282
— gelatin, making, 6762
— in mining, process and implements, 2584; explosives, 2587; quarry work, 2955; special, *2957*
— pipe, locomotive, 6514, *6515*
— in railway construction, 3175
— in well sinking, 4028
Bleachers, employment conditions, 2651
Bleaching, in dyeing, 6197, 6198
— in laundry work, 2912
— liquor, electrolytic, 3262
— powder, 1041; in glue manufacture, 5359; manufacture, 4777, 5759
Blende, 1042, 5754, 6733; lead extraction, *5755*
Blended inheritance, explained, 652
Blending, in wool manufacture, 1125
Blenheim, battle, 4951
Blight: *see* Plant lice *and* Aphides
Blind arch, in architecture, 3231, *3232*
— spot, of the eye, 2402, *2403*, 2954
— worm, classification, 2678
Blindness, infant's, cause, 4684
Blinds of brougham, 2829, *2831*
Blister beetle, description, 3512
— in masonry, working cylindrical, *3037*, 3040
— printing, textile, 4499, *4500*, *6724*, 6725
— plummer, fitted to bracket, 3268, *3269*
— of pulley, 684, 688
— silk hat, 6154
— stone, in sculpture, roughed out, *1676*
— tin, long account, 358
— in-course work, in masonry, defined, 1452, *3035*, 3036
Blockers, in mining, work of, 2956
Blockhouse, military construction, 6721, 6722
Blocking press, in bootmaking, 4542
Blocks, half-tone, making, 6482, *6485*
— line, 6482, *6484*
— linoleum printing, 5125
— packing, in timber bridges, 4642, *4643*

— relation to spirit and soul, 4527
— of vehicles, construction, *2827* ; fittings, 3022, *3023*, *3024* ; free-hand designs, *2729* ; patterns and machinery, 2833
— violin, *2121*, 2122
— viola, *2823*
Body-gear, of harness, 4886
Body-linen, ironing and folding, *2910*
Body-loop of dress landau, 3122, *3123*
Boer wars, history, 6693
Boethius, Alfred's translation, 1608, 2356 ; and Theodoric, King of Ostrogoths, 2945
Bog-slide, cause, 1505
Bogie, railway carriage, use, 2555
— in vehicle construction, 3121 ; springs used, 2726
Bohemia, kingdom, coalfields, *2739* ; craniology, 1786 ; electoral choice of Emperor of Germany, 2947 ; geography, 2162, 2165
Boiled oil, use of term, 1032
Boiler, caulking tool work, *5455*, 5456
— deposits in, 4096
— fittings, list, 3105, 3107
— domestic, 6016, *6017*
— egg-end, drawing, 5041, *5042*
— feed condensation, advantages, 6070
— laundry, care and heating, 2475
— locomotive, *3101*, *6515–6517*, 6877 ; "washing out," 5103
— marine 6874 ; drilling, 3098, *3104*, 3106
— prover, explained, 3107
— rail motor-car, *4801*, 4811
Boiler scaling, described, 1307 ; and waste of fuel, 5761
— ship, fitting, 5924
— steam, *3099*, *6874*–6879 ; books on, 5595 ; evolution, 5418 ; multi-tubular, 5418, 6875 *6876* ; safety factor and working load, 211 ; test pump, 1082
— steamer, position and types, *5401*
— tubes, 6514, *6515*, *6878*
Boiler-making, *3097*, *3098* ; conditions of employment, 2645 ; flanging press, 1223
Boiler-shop, general description, 2109
Boiling, connection with evaporation, 1741 ; under high pressure, 1742
— in cooking, 1485, 3313
— in laundry work, 2689
— point, use in chemistry, 696, 1566, 1741
Bola, distribution, uses of fibre, 818
Bolingbroke, H. St. J., philosophy of, 2054 ; Burke's attack, 2055 ; opposition to Walpole, 5554 ; politics, 4950, 4952
Bolivia, cotton industry, 383 ; geography of, 4282, 4290 ; rubber industry, 1154
Boll, cotton-seed vessel, 388
Bollards, fitting to ship deck, 5924
Bolobolo, distribution, use of fibre, 818
Bologna, silk industry, 582 ; university, 2230
Bolometer, invention of, 2433
Bolsover moor stone, strength and weight, 1520 ; use, colour, 534
Bolster, of anvil, form and function, 2991
— in building, definition, 1950, 1951
— penknife, manufacture, 5474, 5475
— in plate punching, 3095, *3097*, 3107
— springs, of bogie frames, 3121
— table knife, 5476, 5477
— of van, 2828, *2829*
Bolt, cotter in, 834
— forcer, 1222
— in ironwork construction, **1454**, 5791, *5793* ; machine, 3107
— Mauser pistol, *6417*, 6418
— plumber's, 5029, *5030*, 5630
— in staging constructing, 1174, 1176
Boltheads, Whitworth, in technical drawing, *3004*, *3005*, 3006
Bolts, carpenters', 1703, *1704*, *3543*, 3546, *4249*, *4251* ; method of cutting, 3628 ; door framing, *5181*, 5182 ; drawing, 3003, 3006, *3007*, 4203, *4204* ; forging, 2991 ; strength testing, 1703, *1704* ; timber crane work, 4644, *4645* ; timber uniting, 4642, *4643*
Bomb, volcanic, 1074, 1207
Bombardier beetle, 3510, *3511*
Bombardon, musical instrument, 5130, *5131*, 5140 ; compass, 5732, *5733*
Bombastes, bombastic, explanation, 59
Bombay, province, 2818, 2822 ; ceded to England, 6549 ; trade, 2822, 5381
Bombus : *see* Humble-bee
Bombyx mori : *see* Silk-moth
Bonaparte, Joseph, King of Spain, 5238
Bonaparte, Napoleon : *see* Napoleon
Bonanza, in mining, definition, 2378
Bond, electric tramway rails, *1935*
— in masonry, 1521, 3633
Bonding, in brickmaking, 1282
Bonding blocks, in arch construction, 2386, *2387*
Bonds, brick-wall, 2170, *2171*, *2173*, *2177*, 2261, *2265*
Bone, human, jointing, 1709
— carving, 6299, *6300* ; dyeing, 6299, 6768 ; physiological account, 435 ; thermal conductivity, 2061 ; uses, 811 ; *see also* Bones
— ash, for phosphatic manure, 5587 ; source of phosphorus, 4779
— black, 1157, 1167, 5145 ; use in glucose refining, 4557
— fat, source, uses, 4832
— form, in sculpture, 1511
— glue : *see* Glue
— manure, composition, uses, 589, 811
— turquoise (odontolite), characters, 5853, 5856, 6733
Bonebreccia, geological classification, 1073
Bonellia, siphon-worm, *3958*
Bones, ammonia from, 4775
— glue manufacture, *5357–5359*
— human, list and measurements, *1348*, *1349*
— musical instrument : *see* Castanet
Boning, in dressmaking, bodice, 476
— in tailoring, 2205
Bonnet acid, origin of name, 3704
Bonnet, cockade rosettes, *5506* ; linings, *5329*, *5330* ; patterns, 4766, *4767*, 4769, 4860, *4861*, 5037
— child's, copying, *4767* ; Dutch, *5939* ; styles, 4054 ; Veronique, *5942*
— drawn silk, 5219
— of motor vehicles, *2729*
— nurse's, 5504
— straw, 5218, *5219*
— velvet strings, *5331*, *5332*
— widow's, *5774*
Bonus system, in insurance, **2727**, 3223
Bony tissue : *see* Bone
Book, Babylonian, 17
— catalogues, in bookselling, 1100
— textile, definition, 1247
Bookbinders, employment conditions, 2655
Bookbinding, *6775–6778* ; booksellers and, 1100 ; leather tanning for, 3163 ; modern, defects, 377, 6775 ; as women's employment, 321
Book-case, making, *6581*, 6589
Bookkeeping, analysis, 2269 ; auditing, 918 ; bank account entries, 1966 ; compensating errors, 2503 ; dead rents, 3918 ; departmental accounts, 3416 ; double entry, *488–491*, *3917* ; diversity, 777 ; comparison of ledger and journal, *1750*, *1751* ; foreign trade, 3679 ; goods account, defects, 2270 ; ledger classification, balancing system, 2980 ; loose leaf, 6522 ; petty cash accounts, 2201 ; posting problem, *488–491* ; posting precautions against confusion, 2503 ; prime cost accounts, 2419 ; professional accountancy, 3918 ; profit, standard rate, for testing purposes, 2420 ; returns inward and outward, *1571*, 1572 ; single entry, 3916 ; trading account, 2500 ; transactions and transfers, 1567 ; trial balance, 2501
— American card system, 2225
— bank system, 4438
— grocer's system, 3044
— hire-purchase, 3917
— house furnisher's, 3448
— Italian mediæval, Venetian, 1467
— laundry business, 2967
— limited companies, 3186
— loose-leaf system, 6521
— partnership accounts, 2756, 2978
— for small firm business, 403
— in small shops, 45
— tabular system, 3567
— *see also* Clerkship, Double entry, Journal, Ledger, *etc.*
Book publishing, business of, 6779
Books, general account and classification of, 105 ; first printed in England, 3605 ; journalist's choice in reading, 4577 ; how to select, 2937 : *see also* Reading ; library systems, 6871 ; necessary and unnecessary, 3782, 3783 ; production, effect of newspapers and magazines, 2686 ; publishing, 6779 ; trade : *see* Bookselling ; weight of, 1704 ; *see also* Literature
Bookselling, the business, 46, 1096
Booking offices, railway, arrangement and staff, 4813
Boom, bridge, renewal, 4642
— girder, general account, 540
— load, girder, defined, 540
— sailing ship, adjustment, 5398
Booms, electric traveller, drawing, 4205, *4206*
Booster, electric, description, *2246* ; use with storage battery, 3088
Boot manufacture : *see* Bootmaking

Boot and shoe operatives, employment conditions, 2649
— retailing, the business, 1327
Boot boiler, domestic, material and construction, *6017*
Boot-cream, recipes, 5150
Boot factory, oganisation of work, 4239; specialisation, 4241
Boötes, constellation, 6118
Boot-locker, of van, 2828, *2829*
Bootmaker, wages, capital, 46
Bootmaking, 1274, 3873, 4015, 4137, 4237, 4432, 4540; button boots, 4018; elastic-side boots, 4018; fit and measurement, 4015, 4016; lining, 4018; method of cutting, *4015*, 4016, 4017; mountings, 4018; technical school teaching, 4546; tongue attachment, 4018
— by machine, 4237, 4432, 4540; bottoming and heeling, *4540–4546*; use of bristles, 4017; lining, 4018; making up parts, 4540; packing, filling process, 4541; preparation of thread, 4017; sewing, 4017; skiving, *4017*; stiffening, 4017
— machines, *4237*, 4432, *4436*, *4437*
Boot-rails and side, of brougham, 2829, *2831*
Boots, American machine made, *4237*, 4238; British machine made, 4238, 4239; evolution, 3873; hand and machine made compared, 3874, 4239; hygienic, 4257; jack-boots, 3874; manufacture: *see* Bootmaking; modern defects, 378; preserving from damp, 2851; retailing: *see* Boot and shoe retailing; sizes, 1326; top-boots, 3874, 4137, *4138*, *4139*; Wellingtons, 3874
— tops, hand and machine cut, 4432; making, 4239; seam making, 4434
— waterproofing, 3219
Boracic acid, chemistry of, 7042; use in deliming hides, 2856; food preservative, 3819; in leather tanning, 3162; use as preservative, 5408; reagent and test, 4410
Boracite, definition, 1042, 6733
Borax, 6881; chemistry of, 842, 1042, 6773; as flux in welding, 3107; in niello work, 5529; laundry uses, 2477; in pottery glazing, 5236; use as preservative, 5408; use in soldering, 3884, 3886, 6459; in making starch, 2591
Borax beads, colour test in chemical analysis, 4406
Bord, in mining, definition, 3561
Borda's method of weighing, 62
Borders, in drawing, geometrical design, *2320–2322*, 2397, *2398*
Bore, cylinder, lining out and tooling, *3317*, 3318, 3324, 5641
— key-seating, *3403*, 3404
— river, cause, 5333
Bored guides, use in horizontal steam engines, 5910, *5911*
Borehole, mining, 2662; lining and working, 2846, *2847*
— oil, 3190; pump, 6062, *6064*
Borers, workshop tests, 3965
Borgia family, Alfonso de, Rodrigo, Cæsar, and Lucrezia, 4322
Boric acid: *see* Boracic acid.
Boring, in mining, *2666*, 2667, 3460; percussive, *2666*, 2667, 2845, *2846*; in prospecting, 2582; rotary, *2666*, 2667, 2845, *2846*
— bars, forms of cutters, *4263*
— head, use, construction, *4263*, 4264
— machines, classes and construction, *5008*, 6754, *6755*; cylinder type, *5007*, 5009, *5283*; Harker's hand-power, 2668, *2669*; vertical, *3317*, 3319
— mills, function, *3317*, *3319*
— rod, in shaft sinking, *3460*, 3461
— tools, mechanical engineering, 4479, 4481; pattern making, 2453; mining, 2584, *2666–2671*, *3386*, 3387
Borings, dock construction, 6496
Borneo, island, description, 3161; petroleum deposits, 6009
Bornite, properties, 6305, 6733
Boron, chemistry of, 517, 1042
— carbide, use and production, 5758
Borough constabulary, organisation, pay, *etc.*, 1406, 1408
Borough councils, architect, 785; education authority, 1677; education scholarships, 482; engineer and surveyor, 452; financial officers, 1067; inspectors of weights and measures, 787; junior clerks, 1213; librarian's salary, 1495; medical officer's salary, 698; town clerk, 989
— — London, creation, 318; functions and analysis of departments, 319
— — public servants and duties, 81, 82
— surveyor, duties, 454
Boroughs, town and county councils, 316
Boshes, of blast furnace, angle, 4470
Bosnia, state, geography, 2162, 2165
Boss, in geology, definition, 2065, *2067*
— in masonry, 3145, *3147*
Boss-plate, function, *3125*, *3126*
Boss-tool, use, *2457*, 2458
Bosses, in casting, process, 2337–*2339*; distinguished from cores, 2342
— drawing, 4203, *4294*, *4205*
Bossing, boring machine, *3317*, 3319
Boston, Lincoln, industries, 1273
Boston, U.S.A., tea-cargo destruction, 5845; a commercial centre, 4172
Boswell, J., Johnson's biographer, 2053
Bot fly, classification, 3722; in horse, symptoms and treatment, 2626, *2627*
Botany, classification, 165; dictionary of: *see* Biology; fertilisation, *348*; relation to biology and zoology, 135; relation of water, wind, animals, insects, to plant life, 727–732; reproduction, *346–355*; struggle for existence, 503
— applied: *see specific subjects—e.g.*, Basket-making, Brush-making, Cork
Botaurus stellaris: *see* Bittern
Bothwell, J., Earl of, tried for murder of Darnley, marriage with Mary, Queen of Scots, 3998
Botticelli, painter, *869*, 3021; character of work, 3793, *3794*
Bottle brushes, manufacture, 6110
— float, in marine surveying, 1017
— glass, recipe, 4533
— makers, employment conditions, 2653
Bottles, drift, use, 5188
— feeding, kinds, 4682
— glass, manufacture, 4735, *4736*
— wash, chemical apparatus, prices, 4993
Bottling wine, method of, 762
Bottom back, vehicle design, *3624*
Bottom-boards, in moulding, 2540
Bottom, of steamer, *5401*, *5402*
Bottoming, boot machinery, *4240–4242*
Bottomry, in marine insurance, definition, 4854
Boucher, François, painter, 4118
Bouguereau, painter, his art, 868
Bought ledger, function, 778, 2981, *2982*
Bouillir (French verb), conjugation, 4362
Bouillon, action of radium on, 2031
Boulder-clay, geological classification and formation, 1073; glacial production, 2067, 2255
Boulder, striated, in boulder clay, *1636*
Boundary walls, safe proportions, 2570, 2572
Bounty system, international, 4558
Bourbons, restoration of, 5239
Bourgeois, type, *5028*
Bourges, cathedral, 3374
Bouvier, M., dam profile formula, *4335*
Bow, viola, *2824*
— violin, *2123*, *2124*, 2314; balance of, 2742
Bowel: *see* Intestines
Bowels, inflammation in cattle, treatment, 2624; in horses, 2620
Bow-fin, fish, classification, 3066, *3067*; respiration, 3070
Bowing, double-bass, 3167, 3169
— viola, *2824–2826*
— violin, *2124*, 2741, *2742–2744*
— violoncello, 2970
Bow-lines, of ships, *5609*, 5610, 5614
Bowl, silver, working, *5524*, *5525*
Bowl-feed, principle of, 962
Bowling hoop, of boiler furnace, *3101*, 3102, 3107
Bow's notation, in mechanical construction, 415
Bows, in millinery, 5503, *5504*; straw, 5504, *5505*; velvet, 5531, 5504, *5505*; wiring, 5503, *5504*
Bowsprit, of ships, use, adjustment, 5398
Bowstring hemp, 718
Box, bell, boring tool, *2666*
— calf, boots, 1326
— filling, in founding, 2110
— framing of machinery, 206
— heading, in printing, 4236
— joints, in carpentry, 4111 *4114*
— pleat, in dressmaking, 968, quantity of material allowed, 187
— sextant: *see* Sextant
— (timber) strength, 1260; use of wood, 57, 4658; for carving, 5809
Boxer movement (1898), 6693
Boxes, hat and bonnet, trade in, 929
— for moulding, 2697, 2700
— match, *5471*
Boxing-in, in railway construction, 3433
Boxing-up, patternmaking, 2454, *2455*
Boxwood, 57, 1260, 4658, 5809, 6881; in engraving, 6291
Boy, height and weight, 4529
— clerks, in Government offices, examination, pay, 2252, 2474, 2575
— messenger in Government offices, pay, 2252, 2576
Boyer long stroke hammer, construction and use, *1803*, 1807
Boyle, Robert, heat discoveries, 59; definition and classification of elements, 516; experiments with fluids, 1142; law, in physics, 1142, 1802; Rankine's statement, 1805
Boys, admission to Army, 4032
— career as clerks, 192
— garments for small, *4195*, *4196*
— hygienic clothing, 4863
— little, shirts and suits, *4355–4357*
— man-of-war hat, making, *5940*
— in Navy, entrance, training, 4265
— tailoring, 1113, 1289
Brabazon system, workhouse, 1852
Brace, tool, use, 3386, *3387*
Braced structures, calculations, and design, 540
Bracehead, in mining, description, 2669
Bracelets, jewellery, making, *5859*
Braces, in carpentry, tools, 4586; of beam, use, 4640, *4641*; field gate, *4655*, *4656*
— in vehicle construction, C-spring, 3623; perch suspension, 3122, *3123*
Brachial plexus, human, *1941*
Brachialis anticus, muscle, position, *1350*
Brachiopoda: *see* Lamp-shells
Brachycephalic races, 1786
Bracing, lattice: *see* Lattice bracing
Bracings, in smiths' work, 3107
Bracken, description, 1116
Bracket of brougham, 2829, *2831*
— casting, described, *2111*, 2114
— crank, of bicycle frame, 3773
— for line shafting, *3268*
— pattern, jointing, *2456*, 2457
— piece, of light waggon, 2829, *2830*
— of shaft bearing, 3264, *3265*
— tread, of brougham, 2829, *2831*
Bracket, under various conditions of load, 2226, *2227*
Brackets, in algebra, use, 705, 1818, 1993; removal of, 1993
— for cornice work, 5501
— in punctuation, use, 1471
— roof gutter, *5793*, 5795
Bract, in botany, defined, 346; of grasses, 355, 875; of wheat, 913, *915*; "winged" seeds, *911*, 912
Brad, use in carpentry, 3546

Bradawl, use, 3386, *3387*
Brahma, deity, 417, 418
Brahma fowls, breeding, 4659, 4661, *4856*, *5622* ; comb, *4857*, 4858 : points, 4955 ; table qualities, 5624
Brahmanism, Buddhism contrasted with, 417 ; distribution, 629
Brahmans, privileges and caste, 417
Brahmaputra, river, course, 2563, 2972
Brain, in animals, evolution of, 2155
— human, activity, economising, 2672 ; anatomy, 2144 ; artery, 2147 ; complementary colour sensation, 3730 ; development, 4862 ; divisions and functions, 4527 ; materialist conception, 3664 ; nervous system, 197, 2147, *2400* ; optic nerve, *2400*, 2402, *2403* ; and perception of sound, 2315 ; philosophical theories, 6536 ; position defined, 98 ; psychology, 2209, 6466, 6536 ; psychological account of, 2804 ; psychological problem, 2014 ; relation to mind, 6536 ; in relation to skull capacity, 1785 ; rest periods, 4391 ; shock prevention, 1799 ; spontaneity of inspiration, 3184
Brain-cell, *2147* ; appearance and age, 2299, *2300* ; cause of knee-jerk, *2994*
— child's, size and weight, 4862
Brain-coral, *4084*
Braire (French verb), conjugation, 4939
Braising, in cookery, 1486, 3313
Brake machine, used in biscuit-making, *3593*, *3594*
Brake-block and treadle, van, *2829*
Brake-cylinder, railway, *4694*, 4695
Brake-dynamometer, use, 964
Brake-vans, railway, 2462
Brakes, 3127, 3128
— cycle, back-pedalling, 3775
— foot lever, 831
— friction, principle, 959
— motor-carriage, *3123*, *3124*
— railway automatic, 4690, *4694*, *4697* ; dual system, evils, 4697 ; goods waggons, either-side type, 5070 ; locomotive, testing, 5105 ; vacuum, action, 4805
— slipper, 960
— Strub, on Jungfrau railway, *3817*
— tramcar, 1934
Bramah press : *see* Hydraulic press
Bramble, growth, 504
Bramwell, Dr. Milne, method of hypnotising, 3663
Bran, cow's food, 3892, *3893* ; in dyeing vat, 5782 ; as livestock food, 2908 ; poultry food, 5436 ; in washing linen and canvas, 2912 ; in wheat, 913, 3078, 3079, 3082
Branch, in engineer's coppersmithing, use, 3886, 3887
Branch accounts, bookkeeping, 3417
Branch pipes, use in building, 6018
Branch shops, expansion of retail business, 5926 ; manager's salary, 5928 ; management systems, 5929
Branchiata : *see* Gill bearers
Branching coral, 4084
Branchiopoda, classification, *3809*
Brandenburg, Margrave of, as Imperial Elector, 2947
Brandering, firring, in carpentry, 4448
— in lath work, defined, 5498
Brandes, Dr. Georg, on Byron, 1308 ; history of nineteenth century literature, 2787
Brands, in smith's work, 3107
Brandy, adulteration, 3718 ; alcohol percentage, 1035 ; composition, 2879 ; dietetic value, 3314 ; as medicine, 3377 ; prussic acid antidote, 3537 ; source, 4876
Brandywine, Battle of, 5846
Brangwyn, F., painter, style, 1021 ; " Modern Commerce," *frontispiece facing* 4657
Branly's coherer, *3895*, 3896
Brard's durability test for building stones, 1517
Brass, alloys, 360, 3940, 5523, 6310 ; casting, 1404, 6312 ; electroplating, 3422 ; friction data, 959 ; casting shrinkage, 2342, 2699 ; composition, 1042 ; conductivity of, 1397 ; cooling contraction, 1397 ; manufacture, 6311 ; melting furnace, 2545 ; use in patternmaking, 2456 ; physical data, 1556 ; solder for, 5523, 6460 ; spinning, 6314
— band, instruments, 5890
— workers, employment conditions, 2648
— in drawing, how indicated, *2792* ; bearings, *3264–3266*
— founding, furnaces, *2862–2864* ; moulding-box used, *2698*, *2700*
— moulding, defined, 2545
— plating, process, 3422
— rule cases, printer's, 5252, 5867
— solder, composition, 3940
— wire, manufacture, 3940, 5171, 6313
Brasses, engraving inscriptions, 5529
Brassica campestris : *see* Rape
Brassica campestris raba : *see* Turnip
Brassica oleracea : *see* Cabbage
Brassica oleracea caulorapa : *see* Kohlrabi
Brassica sinapistrum : *see* Charlock
Brawn, recipe, 1433, 2331 ; press, butcher's, *1431*
— in farming, application of term, 2367
Braxy, sheep disease, 2625
Braying, in cloth-making, 4106
Brazil, coins, weights and measures 409 ; cotton industry, *383*, 384 ; diamonds, 1157 ; discovery, 2947, 5397 ; economic conditions, 5660 ; geography, 4282, 4286, 5380 ; petroleum deposits, 6009 ; population. 628 ; products, 5380 ; trade, 5380, 5664
— nut, 6881 ; classification, 353
— woods (dyes), sources, kinds, and uses, 5906
Brazing, metals, 3839, 3881, 6311, 6458 ; materials, *3885*, 5525
Bread, adulterants, 5581 ; adulteration, 3717 ; ancient forms, 3281 ; alcohol produced in making, 2878 ; British law concerning, 3281 ; brown, recipe, 3395 ; dietetic value, 2706, 3311 ; digestibility, 866, 3314 ; glazing, 3395 ; home-made, making, 3281 ; kinds, 3601 ; making, 3312 ; nutritive value, 3381, 3601 ; from patent, low grade and straight grade flour, 3282 ; special kinds, 933 ; stale, in cookery, 2335
Bread Act, provisions, 3281
Breadcrumbs, chicken ration, 5435
Bread-fruit, 5040 ; classification, 355 ; source, 4873
Breadmaking, 3281, 3312 ; commercial methods, 3392 ; machinery and ovens, 3395
Bread sauce, recipe, 2004
Breaker card of cotton spinner, 1544 ; of jute spinner, 1886
Breakfast dishes, recipes, 2331
Breakfasts, English and French, 3601 ; menu suggestions, 5581
Breaking horses, 2079
Breakwaters, effect in erosive action of sea, 1814 ; types and construction, 6334, 6494
Bream, place for fishery, 2527
Breastbone : *see* Sternum
Breast-wheels, principle, 1690
Breathing of animals and plants compared, 173, 277, 1491 ; changes accompanying psychic phenomena, 2694 ; essential to life, 96 ; of fishes, amphibians, etc., 30 ; nose, necessity, 2538 ; physiological account, 1299 ; rate of, 96
— in singing, correct, 6047, *6048*, 6052
— *see also* Respiration
Breathings, Greek, 5375
Breccia, rock, 1072, *1073*
Brèche d'Oré marble, *frontispiece next* 481
Brecknockshire, geography of, 1277
Breech-blocks, gun, *6611*, *6612*, *6613*
Breeches, boys', making, *1752*, *1753*
— straps, harness, 4886 ; making, 5191
Breeding cattle, 2238 ; best conditions, 3671 ; books on, 3470
— horse, 2078
— of plants and animals, in agreement with Darwinian theory, 827
Bremen, trade, manufactures, 1975, 1976
Brenner Pass, value in intercommunication, 4496 ; touring, 1249
Brephos notha : *see* Owlet-moth
Breslau, woollen manufactures, 1976
Bresse fowls, points of breed, 4957 ; egg weight, 5873
Brest, France, expedition against, 4843 ; naval port, 1684 ; swing bridge at, 2888
Brett drop hammer, *2991*
" Brett " stamping system, *2989*, 2992
Breughel, " velvet " painter, 4299
Breve, in music, 38
Brevier type, *5028*
Brewery plant, 6057
Brewing, 3315, *6057*, 6228 ; books, 6230 ; cleaning plant, 6059 ; Pasteur and, 3274 ; waters, 6059 ; refrigeration in, 5405
Brewster, Sir D., invention of kaleidoscope, 2603 ; colour-blindness, 3731 ; polarisation discovery, law, 3850
Briar root, tobacco pipe manufacture, 4378
Brick clay, defined, 1072
— earth, in brickmaking, 643 ; *see also* Brickmaking
— tea, defined, 3378
— burning, 1284
— wall, air permeability, 6020
Bricked-up fire, description, 3107
Brickfields, English, 1278
Bricklayers, employment conditions, 2643 ; railway " works," 4592
— scaffold, in building, 1170, 1171
Bricklaying, 1452, 1950 ; dictionary of, 1954 : *see also* Building *and* Masonry
Brickmaking, general account, *634*, *644*, *1278* ; A B C and progressive working, 1279 ; clays, 1278 ; double chamber, *1282* ; fireclays and firebricks, 1285 ; hand making, 1281 ; history, 1278 machinery, *1278–1281*, 1282 ; moulding processes, *1948*, 1949 ; press, 1282
Bricks, general account, *643* ; air, *2263*, 2266 ; blue, 1279, 2515 ; bonding, *1451*, 1452 ; cement manufacture, 1583, 1728 ; colour, 1279 ; dwelling houses, materials, 5050 ; furnace, 2863, *2864* ; glazed, use in drains, 734 ; green, 1284 ; kinds, 1947, *1950*, 2168, *2169*, 2174 ; machine moulded, 1282, 1947, 1948 ; for paving, 2179, 2426, *2427*, 2430, 2515 ; quality variation, 1947 ; red, 1279 ; in sewer construction, 4460 ; Staffordshire blue, for paving, 2515, *2516* ; strength, 1519 ; use in sweeping-up moulding, *2461* ; ventilating, Ellisons', 4020 ; from waste products, 5767 ; weather effect, 1281 ; wire-cut bricks, 1281 ; yellow, 1279
Brickwork, altering old, 2515 ; books on, 6349 ; other trades than bricklayers, 2514 ; building-in iron and timber, 2513 ; carved mortar for, 1953 ; chases, 2388, 2385, *2389* 2513 ; fireproof, 4752 ; heat and frost, effect on, 2268 ; joinery, fixing, 2514, *2516* ; of mining shaft, 3308, 3457 ; paving, 2515, *2516* ; perforations, 2513 ; pinning up and underpinning, 2514 ; quantity surveying, 6505 ; sand courses, 2513 ; wall dressings, 3035, 3036
Brickworks, cost sheet, function, 3419
Bridge of boiler, *3097–3099*, 3102, 3107
— of viola, *2823*
— violin, *2121*
Bridge, arch and abutment, stability, 2760, *2761*, 2762, 2763 ; bascules, Tower Bridge, 828 ; loads upon, 210 2760, *2761* ; military construc-

Bridge—continued
tion, *6265–6268*; of piers, width, 5114; timbers, rigidity, 4640, *4841*; weight reduction, 208
Bridge-construction, books on, 2764, 5596; erecting staging, 1172, 1173, 1175; by "floating out" and "building out," 1175; modern, *2736*, *2738*, *2739*, 2740; modern problems, 520; reinforced concrete, 1557, *1559*, 1643; timber, *1453*, 1454; trestles, 4640, 4641
— mining shaft, 3308
— steamer, use, 5401
Bridge-tone, term in sol-fa notation, 923
Bridges, general description of varieties, 2497, 2498, *2499*
— brick and stone arched, 2497
— cane suspension, construction, 5723
— in carpentry, 4640, *4641*, 4642
— dental, construction, 6033
— girder, iron, 2498
— movable, 2886, *2887*
— Parliamentary powers for, 1238
— punching and reamering, 3095
— swing, hydraulic, 1224
— suspension, 2498
— timber, 4642, *4643*
— trussed, 2497
Bridgwater Canal, description, 5487
Bridle, in dress, definition, 2874
Bridle, saddlery, varieties and manufacture, 5057, 5058; dimensions, 4886
Bridle joint, in roof work, 4248, *4249*
Bridle-path, obstruction of right-of-way, 1979
Bridles, of beam trawl net, *4990*
Brie cheese, composition, 4490, 4492; manufacture, 4575
Breeze-fly, mouth, 3721
Brig, type of rig, use, *5399*, 5400
Brigands, in modern Europe, 392
Brigantine, type of rig, *5399*, 5400
Bright, John, composition of his speeches, 77; politics, 6691
Brill, boiling, 1874: in season, 1531
Brilliant-cut, precious stones, *5028*
Brimstone: *see* Sulphur
Brine, in glue manufacture, 5380; in Pasteurising milk, 5406; in refrigeration, 5403; in shaft sinking by freezing, 3460
Brine saturator, in ammonia soda process, *4772*
Brin's oxygen process described, 1204
Briquettes, cement, 1861, *1862*; mould for, *1858*; in cement tester, *1859*
— coal-tar as binder, 5462
Brisbane, climate, 3466; rainfall, 3237
Bristle-worms, description, 3956, *3957*
Bristles, in bootmaking, 4017
— for brushes, sources, dressing and bleaching, 6163; washing, 6107, *6108*; tests, 6110
Bristol, trade, 1276, 6005, 6006
Bristol boards, for pen drawing, 113
Bristol Cathedral, skewbacks in chapel, 3145, *3147*
Bristol Docks, bridges, 2886
Bristol pennant stone, use, 532
Britain, history, Roman conquest, effect on trade, 146; government of Agricola, 1940; Hadrian's wall, 2069; and Emperor Severus, 2071; to end of Heptarchy, 2243; Saxon invasion, 2355

— Egyptian worship, 419
"Bull-fight," Manet's picture, *4395*
Bullaces, in season, 1532
Bulldog, use in puddling furnaces, 4637
Bulldozer, in smith's work, function, 3107
Bullet-making, *6617*
Bullfinch, classification, 2209
Bullhead, fish, form of head, 3069
Bullhead rail, wear, *3436*, 3437
Bullion, assay, 5850; Bank of England reserve, 4168; banks' reserve, 4438; sampling, 5850
— in crown glass manufacture, 4534
Bullnose bricks, form, *1948*, *1949*
Bullock, application of term, 2238
— carts, for transport, 2153
Bull's metal, cast, strength, 1396
Bull-wheel, of planing machine, function, 5000; in mining, in rope-boring derrick, 2845
Bulwer Lytton: *see* Lytton
Bunch, in mining, definition, 2378
Bunching machine, cigar, 4374
Bunker's Hill, Battle of, 5845
Bunkers, steamer, position, 5401
Buns, Bath, recipe, 2332
— rice, recipe, 2333
Bunsen, scientist, grease-spot photometer, 2436
— burner, use in chemical analysis, *4404*, 4405, 4412
Bunt, fungous disease, *1667*, 1669
Buntings (Eringillidæ), description, 2209
Buntons, use in mine shafting, 3193
Bunyan, John, author, 1640; his "Pilgrim's Progress," 2963; predominance of Anglo-Saxon words, 1771
Buoninsegna, Ducciocli, painter, 3519
Buoy, globular, drawing, 5041, *5042*
Buoyancy, in hydrostatics, 1078: *see also* Metacentre
Buoys, use and construction, *6497*
Buphaga: *see* Ox-pecker
Buprestids, beetle, decorative use, 3512
Burdock, plant, seed dispersal, *911*, 912
Bureau, construction, 6588, *6589*
Bureau Veritas, ship's efficiency, 6221
Burette, chemical, described, *62*, *63*
Burglary insurance, risks, 4852
Burgoyne, General, American War of Independence, 5845, 5846
Burgundy Canal, France, course, 1684
— establishment of kingdom, 2915; Saracen invasion, 2946; alliance with Henry V. of England, 3463; wars for possession, 4396
Burham bricks, size and weight, 1520
Burin, engraving tool, *6111*, 6114
Burke, Butler, investigation concerning origin of life, 2030; book, "The Origin of Life," 2554
Burke, Edmund, author and statesman, works, *2054*, 2055
Burling, in cloth-making, 4106, 4110
Burlap, use for wall covering, 5828
Burma, cotton industry, 386; ethnology, 1789; geography, 2818, 2972, *2973*; oil-fields, 5305; petroleum deposits, 6009; petroleum transport, 6014; products, 5381; skull measurement, 1785; trade, 5381
Burne-Jones, Sir E., stained glass, 4945
Burners, gas, acetylene, kinds and sizes, 6025; argand, 6152; duplex flatwick, 6152; fish-tail, 6153; gas, kinds, 6026; Holden, construction and use for liquid fuel, 6153
Burnet, cows' food, 3890
Burnet moth, protective colour, 3516
Burning, in chemistry: *see* Calcination
— metals, 5032, 6454
Burnisher, agate, *6776*, 6778
— boot factory, use, 4241
— saddlery, 4784
Burnishing, in art metal-work, 5528
Burnley, industry, 1272
"Burnley" loom, 3636, 3637
Burns, John, on glorification of motherhood, 4667
Burns, Robert, poet, *993*, 995, 3783
Burns, treatment, 6472
Burnt sienna, pigment, 871
Burr, of deer's antler, 2156
— in plate-punching, 3095, *3097*, 3107
— of punching tool, defined, 4584
Burr-stones, found by probing, 2582
Burrell spring governor, *2019*, 2020
Burring machine, wool, *1125*
Burrs (bricks), description and use, 1947
Burslem, Staffs, industries, 1272, 1895
Burster, mining tool, use, 2956
Burton, William, modern pottery, 5385; *plate facing* 5233
Burton-on-Trent, brewing, 1273
Bury, Lancs, industry, 1272
Burying beetle, habits, 3511
Bus: *see* Omnibus
Bush, eccentric, of clock, making, 5883
— grinding process, *3404*, 3408
— key-seating, *3403*, *3404*
— roller chain, drawing, 4000, *4001*
Bushel, 226; values, 872, 6676
Bushmen, average stature, 1788; ethnology, 1789; skull measurement, 1785, *1787*; South African, 629, 3278, *3279*, 3586
Business agreements, law of, 6752
— books, 776, 977
— correspondence, 6350
— expansion, examples and methods, 5926, 5927
— management: *see under separate heads—e.g.*, Advertising, Factory, *etc.*
— premises, account in bookkeeping, 2883
Bustard, order of birds, 2212, 2213
Busts, electrotyping, 3422
But, preposition, rules for use, 1336
Butcher, business of, 1427; outfit and premises, 1427, 1428, *1429*; cart, *2463*; wages, capital, etc., 46; use of waste products, 640
— pork, cooking and shop outfit, 1432
Butcher bird: *see* Shrike
Butler, Joseph, philosopher and theologian, 2054
Butler, Samuel, author, 992
Butler, manservant, duties, 761
Butomus: *see* Flowering rush
Butt, in leather manufacture, 3013
— hinge, 3022, 3547, *5183*, 5184
— joints, *5351*, 5352; in vehicle construction, 2833
— straps, in boiler-making, *3099*, 3100
— ship plating, fitting, 5922
— weld, described, *233*, 236, *2987*, 2988
Butter, adulterant, 5581; adulteration, 3553, 3716, 4715; anchovy, recipe, 2003; aroma, 4211; books on, 4834; brands, 3551; churning, 4279, *4280*; colour and flavour, 4210, 4211; constituents, 4034, 4210; countries producing, 5119; cows, yields, 3666; dietetic value of, 3109, 3311; digestibility, 866; ferments in, 4036; green, recipe, 2003; imported compared with home-made, 3552; imports (1905), 3551; judgment of, 4281; kinds, 4714; making: *see* Butter-making, *below*; margarine a substitute or adulterant, 1032; milk yield, 4211; nutritive value, 3381; melting point, 3486; preservation, 3819; 3820, *4281*; rancidity, cause, 4036; refrigerating machine, 5404; water, percentage, 1625, 4714; watered, 4210
— fat, source, constitution, 4832, 4833
Butterbur, underground stems, 909
Buttercup, classification, 352; fruit, 348, *349*; nectar, *730*, 731; farm weed, eradication, 1378; species, 136; spiral leaves, 350
Butterflies, *plate facing* 3505; classification, 3362; courtship colour, 3516; eggs, *3513*, 3514; metamorphosis, 3362; as pollen-carriers, 731, 782; structure, *3512*
Butterfly, sea, muscular fins, *3113*, 3114
Butter-making, 4210, 4212, 4279; bacteria, influence, 3553
Butter-milk, composition, 4034, 4038
Butterine, defined, 4832

Butterwort, description, 507, 508
Buttock-lines, of ship, forms, *5609*, 5610, 5614, *5618*
Buttonholes, *153*, *475*; machine for, 6796
— in tailoring, *1111*, 1113
— in underclothing, *3337*, 3338
Buttonholing, in bootmaking, *4436*
— gloves, 5482
Buttonhooks, haberdasher's stock, 3152
Buttons, haberdasher's stock, 3152; how to sew on, 153, 1460
— boot, fastening machine, 4436, *4437*; machines for making, *4240–4242*
— cabinet work, *6589*, 6591
— glass, manufacture, 4736
— glove, varieties, 5480
— in joinery, 5293, *5295*
— plain needlework, 3093
— on underclothing, *3337*, 3339
Buttress, in building, stability, *2571*, 2572; in Gothic architecture, 3373; in masonry, use, 3145, *3147*
— flying, of Lincoln Cathedral, 3144, *3147*
Butts, of round basket, use, 5490
— ship plating, *5917–5919*, 5921
— water, drainage, 780
Butylic ether, definition, 2879
Butyric acid, formula, production, 3273; formation in milk, 4036, 4037
Butyrin, constituent of milk fat, 4035
Buying, in shopkeeping, general principles, 175; errors, 175; overdue payments, 177; speculative, 5929
Buzzard, pursuit of prey, *2492*, 2493
By, in English place-names, 1769
Byre, in farming, construction, 2997; management, 3672
Byron, Lord, poet, 1308, *1305*; editions, 1438; Hebrew melodies, 500, 502, and Greece, 6448
Byssus, of edible mussel, *3285*; of glochidium, *3286*
By-tones, harmonic, in music, 568
Byzantium, architecture and art, 3089, 3090; Roman seat of empire, 2072; Philip II of Macedon's attack on, 775; use of veined marble in building, 3245, *3247*

C SPRING, of carriages, description, 2725, 3329; freehand model, *2729*; in under-carriages, 3122, *3123*
C-T bate, in leather manufacture, 3010
Cà d'Oro Palazzo, *3376*
Cabal Ministry, constitution and policy, 4762
Cabbage, classification, 352; varieties, cultivation and seed, 1197; boiling, recipe, 2126; cows' food, 3890; digestibility, 3314; as livestock food, 2704, 2904, 2905; seed of, 638, 1198
Cabinet-makers, employment conditions, 2652
Cabinet-making, 6579-91; dictionary of, 3389; joints, 4111, *4112*, *4113*; woods, 6579; use of hard wood, 3542
Cabinets, construction, *6589*
Cable, *6546–6548*; conduits, *6794*; insulation, 6795; joining, 6792; laying, *6794*; electric testing, 3088; three-phase, 1907, *1908*; urban supply, *2246*, 2247; varieties, *6791*, *6792*
— joints, *6793*
— rope, materials, making, 5288, 5291
— submarine, and earthquakes, 1209; invention, 128
— telephonic, 6179; colour code, 6078; distributing frames, *6078*, *6079*
— traction: *see* Tramways, cable
— wire, manufacture, uses, 5173, *5174*
Cable-ways, principle of inclined plane, 834; use in quarrying, 2956
Cabling frame, construction, 5289
Cabmen, regulations and conditions, 4187, 4188
Cabriolet, carriage, structure, 2467
Cabs, dimensions and weight, 2726; fares, 4188; hansoms, 2466, 4189; hire by cabmen, 4188; London, number of, 2153; motor, regulations, 4189
Cabul, British retreat from, 6691
Cacao butter, source, 4832
Cachelot, source of sperm oil, 4833
Cacti, Mexican, description, 4175
Cactus, absorption of moisture, *727*; spines, *909*, 1114
Cactus group, classification, 353
Caddis-fly, description, *3365*, *3366*
Cade, Jack, revolt, 3465
Cadence, in harmony, 365; in music, inversions used, 565
Cadets, army, training, 4197; mercantile marine, 6365; naval, training, and pay, 4401
Cadetships, state, examinations, 2251
Cadmium, in art work, 5523; characteristics, 3837, 3838, 3839
— amalgam, in mercury lamp, 2684
— orange, manufacture, 5144
— yellow, manufacture, 5144; in oil painting, 871
Cæcilians, description, 2799
Cæcum, valve of, *576*, 579
Cædmon, father of English poetry, 304
Cæsar Augustus: *see* Augustus Cæsar
— Caius Julius, and the Belgæ, 2948; calendar, 226; career and character, 1513; Catiline conspiracy, 1513, 1514; conquers Gaul, 2915; in Egypt, 1515; and Pompey, 1514; visit to Britain, 55 B.C., 68; his fall, 1670
Cæsura, in English verse, 306; in Latin verse, 1767
Caffea arabica: *see* Coffee plant
Caffeine, in coffee, 3378, 3823, 6554; dietetic value, 3378; properties, use, formula, source, 4007
— citrate, preparation and use, 4009
Caffeol, properties, 4007
Cage, mining, 3305, *3308*, 3462
Cainozoic rocks: *see* Tertiary rocks
Cairngorm, precious stone, 5855
Cairo, captured by Napoleon, 5238; geography, 3450, 3451
Caissons, in bridge building, *1403*, 2737; dock, 2889, 6497
Caithness, industries and towns, 1064
Caius Cæsar, Emperor of Rome: *see* Caligula
Cake, chocolate, recipe, 2332; plain soda, recipe, 2333; plum, recipe, 2331; recipes, 2331; making, 1530, 1532; stale, using, 2336; veal, cooking, 1872
Calabria, made a state, 2945
Calais, France, harbour, 6332; recaptured by France, 3834
Catalysor, definition, 4135
Calamary, squid, pen of, *3114*, 3115
Calamine, zinc ore, 358, 1042, 4306, 6166
Calamus, genus: *see* Cane
Calanthes, culture, 6534
Calc sinter: *see* Travertine
Calcareous rocks, 1073
Calceolaria, culture, 6492, 6532
Calcimeter, lime tester, use, 1856; chemical analysis, *4416*
Calcination, in chemistry, process, 4316
Calcining, ores, 356, 3836: *see also* Roasting
Calcite (calc-spar), composition, 843; crystalline forms, 766, *767*; double refraction, 3849; formula, 768
Calcium, chemistry of, 843; proportion in earth's crust, 239, 624; per cent. in human body, 438; plant food, 167; occurrence, 5757; salts, 1041
— acetate, in acetic acid manufacture, 5466; acetone from, *5467*; in dyeing, 5781; production, *5466*; wood distillation product, 5465
— carbide, electric formation, 3032; manufacture, 5588, 5758; preparation and properties, 3707, 6829
— carbonate, chemistry of, 843; lime making, 1455
— carbonates, 768
— chloride, use in dyeing, 5781
— fluoride use in flame-arc lamp, 2684; formula, 768
— hydrate, production and use, 5781
— hypochlorite: *see* Lime, chloride of
— nitrate, 3032, 5888; in soil, 1599
— oxalate, product of rhubarb, 3704
Calcium, phosphate, from bones, 5359; chemistry of, 1041, 1162; in phosphatic manures, 5586, 5587
— salts, in dyeing, 5781; from orthophosphoric acid, 5586
— sulphate, in cement, 1859; in earth's crust, 768; precipitate, 4405; removal from hard water, 5762; presence in wines, 2879
— sulphide, 1041
Calc-spar: *see* Calcite
Calculagraph, 6519, 6644; telephone, 6181
Calculus, differential and integral, 6790
Calcutta, exports, 5381; history, 6549
Caldecott, Randolph, his art, 343, 1022; press illustration, *6102*
Caledonia, history of, 2607
Caledonian brown, pigment, 871
Caledonian Canal, 982, *1065*, 5486
Caledonians, invade Britain, 2241; Roman struggles with, 2069, 2071; invaded by the Scotti, 2607
Calendar, history of, 226; Julius Cæsar's reform, 1516; reformed, (1751), 5554; Roman, 1182
Calender, rubber sheet and belting, 5200; spreading machine, *5201*
Calendering, carpet, 4341
— in cloth manufacture, *4342*, 4343
— in hosiery manufacture, 4765
— in paper-making, *6396*, 6399
Calends, Roman, 1182
Calf, feeding, 2238, 2907; rearing, 2238
Calf-skin, drenching, 3011; grain, *plate facing* 3217; tawing process, 3164
"Caliche," composition, 5587
Calico, in dressmaking, preparation, 3340; for underclothing, 3093
— mordants, citric acid, 4782; potassium chlorate, 4778; tragacanth, 810
— printing, block, 4490; machine, 4502; design, fitness, 5980
Calicoes, finishing processes, 4341–4342
California, admitted to U.S.A., 5975; economic conditions, 5662; industries, 4175; irrigation, 5484; petroleum deposits, 6007; products, 5662; rainfall, and irrigated land, 5660
Caligula, reign, 1832
Calipers, use, 3319, 3386: varieties, 4708
— adjustable, types, *4703*, 4707
— beam, forms, *4703*, *4705*, 4708
— compass, use, *4703*, 4707
— micrometer, use, construction, 4702, 4707; horseshoe type, *4705*, 4709
— plasterers', 5496, *5497*
— vernier, construction, *4705*, 4708
Caliper rule, form and use, *4703*, 4707
Caliph, meaning and creation of, 2353
Called-up capital, term explained, 3185
Calling lamps, telephonic, *5880*
Callosities, treatment by chiropody, 1896
Calmar, Union of, 2948; result, 5396
Calorie, heat unit, 4630
Calorimeter, ice block, structure and use, *1739*, 1740
Caltrop, defined, 912
Calvin, rule over Geneva, 4399
Calving, 2238; care of cow, 3671; season for, 3672
Calvinists, persecution in France, 4102
Calyptra, of mosses, 1312
Calyx, of flower, defined, 346, *347*
Calyx system, in rotary boring, 2845, *2846*
Cam, general account, *828*, 832; heart-shaped, drawing, *4323*; single acting, 4323, *4324*
— plate, of lathe, *828*, 4919, 4920
Cambium, in plant stem, *169*, 170
Cambrian system, in geology, 2067; rocks, 2253
Cambric, for underclothing, 3093
Cambridge University, 1273; engineering course, 483; origin, 3073; scholarships and cost of living, 4823
Cambridge Gulf, Australia, 3697
Cambridgeshire, geography of, 1273
Camel, African fauna, 3277; blood corpuscles, 952; distribution, 628; foot, modification for desert, 1870; as means of transport, 2152; transport in Australia, 3701

Camel-hair brush, in water colour painting, 1021
Camel's hair, uses, 5120, 6882
Camellia, culture, 6532
Camellia thea: *see* Tea plant
Camembert cheese, composition, 4490, 4492; manufacture, 4575, *4576*
Cameo, 6300; use of helmet shell for, 3113
Cameoid, wall covering, 5828
Camera, photographic, construction, 6679; cost, 4417, 4420; enlarging, 6683; equipment of studio, 4418; lenses of, 2952; repairs and hire, 4422; second-hand, 6679
Camera obscura, principle of, 2902, 2952
Cameron, bacterial sewage system, 4742
Cameroons, mountains, 3582
Cames, use in glazing, 5840
Camisoles, various patterns, 3588, *3589*
Campagna, Roman, *2231*
"Campania," liner, engines, 5418
Campanile, at Florence, architecture, 3376; relief panels, *3517*
— Romanesque, in architecture, 3232
— at Venice, 3090
Campanology: *see* Bell-ringing
Campanularia: *see* Hydroid zoophytes
Campbell, Thomas, on Beaumont and Fletcher, 846; poetry, 1307
Campbell's Act, liability of railway companies, 5107
Camphor, 6882; distillation and uses, 812; Formosan, 5659; formula and synthesis, 3487; obtaining, source, 4969, 4873; properties, 4971; uses, 4873, 4971; weight, 1704
— compounds, essential oils, 4968
— emulsion, 1033
— laurel, Formosan, 3161; Japan, 3159
— tree, distribution, production of camphor from, 812
Campines, fowls, points of, 4957, *5090*
Campions, classification, 354
Campos, Brazil, 627, 4286
Camwood, use in dyeing, 5906
Can, milk or cream, *4210*
Can, tapering, drawing, 4522, *4523*
Can (verb), conjugation, 94
Canaan, division into the 12 tribes, 666
Canaanites, ethnology, 1790
Canada, area, population, 3203; British emigrants to, 3203; clerical service, restrictions, 3548; climate, flora, 1649; coalfields, 5305; commercial opportunities, 6212; electricity development, 131; exports (1903–5), 5662; farming in, 3203; fisheries, sea, encouragement of, 5318; geography, 4065, *4067*; history, 5111, 5845, 5974, 6690; imports, 5663; labour supply, 6629; land grants, 6632; medical profession in, 5428; police, 3850; power sources, 5011; sugar production, 4351; touring, 1649; trade with U.S.A., 5664; trained teachers, salaries, 3741; U.S.A. boundary, 5975; wheat export to England, 3282; wheat supply, 914; wood-pulp industry, 1650
— Arctic, geography, 4066
Canada balsam, 1034, 3849, 5385, 6125
Canadian hemp, character, uses, 718
Canadian Pacific Railway, construction, 3051, 6630, 6632; route, *4068*
Canal, auditory, structure, 2316
— boats, electric tractor, *2275*; as means of transport, 2277
— lifts, hydraulic, 1224
Canaliculus, in bone, 435, *436*
Canals, Babylonian system, 16, 17; Canadian, 4068; classes of, 5483, 5485; commercial use, 4518; engineering construction, 5483, 5484, *5485*; excavation, 5336; French, 1681, *1682*, 1684; gauge, want of uniform, *5485*; German Rhine, 5826; great, list, 4515; inland construction, 5483, *5485*; inundation type, 5484; lockless, 5487; Russian, 2406, 2409; ship, construction and uses, 5486
Canalisation, canals, definition, 457
Canary, classification, description, 2209
Cancellœria Palace, Rome, Bramante's architecture, *3676*
Cancellous tissue, physiology, 135
Cancer, lymphatic vessels in, 1196; Röntgen rays cure, 4093; ultra-violet rays, effect, 3617
Cancer, tropic of, equinox, 293
Cancer, Zodiac sign, 6251
Candle-power, of incandescent lamp, 2613, 2614
Candle-wick, manufacture, 4838
Candles, advantage as illuminant, 4835; antiquity, 4835; books on, 4834; burning power, 5193; dipping, 4838, *4839*; forms, *4840*; illuminating value, 4840, 6024; in lighting mines, 3769; materials, 1032, 4835, 4838; manufacture, 4835; moulding, *4839*; sizes, 4839
Candy, for bees, recipe, 5961
Candying, process, 4848
Cane, description 5723: in basket-work, 5488; bending, *5723*, 5724; seating, 5723; skeins, 5723; splitting, 5723; uses, 3583
— whangee, use, 5724
Cane sugar, formation of dextrose and lævulose, 3706
Canella bark, source and uses, 6068
Canidæ, species, 1494
Canine teeth, *1605*; cutting, age, 577, *578*
Caning blade, use, 5724
Canister top, describing patterns, 5347, *5349*
Cannabis sativa: *see* Hemp
Canning, foodstuffs, process, 5407; danger of ptomaine poisoning, 5407; preservatives, 5408
— fruits for, 4875
Cannon-bone, in hoof of deer, 1870
Cannon Street station, roof truss, 2448
Canon-beetle, disease in beetroot, 4048
Cañons, barriers to communication, 4496; North America, 4062, 4069
Canopy, in motor vehicles, 3023
Canopus, magnitude, 6697
Canova, sculptor, 4119
Cant board, described. *2727*, 2730, *2731*
— rail of brougham, 2829, *2831*; of carriage, *272*
Canterbury bell, pollen, protection, *1114*
Canterbury Cathedral, chapel vault, 3146, *3147*
"Canterbury Tales," Chaucer's, 325, 3783
Cantharides, source of, 3512
Cantilever, relative carrying capacity, *1987*, 1988; under various loads, 2226, *2227*
— bridges, 2737; military, *6269*
Canting fence, of saw bench, 6146
Cantle, of riding saddle, form, 5339
Canto fenno, in music, 632
Canton, China, commerce, 2977, 6690
Cantoons, cloths, finishing, 4343
"Cantoria," Lucca della Robbia's relief from, *3677*, 3678
Canute, King of Britain, reign, 2357
Canvas, Admiralty test, 1701
— jute, preparation for floor cloth manufacture, 5122
— painting, background, 1020
— sails, for painting, 1168
— upholsterers', 6715
Caoutchouc: *see* Indiarubber
— plant, flower, 3583
Cap, boy's polo, making, *5939*, 5940
— cloth, making, *6159*, 6160; elderly lady's, *5775*; Glengarry, manufacture, *6159*, 6160; golf, making, *6159*; hatter's stock, 3443; millinery, *5775*; woollen cloth, early manufacture, 4619
Cap, bullet, *6615*
— driving, mining boring tool, *2666*
Cap spinning frame, mechanism, 2441
Capacity, electric, of condenser, 3580; dielectric, 3580
Cape cart, yoke attachment, 3126; hood, 2559, *3623*
Cape Colony, economic conditions, 5660; geography, 3586; medical profession, 5428; sea fishery, 5318; teachers, opening for, 3741; wool trade, 72, 220, 221, *224*
Cape-to-Cairo railway, *3587*
Cape of Good Hope, discovery, 2947
Cape chisel, *4151*
Capella, star, description, 6117
Caper-plant, classification, 352
Cap-front, of baby's bonnet, 5939
Capillaries, in blood system, *954*, 955, 1193; digestive system, 677; food assimilation, 865; in lung air-cells, 1299, *1301*
Capillarity, explanation, *1374*
Capillary, circulation, 1193
Capital account, bookkeeping, 490; double account system, 3332; in partnership concerns, 2756, 2978
Capital, in architecture, Egyptian, *2520*; Gothic, *3517*; Greek orders, 2858; Persian, 2659; proportion, 5977; Romanesque, 3231
— in finance, defined, 1262
— letters, rules in French, 418
— of limited company, 3185, 3186, 3331
Capitoline Hill, Rome, *2933*
Cap-making, men's, *6158*, *6159*
Capon, quality independent of breed, 5623; results of feeding, 5094
Capotasto, in banjo music, 4312
— in guitar playing, 1058, 3761, *3762*
Capping, in mining, methods, 3766
Capricornus, Zodiac sign, 6251
Capricorn, tropic of, sun's position, 293
Caprifoliales, classification, 353
Capsicum, properties, 4721
Capstan, hydraulic, 5676, *5677*
— lathe, expanding clutch, 962; friction-geared head, *4913*, 4917; types, *4918*, *4919*, 4922, 4923
Capstans, 1685, *6498*
Capsule, of kidneys, 1602, *1603*
Captain, Army, 4199; marine, 6895
— Navy, promotion and pay, 4402
Capua, Italy, Hannibal at, 1381; principality, 2945
Capybaras, classification, 1762; swimming apparatus, 2038
Car, balloon, construction and use, 3979, 3980, 3982, 3984
Car, observation, use in U.S.A., 4593
Caracalla, Roman Emperor, 2071
Caramel, characters and uses, 4165; prices, 5494; production, 3652; in tinting glucose, 4558
Carapace, of crustaceans, 3807
— of tortoise, 2799
Carat, of gold, 361
Caraway, classification, 353; seeds, 4722
Carbamide: *see* Urea
Carbides, production, 5758
Carbonyl nickel process, 4306
Carbohydrates, constituents, 439, 636, 3111; contrasted with hydrocarbons, 2713; in dietetics, 3111; discussion of term, 3706; digestibility of, in starch foods, 866; digestion, 673; effect of excess in human body, 867; in livestock feeding, 2703; paraffin derivatives, 3705; sources, 3111; in standard diet, 3380; starch, 5364
Carbolates, separation from carbolic oil and decomposition, 5463
Carbolic acid, antidote, 3710; as antiseptic, 3709; from coal-tar distillate, 5463; use as disinfectant, 2590, 5055; formula, preparation and properties, 1163, 3709; protoplasmic poison, 3017, 3709; solution for beehives, 5962
— cloth, for quieting bees, 5959
— oil, uselessness in surgery, 3709, from coal-tar distillate, 5462, 5953
Carbon, action on other elements, 840; in Bessemer pig iron, 4907, 4910; in cast iron and steel, 1045; chemistry of, 1046, 1157; corpuscle emission, 4700; Dewar's experiments, 1158; dietetic value, 3109; in distilled coal-tar, 5462, distribution, 239; dynamo brush, *1107*; in electric batteries, 464, 467; elements allied to, 1160; graphitic, 232, 2546; graphitic arc lamp pencils, 2414, 2416; graphitised, use, 5753; heat units, 5194; in human body, 438; in

Carbon—continued
iron, 1014, 4746; percentage and effect in iron and steel, 231, *233;* in living things, 275; occurrence, 239, 839; in plants, 170; proportion in earth's crust, 239, 624; in rolled steeled bars, 3938, *plate following* 3936; percentage in steel, table, 234, 235; in steel manufacture, 5015; universal presence of, 2713; use in electric lamps, 2612; varieties, 362, 1157
— bisulphide, formation, properties, products and uses, 1718, *4625*, 4626; oil, solvent, 4830; sulphur solvent, 4625
— compounds, 402, 516, 2713; chemistry of: *see* Organic chemistry; synthesis, 4128
— dioxide, absorption by plants, 22; aeration with, 6391, 6393; analysis, *4414;* animal exhalation, 22. 6019; atmospheric constituents, 3719, 3798, 6019; atmospheric, measuring apparatus, *4414*; from chalk, 60; chemistry of, 1046, 1158, 3487; combustion product, 232; decomposition, 1598; graphic formula, 2714; in human body, 438; in mines, 1158, 3768; mortar, penetration through, 1459; plant food, 170, 276; properties, 362; relation to carbonyl chloride, 3703; in refrigerating machines, 5404; in respiration, 1302; waste product of living organisms, 1491; *see also* Carbonic acid
— monoxide, in air, 3720; chemistry of, 362, 1158; combustion, 232; in mines, 3768
— pencil, for shading, 2188
— tetrachloride, properties, 1601
— work, in typewriting, 1698, 1920
Carbonaceous rocks, 1073
Carbonatation, sugar, 3828, 4161
Carbonates, gas test for, 4404; in earth's crust, 768; varieties and distribution, 231; in water, 5761
Carbonating tower, in ammonia soda process, *4772*, 4773
Carbonic acid, discussion of term, 1158; *see also* Carbon dioxide
Carbonic oxide: *see* Carbon monoxide
Carboniferous rocks, formation, 1921; system, 2067; strata, 2253
Carbonyl chloride, formula, 2714, 3703
Carborundum, as abrasive, 813; formation in electric furnace, *3032*; in lens grinding, 6124; use, properties, and production, 5758
Carburetted water-gas. 6818, 6829
— wheels, for teeth of cutters, 3408
Carcase, in building, 307; in cabinet-making, *6581*
Card index system, 6520
Cardamoms, *4721*, 4722
Cardboard boxes and rolls, 6560, *6562*
Carder, textile machine, function, *1541–1546*; in felt manufacture, 1998; jute, *1886*, 1887; silk waste and ramie, 1725; tow, *1885*
Cardinal numbers, French, 1619; German, 2050; Italian, 2919; Latin, 601; Spanish, 2768; *see also* Numerals
Carding, cotton, process and machinery, *1541;* felt, 1998; jute, 1886; tow, 1885; wool, 222, 1544
— engine, *1542*, 1543, *1544*, *1885*
— flats, definition and use, 1543, 1544
Careers, choosing, 3; *see also* Profession, *and under separate headings*, Clerkship, Civil Service, *etc.*
Cargo, of ship, dead-weight capacity, 5964; weight distribution, 6222
Caribou, habits, 4065
Carillon: *see* Glockenspiel
Carinaria, shell-fish, modification of foot, *3113*, 3114
Carinatae, flying birds, 2209
Carlyle, Jane Welsh, work, 2615
Carlyle, Thomas, author, 2451, *2629*; compared with Macaulay, 2615; contempt for Spencer, 5390; contempt of novels, 3986; instance of "great-man" theory of history, 3987; on man as a fighter, 5245; on poetry, 304; on struggle between right and wrong, 5389; on war, 5098
Carman, coal-dealer's, wages, 1990
— railway goods staff, duties, 5072
Carmarthenshire, geography, 1277
Carmen, conditions of work, 4189
Carnallite, 1042; Stassfurt deposit, *5585;* extraction of potassium salts, 5585; magnesium extraction, 5756
Carnarvon, county, geography, 1277
Carnations, classification, 354; culture and varieties, 6488, *6491*, *6493*, 6532
Carnauba wax, production, uses, 1033, 4835; characteristics, 4834
Carnegie, Andrew, assistance to Scotch education, 483; early life, 195
Carnivora, characters, 1494, 1763; classification, 380; development of claws for climbing, 1871; evolution of, 1761; swimming apparatus, 2038; teeth, 577, *578*
Carnivorous plants, 277, *507*, 508
Carpaccio, Vittore, painter, style, 3795
Carpal bones, anatomy, 1708, *1709*
Carpathian Mountains, in Austria, 1973; in Hungary, 2164
Carpel, of flower, defined, 346, *347;* variation in number, 352
Carpenters, employment conditions, 2643; Marine, 6803; Navy, 4265, 4269; railway "works," 4592; ship, appointments to Coastguard service, 3197; stocking tools for, 2091; as undertaker, 5785
Carpentry, architects' detail drawings, *5696*, 5698; dictionary of, 3389: *see also* Building: heavy carpentry, 4639; joints, *3843*, 4111: *see also* Joinery; materials, 3539; metal accessories, *3543*, 3546; railway shops, 4646; roof work, 4247, *4249*, 4250, *4251*, 4252, *4253*, 4254; staithes, 4644, *4645*; timber joints, 4039, 4044; timber used in, 54; timber work, *3753–9*; tools and appliances, 3385, *3387*, *3388*, 4644; trestles, 4640, *4641*
Carpet-bedding, *plate facing* 6329, 6491
Carpet merchants, the business of, 1625
— weaving, *3990–3996*
Carpeting, problems in arithmetic, 1547
Carpets, use in carriage trimming, 3621; Chenille weft, 3157; design, *3357–3360*, 5980, 6386, 6389, 6390; finishing processes, *4341*; manufacture, *3390*; manufactured in Asia Minor, 2719; mixed pile warp, 3360; planning and laying 6722;
— Axminster, design, 3357, 3358, *6385*, 6387; manufacture, *3993*, 3996
— Brussels, contrasted with Wilton, 3993; designs, *3357*, *3358*, *6388*; manufacture, 3991, *3992*
— felt, manufacture, 1995; milling, 4108
— Kidderminster, design, 3360
— Oriental, manufacture, 3993
— Persian, manufacture, 2817
— tapestry, design, 3358, *3359*; manufacture, *3996*; velvet pile, 3996
— Wilton, design, 3357, *6388*–6390; manufacture, 3993
Carpus, human anatomy 1708, *1709*
Carrageen moss, use, 1369
Carriage, axle box, drawing, 3265, *3266*
— builders, employment conditions, 2653
— release, of typewriter, *1529*
— way, construction across footpath, *2425*
Carriages, brakes, 3128; cleaning, 1001; design, 2555; funeral charge, 5786; horse, *2464*, *2465*, 2466, *2477*; construction and dimensions, 2557; metal work, *3325*; motor: *see* Motor vehicles, cars, *etc.*; painting, *etc.*, *3479–81*; trimmings, 3621; under carriages, *3121*; ventilation, 3025
— of lathe: *see* Saddle
— loom lace, 4978; net, *4880*
— railway, demurrage fines, 5102
— of staircases, in joinery, 5298; construction, 5300, *5301*
Carrier beams, used in linen loom. 3912
Carriers, animal, used in transport, 4517
— human, use in transport, 4516
Carrion bettles, description, 3811
Carrion crow, classification, 2210
Carrot, *349*; classification, 353; cultivation, *944*, 945; harvesting, 1666; insect pollination, 731; as live-stock food, 2704, 2905, 3892
Cars, American railroad, trimmings, 3621; railway Pullman, *4801*
Carr's furnace, explained, 2863, *2864*
Cart-horse, shire, 2073, *2075*
Carthage, foundation, 1204; Roman invasion, 1381; Spanish colonies, 2946; wars with Pyrrhus, 1203
Cartilage, histology, *435*
Cartilaginous tissue, human, 196, 435
Cartoon, stained glass, 4945, *4947*
Cartridge cases, manufacture, *6615–6617*
— paper, manufacture, 6400
Cartridges, manufacture, *6615*
Carts, agricultural, 1846; pleasure, 467, *2463*; two-wheeled, side framing, *2727*
Cartwright power loom, 224, 1398, 3492
Caruncle, violet and pansy, *911*, 912
Carver's bench, *5809*, 5810; knife, *5809*, 5810; punch, *6044*, *6045*; screw, *5810*; tools, 4150, *5809*, 5810
Carving, Roman relief, 2933; Romanesque, 3234; in cabinet-making 6584
— food, 3314; requisites, principles, and methods, *5933*, 5934
— ivory, 3517, 6299, *6300*
— stone, Gothic variety of subjects, 3517; polychromatic, 3517
— wood, *5809*, *6043*, *6135*
Caryatid, architectural order, *2858*
Cascara sagrada bark, source, 6068
Cascarilla bark, source, uses, 6068
Case, in grammar, 116; rules, 246
— packing, joints, 4111
Case-hardened metal, grinding, 3408
Case-hardening, 210, 3107; axles, 3328; iron, 234
Casein of milk, composition, precipitation, 4033; dissolving, 5362; influence in cheese production, 4492, 4573; uses, 5149, 5362
Cases, type, kinds, 5156, *5157*
Cash account, bank bookkeeping, 4440; explained, *489*; old and new methods compared, 1864
Cash book, bank account entries, 1968; bank bookkeeping, 4441; debit and credit sides, 1865; definition, 778; discount transactions, 979; of limited company, 3187; loose-leaf, 6522; modern entries of bank lodgments, 1968; old and new methods compared, 1864; relation to old-fashioned journal, 1468; relation to bought ledger, 2982; in single entry, 3916; small shops, 45; tabular system, 3567; *see also* Petty cash
Cash-on-delivery system, 5930
Cash-railway system in shops, 46
Cash sales, explained, 979; book-keeping entries, 1969
Cash trade, contrast with credit, 5927
Cashiers, bank, classes, 4441; duties, 4588
— in business house, 660; function in departmental system, 3416
Cashmere, arrangement of threads, 3909; warp, 2594; width, 186
— shawls, 220
Casing boards of brougham, 2829, *2831*
— — use in mine shafting, 3193
Caslon letter foundry, 6073, *6074*
Caspian sea, 2406; salt in, 1600
Cassia, source, *4722*
— oil, composition, 5469
Cassiopeia, constellation, *6116*, *6117*
Cassiterite, tin ore, 6161, 6734
Cassowary, *2213*; classification, 2214
Cast iron: *see* Iron, cast
Castanets, musical instrument, 5569, *5570*
Castelli, coherer, wireless telegraphy, *3895*, 3897
Casting, dictionary of terms in, 2545; "head" and artificial pressur

Casting—continued
methods, 1404; in machine construction, 207; methods, materials and processes, *2109*, *2337*; pattern construction and moulding, *2453–2461*; shrinkage precautions, 2698, 2699; tooling allowance, 3316; weight estimation, 2699
— in art metal-work, 5526
— in bronze, art, 1674
— calf, treatment, 2623
— in iron working, 235
— in pottery manufacture, 5234
— in sculpture, 1217; figure, 1509
Casting-box, stereotype, *5556*, 5557
Castings, steel, test pieces, 3961; faults (draws, blowholes, etc.), 3962
Castor oil, source and uses, 1032, 4658, 4831; use in dyeing, 5780
— — plant, seeds, 1032
Castration, of calves, 2239; of horses, 2079; of pigs, 2369; of rams, 2364
Casts, drawing, suggested groups, 1540; study in sepia from, 1794, 1795
— plaster work, 5502
— wood-carving, 6137
Cat family, description, 1765; weapons of defence, 2155; papillæ of tongue, 2535; skins and furs, 6426
Catalogues, auctioneer's desk, 4985; ironmonger's, 3574; retail business, classes and treatment, 6056; seedsmen's, cost, 4997; vehicle trade, 2730; wholesalers', 6209
Cataloguing, library systems, 6872
Catalysis, 4135, 4630
Catapult fruits, seeds, 910, *911*
Cataract, eye disease, 1954; operations, 6264
Catarrh, causes, symptoms, and treatment, 6133; in cattle, 2622; in horses, 2620; in sheep, 2624
Catch-crop, definition, cultivation, 1233
Catch-flies, plant, protection against insects, 1115
Catch-pit, in drainage, 781
Catch-stitch, milliners', *4565*, 4566
"Catcher" apparatus, electric train staff, *4692*, 4693
Catenary curve, suspension bridge, 2498
Catering, principles of, household and public, 5581, 5582, 5720; innkeeper's profits, 3737; railway stations, 4810; yachts, 5721
Caterpillar, characters, *3513*; extermination of, in agriculture, 1666, *1667*, 1668; food of birds, 2493
Catgut, 6882
Cathedrals, in building, domes, buttresses, and vaults, *3147*
— English, architecture, 3233; Gothic period, 3373, *3375*; Gothic stone carving, 3517
Catherine I., of Russia, reign, 6201
Catherine II., Empress of Russia, life and reign, 6201; travels of, 212
Cathode: *see* Kathode
Catholics, English, Devonshire rising, 3833; favoured by Queen Mary, 3834; Catholic Emancipation Bill, 5685; persecution by Elizabeth, 3997
— in France, struggle with Protestants, 4102
— Irish, persecution by Elizabeth, 3999
Cation: *see* Kathion
Catkin-bearing group, *351*, 355
Catkins, hazel, *plate facing* 728
Cato the Censor, "Delenda est Carthago," 1382
Cato the younger, his death, 1515
Cats, trade in, 891
Catseye, precious stone, 767, 5855, 6734
Cattle, *256*, *257*, *258*, *431*, *432*; abortion in, 1669; age indications, 2239; books on, 3471; breeding and farming, 986, 2235, *2237*; breeding, Scotland, 2236; British, 2235, *2237*; buying, 2701; dairy, breeding, *3666–3673*; diseases of, 2622–2624; Dutch dairy, 1836; fattening, 2238; feeding, 433, 2702, 2704, 2904; housing of, *22*, 2997; oils as food, 1032; parasites, 2626; rearing, countries engaged in, 5119; selling, 2701; stock foods for, 2904; teeth, *2239*; tuberculosis among, 5409
Caucasia, geography of, 2718
Caucasian race, distribution, *627*, 629
Caucasus mountains, 2406
Cauda equinia, human, *1941*, 2143
Cauliflower, classification, 352; cultivation, 1197; au gratin, recipe, 2126
Caulking, importance in boiler-making, 3098, 3100, 3107; of Lancashire boiler, *3104*, 3106; of plates, metal, *3096*, 3107; pneumatic tools, 1807, *5455*, 5456; of water tanks, 1404
Causation, and the new chemistry, 2553; in relation to free will, 2995; in science, nature of, 4124
Causeway, second pyramid, *2520*
Causey Pike, geological section, *1354*
Caustic alkali, effect on cotton, 5638; in manufacturing oxalic acid, 4781
— potash, 842; formation, 5757
— soda, effect on cotton, 5638; in dyeing, 5780; electrolytic production, 3262, *5759*; industrial uses, 4774; Leblanc and Loewig processes, 4773; manufacture, 4771, 4774; properties, 841, 4774; in soap manufacture, 4964
Cavalry corps, commissions, pay, 4198
— Household, service and pay, 3840
— Line, service and pay, 3841
Cave-dwellers, weapons, *2478*
Caverns, limestone, cause, 1502; underground, cause, 1505
Cavetto, form of moulding, 5297, *5299*
Caxton Monument, 2286, *2288*
Caxton, William, first printer of Chaucer's works, 327; first English printer, 1608, 1609; life, 3604
Ce (French pronoun), pleonastic use, 5800; agreement of être, 5947
Ceara cotton, description, 384
Cedar, 6882; classification, 503; age, 504; strength of timber, 1260; timber, 55; wood, use for carving, 5809; wood in vehicle construction, 2827
Cedar of Lebanon, timber, *55*; strength of timber, 1260, 1261
Ceilings, panelled, 4755; ornamentation, 2321; panelled plaster, *5502*
Celery, classification, 333; fritters, recipe, 2126; sauce, 1874
Celesta, musical instrument, *5568*, *5754*
Celestial altitudes, *6243*, 6245
— sphere, imaginary, *6243*, 6244
Cell, auditory, function, 2316
— in biology, 200, 276; animal and vegetable distinction, 276; chemical power of, 1598; conversion of inorganic into organic substances, 29; division, 381, 2032; dormant life, 277; "germ" and "organic," etc., 485; heredity: *see* Germ-cell; osmotic pressure, 4562; protozoan and metazoan, classification, 380; reproduction by fission, *381*, 2032; *see also* Germ-cell.
— in botany, *168*, *169*; of wheat, 194, *195*
— electric, 462; energy, 467; standard cell, 790; storage: *see* Accumulator, electric; telegraphic, kinds, 4904, 5067; testing, 466; types, *465*
— physiological, description, 199; food assimilation, 865; motor nerve, *1710*, 1711; muscles, *1712*
— sap, in plant-cells, *168*, *169*
— theory, Schwann, 199; physiology, 577
— wall, motion, 200; of plant-cells, *168*, *169*
Cellar, grocer's wine and beer, 3046; licensed victualler's, 5737
Cellini, Benvenuto, style of sculpture, 3678
Cellular tissue, of plants, function and description, 170; of trees, *51*
Celluloid, coloured, 5470; dyeing, 6770; electrical insulator, 672; manufacture and uses, 5470; for artificial teeth, 6033; for large type, 6076; ship hull coating, 6572
Celluloid, paper manufacture, 6400
Cellulose, formula and properties, 52, 5637, 6562; importance in distinguishing plants and animals, 276; in plant-cells, 168; of potato, 3706; in starch grains, 673
Celtic language, 1768, 1771
Celts, art, 3092; early history in Ireland, 2608; early history in Scotland, 2607; ethnological survey, 1790; footwear, 3873
Cement, adulterants, 1860; analysis, *1856*, 4415; in brickmaking, 1282; colour, 1859; density and quality, 1860; in drain laying, 733, 734, 736; fineness, 1860; kinds, 1578; in linoleum manufacture, 5124; manufacture, 1578, *1853–1863*; in paving, 2516; setting, 1860; testing, 1521, 1522, 1523, *1858–1863*
— medina, 1579
— mortar, manufacture, 649
— natural, 1579, 1585
— Portland: *see* Portland cement
— Roman, 1578; matrix, 1952
— tooth-filling material, 5553
— for water-tanks, 1404
Cementation process, in iron-working, 234, 1045, 4749
Cementing, in bootmaking, 4542
Cementite, component of iron, 3938
Cements, varieties, 648, 1302
Cennini, painter, 1023
Centigrade thermometric scale, 6128
Centipede, sea, *3956*, *3957*
Centipedes, description, 3361, *3362*
Central America, ancient roads, 1977; geography, 4176, *4177*, 4178; German trade, 5826
Central conics, problems, 5783, 5944
Central Provinces, India, 2818, 2822
Central London Railway, mileage receipts, 2274
Central-seeded group, 354
Central stations, electric, 4298
Centre bar, of light waggon, 2829, *2830*
— bit, use, 3386, *3387*
— line, in mine shafting, 3310
— of buoyancy, defined, 1077, 1080; of floating vessel, 799, 800, *5969*; calculation, *5970*, *5971*
— of circle, definition, 4208
— of effort, in sailing vessels, *6225*
— of gravity, 799, 800, 1834; of areas, vertical and horizontal, *5969*, 5970; of bodies at rest, floating, *5968*, *5969*; in hydrostatics, 1077, 1080; of ships, calculation, 5972
— of lateral resistance, sailing vessels, *6225*
— of pressure: *see* Centre of buoyancy
— pin: *see* King bolt
— pops, in lining out, 3318
— punch, 5000; in shipbuilding, 5921
Centres, gear wheel, bearings, marking out, *3690*, 3692; measurement by, 3692
Centre-weighted governor, described, *2019*, 2020
Centrifugal forces, pendulums and governors, 2017, *2019*; in dynamo armature windings, 2021
— pump: *see* Pump, centrifugal
Centring, in building, methods, 2385, *2387*; in vehicle decoration, *1348*
Centring machines, use, 5214
Centrobaric bodies, in physics, 799
Centrode, in mechanics, 88
Centrolinead, *598–600*
Cephalic index, explained, 1786
Cercaria, liver fluke, 3959, *3960*
Cere, of pigeon, 2211
Cereals, classification, 355; cultivation of, *1229–1233*; cultivation in Europe, 855; dietetic value, 3111; extermination of pests, *1667*; fertilisers, 1199; germination, sowing seed, *635*; harvesting, 1662; as livestock food, 2704; as poultry food, 5433; rotation of crops, 1199; of temperate lands, 4873; tropical and sub-tropical lands, 4875; United Kingdom, 986; varieties, *872–874*; wheat: *see* Wheat

Cerebellum, human, anatomy, 197, *2144–2147* ; function, 2301 ; nervous system, *1941*
Cerebral circulation, 1194, *1195*
— hemispheres, anatomy, *2146* ; physiological psychology, *2299*, 2300
Cerebro-spinal fluid, 2145
— system, human, function and structure, *1941*, *1942*, 1943
Cerebrum, anatomy, *197*, *2144* ; nerves, *1941* ; physiology, *2299*, *2301* ; psychology, 2804
Ceresin, 4835 ; hardening stonework, 3244
Cerin, constituent of wax, 1033
Cerusite, lead ore, 4303, 5985, 6734
Cervantes, Miguel de, Spanish author, 2482 ; influence on English fiction, 2962
Cervical nerves, human, *1941*
— vertebræ, structure, *1605*, *1606*, *2144*
Cess, in railway construction, 3430
Cesspool, in drainage, 780 ; detection of disused, 329 ; lead gutter, *5031*, *5032* ; sewerage, 4457
Cetacea, characters of, 1494, 1763 ; swimming apparatus, 2039
Ceylon, Civil Service, 3477 ; geography of, 2818, 2972 ; rubber industry, 1154 ; tea, dietetic value, 3378
Chacun (French pronoun), syntax, 5802
Chad, Lake, description, 3582 ; inland drainage, 3454
Chafer, insect pest, 4925 ; classification, *3510*, *3511*
Chaff-cutter, construction, use, 1850
Chaffinch, classification, 2209 ; nest, 2507, *plate preceding* 2497
Chain, definition, 88, 1147
— bicycle, 3774, *3774*
— of crane, 542, 545
— design, *2322* ; engine frames, 4206
— driving gear, *4000–4003*, 5354 ; Renold " silent " type, 5355
— jewellery, manufacture, 5859
— kinematic, 687, 832
— linear, in table, 226
— rule, explained, 997
— stitch, in underclothing, *3337*, 3339
— straining, use in piling, 1174
— strengths, 1700
— survey, general account, 262 ; in railway surveying, 801
— suspension bridge, 2498 ; stresses, 2764
— warp, *3489*
— verge watch, *6081*, 6082
— watch, mending, 6083
Chain-angles, in surveying, 264
Chain-feed bench, sawmill, 6145
Chain-leg, of derrick stagings, 1176
Chair, American barber's, *3297*
— cane-seating, 5723
Chairs, forest industry, 4928
— railways, construction, *3430*
— upholstering, *6716*, *6717*
— wooden, making, 6588, *6589*
Chakaze copal, 1034
Chalcedony, precious stone, 767, 5855
Chalcocite, 6305, 6734,
Chalcopyrites, nickel ore, 5981, 5982, 6734
Chalk, in agriculture, 255 ; in clays, 1279 ; chemistry of, 843 ; deposit of British, 1817 ; in cement manufacture, 1579 ; formation of, 558 ; in foundations, 332 ; geological classification, 1073, *1074* ; geological formation, 1815 ; effect of heat, 60 ; in pastel work, 1061 ; photomicrograph of, *1074* ; quarrying, 3191 ; in rubber manufacture, 5203 ; shading medium in drawing, *1533*, 2188 ; in soldering, 5029 ; weathering, 2835
— French, in gelatin moulding, 1673
— white, in cement manufacture, 1855 ; deposits in South England, 1455
Chalk-stones, formation, 6038
Chamber of Commerce, London, examinations, 148
— in drainage, 734, *735*
— gears, use, construction, 1686, *1687*
— kilns, *1729*, 1730
Chamberland porous filter, 5765, *5767*
Chameleons, description, 2678
Chamfer, in building, 5179, *5181*
Chamois, Alpine, even-toed foot, 1870
— leather. manufacture, 1166, 3165 ; dyeing, 6619
Champlevé enamelling, 3234, 5689, *5690*
Chance's artificial stone, 534
Chance, laws of, discussed, 650
Change wheels, in lathe, 835
Channel, drainage, description, 570, 736
— in drain-pipe, use, 733
— in girder, 544
Channel Islands, cattle, 986 ; geography, 980, 1367 ; history, 2611
— paved, in building, 2516
— section, in plating shop, *3096*, 3107
Channelling, in bootmaking, 4139, 4542 ; in mining, 2957 ; in road drainage, 2326
Chanter, of bagpipes, description, *5059*, *5060* ; of Irish bagpipes, compass and keys, 5063
Chanterelle, of banjo, 4310, *4311*
" Chaotism," in philosophy, 6253
Chapes, bridle, 5057 ; of harness, 4886
Chapman, George, dramatist, 846, *847* ; editions, 849
Chara, description, *1369*, 1373
Character, importance in life, 1744 ; factor in journalism, 3811 ; importance of in practical affairs, 1286 ; influence of government on, 4371 ; relation to education, 2860 ; relation to reason, 2805 ; relation to will, 2993
— servant's, law concerning, 610, 611
Characteristic, of logarithm, 6627
Charcoal, characteristics, preparation, 1167, 6882 ; chemistry of, 1046, 1157 ; as disinfectant, 1157 ; as drawing medium, 1020, 1534, 2188 ; filters, 1167 ; manufacture, 6758 ; wood distillation product, 5464, 5465
— animal, manufacture of, 1167 ; weight, 1704
Charcoal-block filter, 3380
Charge, electromagnetic, relation to mass, 3618
— in static electricity, positive and negative, *3579*, 3580 ; relation to capacity, 3580
Charing Cross Station, roof truss, 2448, *2449*
Charlemagne, King of the Franks, 2915, 2916 ; Emperor of the West, 2947
Charles's law, in physics, 1566, 1805
Charles's Wain, constellation : *see* Great Bear
Charles I. of England, at Carisbrooke Castle, 2611 ; " Progress to Guildhall," *plate facing* 4369 ; reign, trial and execution, 4552, 4553, 4762
Charles II. of England, biography, reign, 4762 ; miniature of, *1062*
Charles IV. of France quarrels with Edward II. of England, 3076
Charles V. of Germany, contest for power in Italy, 4322 ; political power, 3650 ; possessions, biography and wars, 4396
Charles VI. of France. latter years of reign, 3251 ; Henry V. of England becomes regent during reign, 3463 ; Hundred Years War, 3464, 3465 ; institution of paid army, 4102
Charles VIII. of France, acquisition of Brittany, 4102
Charles IX. of France, civil war, massacre of St. Bartholomew, 4102
Charles X. of France, reign, abdication and death, 5239
Charles X. of Sweden, wars, 5396
Charles XII. of Sweden, reign and wars, 5396, 5397 ; war with Peter the Great, 6201
Charles XIV. of Sweden, 6446
Charles, Archduke of Austria, candidate for hand of Mary Queen of Scots, 3997
Charles, Duke of Burgundy, wars with Louis XI., 4102 ; defeated by Swiss, 4399
Charles, Robert, of Hungary, improvement of country, 4399
Charlock, weed, defined, 352 ; eradication of, 1378 ; seed of, 336
Charlton white, pigment, 1036, 5143
Chartered accountants, examination for, 148 ; Institute of, value of diploma, 1068, 1069 ; Scottish examination, 149
Chartered Institute of Secretaries, examination, fees, age, etc., 148
Chartres, France, cathedral, 3374, *3375*
Charts, calculating, use in technical drawing, 4329
— nautical, 6662
Charwoman, duties, wages, 1094
Chasers, of dies, form and use, *4481*
Chases, formation in brickwork, 2513 ; used in electrotyping, 5559
— compositor's, in printing, 5252
Chasing, in art metal-work, 5526
Châssis, motor-car, 2557, 3903 ; three-quarter elliptic springs, 3328
Chateau of Blois, newel of stone staircase, 3242, *3244*, *3245*
Chatham, geography of, 1275 ; Royal Marine station, 4269 ; harbour regulations, 6220
Chatterton, Thomas, poet, 995
Chaucer, Geoffrey, life, works, criticism, 324, 3077 ; influence on English grammar, 324 ; influence on English fiction, 2963 ; language used by, 1608
Chauffeur, of motor-car, seat, 3906
Check springs, of van, *2829*
Check till, use in branch shop, 5929
Checkers, in harness and saddlery manufacture, 4784
Cheddar cheese, acidity, 4492 ; composition, 4490 ; dietetic value, 3311 ; manufacture, 4571 ; ripening process, 4573
Cheek bone, human, 1604, *1605*
Cheeks, bridle, manufacture, 5057, 5058 ; of harness, dimensions, 4886
Cheese, acidity, 4492 ; adulteration, 3716, 4715 ; blue-veined, manufacture, 4574 ; Cheddar : *see* Cheddar cheese ; Cheshire, types, manufacture, 4574 ; in cookery, 2335 ; countries producing, 5119 ; dietetic value, 3311 ; fat, quantity of, 4573 ; ferments in, 4036 ; imports, 1905, 3551 ; kinds, 3551, 3552 ; lactic acid bacteria, percentage, 3536 ; with macaroni, value as food, 3601 ; manufacture, 4489, 4574 ; nutritive value, 3599 ; press, *4573* ; production of good, 4489 ; ripening, cause of, 4036 ; varieties, 4489, 4490
— aigrettes, recipe, 2003
— custard, recipe, 2003
— dairy, equipment, 4489
— skim, constituents, 4034
Cheesemaking, 4489, *4491*, 4492, 4574 ; bacteria, influence, 3553 ; quality of water, 4489
Cheese-mite, classification, 3805
Chef, wages in restaurant, 5584
Cheliceræ, of scorpion, *3803* ; of spider, 3803, *3804*
Chemical action, geological effects, 1355
— analysis, 4403, 4406, *4407*, 4416 ; qualitative, 4404, *4405* ; quantitative, 4411 ; sampling, 4416 ; spectroscope test, 4406 ; systematic examination, 4408 ; books, 4403
— forces, 238 ; electrical nature, Thomson on, 2297
— synthesis of vital products, 237
— trades, employment conditions, 2656
— union, explanation of, 2297
Chemicals, photographic, prices and uses, 4421
— trade returns, British, 6004
Chemicking, in dyeing, bleaching, 6197
Chemise, girl's, 4473 ; in laundry work, folding, *2910* ; shapes, cutting out and making, *3472*, *3473* ; young child's, drafting, *4050*, *4051*
Chemist, " as creator," 4129 ; examinations for, 161 ; length of life, 4528 ; openings in colonial municipalities, 3743 ; pharmaceutical, business of, 1652, 1656 ; railway, 5102, 5103 ; railway engineers, 5103 ; trading and practising as, 1651

Chemistry, analytical, books on, 6689; apparatus, 240, 4993; atomic disintegration, 2391; atomic theory, 692, 2080: *see also* Atom; and biology, 134; books on, 6689; branches of, 516; of carbon compounds: *see* Organic Chemistry; compounds: *see under name of element, etc.—e.g.,* Sulphate of potassium *under* Potassium sulphate; of consciousness, 3140; division into organic and inorganic, 2710; of drugs, 4006; employment in commerce, 237; equations, 694; equivalents, law of, 695; fixed proportions, law, 694; of foods, 238; formulæ, 696; future of, 238, 4136; and geology, 844; history, 58; of living matter, 516; laboratories and instruments, 61; mixtures and compounds, 692; molecules, 692; notation, suffixes and prefixes, 1045; public offices, 786; relation to electricity, 238; relation to physics, 402, 1144, 2080, 2391; scope of, in modern industry, 58, 642
— applied in commerce, 4316; dictionary of terms, 4317: *see also specific subjects—e.g.,* Alkalies, Soaps, *etc.*
— astronomical, atomic evolution, 4135
— celestial, 3371
— imitative, defined, limitations, 4130
— metallurgical, scope, 3835
— the new, theoretical importance, 2552
— physical, scope, 2080; books on, 6689
— physiological, 438
Chemists and druggists, business of, 46, 165
Chenille, designing for, 6596; weaving 3157; in Axminster carpets, *3994*
Cheque, really bill of exchange, 1089; form, precautions against fraud, 3482; not cleared, in bookkeeping, 1868; paying process in English and Scottish banks, 1966
— book, definition and functions, 778; use by current depositor, 4291
Cherbourg, breakwater, construction, 76; naval station, 1684
Cherries, season, 1531; preserving, 4846
Cherry pulp, preparation, 4846
— tree, culture, 6677, 6682
Cheshire cheese, composition, 4491; acidity, 4492
Chest, human, bones of, 1605, *1606*; and respiration, *1300*, *1301*
— of drawers, making, 6586, *6587*
Chester, antiquity of, 1277; bridge, described, 2497, *2499*; derivation of name, 1769
Chesterfield, Earl of, "Letters to His Son," 2139
Chesterton, G. K., critic, 2785
Chestnut, 6682; classification, 355; husks, use in dyeing, 5780; timber, 56; used for carving, 5839
Chestnut oak, bark as tanning agent, 3012, 6066
Chevé system of notation in music, 805
Cheviot Hills, heights, 1271; situation of, 984; volcanic rocks, 2253
Cheviot sheep, 2363, *2365*
— wool, number of fleeces in bale, 1120; production, 71, *72*, 221
Chiaroscuro, in art, 725, *2184-2188*; drawing in monochrome, 1793; principles of, 1534
Chiasmus, in grammar, defined, 1616
Chicago, meat industry, 5119; teaching of sociology, 4123; tinned food products, 3820; manufactures, 4174; touring, 1649
Chicory, in coffee, 3379, 5581
Chicken-pox, incubation, 5412; symptoms, 6260
Chicken, boiled, cooking, 1874; chaudfroid of, cooking, 1875
Chicken-houses, types, *5092*, *5093*: *see also* Poultry-houses
Chickens, breeding, 4662; cages and baskets, *5093*; care of, 5092; hatching early, 5628; hatching in incubator, 5263; hatching process, 5092; Palmer's rations for, 5435; purchase and transport, 5093; ration for, 5094, 5435: *see also* Poultry
Chickweed, annual weed, *882*, 1378; classification, 354; fertilisation, 909
Chiffon, in millinery, cleaning, 6042; joining, *5621*; washing, 2911
Chigger: *see* Sand-flea
Chih, Chinese measure, 409
Child, psychology, development of self-consciousness, 2373; growth of perception, 2803; mental development, recapitulation theory, 3117; origin of study, 3117; variability of attention, 2258
"Childe Harold," Byron, 1308
Children, ailments, 4684; air used in repose and at work, 3801; alcoholism inborn, 5674; alcoholism in parents, effect, 5812; the amusement problem, 641; baths, 4864; boracised milk, effects on health, 3821; brain, weight and size, 2145, 4862; care of eyes, ears, teeth and hair, 4863; clothing, *3744–3746*, *4050*: *see also under* Boy, Girl, Infant; comparison of Gentile and Jewish, 4665; dangers of school life, 4862; dentistry, 5553; diseases of, book on, 5427; diseases at school, 4862; dress, hygiene, 4863; exercise, 4683; feeding of, 674, 4861, 6037; helplessness compared with young of animals, 4539; hygienic clothing, 4683; millinery, materials, 5939; and monogamy, determining factor in its dominance, 4537; mortality, comparative, 2794; nationalisation of, reasons against, 4538; nursing, 6288; observation, value of training in, 1881; over-pressure in school life, 4862; parental control, 6850; pauper, Poor Law provisions, 1930; physical culture, 4387; respiration, 1361; school law affecting disease, 5056; sleeping, 4391, 4684; standard diet, 3381; teeth, regulation, 6035; teeth, cutting, 576; use of Saturday's holiday, 4391; vertebræ of, 1605
Chile, economic conditions, 5661; geography of, 4282, 4289; population, 628; products, 5661
Chile saltpetre, 842, 6734
Chilled iron, process, 235
Chilling, metals, described, 210
Chimb, violin, *2121*, 2122
Chimney, of boiler smoke-box, 3105; in mining, definition, 2378; a means of ventilation, 4019
— bars, bond, smoky, stack, *2387*; use in building, 5797
— breast, in building, *2387*, *2388*; underpinning, 918
— piece, marble, 3246
— stack, finishing, in building, 2268
Chimpanzee, *plate facing* 1491; skull, *1787*
Chin, in sculpture, position, 1511
Chin-rest, violinist's, 2123
Chin-strap, cart-horse bridle, manufacture, 5057; of harness, dimensions, 4886
China, art of, 2660; area of coalfields, 5302; coal and iron deposits, 5304; coins, weights and measures, 409, 5658; cotton industry, *383*, *384*; economic conditions, 5380; economic resources, 5660; ethnology, 1789; geography, 2974, *2975*, 5658; hereditary succession, 215; history, 215, 6693; Indian exports and imports, 5381; industrial conditions, 5658; Japanese war, 6694; jute industry, 719; opium war, 6690; population, 628; products, 5658; ramie cultivation, 720; rice-growing, 10; silkworm cultivation, 582; tea consumption, 3378; trade, character of, 5379; trade with Japan, 5659; trade with Russia, 5708; trade with U.S.A., (1904–5), 5664
China and glass, business, *1893*
China Sea, Continental shelf, *298*
China, English bone, features, 5606; manufacture, 5606, *5607*
— clay, composition, preparation for earthenware, 5160; in firebricks, 1285; *see also* Kaolin
— dealing in, 46, 893
Chinchilla, skins and fur, 6426, 6430
Chinese, as labourers, 6630; skull measurement, 1785, 1787
Chinese Empire: *see* China
Chinese insect wax, 1033, 4835
— language, English importations 1770
— nettle: *see* Ramie, plant
— vermilion, pigment, 871
Chinook winds, effect on agriculture, 4495
Chip-carving, designs, *5810*, *5811*, 5980: *see also* Carving
Chipping, pneumatic tools, 1807
— in sculpture, method, 1510
— in workshop practice, 3687
Chipping chisel, function, 3107
Chiropodists, business, 1895
Chiroptera, bats, characters of, 1493; flying apparatus, 2037, *2038*
Chisel, action of, 4259, *4261*; in engraving, 5529; functions and qualities, 4149, *4151*; grinding, 4150; used in metal-work, *5522*, 5524; temper, 4746, 4749; varieties of, 4151, 4152
— boring tool, in mining, *2666*, 2668; in rope boring, 2845, *2846*
— cold, used in chipping, 3687
— mason's, description, *2837*, 2839
— plasterer's, 5497
— well-sinker's, 4479, *4481*
— wood-cutting, picture framer's tools, 4611
Chladni's vibrating plates and sand "figures," 2106
Chlidema carpets, 1626
Chloral, action of, 3142; decomposition by alkalies, 3270; introduction into medicine, 3270
Chlorates, manufacture, *5760*
Chloride, defined, 839
Chlorine and aluminium, 359; atom, electro-negative, 2297; chemical properties, uses, 1444; Deacon's process, 4777; discovery, 61; electrolytic preparation, 3262, 5753, *5759*; from chloroform, 3270; in gold extraction, 4305; liquefaction, 949; manufacture, *4776*, 5759; properties, 1444, 4776; proportion in earth's crust, 239; uses, 1444, 4776
Chlorite, mineral, 768, 6734
Chloroform, discovery as anæsthetic, 3140; discovery, uses, characteristics and preparation, 3270; effect on nerves, 1943; formation, 1601; a protoplasmic poison, 3017
Chlorophyll of algæ, 166; action in forming coal, 1157; decomposition agent, 1598; function, 172, 3110; iron in, 1046; in leaves, 636; necessity for light, 504; in distinguishing animals and plants, 276
— granules, explained, 170, *171*
Chocolate, countries using, 4962; how made, 3379; manufacture, 6536; refrigeration, 5405
— beverage, recipe, 2334
— cake, recipe, 2332
— fingers, manufacture, 3595
Chocolates, kinds and prices, 5494
Chocks, in mining, use, *3560*, 3562
Choir, arrangement of voices, 5895; pitch of voices, 1058; teaching by tonic sol-fa, 806
— training, books on, 3866; methods, 5895, *5896*, 5896
Choirmaster, duties, 5895
Choke-damp, defined, 232, 362, 1158
Choking, treatment, 6473
Cholera bacillus, *6540*, 6541; causes, stages, and treatment, 5410
Cholestrine, in wool, 5767
Chondrin, in glue, 3560

Chopin, musician, method of fingering, 1889; nocturnes, *1890*, 2023; study of, influence on technique, 2023, 2024; technique of, 1507
Chops, of pendulum clock, 5714
Chord, of circle, 285, *287*, 5043
— in music, 363; arpeggio, 271; connection of, 364; fingering in pianoforte playing, 1888; fundamental, in guitar playing, *3763*, 3705; harp music, *3525*, 3527, *3589*, *3599*; inversions, 565
— common, ratio of notes, 2103
— scale of, in geometry, 492
— scoring for orchestra, 5885, *5889*
— in tonic sol-fa notation, 925
— violin playing, broken, *2314*; four-string, *2411*, 2413
Chorea, symptoms, treatment, 6261
Choroid, of eye, *2402*
Chrismatory, early German silver-smithing, 5687, *5688*
Christian Church: *see* Church
Christian Science, healing caused by auto-suggestion, 3663; psychological basis, 2550
Christianity, in Africa, *3279*; in Asia, 2716; attitude towards women, 4826; compared with Hinduism, 418; geographical distribution, *629*; earliest days in Ireland, 2609; in the Middle Ages in Europe, 2241; Nero's persecutions, 1938; philological importance in England, 1769; in Rome, 1830, 2069, 2070
Christmas rose, nectar cups, *plate facing* 728, 731
Chroism, of precious stones, 5853
Chromatic aberration, in lenses, 6123
— scale, in music, 272, 273; in tonic sol-fa notation, 924
Chrome, distribution, 3772, manufacture and composition, 5144; use in bronzing casts, 1673
— alum, 1043, 4780; in tanning, 3162
— brown, dye, fixing, 5956
— green, origin of name, 5954
— iron ore, refractoriness, 3942
— leather, finishing process, 3456
— steel, 234
— tanning, 3162, 3456
— yellow, in oil painting, 871, 6734
Chromic acid, reagent and test, 4410; test for alcohol, 3020
Chroming process, in tanning, 3162
Chromium, chemistry of, 1043; in pottery, colouring, 5382; proportion in earth's crust, 239; reagent and test, 4409; in steel, 4748; symbol and atomic weight, 517; as tanning agent, 3162
— oxide, in magnetite lamp, 2684; in oil painting, 871
Chromocyanine, mordant dye, 5956
Chromo-lithography, in decorating pottery, 5384; women workers, 321
Chromo-proteins, chemical classification, 4134
Chromosphere, of sun, 6252
Chromotropes, dyes, fixing, 5956
Chronograph, shot-velocity test, 6613
Chronometer, marine, 5787, 6658
Chronometers, making, 6084
Chronopher, telegraphic, *5536*, 5537
Chrysalis, coloration of exposed, 3515; hawk-moth and puss-moth, *3513*; methods of protection, 3515
Chrysanthemum, 354; culture, 6487, 6532
Chrysoberyl, precious stone, characteristics, 5853, 5855 6734
Chrysochrea, *plate facing* 3361
Chrysolite, oriental, 5853, 5855
Chuck, drill, use, 5007
— in fixing mechanism, use in grinding, *3404*, 3408; types, *3317*, *3320*, 3322
— lathe, types, *4918*, 4923, *4924*, *6854*
Chuffs, bricks, description, 643, 1947
Chump pieces, of brougham, 2829–*2831*
Church, architecture, Byzantine, 3090, 3091; early Christian, 3089; Gothic period, 3373, 3374, *3375*; Renaissance, 3675; Romanesque period, 3231; study by designer, 5818; village, architectural design, 2284, *2285*
Church, the Christian, attitude towards marriage, 4535; early architecture, 3089, 3090; Henry II. and judicial authority of, 2913; and Henry IV., 3251; mediæval dogmas and logic, 5999; women pastors, U.S.A., 321
Church of England as a career, 162, 6599
Churches, ministers of, 6599
Churka, in cotton industry, *387*, 389
Churn, in dairy farming, care of, 4213; cleaning, 4280; systems, 4279; use, 4279; varieties, *4279*, *4281*
Churning, in dairy farming, *4279*, 4280; preparation of cream for, 4213
Cibber, Colley, dramatist, 1150
Cicada, insect, 3364; *plate facing* 3361
Cicero, the Orator, and Cataline Conspiracy, 1513; life and death, 1671
Cider, composition, 3315, 6356; manufacture, *6356*
Cigar, description, manufacture. machines, 4374, *4376*; quality, 5601; storage and conditioning, 5601
— Havana, 5601; from Cuba, 5380
Cigarettes, effect on voice, 2539; origin, manufacture, and machines, 4375, *4377*, 4378; mouthpieces, 4377; shape, 4376; smoking, physiological effects, 4011
Cilia, of bacillus, 6437, 6439; of cells, *200*; of ciliates, *4088*; of tube-worm, 3956
Ciliary muscle of eye, use, 3179, 2954
Ciliated epithelium, motion, 200
Ciliates, description, *4088*, 4089
Cimabue, not the father of modern painting, 3518
Cinchona, classification and use, 354; grown on Andes slopes, 4286; Peru, 4290; Venezuela, 4287
Cinchona bark, 4873, 6067; cultivation, 6067; Hahnemann's experiment, 5430; marketing, 6067; medicinal value, 4873; moss covered, 6067, *6068*; sources, 4873, 6067; species, 6067; source of quinine, 4012, 6067
Cincinnati, U.S.A., meat industry, commerce, 4174; touring, 1649
Cincinnati grinding machine, *3407*, *3408*
Cinder-bed, in moulding, *2458*
Cinematograph, principle and use, 2951; use of collodion, 5470
Cinnabar, mercury ore, 361, 4307 6734
Cinnabar-moth, larvæ, 3514; colour of adult, 3516
Cinnamic aldehyde, defined, 4971
Cinnamon bark, 4873; preparation, and uses, 6068; source, *4721*, 6068
— oil, composition, 5469
Cinnamon-stone, 5853, 5855, 6734
Cinquefoil, nectar, 731
Cione, Andrea del, work of, *3518*, 3519
Circle, area problems, 1251
— on circle work, in building, 1951
— in drawing, origin, 2321 enclosed ornament for, 2398, *2399*; treatment in perspective, *596*, *597*
— generating, definition, 1414; in drawing spur-wheel teeth, 3639
— geometry of, 792, 1012, 1411, 5043; contact of circles, 5198; circumscribed and inscribed, 744; concentric, 285, *287*; definitions, 285, *287*, 4208, 5043; problems, 2005, *2007*; propositions on, 5043, *5197*; rectangles connected with, 5337; tangent properties *5197*
— great and small, vertex, *6665*
— letters in shorthand, 427, 587, 689
— of perpetual apparition, 6117
— of Willis, anatomy, function, 2147
Circuit in electricity, 463, 669; leaking and breaking, 464; open, 466
— telegraphic, description, 4605
— telephonic, testing, 6080
Circular measure of angle, 6085
— notes, issue by bankers, 4294; account, bank bookkeeping, 4441
— saw, *6449*
— skirt, cutting, 524, *525*
Circulating decimals: *see* Recurring decimals
Circulation of the blood, 675, 952, 1192; in brain, 2147; influence of will, 5841; *see also* Blood
Circulation, pipe, domestic water heating, 6018
— telegraphic, defined, 4605
Circulatory organs, 102, 955; use, 196
— system, diseases, 6036; nutrition agent, 865
Circumference of circle, definition, 4208
Circumferenter, in surveying, 159; in underground surveying, 803
Circumflex accent, 124; special rules, 449
Circumscribed circle, in geometry, 744
Circumvallate papillæ, of tongue, structure and function, *2536*
Cire perdue, bronze casting, 1674; casting, 5526
Cisterns, house, materials for, 4159, 5632; flushing, failure of trap, 781; for rain-water, 781; sanitary, 5054; slate, 3248; water-waste preventing, *5631*, 5634
Citric acid, preparation, 4782; properties and uses, 3704, 3705, 4782; reagent and test, 4411; reduction of body weight, 3016; source, 3112, 4782
City Corporation, London, general account, 318, 320; auditor's salary, 1068; clerks' salaries, 1213; finance dept. salaries, 1067; gas examiner's salary, 787; medical officer's salary, 698; rate collector's salary, 1069; relieving officers' salaries, 1927; solicitor's salary, 1410; surveyor's salary, 455; town clerk's salary, 989; weights and measures inspector, salary, 788
City and Guilds of London Institute, millinery examinations, 6402; plumbing examinations, 4613; textile examinations, 5511; vehicle construction examinations, 3908
City of London police, 1406; surgeon's salary, 699
Civet cat, 1765
Civet, perfume, source, 4971
Civil engineer, railway, duties, 4231
— engineering, as a profession, 155; books on, 2764; conditions abroad, 6829; dictionary of, 310, 1981: *see also* Building; examinations, tables, 160; varieties of construction, 1449, *1451*, *1453*, 1454: *see also under specific headings—e.g.*, Bridges, Hydraulics
Civil Service, general account, 2158, 2249; colonial services, 3548; first division clerkships, 2250; imperial service, 3476; salaries, second division clerks, assistant clerkships, 2472; women's salaries, 321
Civilisation, evolution, mental, physical, and moral, 1586, 1705; European and non-European contrasted, 3989; relation to commerce, 145
Clack-valve of pump, 1081
Clambs, pipe, boring tools, *2666*, 2667
Clamp, in agriculture, 1665, *1665*, 1666; in brick burning, 643
Clamping, in grinding processes, *3403*, 3406; in key-seating processes, *3403*, *3404*; methods and implements, *3317*, *3320*, 3322
Clamps, glovers' sewing, 5479, 5480; in saddlery manufacture, 4784; in smiths' work, 3107
Clams, in workshop practice, *3689*, 3691
Clap-boarding in timber, meaning, 56
Clappers, side-drummer's, 5569
Clarion, harmonium stop, 4180, *4182*
Clarionet, attitude of player, 4785; chalumean sounds, 4789; construction and compass, *5729*, 5730; fingering, 4789; manufacture, 6326; in full orchestra, 5887; production of notes, 4787; shake, *4789*, 4790, *5730*; staccato effect, 4788; types, 4785, *5730*
— harmonium stop, use, 4180, 4181
Clark's water softening process, 4158
Clark's standard electric cell, 790
Clasp-nut, two-slot cam plate, 832; Whitworth, 830
Clasps, in hat trimming, 5506
Class, in natural science, defined, 380

Classicists, French painters, 4118
Classification, of animals in biology, 29, 135, 1492 ; of biological sciences, 279 ; in biology, natural and artificial, 379 ; ethnological, 1788 ; of words in grammar, 115
Claudius, Emperor of Rome, reign, 1937, 2071
Clause, grammar, principal and subordinate, *1618*
Clauses, in Esperanto, 6525 ; in German, ordinate, 3932 ; subject, object, 4075 ; attributive, relative, adverbial, 4218, 4219
Clavicle, human, *1604*, *1606*, *1709*
Claw hammer, use, *3388*
— of hydraulic jack, safe load, 1220
— tool, mason's tool, use, *2837*, 2839
Claws, development in mammals, 1871 ; weapons, 2155
Clay, aluminium silicate, 1043, 5988 ; analysis, 4415 ; angle of friction, 2572 ; bearing power, 330 ; in brickmaking, 643, 1278 ; cutting in, railway construction, 3174 ; in foundations, 143, 331 ; garden soil, treatment, 6204 ; geology of, 1072 ; infertility, 4497 ; modelling, 6312, 6135, 1217, 1347, 1673 ; natural slope, in earthworks, 3171 ; painting, 5382 ; in pottery manufacture, 5233, *5234*, *5235* ; properties and composition, 3942 ; refractoriness, test, 3942 ; relation to coal seams, 1921 ; in tobacco pipe manufacture, 4378 ; tunnelling machinery, 1824, *1825* ; weathering, 3771 ; weight, 1704
—, ball, properties and composition, 5160, 5161
— boulder, cause, 1638
—, china, composition, preparation, 5160
—, earthenware, properties and constituents, 5160
— gault, in cement manufacture, 1855
— ironstone, 231, 1044, 6735
— puddle, in house drainage, 780
— soil, cultivation, 255, 257, 258 ; drainage, 432 ; in garden, treatment, 6204
— tablets, Babylonian, early writing, 17
Clayton black, dye, preparation, 5953
— cloth red, madder, substitute, 5906
Cleaner, use in moulding, *2457*, 2458
— railway locomotive, *4594*, 4596
Cleaning-rod, in drainage, 784
Cleanliness, effect on health and morals, 4255
Cleansing pipes, in drainage, 569, *571*
Clear soup, recipe, 1735
Clear-wing moth, mimicry, 3516
Clearance, between rails, definition, 3608
— of engine, in drawing, 4424
Clearcolle, painters', 5834 ; in whitewashing, 5836
Clearing House system, bank, 3971
— railway, organisation, staff, 5101 ; treatment of lost property, 5109
— solution, photo, 6683, 6686
Cleat, of king post roof, *4251*, 4252 ; in shoring buildings, 916 ; in wood jointing, *3845*, 3847
Cleavage, in geology, caused by pressure, 1356 ; of slate, *530*
— planes, cause, 1925 ; of crystals, 766 ; in igneous rocks, 2066
Cleave, used in basket-making, *5489*
Clef, in music, *37*, *38* ; "C" clefs, 1059 ; violoncello, *2970*
Clematis, climbing, described, 504 ; garden cultivation, 6322 ; seeds, wind-dispersal, *909*, 912
Clement's driver, of lathe, 830, *4924*
Cleopatra, quarrels with Ptolemy, 1514 ; and Mark Antony, 1672
— wood engraving after Sandys, *6291*
Clerestory, railway carriages, 2555 ; for ventilation purposes, 3024
Clergyman's sore throat, 6133
Clericalism, development, 6774
Clerks, entering-desk work, 659 ; importance, compared with salesmen, 659 ; longevity, 4528 ; in Shakespeare's time, 404 ; women's careers, 192
—, dismissal, law of, 6845
Clerks, government, 2158, 2249, 2472
— *see also under specific names or offices—e.g.*, Bank clerk, Admiralty, *etc.*
Clerk to guardians, 1926 ; assistants, 1926
— of works, in building, duties, 307, 785, 1911
Clerk-Maxwell, J., on atoms, 312, 1915, 2081 ; colour top, 3729 ; dynamics, 314 ; on gravitation, 937 ; light, electromagnetic theory, 938, 3943, 4021 ; scientific work, 3851 ; on unity of ethereal vibrations, 3943 ; visual cell experiments, 3226
Clerkship, analysis and synthesis, 2269 ; bank transactions, 1966 ; bookkeeping : *see* Bookkeeping ; books used in business, 776, 977 ; Civil Service : *see* Civil Service ; master-builders of our commerce, 145 ; municipal careers, 1213 ; Stock Exchange training, 164 ; survey of careers, 162 ; town clerk and clerks to county councils, 989 ; *see also under specific headings—e.g.*, Bookkeeping, Cashbook, Company accounts, *etc.*
Cleveite, mineral, helium in, 839, 1917
Cleveland Bay, horse, 2074, *2075*
Click beetle, larva, 1666, *1667*, 3512
Click work, verge watch, cleaning, 6083
Clicker, in shoemaking, defined, 3875 ; sections in factory, work and tools, 4432
Clifton suspension bridge, span and deflection, 2498
Climate, African, 3275, *3276* ; Asiatic, *2564*, 2565 ; effect of altitude, 4494 ; and building trades, 6349 ; effect on distribution and development of mankind, 4493 ; effect of water on, 1739 ; effect of wind, 4494 ; Europe, 853 ; geographical divisions, 4493 ; influence on buildings, 142 ; influence on health, 5274 ; relation to land and sea, 300
Climbers, for gardens, 6316, 6322
Climbing irons, in drain manholes, 734
— plants, description, 504, *505*
Clinical thermometer, structure, 361, 1564, *1566* ; *see also* Thermometer
Clinker, in building foundations, 332 ; in brickmaking, 1282 ; in cement manufacture, *1853–1858* ; in paving, 644, 2515 ; refuse destructor, composition and uses, 5021 ; in rotary kilns, 1733 ; utilisation, 5767
— coolers, use in building, *1732*
Clinkering, in cement making, cause, 1578
Clinkers, bricks, strength, 1520, *1948*
Clinometer, described, 803, 897, 1923
— prismatic, 266
Clippers, tea, type of vessel, *5257*
Clipping, sheep, process, 2366
Clips, for fitting iron pipes, 5627, *5629* ; in machinery, 831
Clive, Robert, 6549, 5555
Cloak, evening, making, *970* ; girl's Red Riding Hood, *4473*, *4475* ; infant's, *3745*, 3746, 3855, *3856*
Cloak-rooms, railway, 5109
Clock, sidereal (astronomy), *6244*, 6246
Clock-making, 5711 ; employment conditions, 2647 ; Switzerland, 1839
— repairing, 5719, 5882
Clocks, arithmetical problems, 1713 ; classification, 5787 ; finishing wheels, 5882 ; pendulum mechanism, 5714 ; Popp system of driving, 5356 ; propulsion, 5787 ; repairing teeth, *5882* ; watchmaker's stock, 5788 ; weight mechanism, 5715
— American, movement, manufacture, adjusting, cleaning, etc., 5711, *5712*
— eight-day, mechanism, cleaning, putting together, 5715, 5717
— French, mechanism, 5884
— turret, mechanism, 5884
Clod crusher, construction, *1847*, 1850
Cloisonné enamelling, 5690 ; compared with champlevé, 3234 ; Japanese, 3161
Cloisonné, glass, uses and process, 5838
Closer, in building, disadvantage of, 1521 ; king and queen, 2168, *2169*
Closets, of sanitary house, kinds, *5052–5055* ; syphonage, 5053
— sewerage, dry earth system, 4457
Cloth, Admiralty test, 1701 ; analysis, 5508 ; contraction in weaving, 5509 ; composition and uses, 1169 ; crabbing in dyeing, 6198 ; designs, *6595* ; design in weaving, 2940 ; dyeing, 6367—9, 6501 ; for hats, 5036 ; printing, processes, 4409 ; singeing, 6197 ; testing, 3015
— architect's tracing, 5420
— crinkled, weaving, 3685
— double, structure, *5509*
— double plain, design of warps, *5510*
— fancy, weaving, 3685
— manufacture, finishing processes, *4106–4110*, 4342 ; number of healds, 3909 ; sizing, 3489
— overcoating, design, *5510*
— plain, structure, *5508*, *5509*
— two-face and one back, design, *5510*, *5511*
— twill, structure, *5509* ; face and back, *5510*
— woollen, manufacture, 70, 71, 72
Clothes-horse, laundry, 2475, *2476*
Clothes-moth, habit of caterpillar, 3514
Clothiers, business of, 1896–1898
Clothing, cautions for tourists, 515 ; children's hygienic, *4050*, 4863 ; colour of, influence on warmth, 4256 ; disinfection, 5055 ; health considerations, 4256 ; heat conductivity, 2061 ; hygienic, 4256 ; in laundry work, 2590, 2591 ; material, good, 4256 ; for old age, 4530 ; shopkeeping, 1896 ; stains, removal, 2590 ; washing, 2591, 2688 ; white, in laundry work, 2688
Cloths, fringed tray, ironing, 2910
— harness-maker's, 4885
— tailor's, 5598, 5599
— for trousers, stretching and shrinking, 2606
Clotting, Huxley's experiment demonstrating, 954
Cloud, definition, formation, 1900
— cirrhus, cause, 2901
Clouet, François, miniatures, 4117
Clough, Arthur Hugh, poet, 1438
Clove, spice, 483 ; classification, 353 ; sources, 3452, 4722, 4873
— oil, source, 5469
Clover, classification, 353 ; cows' food, 3890, 3891 ; cross-pollination, 732 ; cultivation, 1233 ; in farming, 23, 258 ; haymaking, 1629 ; livestock food, 2704, 2904 ; manure in cultivation, 1378 ; poultry food, 5436 ; sowing, 1232 ; seed statistics, 877, 941 ; varieties, *940*, *941*
—, alsike, as livestock food, 2704
—, crimson, 1197 ; as livestock food, 2704 ; seed statistics, 940 ; sowing, 431
—, red, as hay, 1629 ; as livestock food, 2704 ; seed statistics, 877, 940 ; varieties, *940*
—, white, 940 ; as livestock food, 2704 ; seed statistics, 940
—, yellow, value, seeding, *940*, 941
— *see also* Cow grass
Club-moss, *1119* ; structure, reproduction and varieties, 1310
Clubs, management and catering, 5720 ; *see also* Friendly societies
Clumps, in printing, 5867
Clun sheep, general account, 2363
Cluster system of bridge-erecting stages, 1175
Clutch, 960 ; coil, 962 ; expanding, 962 ; friction, of lathe, *961*, 4920 ; drawing, 4002, *4005*
Clyde Trust, harbour revenue system, 6220
Clydesdale horses, 2073, *2075*
Coach horse, breed, 2074, *2075*
Coach screw, in carpentry, *3543*, 3546,
Coaches, 2465 ; dimensions, 2726

Coaches, railway, slipping, *4801*, 4805; testing running stability, 5105
Coachbuilding, construction and dimensions, 2557; drawing and design, *2726*, *2729*, *2731*; machinery, 2833, 3907; metal work, *3325*, *3359*; painting, etc., *3479–3481*; tools, 2828; type of springs used, 2725; undercarriages, *3121*, *3126*
— *see also* Carriages, horse, *and separate vehicles*
Coachmaker's chisels, *4150*
Coachman, duties, 816; jobmaster's, wages, 4189
Coagulation of blood, reason for, 954, 955
Coal, 1157; ammonia from, 4775; in black ash process, 4770; in brick kilns, 1284; British exports and imports, 6004; in cement kilns, distillation, 6818–*6820*; grinding for, *1731*, *1733*; crushing, 3770; formation of, 1356, 1921, 5302; gas liquor yields, 5461; distribution, 3771; geological classification, 1073; household economy, 1227; mining: *see* Coal-mining *below*; kinds, 1990, 5302; paraffin from, 4837; for power production, 5127; railway locomotive consumption, 4597, 4599; railway waggons for, 5070; screening, 3770; specific gravity, 1704; sulphuric acid from, 4632; table, 535; tar yields, 5461; trading in, 1989; washing, 3770
— bituminous, 1163; properties, 5302; U.S. deposits, 5302
— dealers, business of, 1989
— dust, as kiln fuel, 1854; harmlessness in air, 3798; in moulding, 2110
— fields, African, 5304; American, 5305; Asiatic, 5304; Australian, 5304; Austrian, 5304; Belgian, *1835*, 2378, 5304; books on, 2256; British Isles, *987*, 988, 1271, 1817, 5302; characters of, 2378; England, 1271; France, 1681, 5304; German, *1974*, 1975, 5304; Russian, 5304; Scottish, 1066; Spanish, 5304
— gas: *see* Gas, coal
— measures, 231; effect of mountains on depth, 4495; formation of, 1814, 1816, 1817; relation to Old Red Sandstone, 2067
— merchant, business of, 1989
— miner, absence of industrial drinking, 5815; employment conditions, 2641; length of life, 4528; mortality from phthisis, 5409
— mines, fire-clay found in, 1285; initial cost, 2847
— mining, 3307, *3560*; crushing, 3770; lighting, 3769; longwall face, *3560*; machine cutting, *3563*, 3564; screening, 3770; submarine, 1354; surface works, 3766; underground transport, 3566; washing, 3770; winding plant, 3767; ventilation, 3767
— oil: *see* Petroleum
— seams, position and deposit, 1921
— smoke, use of, 639
— supply, investigations into, 5302
Coal-tar, composition, 3708, 5461; crude, uses, 5461; distillation, *5162*; formation, 5836; rational distillation, 5953; future discovery, 237; minor sources, 5461; Perkin's discovery of aniline dye, 641; partially prepared, process, 5461; production, uses, 1163; production of colours, 3710; products, 3824, 5467, 6433; properties, and coal yields, 5461
— — brown, oil yield, 6151
— — colours, diagrammatic tree, *plate facing 5953*
— — creosote, constituents, 1163
— — dyes, manufacture, 3711, 5468, 5953; preparation of coloured inks, 5367; uses, 6766
— — naphtha, 3824; use in paint making, 5147
Coaling, railway locomotive, *4595*, 4597
Coast, erosion of, *1813*, 1815, 5577; Royal Commission on, 6220
— line, marine surveying, 1017; physical geography of, 625; subsidence, 1354, *1813*
Coastage, in architecture, *2129*, 2132
Coastguard service, appointments, salaries, 3197
Coat, in dress, boy's, 1552, *1553*; girl's 4473, *4474*, 4475; infant's outdoor garment, *3745*, 3746; little boy's, 1113, *1283*, 1289, *4196*, 4197; young child's, *4050*, *4054*
— in tailoring, Empire, *2328*, *2329*; fitting, 3014, *3015*; little boy, drafting, 1113; men's lounge, morning, frock and dress, *2752*, *2753*, *2754*; woman's, collar, cuff, sleeve, 2056; woman's double-breasted, 1840, *1841*, *1842*, *1843*
— and skirt, girl's reefer, *4473*, *4475*
Coating, of materials, purpose, 5141
Cobalt, metal, chemistry of, 1043; magnetism, 559, 5981; occurrence, 5981; origin of name, 5981; properties, 4306, 5981
— bloom, cobalt ore, 5982
— blue, manufacture, 5145, 5985
— colours, composition, 5985
— compounds, kinds and uses, 5985
— glance, 1044, 1045
— oxide, in earthenware manufacture, 5162
— pottery, colour, 5382, 5383; varying tint, 5384
— pigment, 871
— yellow, pigment, 871
Cobbett, William, author, life and works, 2450, 2618, *2619*
Cobden, Richard, commercial treaty between England and France, 5240
Cobras, hood, 2679, *2680*
Cobweb, structure, *3804*, 3805
Coca leaves, source, use, 6883
Cocaine, source and use, 4962, 6883
Coccus, 6437, *6439*; suppuration, 6541
— beech pest, 4926
Coccy, human, anatomy, *1605*, *17 ;08* in modelling, *1348*, 1349
Cochin, fowls, breeding for table, 4660; points of breed, 4955; sitting, 5626; table qualities, 5624
— buff, points, 4808
— partridge, cross-breeding, *5622*, 5623
— white, breeding, *4856*
Cochineal, 6883; countries cultivating, 5121; origin, 3365; source of colour, 5145; in dyeing, 5907
Cochlea, human, 102; physiological anatomy, 2534, *2535*
Cockatoo, classification, 2211
Cockchafer, *plate facing 3361*; classification, *3510*; as pest in forests, etc., 4925, *4927*; ravages of, 1668
Cockerels, care of, 5093; value, mate for egg-laying hen, 5626
Cockle, shell-fish, 3113; locomotion, 3286; in season, 1531, 2527
Cockle cylinder, in milling, structure and action, 3080, *3082*
Cockroach, description, *3363*; development of young, 3362
Cocksfoot, orchard grass, description, *875*; cows' food, 3890
Cocoa, 6883; adulterant, 5581; adulteration, 3718; analysis, 3378; bean, 3379, *6554*, 6556; cultivation, 4962, 6555; dietetic value, 3311, 3379; fruit, *6555*; manufacture, processes and machines, *6554–6556*; source, 4962; preparation of nibs, 4962, 6555; theo-bromine in, 4007
— butter, 6556
— powder, 6556
— stearin, uses, 1032
— tree, classification, 353
Cocoanut, 6883; for biscuit making, 3592; for carving, 5809
— cake, as livestock food, 2704, 2908
— fibre, 1168; for brushes, 6106
— oil, production, uses, 1032, 4832; source, properties, varieties, 4832; in soap manufacture, 4964
— palm, coir from, 68; height and classification, 355; limitation of range, 4493; oil from, 1032; seed-dispersal, 910, 911
Cocoon, puss-mouth, *3513*, 3514
— silk manufacture, treatment of waste from, 1246
— silkworm, description, *582*, 584, 585
Cod, boiling, 1874; carving, *5935*, 5936; choice of, 3717; classification, 3065; fishing grounds, 5121; cutlets, cooking, 1874; floating egg, 5189; frying, 1873; grilled steaks, cooking, 1873; marine hatcheries, 5314; Norwegian fisheries, 1561
— in coppersmithing, 3884, 3886, *3887*
Cod-end of trawl net, *4990*
Cod-liver oil, constituents, food value, 3486, 6883; countries exporting, 5121; in calf feeding, 2239; composition, 4834; emulsion, 676; source, uses, 4834; in leather manufacture, 3219
Codling, choice of, 3717; protection of immature, 5314
Co-education, success of, 4667
Coefficient, in algebra, definition, 1818; of contact, 1573; of discharge, in hydraulics, 1574; of friction, 958; of roughness, river banks, 1576; of velocity in hydraulics, 1573
Cœlenterata, characters, 1492, 4083, *4087*
Coffee, adulterants, 3581; adulteration, 3045, 3718, 4962, 6555; analysis, 3378; Brazil exports, 4286, 5380; chemical properties, 4007; consumption, 4962; cultivation, 4961, 6555; food value, 3705, 3379; Indian, 2820, 2972; manufacture, 6555; output, 4961; production, quality, sorting, 4961; recipe, 2334; stains, removal, 2590; stimulant, uric acid formation, 3705
— husk, micro-photographs, *3893*
— plant, bean, 3379; classification, 354
— stalls, catering, 5584
Coffer, in masonry, definition, 3148
Cofferdams, in bridge building, 1402, 2737; construction, 4642, 4644, 6496
— in carpentry, 4642, 4643, 4644
Coffer-fish, boring plates, *3067*, 3069
Coffin, measurement and prices, 5786
— makers, wages, 5785
"Cogito ergo sum," origin and explanation of phrase, 2373
Cogs, roofing, defined, 4870
— of wheels, in technical drawing, *3921*
Coherers, wireless telegraphy, *3895*, 3896
Cohesion, compared with adhesion, 1374
Coil armature, *1905–6*, *1908*
— electric, invention, 129, 130; insulation of, 1660; ventilation, *1661*
— induction, cost, 4994
Coinage, alloys, gold and silver composition, 3941, 6308; bimetallism, substitutes for, 3970; British, 360, 5850; loss in light coins, 5851; trial and remedy, 5851
Coinages of the world (tables), 409
Coins, die-sinking, 5529; kinds, coining operations, 5851; nickel and copper, 1044
Coir manufacture, fibres, 68, 819; non-dyeable, 5639; source and use, 1168, 5118
Coke, defined, 1157; conversion from coal, 4125, 6819; in cupola furnace, *2862*; carbon dioxide produced from, 6393; formation and use, 5302; fuel for blast furnaces, 4467; sale by gas companies, 1991; in smelting, 232; use in decarburising iron, 5015
— bed, in moulding, 2543
— breeze, 643; use for concrete, 332
— oven gas, 6828
Col, physical geography, 458
Col legno, violin bowing, 2744, 5727
Cold, catching, causes, 1742, 4020
Cold, sense of, 2118; ultimate, "coldest cold," 1269
Cold chisel, *4150*
Cold rolling, iron, 234
Cold-short, in iron-working, 234; in steel manufacture, 1045, 3838

Cold storage, of food, methods and apparatus, *5403–5407*
— wall, in geography, definition, 558
Coleoptera: *see* Beetles
Coleridge, S. T., poet, *1305*, 1306; origin of "Kubla Khan," 77; plays, 1152; prose works, 2309; on Shakespeare's genius, 680; writing under morphine, 4008
Colic, cause and remedies, 5843; caused by lead dust, 3798; effect of nitrites on, 1719
— in cattle, symptoms, treatment, 2624
— in horses, treatment, 2620
— lead, soft water in lead pipes a cause, 359
Coliseum, Rome, 2931, *2932*; Titus finishes building, 2068; Vespasian builds, 1940
Collar, of axle, 3326, *3327*
Collar beam truss, stress in, 2446, *2447*
— in dressmaking, cutting and making, *478*; of boy's overcoat, *1755*; boy's suit, 1552, *1553*; drafting pattern, *186*, 190; man's morning coat, *2753*, 2754; princess robe, *2206*; sailor, little boy's, *4196*; shirt, *6797*; step, tracing, cutting out and making, *1553*, 1753; woman's coat, making and sewing on, 2056
— in forging, process, 2986, *2987*
— lead, use in jointing pipes, 5610, 5628, *5629*
—, loaf, 3392, *3393*
— roof, construction, 4248, *4249*
— of roof truss, use, *4251*, 4253
— of screw, defined, 686
Collar-bone, abolition in evolution of mammals, 1869; birds', 2494; human, *1604*; in modelling, proportion, *1348*, 1349
Collars, cart, materials, 4885
— in laundry work, curling, 2911; ironing, 2910, 2966, *2967*; starching, 2911
Collective nouns, rules for verb, 122
Collectivism, a social force, 5533
Colleges, theological, 6599, 6602, 6607; university and technical, 1782; for women, 3508
Colleoni statue, Verrocchio's, *1674*, 3678
Collet, of Collinge axle, *3326*, *3327*
Collets, of clock, making and use, 5883
Colliery, cost sheet, 3419; pit head gear, *3768*: *see also* Coal mining
Collimation of level, 372; in survey instruments, 266, 372; of theodolite, 269
— method, in levelling, 374
Collinge axle, *3326–3328*
Collins, John Churton, author, 1436, 2687
Collodion, manufacture and use, 3140, 5470, 6481, *6483*, 6563, 6763, 6765
Colloid minerals, defined, 766
Colloids, definition, 4698; nature, 4699; conversion to pectous condition, 5312
Collotype, 6484; books on, 6486
Colocynth (bitter apple), 6883
Cologne, advice to tourists, 857; Archbishop of, as elector, 2947; architecture, 3374; cathedral, 3374; school of painting, fifteenth century, 4117
Colombia, geography, 4282, 4290; petroleum deposits, 6007, 6009
Colon, human, structure, *576*, 579
Colon, in grammar, use, 1338, 6351
Colonial Office, appointments by, 3548
Colonies, British, building conditions, 6346; Civil Service appointments, 3548; commercial opportunities, 6212; medical profession, 5428; municipal posts, 3741; pharmacy regulations, 1656
Colonisation, Phœnician, 501; Roman policy, 1204
Colony, in zoology, defined, *3958*
Colophony, 1034; *see also* Resin
Colorado potato beetle, destructiveness, 3512
Colorado River, 4061, 4063
Colorado State, geography of, 4174
Colostrum, in dairy farming, constituents, 3671, 4033; definition, 2238, 3671
Colour, biologieal importance (Mendel's law), 1481–1484; in brush drawing, treatment, 2691; in chemical analysis, 4405, 4406; cause, 3728, 5193; defective terminology, 3730; Newton's discoveries, 2431; for illuminating, 6277; optical perception, 2402; relation to pitch, 3728; standardisation, 3730; Young's experiments, 3367
— in art, complementary, 725, 726; philosophy of, 182; symbolism, 725; tone, tint, shade, etc., 3730
— in painting, symbolism, 725, 726
— blindness, 2403; disability of, forms, tests for, 3731; test of railway staff, 4379, 4600, 4601
— printing, 5872
— prints, in engraving, 6114
— reproduction, processes, 6483, 6486
— sergeant, infantry line, 3840; examination, 4030; in Royal Marines, 4266, 4269
Colours, of animal and vegetable origin, list, 5145; use in architects' drawings, 5421; artists', trading in, 895; British exports and imports, 6004; for carpet designs, 6389; Coal-tar: *see* Coal-tar colours; complementary, 511, 3729; developed in dyeing, 6194; "ingrain" in dyeing, 6195; insoluble dye, 6194; in laundry work, retention in washing, 2591; liquid, in technical drawing, use, 2793; in millinery, suitability, 4564; mineral, kinds and their manufacture, 5142–*5149*; oil, essential, and to be avoided, 871; oil, setting the palette, 1020; papermaking, sources, 6278; in photography, 6679; pigment, permanence essential, 5141; pigment, safe colours to use in water-colour painting, 1021; pottery, soft, 5384; pottery, firing temperatures, 5385; primary, 3731; textile printing, 4499–4502; production by dyeing, 5779; sulphur in dyeing, 6194; of tiles, production from marls, 5776; wave lengths of, 3369; "woaded," 5782
— *see also* Dyes
Colour-top, Clerk-Maxwell's, 3729
— trough, in carpet manufacture, structure and use, 3359, *3360*
Colour vision, Young and Helmholtz theory, 3730; Hering's theory, 3731
Coloration of butterflies and moths in courtship, 3516; in fish, 3068; in frogs, 2801; of mammals, classification, 2156; in reptiles, 2678, 2679; of sea-snail, 3114
— warning, butterflies and moths, *3515*, 3516; caterpillars, 3514; chrysalides, 3515, 3516; sea-anemones, 4083; of sea-slugs, 3114; wasps and bees, 3722
Colouring, for waxed butts, 5646
— pigments, painters', 5832
Coltsfoot, classification, 354; perennial weed, 1378; underground stems, 909
Columbia, river, 4062, 4069
Columbian fire-resisting floor, *4753*, 4755
Columbine, nectar, *730*, 731
Columbus, Christopher, life, discovery of Bahamas and West Indies, discovery of America, 3606
Column, in architecture, *2657*, 2658; Assyrian, Greek, *2858*, *2859*; Persian, 2659; Romanesque period, 3231
— in building, reinforced concrete construction, 1643, *1645*; shoring, 920
— in carpentry, *3543*, 3547
— cast iron, safe load formula, 2198
— drawing, power mill engine, vertical engine frame *4201*, *4202*
— pattern for moulding, 2457
Columnæ carneæ, *955*, 957
Columns, quarrying blocks for, 2955
Colza oil: *see* Rape oil
Coma, defined, 2794
Comb, honey bee, 3724, 5957; frame, standard, 5958, *5960*; melting down, 5960; wax secretion, 1033
— of fowls, *4857*, *4858*
— hackling, in flax manufacture, 1386
— in quarrying, *532*
— of scorpion, *3803*
— in textile industries, 1542
Comb-bar, of lace loom, *4880*
Combination garment, child's, *4050*
Combinations, boy baby's, in dress, *4195*, 4196; cutting out and drafting, 3474, *3475*; girl's, 4472
Combing machine, textile, function, 1541; operation, 1723–*1726*; in wool manufacture, 70, 223
— wrap, style and material, *3591*
Comb-star, description, 4081, *4082*
Combustion, physiological, 1301; effect of alcohol, 3377
— cause of air impurity, 3798, 3802
— chamber, of boiler, *3099*, 3102; in marine Scotch boiler, *3099*, 3105
— furnace, chemical, 240, *241*
— without oxygen, chemistry of, 1597
Comedy, first English, 678: *see also* Drama
Comets, *6569*, *6570*, 6695; orbits, 6250, *6568*, 6570; spectra of, 3371; tail, 938, 2027
Comma, use, 1338; in letters, 6351
Commander, basket-making tool, *5489*
— navy, promotion and pay, 4402
Commandment, fifth, sociological value, 4665
Commence, condemnation of use of word, 4579
Commerce, bookkeeping: *see* Bookkeeping; contract, nature of, 658; dictionary of terms, abbreviations, coinages and weights and measures of the world, 405–410; earliest history, 145; full list of books used, 776, 977; importance of terminology, 1570; map of world's routes, *5378*; classification of trading countries, 5370; shop, 43; *see also* Shopkeeping *and separate trades*
Commercial abbreviations, dictionary of, 408
— class, statistics, in England, 2796
— correspondence, training, 6354
— geography, adaptation of the earth to man's needs, *4514*, 4520: agricultural products, 4873, 4959; climate and temperature, 4493–4496; economic regions, *5378*; geographical and human factors in commerce, 4493–4498; harbours, 4497, 4498; mineral products, 5302–5308; mountains, 4494–4496; scope, 4493; soils, 4497; timber and economic forest products, 4657; winds, 4494, 4498
— highways of the world, *5378*
— law, 6751
— professions, examinations, 148
— schools, character of tuition, 6354
— terms, dictionary of, 405
— travellers, bribery, 6211; collection of accounts, 6209; commission, 6210; conditions abroad, 6212; foreign languages, 6212; motor-cars for, 6211; partnership, 6209; personal expenses, 6210; presents, 6211; qualifications, 6210; salaries, 6210; "standing treat," 6211; women, 321
Commissions, Army, physical requirements, promotion, pay, 4197; privates' difficulty of obtaining, 3841
— business, how entered, 1571, *1572*
Commissural fibres of brain, 2804
Common axle, distinguished from collinge and mail, 3327
— chord, in harmony, 361; *see also* Bass, figured; in music, 363
Common Council, Court of, London, constitution, 320

Common Council, good fund, in Scottish local government, 317
— larch, timber, 55
Commons, House of: *see* Parliament
Commonwealth, the, history of, 4761
Communal society, ant hill, 5248
Commune, French, account, 5240
Commutation, dynamo, 1323, *1324*
Commutative law, in algebra, 1994
Commutator, dynamo, *1105*, *1106*, *1323*
— motor, continuous current, 1590
— in telegraphy, single-needle instrument, 4385; tapper and drop-handle, *4903*, *4904*
Companies' Acts, balance-sheet provisions, 3189; law as to prospectus, 3186; of 1900, 6800; parliamentary companies, 3331; provisions, 3185
— limited: *see* Limited Company
Company, financial, defined, 1266; law, 6800; promoter, 6803
Comparative, in grammar, 116
Compartments, railway, dimensions, 2555
Compass, beam: *see* Beam compass
— in circumferentor, 803
— box, for plane table, 710
— carpenters' use, *3388*
— course, in navigation, 6661
— drawing, selection, 284
— glaziers', 5836
— magnetic, electromagnetic experiments, 562; as galvanometer, 288
— mariners', first known in China, 216; description, 13, 4243, 4246, 6658
— masons', description, *2837*
— measuring tool, kinds, 4701, *4703*
— plants, description, 727
— plasterers', 5496, *5497*
— prismatic, 266; in marine surveying, 1018; in surveying, 265; in triangulation survey, 594
— race, use by harness-maker, 4887
— saw, use, 3385
— ship's, 6664; variation of, 6665
— wire, metal-worker's, *5521*
Compensating errors, in bookkeeping, explained, 2503
Competition, in retail trade, 5925
"Compo" pipe, manufacture, 5987
Component force, defined, 411
Composers, pianoforte, list of, 2024
Composing, in printing, methods and rules for, 5157, *5158*, 5252
— stick, compositor's, 5156, *5158*
Compositæ, natural order, 354
Composite order, in architecture, Roman, 2932
Composite wheels, described, 2021
Composition, in art 722–726
— in design, 5977
— in drawing, 722, 724
— of forces, in mechanics, 411, 551
Compositions, in bankruptcy proceedings, 3571
Compositor, printer's, work of, 5026, *5156*; jobbing and display, 5871; employment conditions, 2655
Compound addition, subtraction, etc., rules and examples, 228
— interest: *see* Interest
— nouns, English participial forms, 756; German gender forms, 1189; Latin, rules for plural, 754
Compounds, chemical, 516, 517; defined, 692; differentiation from mixture, 1596, 2880; double, 839, 1597; formation, principles of, 1597, 4130; inorganic, 1718–1722; physiological, 438; unstable, 693
Compressed air: *see* Air, compressed
Compression boom, of girder, 540
Compressibility, nature and cause, 1374
Comte, Auguste, biographical sketch, philosophy and positivism, 3869, 3870; on gravitation law, 663; view of ether, 935
"Comus," Milton's, 845, 991, 3783
Con sordino, horn music, 5732; violin music, 5727
Concentrated load, beams and girders, 2198, *2199*
Concentration, psychology of, 2306
Conceptacle, in botany, 1368, 1373
Conception, in psychology, 2804
Concert pitch, 6442
— promotion, 6869
Concertina, musical instrument, construction and playing, *4487*, *4488*
Concerto, in musical form, defined, 634
Concessive subjunctive, Latin syntax, 1183
Conclusion, in geometry, 4208
— of syllogism, in logic, 6098
Concord, in music, defined, 363; allowable in counterpoint, 632
Concrete, 332, *333*, 534, 649; for asphalt roads, 2179; for breakwaters, 6335; use in building, 329–332; compressive and tensile stress, *1555*, 1556; in drainage, 733, *736*, 780; expanded metal, 520; floors, 332; cost and wear for footpaths, 2430; mixing and laying, 334, 1449–*1451*; in paving, 2426, 2515; reinforced: *see* Reinforced concrete; from refuse clinker, 5021; Roman, 142; in scaffolding, 1170; in shoring buildings, 916; in stable fittings, 737; testing strength, 1523; in tramway construction, 3750
— blocks, in construction, 1450
— cement, in building, *647*, 648, 649
— fireproof, 4752, 4755, 4758
— roofs, fire-resisting, 4758
— reinforced: *see* Reinforced concrete
— slabs, manufacture, 534
Concretor, in sugar manufacture, use and construction, 3828, 3830
Condensation, in physical geography, definition, 294
— in physics, influence of temperature and pressure on, 1741; water vapour, 1899
Condensed milk, dietetic value, 3312
Condenser, of coal-tar distilling plant, *5462*
— electric, *3580*, *3581*, 3580; Lodge's oscillation transformer, *3895*, 3897
— marine engine, *6294*, 6295, *6296*
— perfume distillation, 4968
— petroleum, construction, 6147
— of refrigerating machine, *5403*, *5404*, 5407, *5408*
— of steam-engine, invention and use, 5416; steam pressure, 6070; surface condensation type, efficiency, 6069
— telegraphic, 4607, *5242*, *5243*, 5244
— telephonic, rack, *6080*
— textile machine, 1546
— in woollen manufacture, 70
Condensing, in journalism, 3975
Condiments, adulteration, 3718; analysis, 4722; dietetic value, 3312; tree products, 4873; uses, 4717
Conditional clauses, English grammar, 756
— mood, French rules, 3353
— sentences, Latin, 1183
Conditioning, in milling, 3080, *3081*
Condor, classification, 2213
Conducting, in music, 5891, 5892, *5894*
Conduction, in electricity, movement of electrons, 4023: *see also* Circuit
Conductivity: *see* Electric, Thermal, *etc.*
Conductor, electric, 464, 3030, 3260; cable, 6546; magnetism, 288; overhead, for traction, 1931; power, aluminium, 5993; railway system, *2089*, 2090; resistance, 671; telephone and telegraphic, table, 6324; three-phase, 1907, *1908*
— omnibus and tram, conditions of work, 4186, 4189
— orchestra or choir, functions, 5891, 5892
— railway, duties, 4804; sleeping car, duties and wages, 4809
Conduit, reinforced concrete construction, *1557*; tramway system, 1931, 1936
Condy's Fluid, use, 1043; in opium poisoning, 4006
Cone, axle, explained, 3326, *3227*
— clutch, in machinery, 960
— in drawing, definition, 1747; development, *4523*, 4737, *4739*, *5349*, 5350; elements of, 4737, *4739*;
Cone—continued
elliptical sections, *4523*, 4933, 4934, 4935; envelope, 4522, *4523*, 4933, *4935*; friction, use, action, and formula, 4003, *4004*; generation of, *1411*, 1413; geometrical problems, 2005, *2007*, 2008, *2009* hyperbolic section, 4933, *4935* marking envelope, 4737, *4739* oblique, 1747, *1749*, *4738–4741* parabolic sections, 4934, *4935*; plan and elevation, 1747, *1749*; reversing, *4004*; shading, *1792*, 1795
— friction, defined, 960
— inverted, in pumping wells, 4028
— male and female, *505*
— shell, 3113; poisonous bite, 3114
— speed, of pulleys, *3426*, *3427*
— willow, cotton machine, *1241*, 1243
Cone-bearers, coniferæ, description and classification, 52, 503, fertilisation, 729; fungous pests, *4927*, 4928
Cones, retina, description, 3226
Confectioner, employment conditions, 2655; refreshment catering, 5582; sweet-selling, 5495: *see also* Baker
Confucianism, in China, 216
Confucius, life and doctrine, 447
Congenital, in biology, definition, 485
Conglomerate, classification and composition, *1072–1074*
Congo Free State, economic conditions, trade, 5380; geography of, 3583
Congo River, course and scenery, 3275, *3582*, 3583
Congow tea, defined, 3378
Congregationalism, ministry, training, 162, 6604
Congreve, William, dramatist, 1150, *1151*
Congruent of triangle, definition, 4330
Congruity in design, 5819
Conic frustum, in drawing, development, *5349*, 5350; distant apex, 4738, *4739*, 4740; elements, 4737, 4739; envelope, 4522, *4523*, 4738, *4739*; projection, *4523*, 4524; slant unknown, 4738, *4739*
Conic sections, definitions, 1411, 5783; properties of the tangent, 5783; books on, 6790
Conical fire-box, drawing, developments for, *4741*
— mandrel, description, 3107
— pendulum, described, 2017, *2019*
— tubes, boiler, *6875*
Conics, central, 5944
Coniferæ, Conifers: *see* Cone-bearers
Conjugation, in biology, elementary sign of sex, 382
— in botany, in spirogyra, 1370
— in grammar, explained, 116
— of protozoa, 4088
Conjunction, in grammar, 116; English, 1337; English use with subjunctive, 756; Esperanto, 5087, 5654; French, 5228, 6090; German, 2638, 4219, 4220; Italian, 5649, 5945; Latin, 243, 603; Spanish, 5229
Conjunctiva of eyelid, structure, 2401
Conjunctivitis, treatment, 6264
Connaught, Province of, origin, 2609
Connecting-rod, steam engine, types, *4424*, 4426; action, *5461*, *5462*, 5463
Connecting-up switch, telephonic, 6080
Connective tissue, human, 196, 437
Co-operative stores, in competition with private trader, 5925
Co-ordination, in psychology, 2120
"Conqueror Conquered," The (death of Alexander the Great), *973*
Consciousness, chemistry of, at present unknown, 3140, 4008; compared with self-consciousness, 2373; kinetic theories refuted, 2115; and molecular motion, 6537; "narrowness" of, 2258: *see also* Attention; nature of memory, 2304; normal and secondary, 3663; in psychology, 2011; physiological psychology, 2299; relation to association of ideas, 2805; Tyndall on, 6536; value to knowledge, 6257
Conscription, origin in Germany, 2947
Consecutives in harmony, 365

Consequent, in mathematics, 996
Conservation of energy, doctrine of, 289, 426, 313, 2062 ; Isaac Newton on, 36 ; permanency of the law, 1915 ; in psychology, 2115
— of matter, 1915, 2063 ; theory, origin of, 61
Conservatism, place in organic evolution, 5388 ; ignoble form, 5390 ; perpetuating force, 5350 ; of women, 5531 ; of established religion, 5531
Conservator, forest, pay, 3477
Consignment inward, in bookkeeping, defined, 3679, 3680
— note, railway, 5072
— outward, in bookkeeping, 3679
Consignor, in bookkeeping, defined, 3679 ; ledger account, 3680
Consolidation of soil, in building excavations, 329
Consols, conditions regulating price, 3483 ; meaning of word, 1262
Consonant intervals in music, 363
Consonants, in English, definition, list, 121 ; French, 124 ; German, 249 ; Italian, pronunciation, 2044 ; Spanish, 2040
— shorthand table, 49, ,427 ; double, 836 ; final hooks, 689–691 ; initial hooks, 586 ; position of, 1236
— in singing, formation, 6338
Con sordino, musical term, 5447
Constable, John, painter, *4301*
Constable, railway, duties, 5108 ; *see also* Police, *etc.*
Constantine, Emperor, architecture during reign, 3090 ; conversion to Christianity, 2241 ; rule, 2072
Constantinople, architecture, 3090 ; *see also* Byzantium ; founding of, 2072 ; capital of Turkey, 2167
Constellations, astronomical, circumpolar, 6115–6117 ; motion, circumpolar, 6115 ; seasonal, *6117–6120*
Constipation, causes, 5843 ; remedy, 4684
Constraint, in theory of machines, 687
Consul, Roman, election, power, 1136 ; before and after the Decemvirate, 1201, 1202
Consular service, British, appointments, examinations, salary, 2935
Consumption : *see* Phthisis *and* Tuberculosis
Conté crayon, drawing with, 1534
Continental shelf, *298*, *299*, *301*, 302 ; variation in different seas, 554
Continents, defined, sizes of each, 460 ; period of present formation, 2254
Contingent liability, bills of exchange, 1319, 1320
Continued fractions, rules, 706
Continuity of life, explained, 381
Continuous beam, loading stresses, 2197, *2199*
— kiln, in brickmaking, defined, 1284
Contortion, of stratified rocks, *1922*, 1923 ; *see also* Folds
Contour maps, making, *457-460*
Contouring, in surveying, accuracy, 591 ; methods, 591
Contours, in marine surveying, 1019
Contracts, verbal, 6751 ; written, 6752
Contract accounts, bookkeeping, 3418
— in business, defined, 658
— ledger, in bookkeeping, *3420*
Contraction, coefficient of, in hydraulics, 1573
Contractions, shorthand list, 1463
Contractor, building, compared with builder, 141 ; duties, payment, 1910, 1911 ; cost accounts, 3418
Contracts, builders', books on, 2034
Contralto singing, characteristics and compass, *6050*, 6051 ; exercises, *6183*, *6186*, *6191* ; register, *6182*
Contrast, in design, 5819, 5820 ; in geometrical drawing, *2320*, 2321 ; in music, in setting melodies, 631
Convalescence, rest during, 4390
Convalescent, nurse's care of, 6176
Convection, in water, 1738
Converter, basic, described, 1045
— Bessemer : *see* Bessemer converter
Converter, in electric supply, *2247*, 2248
Convexity of eyeball, 2401, 2402
Conveyancing, railway, 5107
Conveyor, in cement manufacture, *1853*, *1856* ; in coal-mining, 3565
Conveyor screws, 835
Convicts, transportation of, 6552, 6694
Convolutions, of brain, anatomy of, *2145* ; psychology, 2299
Convolvulus, 354 ; climbing, 504
Cookery, dietetics, 3311 ; economics in, 2335 ; English schools of, 3509 ; invalid, 6178 ; kitchen requisites and stoves, marketing guide, 1225, 1228 ; recipes, 1735, 1872, 2001, 2126, 2331 ; teachers' openings in S. Africa, 3742 ; vegetarian, recipes, 2344
Cooking, electric, *3030*, 3031 ; general methods, 1485 ; stoves, management, cleaning, 1226 ; in relation to digestion, 673 ; use of hard water, 4158
Cook, duties, 1002, 1003
— dining car, training, 4810
— marine, 6804
Cook-general, duties, 1092
Cooks' mates, marine, 6804 ; Navy, physical standard, 4265 ; service, 4266
Cooler, milk, 4034, *4209*, *4281*
Coolie, Indian, as labourer, 6629
Cooling-box, in wood distillation, *5464*, 5465
Cooper, miniature work, 1061, *1062*
Cooper-Hewitt electric mercury vapour lamp, 2682, *2683*, 2684
Coopers, employment conditions, 2653
— Navy, physical standard, 4265
Co-operation in business, 6519
Coops, poultry, material, 5877 ; types, *5091*, *5092*
Cop reel, mechanism, 2592, *2593*
Copal, resin, 810 ; as painting medium, 871 ; source, 4658, 5147, 5835 ; varieties, 1034 ; use in varnish, 5835
Copernican solar system, 6119, *6121*
Copings, brick formation, *1949* ; jointing, *3035*, 3039 ; in quantity surveying, *6507* ; wall construction, varieties, 2267
Coping-stones, of dock wall, 6494
Copper, 356, *357*, 4126 ; analysis, 4413 ; chemical properties, 1447 ; Chilian, 5661 ; chemical symbol, kathion and union, 3261 ; contraction, in cooling, 1397 ; effect on pathogenic organisms, 4095 ; electric resistance, 671 ; electro-chemical equivalents, 3262 ; electro-deposition, 5752, 6305 ; electro-deposition for tubing, 5326 ; electroplating, 3422 ; metal extraction, *4126*, 4127 ; in food, 1447 ; geographical distribution, 3771 ; Lake Superior region mining, 4068, 4174 ; lead method of recovery, 4304 ; micro-structure, *3937*, 3939 ; occurrence, 839 ; ores, 356, 3835, 4126, 6305 ; (roasting) *3770*, 3771 ; physical properties, 1396, 3837, 3838, 3839 ; pigments, 1037 ; pottery, colouring in, 5382 ; lustre, 5385 ; properties, 4126, 6305 ; refining processes, 5753, *5754*, 6306 ; relative conductivity of, 1397 ; in roofing, 5035 ; shrinkage of casting, 2342 ; solder for, 5523 ; specific gravity, 1078 ; in steel, 4747 ; strength, 1396 ; supply sources, 5308, 6305 ; uses, 6305 ; utility in art work, 5523 ; welding, 6454 : *see also* Cupric *and* Cuprous
— alloys, 1447 ; in gold, 3856 ; composition and properties, 3940 ; varieties, 6308–6314
— bronzing baths, 6576
—, casting, difficulties of, 6306
— in laundry work : *see* Boiler
— oxides, varieties, 6307
— pans, in cookery, dangers of method of cleaning, 1225, 1226
— plate, etching, *6111*, *6113*
— pyrites, 6735 ; properties and occurrence, 6305 ; treatment, 6306
Copperas : *see* Ferrous sulphate
Coppers, brewing, *6058*
Coppersmithing, engineers' tools, materials, 3884, *3885*, *3888* ; machine versus handwork, 4521 ; patterns, 4522
Copra, from coconut palm, 2972 ; source of oil, 4658
Cops, dyeing process, 6367, *6368*
Copts, ethnology, 1790
"Copy," in journalism, 4191 ; revision and sub-editing, 4192 ; obtaining, 4194 ; sources and suggestions for, 4672 ; sources of supply, 4232 ; treatment, 4236
—newspaper, good and bad, 4430
— in printing, reading by compositor, 5157 ; setting, 5157
Copy-holder, proof-reader's, duties, 5459, 5460
— — in typewriting, 1697
Copying ink, 5367
— of letters, office boy's duties, 193
— of manuscript, advice, 2473
— office, fees, 1919, 1920
— paper, manufacture, 6400
— press, principle, 855
Copyright, photography, 4418, 6688
Coquilles, lace, making, *5620*
Cor Anglais, harmonium stop, 4180, *4181*, *4182*
— musical instrument, 4895, *4896* ; manufacture, 6524, 6626 ; tone and compass, *5729*
Coral, calcium in, 843 ; carboniferous system, 2254 ; description, 4083–*4085*, *4087* ; colours and use, 5856 ; formation, *558* ; source, 5121, 5308, 5856
— islands, 558
— polyp, reef building, 1354, 1815 ; appearance and habits, 558
— reefs, geological formation, 1815, 1817 ; upheaval, Cuba, geological explanation, 1353 ; varieties, formation, 4084
— stitch, in underclothing, *3337*, 3339
Corbel stone, forms of, 3242, *3243* ; stopped, *2781*, 2784
Corbelling, in building, *2265*, 2267
Cord, piping, for needlework, 3093 ; paper yarn, 6400, *6401*
Cordæ tendineæ, *955*, 957
Corded fabric, design, 2940, *2941*
Cordilleras, of North America, 4061 ; of S. America, 4282
Cording, in sewing, 152, *153*
Cordite, manufacture, 6763 ; use in demolitions, 6274
Cordova, Arabs settle in, 2946 ; cathedral, 2234 ; tourist description, 1133
Cords, haberdasher's stock, 3152
— manufacture, 5288, 5289
— vocal, structure, over-tones, 2106
Corduroys, finishing processes, 4343
Core, bronze casting, removable, 1674
— in casting, 2337, *2339*, 2340, *2341*
— electromagnet, defined,. 562
— makers, employment conditions, 2645
— in mining, definition, 2686
— in moulding, use and preparation, 2110, *2111* ; in sweeping-up moulding, *2459*
— in pipe founding, 5319, 5320
— in tube-making, *5323*, 5324, 5325
— of wall, definition, 3033
Core-box, explained, 2340, *2341* ; in wheel-moulding, *2544*
Core-prints, in casting, function, 2340 ; in moulding, 2114
Corea : *see* Korea
Coring, in flue construction, 2390
Corinthian order of architecture, characteristics, *2035*, 2858, 2859 ; in Roman architecture, 2932
Cork, *5897* ; bark characteristics, 1166 : cutting knives and machine, 5897, *5898* ; formation on fall of leaf, 728 ; growth and harvesting, *5897*, 5898 ; for linoleum manufacture, 5122 ; source, 4658, 5897, 799, 1078
— asphalt, in road construction, 2181

Cork carpet, 1026, 1027, 5898
— grinder, construction, 5122, *5123*
— linoleum, 1026, 1027
— oaks, 5897; cork yield, 5897; decorticated and wild, *5897*; distribution, 1166, 1167
Corks, making, sterilising, uses, 5898
Corliss engines, compound condensing, types and details, *6292–6294*
— valve, of pneumatic drill, *1803*, 1806
Cormorant, classification, 2213; food, *2492*; webbed toes, 2496
Corms, of crocuses, function, *728*
Corn, extermination of insect pests in, 1666, 1668; harvesting, 1662, manuring, 589; trade in, 1991; seed, good, 636; sowing, 432
— chandlers, trade of, 1991, 1992
— cockle, weed, *883*, 1378; seed, microphotograph, *3893*
— cutting, instruction in, fees, 1896
— laws, abolition, 6691
"Corn Law Rhymes," Elliott's, 1308
— rick, building, 1664
— thrips, insect, 3365
— weevil, *1667*, 1668
Cornea, coat of eye, 102, 2953; lymphatic function in, 1195; physiological account, *2400*, *2402*
Cornel, classification, 353
Cornelia, mother of the Gracchi, character, 1382
Corner locking, 6756
Corners, in business, origin and definition, 204
Cornet, in assaying, *5849*, 5850
— musical instrument, construction and playing, *5441–5444*, *5732*, 6623
Cornets, biscuits, manufacture, 3597
Cornflour, product of maize, 4874
Corni, use in guitar playing, 3762
Cornice, in architecture, harmonising, 2130; proportioned, *2134*, *2135*
— of brougham, 2829, *2831*
— in building, brick for, *1949*; definition, *2265*, 2267; enrichments, 5502; finishing, 5501; plastering, 5501; running mould for, *5501*
— in joinery, 5293–*5295*
— in quantity surveying, 6508, *6510*
— stone, protection by leadwork, 5035
Cornish boiler, *3097*, 3098, *6874*
Corns, treatment by chiropody, 1896
Cornwall, bismuth ores, 1162; building stones, 529, 1518; coast, erosion, *1813*, 1814; early trade with Phœnicians, 145; geography, 1276; graphite, 1157; slate quarries, 530; tin mines, 1160, 5308
— acre, defined, 1147
Corolla, of flower, defined, 346
Corollary, in geometry, 4208
Coromandel coast, 2818; products, 5381
Coronæ, cause, 2900
Coronary circulation, 1194, *1195*
Coronium, existence in sun, 4135, 6252
Corot, landscape painting, *4300*, 4301
Corpora quadrigemina, function, *2145*
Corporal, Army, examination requirements, 4030; in infantry line regiment, promotion, 3840; Royal Engineers, promotion, 4031; Royal Marines, 4266, 4269
Corpus arantii, 957
Corpus callosum, *2144*; of brain, *2537*
Corpus striatum, function, *2145*, 2146
Corpuscular theory of light, 937
Corpuscular theory of matter, Thomson. 2294; Zeeman's confirmation, 3618
Corpuscle, blood: *see* Blood, corpuscles, *also* Leucocyte
— bone, 435, *436*
— in Physics: *see* Electron
Correggio, painter, 3796
Correspondence, arrangement of, in typewriting, 1696
— banker's, limitations of, 4293
— business: *see* Letters
— German, private letters, 4364
— Spanish, 5803; commercial, 6091, 6235
Corridor, arcaded, transference of features in style, *2131*, 2134
— carriages, railway, *2462*; advantages and capacity, 2556; increased cost involved, 2274
Corridors, in architecture, 2131
Corrugated iron: *see* Iron
Corsets, danger of wearing, 1301; use and abuse, 4258
Cortex, in botany, of plant stem, *169*, 170; of root, 168
— of human brain, functions, 101; anatomy, 2145, 2146; physiological psychology, 2299, 2300
— of kidneys, structure, 1602, *1603*
Corti. organ of, description, 2316
— rods of, physiology, 2534, *2535*
Corundum, mineral, 768, 813; *plate facing* 1345; aluminium in deposits, use, 5989; precious stones, varieties and properties, 5852, 5853, 5855; wheels, for teeth of cutters, 3408
Cosecant, in trigonometry, 6231
Cosine, in trigonometry, 6231, 6499
Cost accounts of manufacturers' and contractors' business, 3418
— price, explained, 999
—, prime, factory work, 6640
— sheet in manufacturing businesses, 3419
— system, 6518
Costa Rica, geography, 4176
Costers, competition with fruiterers, 2530; with greengrocers, 2871
Cosway, miniature work, 1061, *1063*
Cotangent, in trigonometry, 6231
Cotman, John, landscape painting, 4301
Cotswold Hills, physical geography, 1273, 1274
— sheep, 2362, *2365*, 2367
Cottage homes, poor law, 1930
— loaf, 3392, *3393*
Cotter, in mechanical engineering, 834, *3133*
— in technical drawing, 3303
— *see also* Keys
— for tie rods, 3547
Cotter-pin, in common axle, 3327
Cotton as carpet warp, 3991; in cloth, destroying and testing, 3015; as clothing material, 4256, 4257; in dressmaking, method of using, 3340; as electrical insulator, 672; in papermaking, 5118; ramie as substitute, 721; statistics, 384; stocking yarn, 4619
— cake, as cattle food, 2704, 2907, 3892; preparation and use, 1032
— cultivation, 5117; Bengal, 5381; Brazil, 5380; Central America, 4176; China exports, 2974, 2976, 5659; in Egypt, 3276, 3451; field, *385*; India, 2820, 2822, 5381; Japanese import, 5659; Madras export, 5381; Nigeria, 3454; sources, 5117, 5637; Sudan, 3450
— dyeing, action of dyes, classes and qualities, 5637; alizarine dyeing, 5956; black dyes, 6195; bleaching, 5637, 6197; cutch and gambier dyeing, 5906; dyebaths, 5954, 5956; logwood dyeing, 5905; preparatory operations, 5637; "wetting out," 6197
— fibres, description, 68, *69*, 222, 383; microscopic structure, 820, *821*, *822*; possible rival fibres, 817; size, *6279*, 6280; testing, 1701; varieties, 1169, 6501
— industry, 222, 224, 5117; British exports and imports, 6004; centres in Great Britain, 6003; Germany, 1976; Lancashire, 1272; Russia, 2408; U.S.A., 4172, 5663
— manufacture, 383; blending with wool, 1126; breaking, mixing, opening, and scutching, 1241, *1242*, *1243*, 1244; carding engine, 1543; carpet manufacture, 3360; craping, 5638; doubling, 2594; drawing, *2097*, 2098; finishing processes, 4341, 4343; lustre mercerisation, 5638; mercerisation, 5638; rags and shoddy removal, 5639; reeling, 2592; scutching, 1385, 1386; sizing, 3490; spinning, 2289, *2290*, 2443; warping machines, *3488*, 3489; waterproofing, 808, 5201; willow machines, *1241*; winding, 2502; yarns, counts, 2895, 2896, 2897
Cotton oil, 1032, 4831, 4833
— plant, *222*, 225, 387; classification, 352; tufted seeds, 912; picker, *387*, 388; varieties, 1169
— printing, mordants, 5993; processes, 4499
— seed, 1032; composition, 2704, 2907; oil extraction, 4830
— sewing, 185, 3093, 4565
— embroidery, 1096; machine, 154, 1842
— thread manufacture, 2707; test, 5598
— twisted, advantage of, 1842
— yarns, Japan's export, 5659; printing, 4502
Cotton-wool, 1169; cost, 5491
Cottrell rotary printing machine, *5870*
Cotyledon in plants, 350, *347*, 635
Couch, making of, *6589*, *6719*
— grass, indication of poor soil, 256; underground stems, 909; a weed, 875, *880*
Couch rolls, in paper machine, *6396*, 6399
Coucher, in papermaking, 6397
Coughing, physical explanation, 1303
Coulomb, measure of electric capacity, 3580
Coulommiers cheese. mould, *4576*; manufacture, 4575
Coumarin, in perfumery, preparation, 4971; source, 5469
Councils, local, England and Wales, classification and numbers, 316
Counter, fitting in draper's shop, *2221*
Counterbalance, in boring machine, 2668, *2669*
Counterbores, tools, types, use, *4263*
Counterchange, in design, *5819*, 5820
Counter-die, in dental work, 6034
Countermines, military, 6273
Counterpoint, in music, 631
Countershaft brake, function, 3128
Countersink, bit used, 3386, *3387*; of rivet hole, 5919
Countersinking, use of electric drill, 5455; machine, construction and use in shipbuilding, 5920
Counter-subject, of a fugue, 633
Counter top, joinery, 5293, *5295*
Counter-weight, in crane, 830
Counting-house, books used, 778; functions, 659, 660
Countries, commercial types, 5659, 5660
Counts, in yarn measuring, 2895, 2896; calculations, 5507; table, 5508
County borough councils, powers, 317; education authority, 1677, 1678
— constabulary, organisation, pay, etc., 1406, 1408
— councils, architect, 785; clerk, 990; definition and powers, 80, 317; education scholarship, 482; education authority, 1677; engineer and surveyor, 453, 455; financial officers, 1067; inspector of weights and measures, 787, 788; roads, responsibility for, 1978
— Ireland, 317
Coupé, car, uses of term, 2830
Couple (French grammar), gender, 5512
— in mechanics, 415, *1834*
— roofs, carpentry, 4248, *4249*
Coupling hook, railway *4802*, 4805
Couplings, of railway goods waggons, types, *5070*; accidents from, 5070; safety, prize offered, 966;
— of shafts, drawing, forms, *3135*
Coupons, collection by banker, 4293; paper manufacture, 6400; payment by banker, 4294
Courage, how to acquire, 2861; physical, Spencer on, 5098
Course, in building, definition, 2168; damp, *2263*; string, *2265*
— cross, geological definition, 2378
— in masonry of a dome, *3146*
— in navigation, 6665
— of ore, in mining, definition, 2378
— sand, formation in brickwork, 2513
Courses, in masonry, in ashlar walling, 3036; lacing, 3034, *3035*, 3036
Court of Lions, Alhambra, *3091*

Courtship, of birds, 2505 ; coloration of animals, 2157 ; of spiders, 3805
Coventry's dam pressure formulæ, *4336*, 4337
Cover, manhole, 3243
— in sculpture, frame for, *1512*
— stones, in strutting buildings, 918
" Cover " system, in bucket shops, 3483
Cow, abortion, 3671 ; analysis of urine, 433 ; breeding, 2238 ; breeds, 3666 ; calving, treatment before, 2624 ; dietetic value of milk, 3311 ; farmer's inspection of, 2217 ; feeding and foods, 1970, 2706, 3553, 3673, 3890 ; housing, 2997 ; milk of various breeds, 4033 ; milking, management previous to calving, 3670 ; milking, method and records, 3673 ; milking, time and place, 3673 ; points of, *3672* ; sale in market, 2702 ; stomach used for bagpipes, 578 ; tuberculosis in, 3554
— bird, 2209 ; brood parasitism, 2507
— grass, 940 ; seed, 877 ; *see also* Clover, red
— house, construction, 2997, 2998
Cow-mouth chisel, *4151*
Cowl, exhaust, in drainage ventilation, 782 ; Sylvester, 4020
Cowley, Abraham, poet, 992 ; description of Cromwell's funeral, 1183 ; as essayist, 1642
Cowper, William, poet, *993*, 994 ; editions, 995 ; his letters, 2140
Cowpox, defined, 5410 ; incubation, 5411 ; treatment, 2624
Cowslip, *349*, 354 ; farm weed, 1378
Cow-wheat, description, *505*, 506
Crab, choice of, 3717 ; description, *3807* ; protective methods, 3808 ; dressed, cooking, 1873 ; fishing, 2527, 4991 ; in season, 1531, 1582 ; zoological classification, 3361, 3806
— in mechanical engineering, 834
Crabbe, George, poems, 1304
Crabbing, in dyeing, process, 6198, *6199* ; machine, 6501
Crack, in wood, cause of weakness, 3540, *3541*, 3542, 3545
Cracked heel, in horses, treatment, 2621
Cradle, mining, structure, use, 2665
Crafts, teachers of, 6479
Craftsmanship, of art, 183, 868
Cram, principle of weaving, 2941
Cramming, folly of, from psychological standpoint, 2372
Cramp, in carpentry, in gluing joints, *3845*, 3846 ; in tenoned frames, 4040 ; use in door and window-making, 5182, *5183*
Cramp, in masonry, iron, copper and vertical, *3035*, 3037, 3038 ; slate, definition and use, *3035*, 3037
— wooden, use in jointing pipes, 5628
Crane, boxplate casting, *2111*, 2113 ; builder's merchant's, 1331 ; brake of, 960 ; in carpentry, 4644, *4645* ; cast-iron jibs, 544 ; chain-pulley, 544 ; chain, 545 ; derrick, drawing, *4202* ; drum casting, 2338, *2339* ; electric, speed and construction, 1595 ; foot brake, 830 ; in foundry work, for ladles, 2865–*2867* ; girders, 542 ; hydraulic, 1220, 1224 ; hydraulic, movable, *5676* ; hydraulic pressure, 5590 ; hydraulic ship, *5677* ; jib, 208 ; mechanics of, 415 ; overhead travelling, 5589, *5591*, 5592 ; saw-mill, 5667 ; side frame, 209 ; simple and compound train, 834 ; steam and electric, 5590 ; testing, 3966 ; timber work, 4644, *4645* ; timber gravings, 206 ; weight reduction by lattice bracing, 208 ; travelling, gantry for, 1173 ; whip, 832 ; winch handle, 832 ; use in hoisting, 3694 ; use in staith, 4644, *4645*
Crane fly : *see* Daddy Longlegs
Craniology, of various races, 1785
Cranium, of man, anatomy, 1603, 1604, *1605* ; in anthropology, capacity in various races, 1785, *1787* ; thickness of, 1604 : *see also* Skull
Crank, in mechanical engineering, 828 ; bent, 828 ; disc, 828
Crank disc, engine, design, *4424*, 4427
Crank-drive, of shaping machine, 5004
Cranking, of tool, purpose, 4154
Crankpin, engine, connecting rod, *5642*, 5643 ; turning machines, 5283
Cranks, bicycle, 3773, 3774 ; engine, forged, *4424*, 4427 ; fireclay, for firing plates, 5606, *5607* ; marine engine, *6295* ; of power mill engine, drawing, *4201*
Crank-shaft, of engine, connecting rod, *5642*, 5643 ; of compound Belliss engine, *5750*, 5751 ; counter-balancing weights, 2021 ; marine, Board of Trade rules, 4426 ; of pneumatic drill, *1803*, 1806
Cranmer, Thomas, martyrdom, 3834 ; the Prayer Book, 1640
Crape, cleaning, 6042 ; in mourning millinery, *5774*, *5775*
Crater, of electric arc, 2414, 2416 ; light distribution from, *2415*
— of volcano, 459, 1207
Crawling suit, infants', 3856
Crayfish, description, *3806*, *3808*
Crayon, press illustrator's, 6103 ; shading medium, 2188
Cream, adulteration, 3716 ; butter-making kinds, 4211 ; churning, 4213, 4279 ; dietetic value, 3109 ; inoculation, 4212 ; principles of production, 4212 ; preserving, 2217, 3551, 3819 ; qualities, 4037 ; ripening, 3536 ; sale of, 2217 ; setting, 4212 ; straining, 4213
— cheese, composition, 4490
—, clotted, 3551
— separator, use, *3553*
Cream of tartar, 3704, 4782
Creamery, apparatus, *4281* ; Danish and Irish, 3553 ; system of, 3552
Creamometer, use, 4037, *4038*
Creasing in saddlery manufacture, *1784*
Creation, modern conception of, 4884 ; Hegel's idea of, 6470
Creative industry, defined, 1
Credit, nature and function, 488, 3970 ; books and documents, 3970 : *see also* Bookkeeping
— note, explained (invoices), 978
— in shopkeeping, 703, 5927, 5929 ; in buying, 176 ; contrasted with cash system, 5927 ; in grocery business, 3045
Creditor, bankruptcy proceedings, 3569
Creel, of ropewalk, description, 5291
— in spinning, defined, 2441
Creep, in mining, defined, 3561
Creeper, food, 2493
— garden, cultivation, 6322
— in zoology, 2209
Creevey, Thomas, his " Papers," 2451
Cremation, procedure, 5787
— of house refuse, 5020
Creodonta, ancient flesh eater, 2039
Creolin, disinfectant, preparation, 5463
Creosote, manufacture and uses, 1163 ; as preventive of wood disease, 52
— oils, 5462, 5953 ; uses, 5463
Creosoting, timber, 52, 3545
Crepe, rubber, defined, 5199
Crescendo, in music, 271 , effect, 1891
Cresol, coal-tar, colour, 5953
Cresolin, disinfectant, preparation, 5463
Cresotic acids, source, 3819
Crest, of weirs, definition, *1577*
Crested dogstail, grass, *875*, 878
Cretaceous system, in geology, 2067 ; rocks, 2254
Crete, history, 668, 6148
Cretonne, design, 5980, 6726, *6727*
Crevasse, cause, 1638 ; definition, 459
Crèvecœur fowl, *4957*, *5090* ; weight of egg, 5873
Crew, of British ship, legal rights, 6364
Cricket, insect, description, 3354
Crighton opener, in textiles, 1243
Crime, caused by disease and chronic alcoholism, 5813, 5815
Crimea, peninsula, Russia, 2408
— history, 6202, 6301, 6447, 6692
Criminal Investigation Department, detectives, appointments, 1408
Criminology, sociological study, 4276
Crimson lake, pigment, 871
Crinkled cloth, weaving, 3155
Crinoidea : see Sea-lily *and* Feather star
Critical speed and shaft vibration, 2022
Criticism, literary, American writers, 2685, 3781 ; English modern, 2865, 2785 ; English 19th century, 2309 ; of living authors, 2685
— in poetry, 304 ; nature and importance of, 1945
Criton water softener, *4096*
Crivelli, Carlo, painter, 3795 ; raised tempera painting, 1023
Croatia-Slavonia, geography, 2162, 2164
Crocodile, classification, description, 2677, *2798* ; breathing apparatus. food, *2798* ; heart and sternum of, 956
— leather, grain, *plate facing* 3217
Crocus, classification, 355 ; corms, *728* ; culture, 6490 ; uses, 6573
Crœsus, of Lydia, Cyrus' conquest, 20
Crome, John, painter, 4300
Crompton's spinning-mule, *2441*–2444, 2594
Cromwell, Oliver, part in the Civil War, 4552 ; foreign policy, government of England, 4761 ; funeral, Cowley's description, 1183
Cromwell, Richard, character, rule, 4761
Cromwell, Thomas, biography, 3832
Cronan of Irish bagpipes, 5063, *5064*
Crontroller, electric tramcar, 1933, *1934*, *1935*
Crook-bit tongs, 2984, *2985*
Crookes, Sir William, on cathode rays, 4091 ; Crookes' vacuum tube, 3945, 4090 ; kathode rays from, *4103* ; radiometer, 938 ; radiant energy, 2029
Crooks, of cornet, 5441 ; of trumpet, 5437
Crop of pigeon, 2494
Cropping, in carpet manufacture, *4311* ; in cloth making, 4106, *4109*, *4110*
Crops, agricultural, foodstuffs, 4959, 4962 ; in Canada, 3204, 3206 ; cereals, culture in Europe, 856 ; for dairy cattle, 3890–3893 ; ensilage system, 1970, 1971 ; extermination of insect pests, 1666, *1667* ; forage, 1197, 1200 ; grain, account, *872*, *883* ; harvesting 1662 ; industrial, list, 4692 ; manures, 589, 590 ; New South Wales, 3239 ; rotation of, 22, 638, 1197 ; seeds and sowing, 366 ; for sewage 4549 ; South Australia, 3236 ; in Tasmania, 3469 ; weed eradication, 1377 ; average yield, 26
Croquettes, cooking, 1873, 2335
Cross, in surveying, 158
Cross-bearer of bogie frames, 3121
Crossbill, classification, form of beak, 2209 ; vegetarian feeder, 2494
Cross-bracing, in scaffolding, 1171, 1173
Cross-cut, in sawing wood, 3754, *3755*
Cross-cut saw, use, 3385
Cross-cuts, in mining, 3192, 3193
Cross-fertilisation, defined, 348, 729
" Cross-fires," in harp music, *3525*, 3527
Cross-fitching, in basket-making, *5564*
Cross-hatching, in drawing, to indicate material, *2792* ; in engraving, 6114 ; in wood-engraving, 6291
Cross-head, of engine, 207, 2338, *2341* ; of connecting-rod, 5641, 5643 ; direction of load, *4424*, 4425
— in journalism, 4236
— of moulding machine, *2541*, 2542
Cross-pieces, in coppersmithing, 3886
Cross-pollination, 348, 732, 908, 914
Cross-rail, of planing machine, *4999* ; testing parallelism, *3963*, 3966
Cross-reference, in bookkeeping, 1866 ; in indexing letter-books, 193
Cross-slide, in turret work, 3632, *3633*
Cross-staff, surveying instrument, 262–3
Cross-stitch, in dress, *151*, 3340
Cross-tubes, boiler furnace, *3099*, 3102
Crossed-arm governor, *2019*, 2020
Crossed orders and cheques, 1966, 3482
" Crossing the Bar," Tennyson's, 1435, 1771
Crossings, railway, *3608*, 3609 ; temporary, 3252, *3254* ; type in Abt system, *3816*

Crotchet, defined, 38
Croton aqueduct, system, 1686
Croup, symptom and cause, 6132
Crowbar, 3253 ; miners', *2583*
Crowfoot, order, *349*, 352 ; cross-pollination, 732 ; nectar, 731
Crown dental gold, 6033 ; soldering, *6034*
— diamond, use in boring, 2668, *2669*
— glass, 5837 ; ingredients, 4533 ; manufacture, *4534*, 5836 ; refractive index, 5852 ; strength, 1702
— lands, New Zealand, 3467 ; S. Australia, 3236 ; Tasmania, 3469
— plates, in vertical boilers, 3100
— steel, 2845, *2846*
— of tooth, structure, 576, *578*
— wheel, verge watch, *6081*
Crows, classification, 2210 ; flight, 2496
Crowsfoot, boring tool, in mining, 2666
Crucial ligament, human, 1710
Crucible, blast furnace, 1044 ; bullion refining, 5848 ; bullion assaying, 5850 ; clay, 4748 ; Gooch, *4413* ; graphite, 1157, 4748 ; platinum, use in analysis, 4407, 4412, 4415 ; plumbago, 3942 ; porcelain, 4407, 4413 ; thermit, 6456
— furnace, *2862–2864*, 4128
— steel, production, use, varieties, 234
Crucibles, manufacture, 3942
Cruciferæ, insect pests, 1666-1668 : *see also* Wallflower
Crampling, in plate-welding, *3096–3098*
Crupper, harness, 4886, 4890, 5191
— billet, dock, and ring, harness, dimensions, 4886, 5341
Crura, cerebelli, and cerebri, anatomy, *2146*, *2147*
Crusades, the, history of, 2674 ; Richard I. and, 2914 ; and Venice, 2915
Crushing rolls, brickmaking, 1282
Crust, of earth, composition of, 624, 765 ; formation, 622, 623
— in leather manufacture, *3216*, *3217*
Crustacea, classification, *3806–3809* ; fish parasites, 5315 ; fishing, 4991 : *see also* Lobster *and* Crab
Crusties, in breadmaking, 3283
Crutch, of pendulum clock, 5714
" Cry of the Children," Mrs. Browning's, 1309
Crying, physiology, 2400
Cryolite, 1043, 5989, 6735 ; in aluminium reduction, 5756, 5989 ; in glass manufacture, 4930
Cryptograms, classification, 165
Crystal glass, recipe, 4533
Crystal Palace, origin of its design, 76
Crystalline lens, of eye, 2401, 2954
— minerals, *765*, *767*, 6730
— rocks, structure, classification, 897, 898 ; *see also* Igneous rocks
Crystallisation, in chemistry, 4316 ; of metals, 211, 3836, 3837, 3937 ; of minerals, 766, 1007, 6730 ; in steel-casting, 2698 ; sugar, 4452
Crystallography, 766, 6730 ; bearing on engineering, 4560 ; formation of crystals, 3849 ; relation to problem of life, 4560, 4561 ; value in study of molecular structure, 4560
Crystalloids, classification, 4698 ; nature, 4699 ; wet reactions, 4406
Crystals, angles, cleavage, systems, 766, 4561, 6730 ; dichroism, 5852 ; refraction, 3849, 5852
Cuba, asphaltic deposit, 1164 ; discovered by Columbus, 3606 ; geological upheaval, 1353 ; geography, 4178 ; Spanish American War, 5976 ; tobacco cultivation, 4270 ; Spanish trade, 5823
Cube in arithmetic, 1547, 1548
— in drawing, shading, *1536*, 1540
— in geometry, plans and elevations, 1747, *1749* ; problems, *2005*, *2009*
— root, symbols and rules, 1264 ; methods of extracting, 1441
Cubic measure, table, 226
— system, in crystallography, 766, 6730
Cubical body, in technical drawing, planes for envelope, 4522, *4523*
Cubing, method of, architect's, 1911
Cuckoo, 2211 ; brood parasitism, *2507* ; caterpillars as food, 3514
Cuckoo-flower, 352
Cuckoo-pint, classification and description, 355 ; fertilisation by flies, 908
Cuckoo-spit : *see* Frog-hopper
Cucumber, stuffed, recipe, 2127
— group, classification, 353
Cudbear, source, use in dyeing, 5907
Cuff, of woman's coat, 2056, *2057*
Cuffs, starching, ironing, 2910, 2911
Culinary utensils, aluminium, 5991, *5992*, 5993 ; copper, 358
" Cullinan " diamond, *5854*
Culm of grass, definition, 875
Cultivator, in agriculture, construction, uses, 1849 ; horse and steam, 431
Culvert, in building, expanded metal and concrete, *1556*, 1557
— in railway construction, *3610*, 3614
Cumber board, in textile weaving, 3911
Cumberland, Richard, dramatist, 1151 ; novelist, 3132
Cumberland, iron ore deposits, 2379 ; mine, 3304, *3306*
Cuneiform inscriptions, on early Babylonian relics, 16, 17
Cunningham, Prof., table of races classified by skulls, 1786
Cup, engraving, 5528 ; silversmithing, 5687, *5690*
— shakes, in timber, *52*
— sponge, *4087*
Cupboard, chemical fume, price, 4993
— ventilation, in building, 6021
Cupel, assayer's, *5849*, 5850
Cupellation, of lead alloy, 4303, 5850, 5987
Cup-flower group, classification, 353
Cupola, in architecture, 2658
— iron furnace, *233*, 234 ; construction and working, *2862*, *2863*
Cupping, dry, in physics, 1140
Cuprammonium, paper solvent, 6561
Cupric chloride, use, preparation, 6307
— sulphide, use and preparation, 6307
Cuprite, copper ore, 4127, 6305, 6735
Cupro-nickel, composition, 3941, 6618
Cuprous chloride, 6307
Cuprous oxide, uses, 3705, 6307
Cups, china, moulding, firing, 5606
Curari, poison, effect, 439
Curates, stipends, 162
Curb, disease of horses, 2621
Curb ring, of derrick crane, *4202*
Curb-bed, mining shaft, 3457
Curd, 4575 ; acidity, 4492 ; breaker, in making Cheddar cheese, *4571* ; of Cheddar cheese, manufacture and treatment, 4571, *4572*, *4573* ; of cheese, manufacture, cutting, 4490, 4491 ; chicken food, 5436
— cheese, Yorkshire, 4575, *4576*
— knives, *4571*
— soap manufacture, 4961, 4966
Curf stone, Bastard roach, *533*
Curie, Mons. and Mme., discovery of radium, 203, 1448, 1916, 4104
Curling machine, felt hat *6377*
Currants, 6884 ; preparation for biscuit making, 3593 ; source, drying, 4844, 4876
— black, source, 4847
— red, preserving, 4846
Currant bushes, culture, 6678
Current account, in banking, 4291
— liabilities and bills of exchange, 1318
Current, electric, calculation of mean power, 1364 ; collecting, for tram and railway, 1936, *2086*, 2088, 2090 ; effect on magnet, 561 ; generation, 288 ; idle component, 1364 ; induced in eye by light, 3226 ; magnetic field, 562 ; series and parallel distribution, 2246 ; supply and distribution, 288, 2245, 2248 ; three-wire distribution, 2246, 2247 ; transmitting, power, *2085*, 2088
— alternating, 1104, 1357, *1362*, *1905*, *1906* ; transformation, 1657
— continuous, 1104, 1357 ; transformation, 1657
— three-phase, *1905–1908*, 2088
Currents, convection, in water, 1738
— marine, 557 ; Atlantic, *557* ; in harbours and docks, cause, 6219 ; Indian Ocean, *557*, 558 ; influence on erosion, 5577 ; influence on navigation, 4498 ; Pacific Ocean, *557*, 558 ; and prevailing winds, *557* ; transport of sediment by, 1814
Currents, in rivers, observation, 1017
Currying, in leather manufacture, 3217
Curtains, weaving, 3637, 4980 ; materials, 6722 ; design, *6594*, 6596
— of vehicles, 3023
Curvature of railway line, results, 3611, 3612
— of stratified rocks, 1923, 1924
Curve, in design, forms, *5820*, *5821*
— involute, tooth, *3656*, *3657*
— and fillet, machinery design, 211
Curved forms, geometrical, 5163, *5665*
— fuller, described, 2983, *2985*
Curves, in architecture, *2287*
— cycloidal, drawing, *1413*, 1414, 3922 ; epicycloid and hypocycloid, 3639
— in drawing, perspective, 596
— geometrical plane, 1411
— in railway construction, 801, 3611
— of railway track, adjustment, 4591
— in ship drawing, *5610*, 5611
— in wood carving, execution, *5811*
Curwen, tonic sol-fa system, 805
Cushions, of vehicles, 3623, *3624*
Cusparia bark, source and use, 6068
Cusps, artificial teeth, 6031
Custom-house, as affecting tourists, 515 ; tourist vocabulary, 1960
Customs office, staff and salaries, 2765
"Customary measure," in land measurement, 1115
Cut glass, process, 5838
Cut nail, use *in* carpentry, *3543*, 3546
Cut-in notes, in printing, setting, 5159
Cut-in sidehead, in printing, 4236
Cutch, kinds and use, 4658, 5779, 5906
Cutch, Rann of, India, 2822
Cutis, of animals, structure, 2852
Cutis vera, human, structure, 1419
Cutlery, dealing in, 2091 ; manufacture. *5474–5478*
Cutter, coal, in mining, action, *3564*
— glazier's, 4946, *4948*
— sailing vessel, type of rig, use, *5398*, 5399 ; Danish deep sea 4991, *4992*
— tongue, in bootmaking, 4432
Cutter-block, wood cutting, 4582, *4583*
Cutter-grinding, process *3407*, 3408
Cutters, of boring bars, *4263*, 4264
— (brick), use, 643, 1947, *1950*
— edge-trimming, boot, *4544*, 4545
— epicycloidal and involute, 3630
— grinding, *5212*, *5214*
— keyway, construction, 5448
— milling, in gear cutting, *3630*, 3660
— rotary, kinds, 3631, *3632*
— wood-planing and moulding, 4582, *4583*, 6655, *6754*
— umbrella, wages, 5603
Cutting on the cross, in dressmaking, 861, 862, 863 ; in metal-work, 5524 ; woodwork, 5667
— angle, of tool, 4150 ; of plane, 4153
— face, of tool, 4149 ; of plane 4152
— iron, slater's, 4865, *4867*
— presses, saddlery, *4783*
— tools, definition, chisel group, 4149, *4151*, 4152 ; horizontal and vertical combined, 3321 ; reciprocating and rotary compared, *3401–3403*
— wheel, paperhanger's, 5827, *5829*
— railway, drawing and preservation of, *3257*, *3258* ; machinery for, *1822*, 1823 ; process, 3171, 3174 ; retaining walls, 3256, *3257* ; surveying, 801 ; trimming, *3174*, 3175, 3255
— in velveteen manufacture, 4344
Cutting-off machines, use, 5214
Cutting out, in bootmaking, 4432
Cuttle, in cloth-making, 4108
Cuttlefish, description, 3113, *3114*
— bone, use for jeweller's casting, 5858
Cuyahoga River, bridge, 2886, *2887*
Cuyp, painting, 4299, 4300
Cwt., symbol explained, 226
Cyanates, discovery by Wöhler, 3703
Cyanic acid, chemistry of, 3538
Cyanide of potassium : *see* Potassium cyanide
Cyanide process, gold extraction, 4305
Cyanides, in electroplating, 361 ; synthesis, 3538
Cyanite, 6735 ; use, 1036

Cyanogen, chemistry of, 3536, 3538; compounds, synthesis, 3538
Cyaxares, King of Media, 502
Cycads (Cycadaceæ), described, 503, *505*; reproductive process, 1118
Cycle, electric, defined, 1357
Cycles: *see* Bicycle
Cycling, as means of transit, 2154; value as exercise, 4389
Cycling-tours, Continental, 393, 715
Cycloid, definition, drawing, *1414*
Cyclones, forecasts, 986; law of, 6412
Cyclopean architecture, period and distribution, 2858; Mycenæ and Tiryns, remains, 1526
Cyclops, description, *3809*
Cyclostomata, order of fishes, 3065, *3067*, *3071*
Cygnus: *see* Swan
Cylinder, in bridge building, 2737
— in drawing, plan and elevation, 1747, *1749*; shading, *1792*, 1795
— engine, manufacture, bolts and nuts of, rules for, 1703; casting, 207, 2338, *2341*; casting, estimate of weight, 2699; casting by "head" method, *1404*, *1405*; castings, tooling allowance, 3316, 324; construction and drawing, *4423*; lining out process and templets, *3317*, *3318*; moulding in loam, *2461*; pattern for moulding, 2457; plumb-line test, *3690*, 3692: *see also* Cylinders *below*
— dock, foundation, 6495
— geometrical problems, *2005–2012*
— hydraulic, strength, 1704
— in joinery, wood, or staving up, 5296, *5299*
— printing machine, 5745, 5868; in textile printing, 4500, *4501*
— steel, manufacture, 5324
— systems of water heating, *6017*, 6018
— in technical drawing: on angular faces, *5039*, 5040; conical, for gear bevels, 3922, 3923; development, *4935*, *5038*, *5039*; elliptical and circular sections, *4935*, 4936; engine, *4201*, *4202*, 4203, *4205*; envelope, 4522, *4523*, 4934, *4935*; fitting to cone, hexagon and at equal angles, 5040, *5042*; intersections, *5038*; jointing at equal and unequal angles, 4934, *4935*; out of centre, *5039*
Cylinders, engine, kinds and use, 5414, 5415; of armoured cruiser, 6296; Brotherhood engine, *6071*, 6072; compound Belliss, *5750*, 5751; Corliss Robey, 6292, *6293*, *6294*; high and low-pressure jacketed, *6070*; of horizontal engines, 5911; locomotive, *6515*; of single-cylinder engine, *5641*; tandem compound condensing, 6069; triple expansion marine, 6295; vertical and inverted, *5748*, 5749, *5750*; Watt's wooden, 5416; *see also* Cylinder, engine, *above*
Cyma recta and reversa, 5297, *5299*
Cymbals, manufacture, 6714; playing, 5567; use in orchestra, 5733
Cymric language, classification, 1771
Cynics, the, doctrine of, 976
Cyprus, cotton trade, 385, 386; Egyptian settlement at, 421
Cyrus, King, 20; attack on Greece, 668; capture of Babylon, his policy, 500
Cyst, of amœba, 4088
Czechs, rare in Bohemia, 2165
Czerny's piano studies, 1759

D.P.H., diploma of public health, 697
Da capo, term in music, defined, 270
Da Gama, Vasco, explorations of, 2947
Dabber, engraving tool, use, *6111*
Dabbing on, in welding, *2987*, 2988
Dabchick: *see* Grebe
Dactyl, metrical, definition, 305, 328; prosody, definition, 1766
Daddy longlegs, description, *1667*, 1668
Dado, in architecture, plaster and cement work, 648; in design, relation to frieze, 5980
Daffodil, 355; culture, 6489
Dagger, in ship launching, 5293, 5294
Dahlia, 354; culture, 6892
Dairy, care of, 4211
Dairy farming, 3551, 3666, 3890, 4033, 4209, 4239, 4489, 4571; in Australia, 3238–3240; bibliography, 3470, 3471, 4576; British cattle suitable for, 2235, *2237*; in Canada, 3204, 4066; countries engaged in, 5119; English, problems of, 1288; in Ireland, 1365; New Zealand, 3467; plan of farm, *25*; in Prince Edward Island and Newfoundland, 4069; *see also* Butter-making, Cattle breeding, Cheese, Churning, *and* Milk
Dairy produce, British, imports (1905), 3551; marketing, 3554; list, and countries exporting, 5119
— shop, 1625, 2215, *2217*
Dairymen, business of, 2215, *2217*
Dairy work, as woman's work, 321
Daisy, classification, 354; florets, 731; perennial weed, 1378; pollen protection, 1114
Dalmatia, state, description, 2163, 2164; acquired by Venice, 2945
Dal segno, term in music, 270
Dalton, John, conception of the atom, 2081; Daltonism, 1596, 3731; life and work, 61, 1596
Dalton's law, in chemistry, 1805
Daltonism, definition, 1596, 3731
Dam, in carpentry, 4642, *4643*, 4644
Dam, for water power or supply, *1402*, *1403*, 1690; Coventry's diagram and formula, *4336*, 4337; composite, construction, 4333; construction and foundations, 4335; earth contruction, 1449, *1451*, *4332*, *4333*; masonry construction, 1454; masonry, stability conditions, 4335; for power, 1690; pressure on, 542, 1076, *4336*, 4337; profile calculation, 4334, *4335*; stability of walls for, *2573*, 2574; stresses, 541, 4335; *see also* Coffer-dams
— Nile, position, 3450, 3451
Damascening, engraving process, 5529; in jewellery, 5858
Damask, design, *6597*
Damasks, principle of ornament, 3154
Dammar, resin, 4658, 5147, 6884; varnish, 1035
Damper, pianoforte, 1210, *1116*
Dampers, in building, use, 2390
— of kitchen range, management, 1226
Damping, cloth, *4342*, 4343
Damsons, for jam, 4847
Damson trees, culture, 6678, 6884
Damstone, of blast furnace, 4469
Dances, catering charges, 5583
Dandelion, 109, 354; farm weed, 1378; fertilisation process, "clock," *909*, 912; florets, 731; in meadows, rosette, *171*, 173; structure, *349*; use for salad, 5581
— order, calyx and seed dispersal, *909*, 912; insect, pollination, 731
Danes, the, and Alfred the Great, 2355; in Canute's reign, 2357; effect on English people, 146; invasions of England, 2354, 2355; in Isle of Wight, 2611; rule in Ireland, 2609
Daniell cell, *465*, 466; voltage, 291
Danish language, translation fees, 1920
Dank's rotary puddling furnace, 232
Dante, Allighieri, biography and works, 537, 4321; "Divine Comedy," 3781
Danton, G. J., revolutionist, 5112
Danube, course, *2162*, 2167; delta, *2165*, 4518
Danzig pine, 54, 1261
Daphne, pass and monastery, 1526
Daphnia: *see* Water-flea
Darby, plasterer's, 5496, *5497*
Dardanelles, Xerxes' bridge across, 772
Darius III., wars with Alexander, 972
Darjiling, India, geography, 2562, 2822
Dark-room, photographic, 4420, 6680
Darkness, produced by interference of light waves, 3229
Darling, river, course, 3697
Darling Downs, Queensland, 627; climate, 3237, 3700
Darning, in carpet manufacture, 4341; in cloth manufacture, 4342; in cloth-making, 4106, 4110
Darnley, Lord, marriage to Queen Mary, 3997; murder, 3998
Dart, of bodice, 475; in princess robe, 2206; in skirt, 654
— spring, mining boring tool, *2666*
Dartmoor sheep, *258*, 2363
Dartmoor College, naval, training, 4401
Darwin, Charles, biological works, 1791; on eye evolution, 3180; founder of modern anthropology, 1788; and modern biology, 27; natural selection illustrative of the law of progress, 5386; origin of idea of evolution, 202; "Origin of Species," 136, 549; pangenesis theory, *1314*; theory of coral reefs, 1354; on variation, 486
Darwin, Sir George, on ether, light, etc., 939; theory of tides, 549
Darwin, Prof. George H., British Assn. address (1905), 239; on development of evolution theory, 487; researches on earth's rotation, 620
Darwinism, definition of, 650, 823, 1180; origin and influence, 136; principal objections, 827
Dash, dash handle, of brougham, 2820
Dashpots, in governors, *2019*, 2020
Date, climatic limitation, 4493; staple food, 4875
— palm, *351*; classification, 355 distribution, 627; means of checking evaporation, 727; transhipment, varieties, 4845
— period of time, Spanish, 3792
Date shell, boring apparatus, 3285
Dating bills of exchange, 1319
Datum level, in building, 309
Dative case, German, government by adjectives, 3931; Greek, 6668; Latin rules and idioms, 900
Daubigny, landscape painting, 4301
"David," Donatello's statue, 3676, *3677*; Michelangelo's statue, *1345*, 1347, 3678
David, Gerard, painter, style, 3941
David, Louis, painter, style, 4394
Davidson, John, plays, 1152; "Fleet Street Eclogues," 1438
Davis, Prof. Ainsworth, on degeneration of sea-squirt, 31; diagram of relation of animal and plant life, and energy, economy, 277; statement of evolution theory, 825
Davis, Jefferson, career, 5976
Davy, Sir Humphry, 841; discovers barium and strontium, 1041, 1042; discovers potassium, 842; invention of arc-light, 129, 2414; safety lamp, 2061, *3768*
Dawnay's tile flooring, 4756
Day, in English time measurements, 226; length, astronomical, 6121; sidereal and solar, 6115, 6246
Day book, *978*; general use, 777; modern methods, 1865; in single entry, 3916; small shops, 45
— — clerk, duties, 660
— gown, layette, *3744*, 3745
— and night, cause of, 11, *12*
Days of grace, explained, 1130, 1319
De Forest, wireless telegraphy, 3898
De Lesseps, Ferdinand, and Suez Canal, 421
De Quevedo, Spanish poet, 2630
De Quincey, Thomas, attack on Carlyle, 2452; portrait, *2619*; works and criticism, 2310
De Vries: *see* Vries
De Wint, painter, 1022
Deacon chlorine process, 4777
Dead, the, fear of, 6772; phantasms of, and messages from, 3626, 3627
Dead centre grinding, *3104*, 3107
Dead-head, in casting, *1405*
Dead men's fingers, 4085–*4087*
Dead-nettle, *351*; description, 354
— — order, cross-pollination, *730*, 732; nectaries, 731
Dead Sea, asphaltic deposits, 1164, 6009; salt in, 1600; the water, 1078
Dead shore, in building, 918, 919
Dead-work, term in mining, 3104

Deadeye, definition, *3263*
Deadly nightshade, 4009, 6881
Deafness, appliances, kinds, and prices, 5493; causes and treatment, 2533, 6264; cause of partial, 2316
—, nerve, use of siren, 2103
Deal, timber, 54; for carving, 5809; kinds in the market, 54, 3544; in staging, 1176; strength, stiffness, resilience, 1260, 1261; sawing apparatus, 5904; size, 3544
— frames, in woodworking, 5900, *5904*
Deals, stringing, in mining use, 2666
Death, causes and statistics, 2794; comparative statistics, 2794; hour when most deaths occur, 440; in evolution theory, 1029; natural, 2662; physiological account, 96; rate, and hygiene, 2662; by starvation, 866
Death-watch, insect, 3365, 3366, 3511
Debenture account, function, 3330
— stock, term explained, 3484
Debentures, defined, 1262; of limited company, loans, 3330
Debit, in book-keeping, *488*, *491*, 978
Debregeasia hypoleuca, shrub, distribution, textile qualities, 819
Debt collecting, by shopkeeper, 5927; law, 5927; societies, 5927
— proof in bankruptcy, 3571
Debts, allowance for, in balance-sheet, 2881; on balance-sheet, 2758
— bad, bank bookkeeping, 4444
Decalogue, the, 666
Decatising machine, use in dyeing, 6501
Decapoda, description, *3806*–3809
Decay, physiological account, 96
Deccan, plateau, India, description, 2818, 2820; products, 5381
Decemvirate, powers of, 1201
Deciduous, in botany, defined, 504
Decimal system of numeration, 89, 337; indexing, 6520; origin, 422
Decimals, rules and examples, 93
Deck officer, mercantile marine, 6365
Deckannee hemp, distribution, uses, 719
Deckhouse, of sailing ship, *5400*, 5401
Decking, in staging, piling work, 1173
Deckle, in papermaking, *6396*
Decks, of ships, curvature, 5741; marking position, 5739; wood, laying, 5922, 5923; plan of steel, *5619*; of four-masted barque, *5400*
— of steamer, position, erections, *5401*
Declamation, in singing, study, 6340
Declaration of Independence, 5846
Declaration of Right, 4842, 5845
Declension, in grammar, explained, 116; German weak and mixed, 1621, 1622; Greek nouns, 5375; Latin, 118, 119, 242, 442
Declination axis of telescope, 6249
— in navigation, *6665*
— of the sun, 709, 6660
"Decline and Fall of the Roman Empire," Gibbon's, 2054, 3783
Decomposition, of food, cause, 5403
Decorated style, in architecture, 3374
Decasyllabic lines, Spenser and Burns, 537
Dedication of public highways, 2425
Deduction, an impossibility to the subjective mind, 3289; nature and power of, 6098; a test of generalisation, 6001; use in logic, 5999; value to science, 6002
Dee, river, bridge over, at Chester, 2497, *2499*; course, 1065, 1277
Deep-sea float, in marine surveying
Deer, antlers as weapons, 2156; origin of antlers and uses, 811, 825; hand, *1869*, 1870; fur of, 6426
— red, *2156*
Defecation, of sugar, 3827
Defective verbs, English, list and conjugation, 903; Latin, 1047
Defence, mammals, *2155–2157*
Defensible posts in military engineering, construction, 6272, 6273
Deferred shares, defined, 3186
Deficiency account, bankruptcy, 3570
Definite article: *see* Article
Definition, in natural science, 484
Deflection, in beam, testing, 3064
— scale, of testing machines, 1261
Defoe, Daniel, biography, 4950; predominance of Anglo-Saxon words, 1771; prose fiction, 2963; works, importance, portrait, *1901*
Deformity, not transmissible, 1586
Degeneration, in animal life, 23
Degree, in geography, explained, 13
— medical, examinations, 5424, 5429
— of scale, in music, table of, 273
— in trigonometry, 6085
— university, for women, 4975
Degumming, ramie fibres, 1390
Dehors, French grammar, 6089
Dehydrator, sulphuric acid, 1720
Deism, 18th century, 2141
Dekker, Thomas, dramatist, 846; editions, 849
Delacroix, F. V. E., painting, 4394
Delaine, material, width, 186; warp, 2594
"Delenda est Carthago," history of phrase, 1382
Delhi, India, 2821; Mutiny, 6551
Deliming leather, 2956
Delineation, 342
"The Deliverance of St. Peter," Teniers the younger, *3948*, 3949
Delivery book, use, 776
— in casting, in machine moulding, 2542; methods of, 2338, 2340, *2341*
— note, auctioneer's, 4986
— pipe, drainage, 781
Delphinium: *see* Larkspur
Delta, formation, 458, 1635, 1816, 4497
Delta metal, composition and properties, 360, 3940; strength, 1396
Demantoid, precious stone, 5853, 5855
Demisemiquaver, 38
Demetri, Tsar of Russia, impostor, 6200
Democracy, failings, 4370; progressive form of government
Democritus, Greek philosopher, first atomist, 1596; materialism, 6258; theory of matter, 34, 1596; theory of mind, 6463
Demoiselle, insect, *plate facing* 3361
Demonstrative adjective and pronoun: *see* Adjective *and* Pronoun
Demolitions, in military engineering, kinds and use, 6274
Demosthenes, orator, as anti-Macedonian, 775; "Philippics," 1671
Denier, old French silk measure, 2598; in silk counting, 2896, 2897
Denmark, coins, weights and measures, 409; craniology, 1786; creameries, 3553; Danish mile, 1148; egg culture, 5624; exports and imports, 5708; geography, 1562; history, 2948, 5396, 6446; language affinities, 1771; population, 628; touring directions, 1425
Dennet, gig, structure, 2466
Denominator in mathematics, 546
Density, of water, 798: *see also* Specific gravity
Dental alloy, properties, 6032
— casemaking, 6031, *6033*, *6034*
— examinations, 5768
— mechanic, training and wages, 5773, 5861; work of, *5861–5862*, 5864, *5865*, 5866
— mechanics, use of aluminium, 5993
— plate, making and fitting, 6027; repairs and additions, 6034; springs, 6035; vulcanite, manufacture, 6029, 6032
— rubber, 809
— system: *see* Teeth
— tools, kinds and uses, 6027, *6028*, *6029*; making, 6035
Dentals, in grammar, 122
Dentine, composition, 102, 576, 811
Dentistry, apprenticeship and cost, 5769, 5771, 5773; artificial teeth, 6027, *6028*, 6030, *6031*, 6032, *6033*, *6034*; cost of establishment, 5773; examinations and degrees, 162, 5768, 5772; licence, cost of, 5773; nature of work, 5549, 5550; possibilities of success in rural districts, 771; preliminary examination and study, 5770; practical training, 5861; profits, 5773; private pupilage, 5770; registration and cost, 5768, 5773; training, 162, 5772; training hospitals, 5770, 5771; training in U.S.A., 5772, 5773; women's work, 321; *see also* Dentist *above*
Denudation, 436, 1813; vegetation as check to river denudation, 456
Department stores, competition with private trader, 5925; development and limitations, 5925
Departmental accounts, bookkeeping, 3416: *see also separate accounts*
Departure, in navigation, 6665; in plotting surveys, 369
Dephlegmator, in methyl-alcohol distillation, 5465, 5466
Depilation, in leather manufacture, by sweating, by lime, 2854, 2855
Deponent verbs, in Latin, 900
Deposit account, in banking, 4291
— receipts, in bank bookkeeping, interest calculation, 4444; for fixed periods, 4292; register, 4442
Deposition, in geology, sedimentary, 1816; alluvial, 2377; marine, gravel, mud, sand, *1814*
— subaqueous, in mining, 2958
Depreciation account, of parliamentary companies, 3332
— of assets, how shown in bookkeeping, 2758; in hire-purchase accounts, 3918; in income tax return, 3334; in relation to cost of production, 3419; *see also* Sinking fund
Derby brights, coal, source, pit price, carriage, cost in London, 1991
Derby, Countess of, 1651; holds Isle of Man against Parliament forces, 2611
— Earls of, rulers of Isle of Man, 2611
Derbyshire, industries, 1272; lead deposits, 2379; Peak district, 1271
Dermestid, beetle, 3511: *see also* Bacon *and* Fur beetle
Dermis, of animals, structure, 2852; human, structure, *1419*, *1423*
Derrick, in building operations, 1172
— in mining, use, *2668*, *2670*; rope-boring, *2845*
— stonemason's, use, 2840
— crane, 205; stagings for, 1176; trestles to carry, 1173; stage, in building, *1453*, *1454*
Derricking, of jib, drawing, 4202
Descartes, René, denies consciousness in lower animals, 3117; discovery of reflex action, 2013; doctrine of automatism, 2012
"Descent from the Cross," Rubens, *3947*, 3948
Desert, Russian, 2408; industries, 5707
Deserts, action of wind in forming, 1500; distribution, 626; irrigation, 627; Mexico, 4175; North American, 4065; plant life, 727
Desiccator, chemical, *4407*, 4412
Desiderative verbs, Latin, 1047
Design, adaptation to material, *5798*, *5979*, 5980; application to ornament, *5818–5821*; beauty in, 2133; books on, 6629; broad principles and their application, 108, 5522, 5523, 5818, 5977; commercial adaptation, 5977, *5978*, *5979*, 5980; fitness in means, material, and purpose, 5980; geometrical basis, 5977; harmony with purpose, 5523; in industrial arts, 5818; laws of, *5819*, *5820*; material, conformability, 5980; plant form adaptations, *5978*, *5979*; the repeat, 5977; study of, 5521; three essentials, 5820; traditional and natural, 5818
— architectural, principles of, *2128–2135*, *2283–2288*
— for books, 6728
— in carpet weaving, 3357, *6385*–6390
— geometrical evolution, application, *2320–2322*, 2397, *2566*
— machine, books on, 5595
— textile, principles of, 2939, **3153**, 5510, *6385*, 6390
— vehicle models, 2728, *2729*
— wallpaper, 6725
— *see also* Drawing

Designing shop, in engineering, 2108
Designer's paper, textile, 2939, *2940*
Desire, contrasted with will, 2993; ethical importance, 2860
Desk, construction, 4862, 6588, *6589*
Desman, aquatic insect-eater, 1764
Desmids, 166, 1370, *1373*
Despotism, in Europe, 629
Desrumanx water softener, *4096*
Dessous and dessus, French, 6089
Destructor, refuse, cost of installation, utilisation of power, 5024
Detail, in drawing, 343
Detectives, qualifications and payment, 1408; railway, 5108
Detector, in wireless telegraphy, Hertz and others, *3895*, 3897
Determinism, psychological theory of, 2995: *see also* Will, Free wil
Detonators, use, 6274; manufacture, 6765
Detrusion, of building materials, timber, *1257*, 1260, 1261
— in tool work, definition, 4149
Detrusive tools, action, 4584, *4585*
Dettingen, battle of, 5554
Developers, photographic, making up, 4421, 4422, 5467, [illegible], 6683
Development, in biology, 137; physiological, 96; *see also* Embryology
Devereux, Robert, Earl of Essex, quarrel with Queen Elizabeth, execution, 3999
Devil machine, structure, *2897*
— plasterer's tool, 5500
"Devilling" in law, 6748
Devilling machine, in preparation of gutta-percha, 810
Devitrification, in geology, 1008
Devon cattle, 2235, *2237*, 3666, *3667*; long wool sheep, *2362*, 2367
Devonian system, geology, 2067; rocks, 2253, *2254*
Devonshire, cattle farming, 986; geography, 1276
Dew, formation of, 1900; geological effect, 1504
Dew point, determination, 1899, 6131
"Dew ponds," construction, 4026
Dewar, Sir James, experiments on carbon, 1158; on fluorescence, 3372; hydrogen liquefied by, 841; low temperature researches, 1294, 1444, 1560
Dewey, Prof., pragmatism, 6470
Dewsbury, industry, 1272; wool counts, 2895, 2896, 2897
Dexter cattle, *256*, 3667, *3670*; crossbreeding, 2236
Dextrin, constituent of human body, 439; formation, detection in gum arabic, 5363; composition, uses, 1169; in glucose, tests, 4557; production, properties, 3706, 5363
Dextrose, chemistry of, 3705
Diabetes, cause, symptoms, 6038
Diæresis, in French, 450, 1054
Diagonal, definition, 4723
— cloths, principle of design, *2941*
Diagnosis, objective, 5540
Dial, verge watch, 6081
Diallage, serpentine component, 520, 768
Dia-magnetic bodies and metals, Faraday's list, 4244
Diameter, of circle, definition, 285, *287*, 4208; of ellipse, 1411
Diamine, dyes, dyebath, 5955, 6501
Diamond, 1046, 1074, 1157, *5854*, 6735; areas for prospecting, 2581; artificial, 5853; from Brazil, 4287; brilliant cutting, *5854*; in boring apparatus, 2668; cutting and polishing, 5854; distribution, 3772; from Golconda, 2820; mining, 5854; sources, 5308, 5854
— earth, weathering, 3771
— glazier's, 5836, *5839*
— in vehicle trimming, 3623, *3624*
Diamond-back moth, ravages by larvæ of, *1667*, 1668
Diaper, use in design, 5821; geometrical design, 2320, *2397*
Diaper, textile, figure-designing, *3153*; warps and weft threads, 3909
Diaper, in wood-carving, *6046*
Diaphragm, in drainage, 570, 734
— of man, definition, *30*, *162*, 147, *576*; and mechanism of respiration, 1300, 1301, *1303*; in singing, function, *6048*, 6052
— of lenses and microscopes, 6126
Diarrhœa, 5843; epidemic, infantile, mortality, 5412 in cattle, treatment, 2624; in horses, 2620
Diary, bank bookkeeping, form, *4443*
Diaspore, aluminium ore, 5989, 6735
Diastase, action in starch, 3085, 3706; ferment in plants, 636; in production of alcohol, 2878
Diathermancy, definition, 2060
Diathesis, in heredity, 1587
Diatoms, description and habitat, 166, 1369, *1373*; spectrum examination, 3228; in tripoli powder, *1814*, 1815
Diatonic intervals, in music, table, 274
— scale, in music, 272; tonic sol-fa, 807, 924
Diaz, landscape painter, 4301
Diazotising, process and bath, 5955
Dickens, Charles, novelist, 3440, *3441*; explanation of his genius, 2136; Forster's life, 2616; on observation, 1883
Dickey seat, of van, 2828, *2829*
Dicks' tube-making process, 5327
Dicotyledons, 350; classification, 3523
Dictator, Roman, power of, 1138
"Dictes and Sayings of the Philosophers," first English book printed in England, 3605
Dictionaries, educational value, 2138, *2938*; Dr. Johnson's, 2053
Dido, and founding of Carthage, 1202
"Dido building Carthage," picture by J. M. W. Turner, *4301*, 4302
Die-cutting, in boot-making, *4540*
Die-forging, 207, *2989*, 2991, 3107
Die-head, capstan lathe, 4923
Die-heads, forms, *4481*, 4482
Dielectric, capacity of electric condensers, 3580
Dies, tools, American solid, *4481*, 4482; English hand, 4482; forging, 207, *2989*, 2991, 3107; machine, forms, 4480, 4482; screw cutting, 3628; screwing, 4480, *4481*, 4482; self-opening, forms, 4482; spring, *4481*, 4482; steel for, 4747, 4749; temper of, 4746
— in saddlery manufacture, 4748
Diesel oil-engines, 2278, 5127
Die-sinking, art metal-work, 5529
Dietaries, avoidance by the healthy, 3600; child's, 4683
Dietetics, 3380; book on, 3823; Berthelot's tablet scheme, 203; beverages and diets, 3377; cookery and food, 3311: digestive system, 673; essential oils in, 1033; food in relation to health, 3109; principles and practice, 3599; vegetable, 3110
Differential block, of pulley, 688, 834
Diffraction of light, 3368: *see also* Refraction
Diffusers, in beet sugar manufacture, 4160, *4162*, *4163*
Diffusion, 1375, law of, 1302
— pulp, of beet sugar, use, 4164
Digesting returns, explained, 2473
Digestion, controlled by will, 5841; effect of alcohol, 3377; effect of coffee, 3379; effects of tea, 3378; of fats, chemical process, 3486; functions of lymphatics, 1195; influence of mind on, 3600; influence of teeth on, 5549; process of, 673; and mental strain, 2672; tables of forms of food, 866
Digestive organs, human, 197, *576*; intestines, *675*, *676*; mouth, 673; stomach, 673
Digger, steam, in agriculture, 431
Digit, in mathematics, explained, 90
Digitalis purpurea, heart tonic, 4013: *see also* Foxglove
Digitigrade, limbs of mammals, 1869
Digits, developed into hoofs, 1869
Dignity in architectural design, *2129*, 2286
Dimensions, algebraic expressions, 2149; in psychology, 422, 2119; in workshop practice, 3692
Dimethyl, in chemistry, definition, 2876
Diminished intervals, in music, 274, 363
Dimity, warp and weft threads, 3909
Dinas bricks, 644, 1285; in furnace construction, 3942
— clay, use for firebrick, 1285, 3941
Dining-cars, railway, *4802*, 4809, 4810
Dinosaurs, in zoology, 2377
Diocletian, Emperor, rule, 2072
Diogenes, his tub philosophy, 976
Diorite, rock, 1008
Dip, in mining, definition, 2377, 2378; measurement, 1923, 1924
Diphtheria, conveyed by air, incubation, causes, mortality, anti-toxin treatment, 5410, 5411, 6544; symptoms and treatment, 6260; toxin, 6781
Diphthongs, absence of in Italian, 2044; English, definition, list, 121; German, 252; in shorthand, 261, 1101, 1102
Diplex, in telegraphy, defined, 4668
Diplodocus Carnegii, skeleton, *plate facing* 2055
Diplomatic service, British, appointments and salary, 2934, 2935
Dipnoi, order of fishes, 3045, *3067*
ipper, classification, 2210
Dipper, in astronomy: *see* Great Bear
Dipping, sheep, 2366
ipteral, in architecture, 2859
ip-trap, in drain pipe, 570, *571*
irect sounder, telegraphic, 4606, *4607*
irector, of cycloidal curve, 1414
Directors, limited company, annual list, 3331; function, 3185, 6800
Directory, French, purpose of, 5112
Directrix, in conic sections, definition, 5783; in geometry, 1411, 1412
Disbursement card factors, 6040
Disc grinder, design, 2791, *2792*, 5210
Disc valve, of sewer, use, *4457*, 4458
Discharge, coefficient of, 1574, 1577
— in textile printing, 4502
— of water through orifice, *1573*; through weirs, *1577*
— in static electricity, 3579, 3580
Discord, in music, 363, 565, 2319; in setting melodies, 631; in pianoforte playing, value, 1890; relation to harmony, 2319
Discount, banker's and true, 1129, 1319, 4292; of bills of exchange, bankers' charges, 1318; of bills, how to enter in ledgers, 1569; of bills, Scottish procedure, 1466; calculation, 1571; for cash, in shopkeeping, 176; on debenture account, explained, 3331; how to record in bookkeeping, 491, 658; legal aspect, 658; stock at, defined, 1262
— rate, Bank of England's, influence on foreign exchanges, 4170
Discounted bonus system, in insurance, 3223
Discounting, 1320: *see also* Discount *and* Exchange, Bills of
"Discus Thrower," statue, 2929
Discussion, as factor in education, 2137
Disease, application of term, 5700; disseminated by mosquitoes, 3721; due to age, 5701; due to sex, 5700; endemic, causes and prevention, 5409, 5410; epidemic, prevention, kinds, 5410; and heredity, 1587, 2662; immunisation during, 6544; immunity, 6543, 6781, 6782; immunity of certain races, 1030; incident to special climates, 5274; infectious, incubation and infection periods, 5054, *5056*; infectious, kinds described, 6260, 6261; infectious, notification, isolation, 5055; infectious, preventive measures, 5054; disinfection after, 5055; infectious, source of impurities in air, 3799; influence on evolution, 1029, 6782; kinds increasing and decreasing, 4530; microbic, 6439; moral, immunity, 6784; nervous

Disease—*continued* 6261 ; recurrent, 5702 ; symptoms and their causes, 5539 ; systems of treatment, 5540, 5541
Dish, of wheels, explained, 3127
Dishonoured bills of exchange, 1090
Disinfectants, kinds and uses, 5055 ; from coal-tar and benzene, 5467
Disinfection, in laundry work, 2590
Disinfectol, from creosote oil, 5463
Disjunctive personal pronouns, in French syntax, 2047
Disk-flower group, classification, 353
Dislocation, in geology, definition, 1925
— treatment, 6472
Dismissal of domestic servant, law appertaining, 611, 6845
Dispensing, career for women, 321 ; by chemists, remuneration, 1651, 1654
Dispersion, in light, 2734 ; in telescope, correction of, 2950
Displacement curve, of ship, *5967*
Disraeli, Benjamin : *see* Beaconsfield, Lord
D'Israeli, Isaac, works, 2450
Dissection, in bookkeeping, 2270
Dissenters, attitude of Established Church, 4950 ; defence by Daniel Defoe, 4950
Dissipation of energy, 1298, 2062
Dissonant intervals, in music, 363
Distance, judging by sound, 1019 ; problems concerning, 1549
Distemper, in horses, treatment, 2620
— water paint, varieties and manufacture, 1036, 5836, 5149
— brushes, painters', *5829*, 5831
Distillation, in chemistry, 241, 4316, 6818 ; destructive and constructive, processes and plant, 5461
— in metallurgy, process, 3836
Distoma hepaticum : *see* Liver rot
Distress, law of, 6847
Distributed load, in beams, 2198, *2199*
Distribution, in biology, 137
Distributive numerals, Latin, 601
— pronouns, English, 607
Distributor, rotary, in type printing telegraph, 5394, *5395*
District councils, summary of powers, 316 ; *see also under* Urban, Rural district councils
— medical officer, 1927
— nursing, conditions of work, 6172
District railway, heating, 3025
— superintendent, railway, 4229, 4230
— surveyor, duties, 454
Diver, birds, 2214 ; food, 2493
Dividend, in arithmetic, 91
— company, 1262, 3186, 3189 ; appropriation of profit account, 3330 ; payment by banker, 4294 ; relation to profit, 2421
— in stockbroking, relation to risk, 3483
Dividers, measuring instrument, use, kinds, *552*, 4701, *4703*, 4707 ; use in drawing, 284 ; spring, metal-worker's, *5521* ; in scale delineation, 5419
Diving bell, description, 1403, 1827
Diving dress, 1827, *1828*
Divisibility of matter, 1265
Division, algebraic, 2151, 2281 ; arithmetical, 91, 94 ; compound, rules, 229 ; of fractions, 705 ; recurring decimals, 885
Division of labour, psychological problems, 2548 ; boot factory as instance, 4239, 4241
— in sculpture of figure, 1509
— in zoology : *see* Fission
Divorce, law of, 6850 ; non-recognition by Roman Catholic church, 4663 ; sociological aspect, 4663
Djibeh, nightdress, drafting, *3588* ; for invalid, *3591*
Dobby, weaving machine, action, 3685
Dobson, Henry Austin, author, critical works, 2687 ; as poet, 1438
Dock, weed, *882* ; classification, 354 ; eradication of, 1378 ; root as tanning agent, 3013
Dock gates, *6333*, *6334*, 6493 ; hydraulic, 1224 ; timber for, 4644, *4645*
Dock, of harness, 4886 ; making, 5191
Dock labourer, industrial drinking, 5815
Docks, construction, *6331*, *6334*, 6494, *6497* ; pressure of water, 1076
Doctor : *see* Medical profession
Doctrine, true and untrue, 5530
Dodder, 506, *507* ; farm weed, *882*, 1378
Dodecahedron, definition, 1747
Dodo, classification, 2211
Doe-leather, 1166
Doffer cylinder, of carding machine, function and mechanism, 1543, 1545, *1546*
Dog, classification in biology, 380 ; diet, 3111 ; length of intestines, 578 ; trade in, 891
— in carpentry, in gluing joints, *3845*
— in joinery, use in trestle construction, 1173
— of planing machine, function, 5000
—, prairie, digging claws, 1871
— tongs, in steel production, 4907
— tool : *see* Commander
— in woodworking, for gripping logs, *5901*, *5902*
Dog-biscuits, manufacture, 3598
Dog-carriage, in wood-working, 5996 : *see* Log carriage
Dog-cart, dimensions and weight, 2726 ; as means of transport, 2152, 2154 ; side elevation and half back, *2731*
Doge, first creation, 2945
Doge's palace, architecture, 3376
Dogfish, use as food, *3065*, 3066 ; plague of, Canadian action, 5318
Dogger Bank fisheries, 980, 987
Dog-irons, in shoring buildings, use, 916
Dogmatism, applied to knowledge, 6257 ; and the new chemistry, 2553
Dogs, boring tools, *2666*, 2667
— of typewriter, mechanism, 1527
— used in shipbuilding, 5737, *5738*
Dog-shore, in launching ships, 5923
Dog-spike, in railway construction, fixing, 3252, *3254* ; unfixing, 3253
Dog-tooth spar, form, 766, *767*
Dog-violet, pollination, *908* ; seed dispersal, 910, *911* ; self-fertilisation, 909
Dogwood : *see* Cornel
Do-kat, in sugar manufacture, 4353
Doldrums, nautical term, definition, 296
Dolichocephalic races, 1786
Dollond, achromatic lens, 295, 4930
Dolly, yarn scouring machine, 6198
Dollying, in knife manufacture, 5477
Dolly-tub, in laundry work, *2475*
Dolmens, erection inspired by religion, 2480
Dolomite, characteristics, 1042, 1073, 6736 ; uses, 3941, 3942 ; for furnace construction, 3942
Dolomites, in geology, 534, 768
Dome coverings, making, *3888*, 3889
Dome, in architecture, churches, 3090
— in masonry, construction, *3146* ; kinds, 3148 ; supporting, 3148
Domes, boiler, construction, *3103*, 3106
Domesday Book, introduction, and reasons for, 2359
Domestic class, statistics, 2976
Domestic economy, schools of, 3509 ; teachers, 6479 ; women's training, 321
— offices, in building, ventilation, 6021
Domestic servants, duties, 761, 814, 1002, 1091 ; position in law, 609, 614, 6845
Dominant, in biology, 1482, 1483
— in music, 273
— seventh, 363, 566 ; use in modulations, 568 : *see also* Bass, figured
Doming block, jeweller's, *5857*
Domitian, Emperor of Rome, 2068
"Don Quixote," Cervantes', quotation with translation, 2482 ; first English translation, 2962
Donatello, sculptor, "Head of a Young Man," by, *1511* ; style and works, 3676, *3677*
Doomsday Book : *see* Domesday book
Door, automatic closing, *4760* ; construction, proportions, varieties, 5179, 5180, *5181* ; fire-resisting, 4752, *4753*, *4757*, *4760* ; frames, and their parts, *5181*, 5182 ; full-size architect's drawing, 5692 ; Gilmour fire-resisting, 4760 ; glazing internal, *5839*, 5840 ; hinging, 5184, *5185* ; quantity surveying, 6513 ; as means of ventilation, 4019 ; woodwork, 3539, 3540
Door post, of room partition, 4448
— vehicle, *2827* ; of brougham, 2829, *2831* ; of carriages, sectional drawings, *2727* ; hanging explained, 3022 ; pillar, concealed hinge, *2727* ; trimming, 3624
Doors, raking mouldings of pediments, 5297, *5299*
Doorway, architect's detail drawing, 5692, 5694 ; splayed work, 5296, *5298* ; double curvature, 5297, *5299*
Döppler's principle, 3230 ; applied to star motions, 3371, 6698
Dorians, invasion of Greece, 668, 2858
Doric order, in Greek art, *2035*, *2858*, *2859* ; in Roman architecture, 2932
Dorking fowls, 4659, *4661*, 4953 ; cross breeding, 5623, *5624*
Dormant life, explanation, 277
Dorsal nerves, human, *1941*
— tube, 29
— vertebræ, human, *1605*, *1606*, *2144*
Dorset horn sheep, *257*, 2361, 2367
Dorsetshire, geography, 1275 ; oil shales, 6009 ; wool, 72, 221
Dot, use in engraving, 6114
Dots, soldered, use in lead roofing, *5033*
— use in plastering, 5499
Dotted notes in music, value of, 38
Dotterel, courtship by hen, 2505, 2506
Double bar, in music, 40
— bass, musical instrument, *3167*, 5726, *5728* ; manufacture, 6704, 6707
— clarionet, cost, fingering, 4785, *4791*
— bassoon, musical instrument, description and playing, 4900
— bowed notes, in orchestral music, 5886, *5891*, *5892*
— chamber system, in brickmaking, 1282
— cloths, design, 2942, 2943, *2944*
— decomposition, term in chemistry, 1597
— entry bookkeeping, conversion from single entry, 3917 ; origin of, 1467 ; *see also* Bookkeeping
— faced cloths, design, 2942, 2943
— note passages, in pianoforte music, direction of hand in, 1758
— perch, of waggon, 2829, *2830*
— ranging, in surveying, 263
— roller, gin, *389*, 390
— slate, size, 530
— stopping, in violin playing, method of playing, *2412*, *2413*
— tip-head, arrangement of lines, railway construction, *3175*, 3176
Doubling, in music and harmony, 364
Doubling, Scottish system, *2707*, 2708
— in silk manufacture, 2596
— in sugar manufacture, 3831
— in textile manufacture, *2593*, 2594
— in thread manufacture, 2707, 2708
Doubt : *see* Scepticism
Dough, making, 3283
— in biscuit-making, *3594*, *3595*
— in breadmaking, *3394*
Douglas, Gawin, Scottish poet, 328
Douglas, Sir Robt. K., orientalist, 2786
Douglas fir, culture, 4679
Doulting freestone, 1518 ; use, 533
Dove's many-voiced syren, 2103
Dover, Admiralty Pier, Prince of Wales' pier, 6333, *6335* ; Continental fares from, 714, 715 ; harbour construction, *6331–6334* ; harbour regulations, 6220 ; shipping and trade, 6005, 6006
Dovetail saw, defined, 3385
— cutting machine, *6656*, 6657, 6756
Dovetailing, in joinery, *4113*, 7656 ; in frames for plain tables, 5294, *5295*
Dowden, Edward, critic, 2687
Dowel, in cabinet-making, *6581*, 6584 ; in jointing window sashes, *5183*, 5184 ; in masonry, *3035*, 3038
— joint, in vehicle construction, 2833 ; of wheels, construction, 3127
Dowson gas, 6818, 6927

Doyleys, in laundry work, ironing and dyeing, 2910
Drable, axle, use of, 3326, 3327
Draft, of bill of exchange, 1317
— in textiles, defined, 3909
Drafting, in cloth weaving, 5509
— table, in drawing, *2780*, 2780
Drafts, in masonry, definition, 2849
Drag, coach axle, 2465, 3326
Drag, comb, tool, *532*
Drag, harrow, 1230, *1231*, 1849
— mason's tool, description, *2837*, 2840
— plasterer's, 5496, *5497* : *see also* Larry
— prop and shoe, of van, *2829*
Dragon beam, of hipped roof, *4253*,4254
Dragon-fly, *plate facing* 3361, *3364*
Dragon's blood, resin, source, 4658
Drain-pipes, agricultural, 570 ; forms, *571*, 646 ; junctions, 570, *571*, 733 ; laying, 734 ; *see also* Drainage ; manufacture, 646, 5777
Drain plug, in buildings, 782, 783
Drainage, in buildings, 569 ; books on, 6349 ; of country houses, 780 ; general arrangement, 737 ; house and stables, 735 ; pipes for, manufacture, 646 ; plan, 733 ; of site for building, 329 ; testing, 736
— of land, agricultural land, 258, 432 ; levelling and gradients, 591 ; pipes used for, 570
— of railway earthworks, *3257*, *3258* ; of permanent way, 3429
— roads, 2323, 2324
Drains, agricultural, 432, 781 ; cleansing apparatus, 734, 784 ; connection with main sewer, 733 ; detection of disused, 329 ; excavation for, 329 ; house and stables, 735 ; laying, 733 ; quantity surveying, 6513 ; of sanitary house, *5051*, 5054 ; self-cleansing, 737 ; testing of, 782 ; ventilation, 781
Drakenberg Mountains, 3275, 3584
Drama, English, 1152 ; Elizabethan, bibliography, 849 ; Milton, 992 ; its place in literature, 678 ; Restoration to 1900, bibliography, 1149 ; to Shakespeare, 678 ; Shakespeare, 680 ; after Shakespeare, 845
Dramatic agent : *see* Theatrical agent
Draper, business and trade of, 45, 2219, *2221*, *2223*
Draperies, hanging, 6722
Drapery, definition of term, 2219 ; business, 45, *2219–2225*
— study in shading, *2187*
Draught, in casting : *see* Taper
— in heating, 6015
— production in furnaces, 4126
— of vehicles, conditions of strength and speed, 2725
Draughtsmen, municipal, 1214
Drave, tributary of Danube, 1838, 2164
Dravidian race, 417 ; ethnology, 1789
Drawbacks, in casting : *see* False cores
Draw boring, of tenoned joints, 4040
Drawbridge, 2886, 2888
Drawer, in joinery, 4111, *4113*, 4115 ; making, 5294, *5295*, *6581*, 6586
Drawers, boy-baby's, *4195* ; girl's, 4473 ; infant's, 3856 ; young child's, *4050*, *4051*
Drawing, 108 ; accuracy, importance of, 1533 ; how to block in, life models, 342, 344 ; chiaroscuro, medium and principles, 1533 ; dictionary of, 3009 ; instruments, 284 ; preparation for modelling, 1345 ; perspective, linear and aerial, 595, 600 ; prehistoric, 2255, *2256*, 2478, *2479* ; in stumping chalk, *1535*, *1536–1539* ; true drawing, 470
— architect's, *5419*, 5420, *5421* ; joinery, masonry, and carpentry, 5694–5697, 5698 ; detail drawings, variety, 5692 ; drawings for a house, 5542, *5543–5547*
— brush, *2690–2693*
— engineer's, 2790 ; axle-boxes, 3263 ; axles, 3133 ; bearings, 3263 ; belting, 3263 ; bolts, 3003 ; clutches, 4002 ; couplings, 3133 ; friction wheels, 4002 ; engine details, 4423 ; gearing, 3638, 3656, 3921, 4090 ; keys, 3003 ; machine design, 4201, 4323 ; nuts, 3003 ; odontograph, 3640 ; pulleys, 3423 ; rivets, 3003 ; rope driving, 3423 ; screw threads, 3003 ; shafts, 3133
Drawing, freehand : *see* Freehand
— geometrical : *see* Geometrical drawing *and* Geometry
— light and shade, 1533 ; in monochrome, 1792 ; pencil, *2184*
— memory, 1088
— model : *see* Object drawing
— object : *see* Object drawing
— pastel work, 1061
— in sculpture, outlining on stone, *1676*
— for sheet-metal workers, 4521; cones, 4737 ; 4933 ; curved articles, 5163 ; cylinders, 4933 ; ellipses, 5163, 5347 ; envelopes, 4521 ; polygons, 5163 ; pyramids, 4524
— solid geometry, 1747, 2005
— technical, dictionary of, 3009 ; instruments, 2788 ; squared paper, 4329 ; *see also* Drawing, engineer's, Drawing, sheet-metal *and* Geometrical drawing
Drawing-board, architect's, sizes and materials, 5420 ; cleat, attachment, 5293 ; technical, 2789
— cards, use in workshops, 4000, *4001*
— down in forging, 2984
— frame in textiles, electric stop-motion, 2293 ; French system, 2291 ; machine details and manufacture, *2097*, 2100 ; woollen spinning, *2290*, 2291, *2293*
— office, of shipyard, 5608
— paper, manufacture, 6401
— shop, in engineering, 2108
Drawings account of partners, 2978 ; division of profits, 2756
— architectural, scale, 1910 ; for certificates, 1912, 1913
— in building, use of, 307
— ship, 5608
Drawing-stitch, in tailoring, *1111*, 1112
Draw-kiln, lime, calcination, *647*
Draw-knife, 3386, *3387* ; chisel, 4150
Draw-plate, metal-worker's, *5521* ; in wire-drawing, *5524*, 5525
Draw-stop action, of organ, 3857
Draw-tongs, metal-worker's, *5521*, *5524*
Draws, in castings, cause, 3962
Drayton, Michael, account, 538
Dreams, savage's interpretation, 6772
Dredger, bucket, in mining, *2958*, *5335*
Dredgers, in canal excavation, 5336
— in mining, *2958*, *5335*
Dredging, machinery for, 1826, *1827*, *1828* ; methods, *5335*, *5336*
— in mining, appliances, *2958*, 2960
Drenching, leather, 3011
Dress, average quantities of material for, 186 ; for evening wear, 968 ; *see also*, Children's clothing, Dressmaking, *etc.*
— chariot, described, 2465
— material, design, fitness, 5980
— vehicles, suspension, 3122
Dresser, carved, *plate facing* 5809
Dressers, plumber's, 5029, *5030*
Dressing gown, *3588* ; Watteau, *3590* ; young child's, *4050*, 4052
— jacket, style, *3590*
— machine, *1215*, 1247
— in milling, process, 3081, *3083*
— in thread manufacture, 2708
— in textile manufacture, 3489
Dressings, in buildings, *2177*, 2178
Dressmaker, business of, 971, 2437 ; equipment, *185*, 2437 ; sundries, haberdasher's stock, 3152
Dressmaking, 150 ; accessories, 185 ; frills, kilted, 968 ; sewing-machine, 154 ; sewing and stitching, 150 ; training for, 322
— business of : *see* Dressmaker
— *see also* Tailoring
Driers, in paints, kinds, mixing, 5831, 6571 ; in varnishes, 5835
Drift tool, form, use, 3107, *4585*, 4586
Drift-net, use, description, 4990
Drifting, forging process, 2990
— in plate-punching, 3095
Drill, effect on children, 4863
Drill, brick and stone boring, 5182, *5183*
Drill, diamond, in boring wells, 4029
— electric, types, *5450*, 5453
— hand-driven, use, 5449
— in mining, 2583–2587
— machines, in agriculture : *see* Seed-drilling machines
— mattress ticking, 6720
— mechanical and power, 3304, *3307*
— metal-workers', *5521*, 5524
— pneumatic, *1803*, 1806, *5452*, *5453* ; rock-cutting, *1825*, 1826
— portable electric, varieties, *5448*–5453
— power, percussive, *2584*, 2585, 2586
— rock, form, *1825*, *2584*, 4480, 5356
— types of, 4259, 4262, *4263*
— *see also* Drilling machines
Drillers, forms of tests, 3965
Drilling, in art metal-work, *5523*, *5525*
— in boiler-shop work, 3100, *3104*
— compared with punching, 3095, *3097*
— by light portable machine tools, 5449
— machines, varieties, construction and use, *5005–5007* ; portable types, *5277*, *5279*, *5280* ; structure and purpose, *3317*, *3319–3323*, 5005
— in mining, quarry work, 2955 ; rotary, Ker, 2668, *2669* ; single-handed, 2584, *2587*
— pillar, 5449 ; portable machine tools : *see* Drilling machines *above*
— in wood-carving, 6043
Drink problem, a social problem, 4124
Drip moulding, of light waggon, 2829
Drip pipe, in building, use, 6023
Dripping points, botany, defined, *727*
Drive, carriage, making, 6318
Drive, in power transmission, 3531 ; universal and flexible shafts, *5449*
Drive pipe, of hydraulic ram, 1685
Driven brush, manufacture, 6109
Driver, railway, work, wages, etc., 4597
Drivers, of American clock, 5712
— of public vehicles, employment, 4185
— of railway motor vans, 5079
Driving-belt, use of raw hide, 3532
Driving box, of brougham, 2829, *2831*
Driving, as a career, 4185
— process in timber crane work, 4644
Driving head, lathe, improvements, 4914
Drone bee, functions, *5957*
Drones, of bagpipes, *5059*, 5062
Drop forging, in iron working, 236
— hammer, 960, *2991* ; construction, 2022 ; in drawing down, 2984
— prints, in casting, 2340, *2341*
— test, application to rails, 3608
Dropper, in mining, definition, 2379
Dropsy, cause, 5540 ; caused by alcohol, 5842
Dross scoop, galvanising, *6164*, 6170
Drought, Australian, 3702 ; cause and effect, 4491 ; suggested definitions, diagram of periods, *4027*
Drowning, psychological phenomena, 2305 ; treatment, 6473
Druggists' sundries, surgical instrument dealer's stock, 5192
Drugs, action and use, list of those with specific value, 5541 ; alcohol in, 2880 ; apothecaries' weight, 226 ; dyers', 5779 ; modern discoveries, 237 ; properties and uses, 4006,4014 ; psychic action, 5690 ; standardisation, 4009 ; synthesis, 2711, 4128
— plasterers' tool, 5496, *5497*
Druid stones, occurrence, 2254
Druidism, in Ireland, 2608
Drum, coal drying, in cement manufacture, 1853, *1855*
— crane, casting, 2338, *2339*
— of the ear : *see* Tympanum
— fur-cleaning, *6431*
— pump, principle, 1686, *1687*, *6060*
— in shaft sinking, 3459
— in stuffing, leather, 3219
— tanners' tool, *3162*, *3163*
— of whip crane, 832
Drumhead cabbage, *2906*
Drummond, Henry, author, 2617 ; story of childhood of, 104
Drummond, William, poet, 539
Drums, classification, 5565 ; chromatic, bass, 5733
Drumstick, manipulation, *5565*, 5566
Drunkards' offspring, heredity theory, 1588

Drunkenness, convivial and industrial, 5814 ; as a disease : *see* Alcoholism ; effects, 5813 ; and heredity, 2662 ; law regarding domestic servant, 611 ; psychological physiology, 2300
Dry cell, electric, *465*, 467
Dry-cleaning, use of benzoline, 6148
Dry rot in timber, 52, 1037, 1371, 3545
Dryer, in cement manufacture, 1853
Dryden, John, author, dramatic works, 1149, 1152 ; poems, 992 ; as prose writer, 1642
Drying, in brickmaking, 1282
— cylinders, in dyeing, 6372
— in laundry work, 2689
— in milling, 3080, *3081*
Dry-point engraving, 6113, 6290
Du Chaillu, work on Scandinavian travel, 213, 860
Dualism, of mind and matter, 3287, 6464, 6467
Dubbin, as stuffing material, 3219
Dub-end carving, design, *2729*
Dublin, exports and imports, 6006 ; harbour, construction, 6330 ; harbour revenue system, 6220 ; police, 1406 ; water supply, 4027, 4157
Dublin University, dental licence, 5770 ; theological course, fees, 162
Duck, Anseres, bill, 2494 ; description, 2213 ; webbed foot, 2496
— poultry, carving, 5934, *5935* ; choosing, 1228, 3717 ; dietetic value, 3311 ; manure of, 5875 ; roast, cooking, 1874 ; varieties, breeding, housing, and rearing, 5704, *5705*
Ducklings, housing, rearing, and feeding, 5706 ; roast, cooking, 1874
Duckweed, *730* ; sewage plant, 4549
Duckwing fowl, *5089*
Duct, in building, ventilation, 6023
— physiological, definition, 102
Ductility, contrasted with malleability, 1375 ; of metals, 3838, 5523
Dudgeon expander, use of, 3104
Dudley, Lord Guildford, marriage, execution, 3833, 3834
Dudley, John, Duke of Northumberland, protectorship, execution, 3833, 3834
Dugong, 1762 ; fishing and uses, 5121
Dulcimer, musical instrument, construction and use, 4314, 4315
Dulcitone, musical instrument, *5569*
Dulong and Petit, atomic heat, law, 1014
Duma, Russian, convened, 6301, 6302
Dumb-fault, in mining, definition, 2377
Dumb well, digging, steining, 2323
Dumdrudge soldiers, quotation from " Sartor Resartus," 5098
Dumpy level, use, in building, 309
Dummies, plumbers', 5029, *5030*
Dummy, masons' tool, 2837–2839
Dunbar, William, Scottish poet, 328
Duncan I., of Scotland, murder 2607
Dunchi, plant, distribution, uses, 818
Dundee, industry, 1025, 1066
Dung, farmyard, properties, 433, 434
Dung-beetle, classification, 3510
Dunlop, J. C., history of fiction, 2962
Dunst, in milling, definition, 3079
Dunstan, St., Archbishop of Canterbury, life, 2356, 2357
Duodecagon, geometry of, 285, 744
Duodecimals, calculation by, 1715
Duodenum, digestive process, 675 ; structure, *576*, *579*, *580*
Duplex system, in telegraphy, *4606*
Duplicating, in typewriting, 1698 ; charges, 1920
Dupré, landscape painting, 4301
Dura mater, anatomy of, *2146*
Duration, singing voice, 6047
Durer, Albrecht, characteristics, portrait by, *4117* ; school of, designs suitable for stained glass, 4945 ; woodcut, *6291*
Duresco, distemper, manufacture, 1036
Durmast oak, timber, 56
Durham Cathedral, 1272, 3233
— cattle : *see* Shorthorn cattle
Durham, county, geography, 1272
Dust, in air, and sources, 3798
— bin, sanitary, 5054, *5055*
— collector, use in milling, 3083
— showers, volcanic, diffusion of, 1207
Dusting brushes, painters', *5829*, 5831
Dutch, phlegmatic temperament, 5701
— bond, in masonry, 1521
— cheese, dietetic value, 3311
— clinkers, size, weight, 1520
Dutch East Indies, coins, weights and measures, 409
— language, 1771 ; English importations, 1770 ; translation fees, 1920
— metal, composition, properties, 3940
— rush, structure and use, 1310
Dye tray, in leather manufacture, 3455
Dye : *see* Dyes
Dye factories, erection, 5908
Dyeing, use of aluminium sulphate, 4780 ; animal fibres, 5637 ; coal-tar dyes, 5953 ; cross process, 6502 ; fixing agents, 5780 ; hand and machine, *6367–6372* ; indigo piece-dyeing, *5782* ; insoluble colours, 6194 ; mixed effects and fabrics, 6501 ; mordants, 5779, 5780 ; one-bath, 6501 ; plant, *5782* ; preliminary operations, 6196 ; principles of, 6649 ; recipes and patterns, 5637 ; slop padding, process, 4502 ; textile fibres, properties and treatment, 5637 ; vegetable fibres, 5639 ; water, quality, 6196 ; woollen, 6502
— leather, 3164, 3455, 6649
— machines, *6367–6372*
Dyers, employment conditions, 2651
Dyes, acid, recipe, kinds, properties, 5955, 5956 ; azo group, composition and representatives, 5468 ; anthracene group, 5468 ; artificial, nomenclature, 5953 ; artificial, subclassification, 5954 ; basic, 5955 ; direct cotton, properties and use, 5954, 5955 ; dyer's, 5779 ; insoluble, 6194, *6196* ; natural, sources, groups and uses, 5781 ; natural, superseded by artificial, 5908 ; nomenclature, 5953 ; phenol group, 5468 ; self-colours, 6504 ; shot-effects, 6504 ; synthetic, 2711, 5953 ; in textile printing, 4501 ; union-cloth, 6501 ; vegetable, 5118, 6651 ; *see also under* Colours
Dyestuffs : *see* Dyes
Dyewoods, source, varieties, 4658
" Dying Gaul," statue, 2930, *2931*
Dyke, in geology, 2065, *2067*
Dynamics, defined, scope, 314, 411 ; Galileo and, 35 ; relation to statics, 85 ; *see also* Mechanics
Dynamite, 6761 ; production of, 3272 ; use in demolitions, 6274
Dynamo, compound-wound, *1324*, 1325 ; construction, 4296 ; excitation rules, 1109 ; Faraday's invention, 129, 951 ; field magnets, *1105* ; frame, 14-pole, *1108* ; giant, *1325* ; induction, right-hand rule, 1105 ; magnet windings, calculation, 1108 ; magnetism, excitation, 1325 ; magneto-electric generators, *1324*, 1325 ; modern type, *1104*, 1106 ; principles of, 949 ; series parallel circuits, 1322 ; series-wound, *1324* ; shunt-wound, *1324* ; supply system, three-wire, *2246*, 2247 ; voltage calculations, 1324 ; windings, lap and wave, *1321–1323*
Dynamometer, use, *3965*, 3967 ; spring tension, in mine surveying, 804
— car, railway, 5104, *5105*
Dyne, unit of force, defined, 424
Dysentery, symptoms and diet, 5843 ; conveyed by water, 5410
— bees', symptoms, treatment, 5963
— in cattle, treatment, 2624, 2625
Dyspnœa, cause, 1303
Dyspepsia : *see* Indigestion

EAGLE, order of birds, classification, description, 2212, 2213 ; flight, 2496 ; pursuit of prey, 2493
— golden, 2213
Ear, human, anatomy, 1512, *2533–2535* ; care of, in children, 4863 ; diseases of, 6264 ; book on, 5427 ; moving, power lost, 2315 ; reconstructive power of, 2317 ; in sculpture, observation and anatomy, 1510, 1512 ; sound wave, analysis by, 2317 ; structure and function, 2315, 2316 ; trumpet for, principle of, 2102
Ear cap, for layette, *3745*, 3746
— middle, function, 2316
Earbreadths, of van, 2828, *2829*
Early Christian architecture, 3089
Early English architecture, 3374, *3375*
Earring, Etruscan and Greek, gold, manufacture, 5687, *5688*
Ears, electric tramway wire, 1935, *1936*
— in millinery, velvet, *5331*, 5332
— in plumbing, in fixing pipes, *5629*, 5632 ; of roof pipes, 5794
Earth, age of, 1923 ; age, geological estimation, 1924 ; age, estimation by saltness of sea, 1601 ; age, radium estimation, 2027 ; astronomical statistics, 6250 ; astronomy of, 6404, 6699 ; circumference and area, 13 ; compared with sun, 6250 ; contraction of, 622 ; curvature, *11*, 375 ; dynamical geology, 1205, 1208, 1209 ; formation, 6702 ; heat of, as power supply, 5127 ; history recorded in stratified rocks, 1921 ; interior, theories of, *623* ; magnetism of, 4243, 4246 ; man's adaptation to his needs, 4515 ; mass, calculation, 6405 ; motion of, physical account, 315, 549 ; orbit, 6120 ; 6404, *6405* ; rotation, 6115, 6119, 6120 ; physical geography, 10, *11* ; relation to the solar system, 620 ; revolution, annual, *15* ; revolution round sun, 11 ; secular movements, 1355 ; spherical shape, 622 ; sun's radiation pressure, 3620 ; surface changes, reasons for, 302 ; yearly revolution, 6120
Earth, in electricity, 669, 670
— (the soil) angle of repose of, 2572 ; " getting " process, 3171 ; medium for transmitting sound, 2101 ; weight, 1704
— slips, railway, 3258, *3259*
Earthenware, early drinking cups, *2478* ; manufacture, 5161, 5233 ; *see also* China *and* Pottery
— burnt, for drain-pipes, 570
— business and trade in, *1893*, 1894
— glazed, use in drain-pipes, 569
— trades, employment conditions, 2653, 2654
— in walls, damp course, 2264 ; ties, 2266
Earthquake, books on, 2256 ; submarine, 1209 ; geological effects, 1352 ; cause and effect, 1208 ; connection with faults, 1925
Earthnut : *see* Arachis
Earth-tremors, cause and effect, 1208, 1209 ; *see also* Earthquake
Earthwork, embankment construction, 1449 ; railway, 3171 ; preservation of, *3257* ; slipping, in railway construction, 3258, *3259*
Earthworm, description, use, *3597* ; fertilising agent, 1814
Earwig, description, 3363, 3364
Easel, *1217*
Easing, in dressmaking, 152
East India Company, 223, 4843, 6549, 6552
East Indies, craniology, 1786 ; exports and imports, 5380 ; map, *3160* ; petroleum deposits, 6009
— Dutch, Dutch trade, 5826
Eastern cadetships, 3477
Eastern Hemisphere, size, 850
Eastings, in plotting surveys, 370
Easy chair, upholstery, 6717, *6718*
Eau-de-Cologne, recipe, 4972
Eaves, of tiled roof, *4869*, 4870, 6511
Ebonite, constituents, use, 809 ; as insulator in electricity, 672 ; manufacture, 4658 ; *see also* Vulcanite
Ebony, for carving, 5809 ; source, 4658, 6884 ; strength, weight, 1260
Eccentric, in engineering, 828, *4426*, 4429 ; engine valves, 5642, *5644*
Eccentricity, in conic sections, 5783
Ecclesiasticism, history of, 6774

Echinoderms, characters of, 1492, *plate facing* 4081, *4083*
Echinoidea ; *see* Sea-urchin
Eciton, wandering ants, 3725
Eclipse, of moon, *11*, 6564, *6565*
— of sun, *6564*, *6565*
Ecliptic, in astronomy, defined, 6120, *6243*, 6246, *6248*, 6250, 6665
Ecology, term explained, 138
Economics : *see* Political economy
Economiser, gas burner, 6026 ; grate, 6015, *6017*
— bowl, of electric flame lamp, 2684
Economy in business, 6518
Ecthlipsis, in Latin verse, 1767
Ectoderm, of cœlenterata, 4083
Ectoparasites, of fish, 5315
Ecuador, geography, 4282, 4290
Edam cheese, composition, 4490
Eddystone Lighthouse, cement used, 2428 ; destroyed (1903), 4951 ; dovetailed joggles in joints, *3035*, 3039 ; stone used for, 529 ; structure and foundation, 76
Eden, river, course, 984, 1271
Edentata, mammals, characters, 1763, 1765 ; development of claws, 1871 ; scale and plate armour, 2156 ; species of, 1494
Edge-cutting machines, boot, *4544*, 4545
Edge-plate, of brougham window, 2829, *2831* ; of carriages, 3325, 3329
Edge-runner mills, cement, 1582
Edges, in drawing, treatment of, 1534
— measurement by, 3692
Edge-setting, in bootmaking, 4545
Edge-trimming, in bootmaking, 4241, *4543* ; in saddlery, 4783
Edgeworth, Maria, novelist, 3132
Edging, in vehicle decoration, *3481*
" Edinburgh Review," founders, 2309 ; Carlyle a contributor, 2452 ; Macaulay's essays, 2615
Editing, newspaper, morality of, 4431
Editor of newspaper, function, qualifications, 3811, 4429
Edmond Ironsides, king, and the Danes, 2357 ; and St. Dunstan, 2356
Education, book on Spencer, 5816 ;
[illegible]
travelling advantages, 64
— Acts (1870 to 1903), 3505 ; as affecting municipal control, 1677 ; effects, 80, 318 ; powers of district council, 316
— applied, 1743, 5593 ; *see further in Group Index, page 6896*
— colonial, openings for teachers, 3741

Edward, King of Britain, 975, 2357
Edward the Confessor, reign, 2358
Edward I. of England, conquest of Wales, 2610 ; takes Isle of Man, 2611 ; reign, 3073 ; restrictions on trade, 146
Edward II., reign, 146, 3075
Edward III., regency, 3076
Edward IV., character and reign, 3603
Edward V., accession and murder, 3603, 3604
Edward VI., reign, 3833
Edward VII., cattle breeding, 2235 ; state landau, 2465 ; travels, 212
Eels, carving, 5936 ; care of young, form of body, 3069 ; choice of, 3717 ; classification in zoology, 3065
Efferent nerves, definition, 102 ; course and nutriment, in spinal cord, *2143* ; *see also* Motor nerves
Effervescing salts, preparation, 4774
Effervescing waters, dietetic value, 3380
Efflorescence, defined, 842
Effluents, trade, exclusion from sewers, 4548 ; purification, *5764*, 5767
Eft, description, 2800
Egg, acid, in sulphuric acid plant, *4628*
Egg in biology, production of germ cells, *1315* : *see also* Reproduction, Pangenesis, Ovum, *etc.*
Egg-and-tongue ornament, 5820 ; moulding, 5297, *5299*
Egg-capsules, of cuttlefish, *3116* ; of purple shell, *3114*
Egg cell, plant reproduction, *347*, 348
Egg-cells, of mosses, *1312*
Egg-generation, biological importance, 1311
Egg-organs, of ferns, *1116–1118*
Egg-laying mammals (monotremata), swimming apparatus, 2038
Egger-moth, maternal solicitude, 3514
Eggs, animal, " dormant " life, 277
— birds, 2506 ; *plates following* 2496
— of bony fish, 3068, *3069*
— poultry, buttered, with mushrooms, 2331 ; centre of gravity and equilibrium, 800 ; chemical analyses, 5094, 5873 ; cooking at high altitude, 1741 ; countries exporting, 5119 ; dietetic value, 3311, 3381 ; digestibility, 3314 ; dummy, *5091* ; fertile and infertile, 5091 ; fricasseed, recipe, 2334 ; hatching conditions, 5091 ; hatching by incubator, 5263, *5264* ; largest, 2214 ; laying by poultry, 4660, 4662 ; preservation, 4931 ; shell, percentage, 5874 ; shell, weight of, 5434 ; sauce, recipe, 2004 ; selection for sitting hens, 5091 ; test for chickens, 5092 ; test for freshness, 4714 ; weight and composition, 5873 ; white and yolk, nutritive values, 3599 ; white and yolk, proportions of, 5874
— of shark, dogfish and skate (mermaids' purses), 3066, *3071*
Arabian conquest, caliphs, 2353 ; army, 4200 ; art, 183, *2519–2523* ; art compared with Chaldean, 2659 ; art, influence on Greek art, 2929 ; art, influence on Persian art, 2659 ; buildings, reasons of permanence, 142 ; coins, weights and measures, modern, 409 ; cotton production, *383*, *384* ; craniology, seaboard, 1786 ; economic progress, 5822 ; ethnology, 1790 ; flax, ancient and modern, 716 ; geography of, 3450 ; history and religion, 419, 1514, 6447, 6692 ; irrigation, 3280, 3450, 5483, 5484 ; literature, ancient romances, 2962 ; Napoleon's expedition, 5238 ; petroleum deposits, 6009 ; shipping, 5255 ; sugar cultivation, 3653 ; tanneries, ancient, 2851
Ehrhardt tube making process, *5323*
Ehrlich, side-chain theory of biochemical action, 4135
Eiderdown, production, use, 6609
Eidograph, in plan drawing, 371 ; in surveying, 158
Eifel, mountains, situation, 1974 ; volcanic formation, 1207
Ejector, of brake, function, 3127
— sewage, Shone's, *4462*, 4463
Elæolite, rock, 1008
Elasmobranchii, fishes, *3065*, *3067*
Elastic cartilage, description, *435*
Elastic limit, defined, 3107
Elasticity, definition, 1375 ; law of, in relation to oscillation, 3747 ; limits of, 1258 ; in machinery, 209 ; in mechanics, 86 ; modulus of, 1258 ; of metals, 1396, 3838 ; of plants, 170 ; of various materials, 209, 1256, 1375
Elaters, of horse-tails, *1119*, 1310
Elbe, river, basin, estuary, *1975*, 1976 disadvantage of shallowness, 4517
Elbow, human, 1710 ; muscles, 1712
— springs, vehicle, 2725, 3328
Elder, in botany, insect pollination, 731
—tree, strength of timber, 1260
Elections, returning officer's fee, 1926
Elector Palatine, rights, 2947
Electors, the Imperial, history of, 2947
Electric accumulator : *see* Accumulator, electric
— batteries : *see* Batteries, electric
— bell, book on, 4298 ; first use, 128 *see also under* Bell
— chronograph, astronomical use, 6247
— conductivity of metals, 1397
— current : *see* Current, electric
— dealers and fitters, business of, 2438
— firing, in war, 6274
— furnaces : *see* Furnaces, electric
— heating, *3030*, *3031*
— impulses in waves, 1359, *1362*
— instruments, books on, 4298
— light, incandescent, cost, 6153 ; domestic use, 5194, 6026 ; fitting to ship, 5924 ; fittings, 6026 ; in shop windows, 398
— locomotive, contrasted with steam, 2085
— measurement, units and standards, 292, 789
— power, calculation, cost, 291, 1951 ; man's use, 4516 ; measurement, 292, 789 ; supply by refuse destructor, 5025 ; water power, turbines, 1694
— power transmission, 291, 5355 ; aluminium wire in, 5171 ; books on, 4298
— pressure : *see* Electromotive force
— railways : *see* Railway, electric
— sparks, oscillating, production, 3748
— stresses, 4023
— supply systems, 2245 ; meters, *2812*
— telegraph : *see* Telegraphy
— trams : *see* Tramways, electric
Electrical apparatus, cost, 4993
— engineer, in municipal service
— worker: 2656
Electrician, work of, 2218 ; in Navy, 4265
Electricity, 128 ; animal, instances, 4449, 4450 ; arc and mechanism of arc lamps, *2414* ; atomic nature, 4022 ; books on, 4298 ; chemical properties, 288 ; chemistry, relation to, 238 ; conduction and insulation, 464 ; and dynamics, 314 ; energy of, conservation, measurement, and transformation, 289 ; in the eye by action of light, 3226 ; Faraday's researches, 949–951 ; generating, older methods of, 949 : *see also* Dynamo ; as illuminant : *see* Electric lighting ; lines of electric force, 4023 ; magnetism, relation to, 562 ; and matter, 313, 4105 ; measurement and properties, 5752 ; mineral deposit, finding by, 2582 ; modern problems, 521 ; nature of, 288 ; negative, charge of electrons, 2028 : *see also* Electrons ; nerves, action on, 1943 ; one-fluid theory, 4022 ; oscillations and electric waves, *3747*, 3894, *3895* ; positive and negative, 288, 2551 ; static, 3579, 3581 ; supply meters, *2812–2816* ; supply, systems of, *2245* ; theories of, 288, 4021 ; therapeutic value, 6264 ; tooling machinery, 3324 ; in transport compared with steam, 2274 ; two-fluid hypothesis, 4022 ; units of, 290 ; vitreous and resinous charges, 4022 ; voltage, 291 ; voltage, alternating, 1857 ; for water transit, 2278 : *see also under* Electric, Electro, *etc.*
Electro-brassing, 6578

Electro-chemical equivalents, 3262
— reactions, instance, 5753
Electro-chemistry, 5752; books, 4298, 6689
Electrode, of electric cell, defined, 466
Electro-deposition, in alloy making, 3930; in art metal-work, 5526; definition, 3421; zinc, 6170
Electro-galvanising, processes, *6170*
Electrolysis, 3260, *5752*; in chemistry, 5, 240, *5752*; preparing elements by, 840; of fused salts, 5753; industrial processes, 3262; ions, direction of, 4022; metals, extraction and refining, 3836, 4127, *5752*, 6165, 6168; of solutions, 5753
Electrolyte, *3260*, 3261; solutions, 4698
Electrolytic dissociation, theory, 4407–4408; Faraday's law, 3261
— reactions, 5752, 5759
Electromagnet, forms and action, *561*
Electromagnetic rotation, 949
Electromagnetic waves, 4021
Electromagnetism, 559; Clerk-Maxwell's theory, 3851; Faraday's researches, 949; Sturgeon's, 129
Electro-metallurgy, processes, 5752
Electromotive force, 291
Electron, 288, 313, 2294, 2317, 4103, 4022; arrangement within the atom, *2295*; cause of comet's tail, 2027; expulsion from atoms, 2554; in gaseous discharges, 4103, 4104; given out by sun, 2027; identity with negative gaseous ion, 313, 4700; mass and inertia, problems of, 2395, 2551; movement of, 2392; properties of, 2551; negative ion, 4700; number in mercury and radium atoms, 2295; relation to atomic weight, 3619; relative size, 2029; speed, 2028, 2551; Thomson's theory of matter, 2294–2298; unit of atom, 1915; and valency, 2296
Electroplating, *6578*; bath, 3421; books on, 4298, 6578; with copper, 5752, 5754; process of, 361, 3421; Woolrich's discovery, 129
Electroscope, in ballooning, 3982; gold leaf, *4022*; radium determination by, 2028; radium "clock," *4105*
Electrothermic reactions, 5753, 5989
Electrotypers, employment, 2655
Electrotyping, 3422; books on, 6076; energy required, 3262; equipment, *5559*, *5560*; study by printer, 5558
Electrozone, use, 4095, 4547
Elegiac verse, rules, 1767, 1768
Elementary schools, 1677; teacher's training and salaries, 164, 6474
Elements, in applied mechanics, 88
— in chemistry, 516; atomic weights, 517; corpuscular groupings, 2298; dissociated in stars, 4136; in earth's crust, 239; electrical characters and corpuscular theory, 2297; electro-chemical equivalents, 3262; essential to life, 2710; etymology, 517; free, 239, 839; in human body, 438; inter-relation, proof of, 3618; list of, 516, 517; Mendeléeff's discoveries, 400–402; nascent state, 693; nature and analysis, 4130; natural synthesis, 4131; new discoveries, 237; periodic law of, 400; preparation, 840; proved to be compounds, 2082; rare elements, 239; relations of, 238, 328, 401; in the stars, 839, 4136; symbols and atomic weights, 517; transmutation, 1448; variation in magnetic properties, 4244; Zeeman effect, 3618; *see also* Atom
Elephant, *plate facing* 1491, 1762; frontal bone of, 1604; ivory of, 811; power, 5011; rate of increase, 824; skeleton, *plate facing* 2085; skin, 2156; tusks, selling, 811, 2155; weight of brain, 2144
Elevation, in architecture, 2131
— in drawing of house, 5542, *5546*, 5548; obtaining, 1747, *1749*
Elevation, in geometry, 595, 599
Elevator, in cement manufacture, *1853*
— grain, gearing chain, 4000
— hydraulic, in mining, 2960
Eliot, George, novelist, *3441*, 3442 3783
Elision, in prosody, defined, 1767
Elixir of life, in early science, 59
Elizabeth, Queen, E. S. Beesly's book, 2786; character, reign, 3997; help to Netherlands, 4398; imprisoned in Tower, 3834
Elizabethan Age, drama, 678; drama after Shakespeare, 845; literature, 845, 848, 849, 2310; morality, general spirit, 848; poetry, 536
Elliott, Ebenezer, poet, 1308
Ellipse, in conic sections, 5783
— geometrical, describing, 1411, *1413*
— in technical drawing, 5347, *5349*, 5350; development from cone, 4933; elliptical section, 4933, *4935*; uniting cylinder and cone, 5040, *5042*
Elliptic spring, vehicle, 2725, 3328; under-carriage, 3124, *3125*
Ellis, H. Havelock, 2785; on the "Woman Question," 4976
Elm, 6317, 6884; classification, 355; bark, 6068; friction data, 959; seed-dispersal, *911*, 912; timber, *56*, 1260, 1261; in vehicle construction, 2827
Elocution, in acting, 6864; singing, 6340
Elæoptene, in essential oils, 4968
Elswick Works, Newcastle, 1272, 2886
Ely Cathedral, 1273, 3374; instance of incongruous design, 5819
Embalming, process, and fees, 5787
Embankment, earth, 1449, *1451*; drainage, 570; effect on erosive action of sea, 1814; water pressure, 1076
— in railway construction, 3175, 3176, *3252–3259*; ballast, 3430; surveying, 801; tipping, *3176*, *3177*
"Embarkation of the Queen of Sheba," picture, by Lorrain, *4300*, 4302
Embden goose, 5704, *5705*
Embolism, cause and effects, 6036
Embouchure, music term, 5135, 5437; of bassoon, 4897; of horn, 5445
Embroidery, finish of camisoles, 3589; cottons used for, 3093; Japanese, 3161; for underwear, 3094
Embryo sac, plant, *347*, 348
Embryology, cellular, 199, 200; continuity and priority of germ-cells, *1314*; definition and scope, 95, 102, 137, 279; importance in psychology, 2116; relation to various parts of biology, 137
Emerald, precious stone, 5855, 6736; imitation, 5852; properties, 5853
— Oriental, green sapphire, 5855, 6736
— green, pigment, 1043
— type, *5028*
Emerson, Ralph Waldo, essayist, 3780; on reading, 2937, 2938
Emery, mineral, properties and uses, 768, 813, 5989, 6573, 6736; use for lens grinding, 6124
— cushion, use, 3093
— paper and powder, 813
— wheels, 2019, 2021; in grinding milling cutters, 3408, 4260
Emeu, description, *2213*, 2214
Emigrants, information and openings for, 3741, 3742, 6212
Emigration, of Irish, 1365; national and economic aspects, 3; purchase of N.Z. lands, 3467; Australian grants, 3235
Emmetropia, in physics, definition, 3178
Emotion, æsthetic value, 180, 723; in Greek sculpture, 2929
Emotions, as mainspring of action, 2805; psychological account, 2694
Empedocles, originator of idea of natural selection, 2030; applied to atoms, 2295; materialism, 6259
Emperor moth, cocoon, 3515
Emphasis, errors and value in reading aloud, 1473; in business letters, 6352; in singing, 6337
— mark, in music, 271
Empire coat, *2328*, *2329*
Employee, commissions, 5927; legal notice, 5928; insurance against dishonesty, 5929
Employer, legal definition, liabilities, 5928; restrictive agreements, 5928; treatment, 5928
Employer's liability insurance, 4852, 5928
Employment agent, 6519
Employment of Children Act, 46
Ems, river, basin, course, 1975
Emu: *see* Emeu
Emulsion, definition, 676, 1033
En (French pronoun), syntax, 1773, 6089
Enamel, metallic paint, 1036
— of human teeth, 576, *578*
Enamelled slate, 530
Enamelling, processes, *5689*, *5690*, 6574; engraving, 5529; Romanesque, 3234
— leather manufacture, 3455
— slates, 530
Enamels, 5521, 6575; in art metal-work, composition, manufacture, 5689; application to pottery, 5384
Encaustic tiles, for building, 646
Encephalitis, symptoms, 6261
"Encyclopædia Britannica," first edition, 2142; Macaulay as contributor, 2615
Enders, in cloth manufacture, 4344
Endochrome of colion, 821
Endoderm, of cœlenterata, 4083
Endogens, term in botany, 51
Endothelium, function, 6354
Endoparasites, of fish, 5315
Endorsement, of bills of exchange, 1318
Endosperm, plant, 350; of wheat, *915*
Endpapers, in bookbinding, *6776*, 6778
Ends, of boilers, *3097*, 3100,
Ends, in millinery, velvet, *5331*, 5332
— in textile industry, definition, 2939
— timber, definition, 3544
End-tip waggon, *3252*
Endowment assurance, 3224
"Endymion" (Keats'), 1307; Croker's attack, 1304
Energetics, science of, 2062
Energism, materialism, 6258
Energy, in animals and plants, sun as source, 4132; bodily heat units, 439; conservation of, 1915, 2062, 4883; conservation of, connection with conservatism of matter, 2391; dissipation, 2062; doctrine of availability, 2062; functions of flywheels, 2018; indestructibility, 2062; interatomic, 2393; measurement, 289; metabolism, molecular, 438; of motion: *see* Kinetic energy; nature of, 1376, 4021; philosophical discussion, 6465; physical discussion, 314; principle of, explanation, 34; mind in psychological theory, 2115; sources of, 2553; *see also* Dynamics *and* Electric power
Enfleurage, in perfumery, definition, 4350, *4969*
Engine, atmospheric, 5415
— caloric, defined, 5413
— fire, 5415
— gas, books, 5595; testing, 3967
— oscillating, use in steamers, 6071
— petrol, types, 3907, 6153
— rail motor-car, bogie, *4801*, 4811
— of railway locomotive, cleaning, *4594*, 4596; coaling, *4595*, 4597; firing, 4597; G.W.R., 6514, *6515*; modern types, *plate facing* 4227; oil fuel, 5106; "pit" examination, 4599; shunting arrangements, 3254, *3255*
— steam, *5909–5914*; automatic expansion, gear, 5654; books on, 5595; continuous working, 5417; crosshead casting, 2338, *2341*; cylinder casting, 2330, *2341*; cylinders: *see* Cylinders, engine; designing for, *4201*; drawings of details, *4423*; early forms, 5010, 5415; efficiency dependent on heat, 5414; erecting, *3691*, 3693; heat, the power agent, 5413; horizontal, *6069*, *6070*; horizontal, coupled, 6071; horse power of,

5418; inclined, 6071; internal combustion, 5415, *6785*; link motions of valves, 6139, *6140*; marine, *5401*, *6292*, 6293, *6294*, *6295*; oldest in existence, *5417*; self-lubricating, 5749, *5750*; of ships, fitting, 5924; side lever, 5748; testing, *3963*, 3966; three cylinder, *6071*; triple expansion type, on liners, 5418; types, *5748*, *5751*, *5909*; vertical, *5748*, *5750*; work proportional to pressure and temperature, 5414: *see also parts of engines—e.g.*, Cylinder, Valves, *etc.*
Engine-driver, railway, 4595
Engineer, apprenticeship, articled pupils, British, German and American contrasted, 5594; education, 1827; employment conditions, 2646; function, 156; training, 2108, 5592
— civil, railway staff, 4591
— domestic, business and plant, 2218
— electrical: *see* Electrical engineer
— marine, training, 6365, 6366, 6807
— municipal, openings in the colonies, 3741, 3743; salaries, 452
— Navy, pay, 4402
— of railway company, 4227, 4230
— Royal Naval Reserve, 6366
— superintendent, of shipping company, duties, 6361
— War Office and Admiralty, 3196
Engineering, Cambridge course, 483; crystallography, bearing on, 4560; societies and diplomas, 453; training, 162; *see also under separate headings*
— mechanical: *see* Mechanical
— municipal officials, 452, 573
— Naval officers' training, 4401
— shops, list, 2108; arrangement, 5589
— *see also* Civil Engineering *and* Mechanics, applied
Engineer's plater, patterns, 4522
Engineers, Royal, service, 3842; drivers, mechanics, and sappers service, 3840
Engineers' tool-makers, employment conditions, 2646
Engineman, railway locomotive, duties, 4598, 4599; wages, 4601
Engine-room artificers, in Navy, 4265
England, architecture, 3374, *3375*; architecture, Renaissance, 3946; climate, temperature, rainfall, 984, *985*; coalfields, 1271, 5303; cotton industry, 223; craniometry, *1786*; engineering, condition of, 5594; evaporation, 4026; exports and imports of port, 6005; flax, cultivation, 716; geography of: *see* England, geography of, *below*; geological connexion with Europe, 1354; geology of, 528; history of: *see* England, history of, *below*; horse breeding, 987; leather trade, history, 2851: *see further* Leather; linen industry and manufacture, 1025; meat consumption, 3381; mortality statistics, 2662; nationalities, in middle centuries, 2354; navigation in Middle Ages, 5256; Navy: *see* Navy, British; place-names, various influences, 1768; police forces, 1406; rainfall, mean annual, 4024; road construction, 2179; roads, history and regulations, 1977; sea fishery regulations, 5318; ships of nineteenth century, 5256; silk industry, 581; skull measurement, *1786*; trade, early history, 146; universities, 1782, 1784; wool industry, 69; *see also* Great Britain

"English Men of Letters," series R. W., 2612, 2618; value of, 1438
Engraved rollers, wallpaper printing, 6725
Engravers, employment conditions, 2655
Engraving, in art metal-work, 5528; etching and line engraving, *6111–6113*, 6114; mezzotint and wood, *6289–6291*; photo., *6483–6486*
Engravings, trade in, 892, 4609
Enlargement, geometrical, 1411
— photo., 6683
— of plans, in surveying, 369, 370
Enlisting in army, facilities for, 3841
Enrichments, architects' drawings, 5698; in brick, *1949*, 1950
Ensemble playing, practice of, 2024
Ensiform process, anatomy, *1606*
Ensilage, in agriculture, 1970, 1971
Entasis, in art, 2287; in masonry, 3040
Entebbe, situation, 3452
Enteric, bacillus, *6540*, 6542; symptoms, 5843, 6260; immunity from, 6544; communication by shellfish, 5315
Entering-desk, 660
— tool, carvers', *5809*, 5810
Enteritis, in horses, treatment, 2620
Entertainments, public, organisation, 6869
Entomology, carnivorous plants, 507, 508; economic, 1666, *1667*, 1668; *see also* Insects
Entry, business, final and original, 777
— single and double: *see* Bookkeeping
Entropy, term in physics, 2063
Enunciation, in geometry, 4208
Envelope, addressing, typewriting, 1697
— manufacture, *6557*
— in technical drawing, 4934, *4935*
— in sheet-metal work, solid bodies, making and drawing, 4521, *4523*
Envers, French preposition, 6090
Environment, change of, effect on animals, 1491; effect on germ-cell, 651; factor in modifying character, 4370; as factor in racial evolution, 1706; importance in education, 2861; in relation to heredity and tendency, 1587; predisposing cause of ill-health, 5702; importance in mental evolution, 3383; psychology, 2995; in Reid's theory of heredity, 1181
Envoy, British diplomatic, 2935
Enzyme, in dairy farming, 4036: *see also* Butter *and* Cheese ferments; action in starch, 3085; not synthesised, 2712; *see also* Ferment
Eocene system, in geology, 2067; distribution of rocks, 2254
Eohippus, fossil horse, 1177, 1178
Ephesus, school of art, 2930
Epigene action, in geology, 1206
Epigynous plants, *347*, 350
Epic poetry, Milton, 991
Epicyclic trains, 12, 832
Epicycloid, definition, drawing, *1414*
Epidermal cell, histology, *1419*, *1420*
Epidermis, of animal hides, 2852
— of human being, structure and function, *1419–1423*
— of plants, 169, *171*
Epiglottis, human, *2144*; function, 1299; function in singing, *6048*; structure, 2537, *2538*, *2539*
Epineurium, in anatomy, *1942*
Epiphenomenon, in Huxley's psychology, 2116
Epiphytes, defined, 506; in Congo forests, 628
"Epipsychidion," Shelley's, 1308
Epirus, under Pyrrhus, 1203, 1204
Epistemology, defined, 2116, 6255
Epithelial cell, kinds of, *200*
— tissue, of human body, 196
Epithelium, ciliated, function, 1300; function in human ear, 2533; in pharynx, 577
Epsom salts, 6736; antidote to carbolic acid poisoning, 3710; at Epsom, 1721: *see also* Magnesium sulphate
Equal altitudes, in surveying, 1709
Equal temperament, in pianos, 2319
Equality, in design, 5980
Equation, chemical, 694
Equations, in algebra, quadratic, 3199, 3290; quadratic, simultaneous, 3291; simple, 2381; involving surds, 3523
Equator, explanation, *11*, 6665
— celestial, in astronomy, *6243*, 6244
Equatorial lines, of balloon, 3984
Equilateral triangle, to construct, 494; definition, 285, *287*, 4330
Equilibrant force, 411, 1833
Equilibration, in evolution of space idea, 2119; function and organ of, 2118
Equilibrium, forces in, 411, 553, 661, 1833
— in physics, 553; gravity and, 799
Equinox, explanation, 15, 293, 6250, 6405, *6665*; instant of, 293; precession, *6248*, 6250
Equivalent, term in chemistry, definition, 1914; law of, chemical, 695
Erdmann's float, use of, 63
Erechtheion, Athens, 1525; order, *2858*, 2859
Erecting, in workshop practice, 3687, 3691; shops, in engineering, 2109
Ergot of rye, 1372, *1373*; characteristics, prevention, *1667*, 1669
Eric XIII., King of Denmark, Sweden, and Norway, 5396
Eric XIV., King of Sweden, rule, 5396
Erica, Ericaceæ, Ericales, 354
Eritrea, geography, 3452
Erlenmeyer's furnace, in chemistry, 240
Ermine, fur, source of, 2157, 6426, 6430
Erratic blocks, on Bondhouse glacier, cause, *1635*, 1638
Erodin, in leather manufacture, 3011
Erosion, definition, 457; of foreshores, 5577–5580; damage by, to railway earthworks, prevention, 3257; geological process, 1813, 1814, 1815; by rain, *1503*; of rocks, glacial, 1638
Error, contrasted with fallacy, 6099; not identical with sin, 5530
Erse: *see* Irish language

Eruptions, volcanic: *see* Volcano
Erysipelas, cause, 5412; treatment, 6260
Erythrosine, dye, source, 5468
Erz Gebirge, 1973, 1975
Erzberg, terraced mines, *2849*, 2850
Escape wheel, of clock, repairing, 5882; verge watch, 6082
Escapement, of American clock, 5712, 5713; of eight-day clock, 5716; of pendulum clock, 5714, *5715*; verge watch, 6081
Escarpment, in mining, definition, 2582
Eskimo race, distribution, *627*; ethnology, 1789; hunting, 4065, 4066; occupations, 10; skull measurement, 1785, *1787*; stature, 1788
Espalier fruit trees, *6675*, 6677
Esparto grass, 6884; countries producing, uses, 5117; size of fibres, *6279*, *6280*: use for paper manufacture, 1168, 6280; testing rope, 1699
Espatra, use in millinery, 4768, 4769
Esperanto, abbreviations, 6666; accusative, 5373; affixes, 4656; alphabet, 4511; article, 4511; elision, 5949; interrogation, 5087; subordinate clauses, 6525; suffixes, 5805, 6093, 6237, 6380, 6524, 6666
Ess bouquet, recipe, 4972
Essay, compared with the modern "article," 2685; English essayists, 1641; English eighteenth century essayists, 2054; nineteenth century, 2308–2310; Macaulay, 2615
"Essays," Herbert Spencer's, 5817
Essential oils, 3486, 4968; analysis, adulteration, 4971, 4972; books on, 4972, 6689; chemistry of, 1033, 3486, 3487, 4968; extraction processes, 4968; sources, natural orders and uses, table, 4970
Essex, in Heptarchy, 2242; peasants' revolt, 1381, 3249
Establishment expenses, in book-keeping, explanation, *3419*
Estate agency, work of, 5284
Estate and land agent, business of, 5284, 5287; training, 5284
— railway, 4227, 4231
— duty department, clerkships, 2765
Esters, 3140; of essential oils, 4968
Estimates, builder's, from drawings, 6343; from quantities, 6342
Estuaries, definition, 458; propagation of tidal wave, 5334; retaining walls and banks, 5335
Etching, brass work, 5529; defined, 6102; metals, 3937, 3938; materials and processes, 6111; needle, use, *6111*; printing, 6112
Etchings, frames for, 4610
Eternal, the, existence of, 6538
Ether, anæsthetic, use, 3139; effect on nerves, 1943; rapid evaporation, 1741, 1742
— gas, manufacture, 6824
Ether, the, 549; and gravitation and light, 935; medium for wave transference, 3943; possible source of power supply, 5011; properties, 4021; relation to the elements, 402; relation to matter, 935; theories of, 935; vibrations, 2396, 2432
Etherification, definition, 3139
Ethers, 3138; presence in wine, 2879
Ethics, of Buddhism, 417: evolution of, 4124; and evolution theory, 1589; free will and fatalism, 2995, 2996; Hudson's theory of moral freedom, 3289; importance of emotions, 2805; Myers' theory of ultimate perfection, 3384; possibility of dogmatism, 2404; practical value of principles and ideals, 2673; psychology of pleasure theories, 2518; relation to sociology, 4275, 4277, 4278; training of the will, 2860
Ethiopians, invasion of Egypt by, 421
Ethmoid, in man, structure, 1604
Ethmoidal cells, *2537*
Ethnology, books on, 5817; race distribution, 629; races of the world, 629; scope and classification of races, 1785, 1788
Ethyl acetate, properties and use, 3140
Ethyl alcohol, production and cost of, 2877; *see also* Alcohol
— ammonium iodide, formula, 3141
— butyrate, essence of pineapple, 5464
— chloride, action of, 3142: *see* Chlorethane
— hydrosulphide, formula, 3140
— nitrate, formation, 3140
— nitrite, properties, 3140
— pelargonate, quince oil, 5469
— sulphide, formula, 3141
— sulphuric acid, formula, 3139
Ethylamine, formation, formula, 3141
Ethylene, preparation, properties, 3706
Etna, Mount, volcanic action, 1206
Eton coat, quantity of material for, 186
Etre (French verb), as auxiliary, 5948; followed by infinitive, 6089
Etruria, art, 2931
Etruscans, characteristics, 1135, 1136; wars with Rome, 1138
Etymology, definition and scope, 115
Eucalyptus, 3698; classification, 353; sources, 3701, 3899, 4658, 5661
— oil, source, 4658
Euclid: *see* Geometry
Euclitic, grammar, defined, 1616
Eugenics, scope and principles, 3120
Euglena, description, *4088*
Euonymin, bark, source and use, 6068
Euonymus: *see* Spindle-tree
Euphonium, musical instrument, description, 5130, 5139, 5732, *5733*
Euphorbiaceæ, rubber from, 808, 5046, *5047*
Euphrates, river, 16, 421, 2719
Euripides, poet, 774
Eurasia, geography, 460, *850*, *851*
Europe, agriculture, 855; animals, 856; classification of languages, 1771; Continental shelf, *302*; cotton trade, *225*, *383*: countries with undeveloped commerce, 5707, 5708; ethnological survey, 1790; forest trees, 626; general map, *852*; history, mediæval, 2241, 4396–4399; history, reference books, 2618, 2787; influence of Byzantine art, 3090–3092; influence on the world (Europeanisation), *630*; modern State system, formation, 4101; national characters contrasted, 391; petroleum deposits, 5305; physical features, compared with Asia, 851, 852; physical geography, 853, 855; physical map, *856*; size, 460, 850; skull measurement, 1785, 1786; trade of Mediterranean countries, 5822; trade of central countries, 5824
Eurypterid, description, 3806, *3808*
Eustachian tube, position of, 577, *579*; structure and function, 2316, 2533
Evaporation, definition, 294, 4026; in chemistry, process, 4516; in desert plants, 727; influence of temperature and pressure on latent heat of, 1741, 1742; from human body, 440
Evaporators, in sugar manufacture, *3828*, *3829*, *3830*
Even and odd, in mathematics, 338
Evening dress, making, 968, *970*
Evening primrose, classification, 353
— schools, L.C.C. staff, 1679, 1680
Everest, Mount, description, 302, 2562
Evergreen oak, 1156
Evergreens, *55*; for front gardens, 6206
Everlasting flower, *plate facing* 728
Evesham, battle of, 3073
Evil, in Persian faith, 502
Evolution, of animal life, 1491; atomic, 1916; atomic, not discontinuous, 2554; Darwinian theory compared with Lamarck's objections, 823; Darwin's "Origin of Species," 136; definition of term and history of its use and misuse, 486; disease, intercrossing and isolation, geological evidence, 1029; emotion and instinct, theories, 2694; future of the race, 3118; general account, various theories and common errors, 650; general definition in relation to biology as a whole, 279; Huxley, on relation to Darwinism, 650; importance of disease, 1587; importance in psychology, 2013, 3118; importance of specialisation of function, 278; of mental characters, of intelligence, 1589, 1705; organic, theories of Weissmann, Beard, Reid, and De Vries, 1180; organic, two conditions of, 5388; problem of variation and specialisation, 484; psychological explanation of human "fitness to survive," 3383; of reflex action, Wundt's theory, 2118; of sex, Paramœcium and Hydra, *381*; training, importance of, 1706; Wallace and Darwin, 202; universality demonstrated by chemistry, 2554
Evolution, in algebra, 3411
Ewe, 2360; feeding, 2364, 2366; full and broken-mouthed, 2361; hogget, 2360
Ex nihilo, nihil fit, doctrine, 2063
Exalbuminous seeds, of plants, 350
Examination system, defects, 2136
Excavation, in building, methods, 329, 331, 6057; shoring with timber, 317
— in civil engineering, *1821–1824*, 1826
— in railway construction, 3171
Exchange, in banking, 3972, 3973
Exchange, bills of, 147, 1089; Act of 1882, 1376; entry in journal, 1468; foreign, 3681; function in banking, 3971; discounting, 1320; endorsement, 1318; negotiability, 1317; procedure in Scottish banks, 1466; rules, 1129; "short" explained, 1570
— in economics, conditions, 4516
— foreign, rate, 3681
Exchanges, telephone systems, 5683, 5684, 6078
Exchequer office, appointments, 3195
Excise, assistant of, salary, 2767
Excise department, boy clerk's career in, 2252, 2575; staff, salary, 2767
Excise duty, intoxicating liquors, 3046
Exclamation, note of, English, 1471; in business letters, 6352
Excluded middle, in logic, 6100
Excluder zinc, use in beehive, *5960*
Excrement, value in increasing organic matter in the soil, *277*
Excretion, in amœba, 278
— in man, physiological chemistry, 439
Excretory organs, kidneys, *1602*, *1603*; the skin, 1419
Executive industry, defined, 1
Exercise, aid to circulation of blood, 1194; effect on physique, 4387; effect on temperature, 440; importance in a healthy life, 2672; and the muscles, 1712; varieties of, 4387
Exhaust branch, of cylinder, *3317*
— opener, machine cotton, 1424, *1242*
— port, of engine, design, *4423*, 4424
Exmoor pony, description, 2074, *2075*
Exogens, term in botany, definition, 51
Expanded metal, use, 520, *1555*
Expanding, in boiler work, 3104, 3107
Expanding clutch, 962
Expansion, co-efficients of, 1738, 5414
— of steam, curve, *5416*
Expansion, engine gear, hand, 6074
— pipe, domestic water heating, 6018
— tube, water heating system, *6017*, 6022
Expectoration, evil of, 3798
Experience, practical importance, 2405; relation to reason, 2803
Experiment, scientific, causes of fallacy, 3944; value in logic, 6002
Expiration, in breathing, analysis of air in, 1302; management of, 2538; mechanism of, 1300, *1303*; by pores of skin, 1422
Explosive will, theory of, 2774
Explosives, in blasting, 2587; coal mining, substitutes, 3564; in demolitions, 6274; manufacture, 6757, *6762*; potassium chlorate in manufacture, 4778

Explosives Act, inspectors under, 788 ; provisions of, 1350
Exponent, in algebra, definition, 1818
Exports, British (1905), 3679, 6004, 6005
Expression, algebraic, dimensions of, 2149 ; homogeneous, 2149
— musical, books on, 1889
— in singing, 6337
— stop, of harmonium, use, 3950
Exstipulate, in botany, 350
Extemporisation, on organ, 3867
Extension, of matter, defined, 1265
— in violin playing, 2413
Extensor, human muscles, 199, 1712
Extract process, rag, 72, 2898
Extractive industry, defined, 1
Extraction, in chemistry, 4316
Eyeball, anatomy, *2400*, *2401*, 2402, *2403*
Eyebright, plant, 506
Eyeglass, watchmaker's, 6081
Eyelet holes, in sewing, 152, *153*
Eyeletter, duplex, *4238*, 4239
Eyeletting, in bootmaking, 4437
Eyelid, human, function of, 2400, *2401* ; reflex action, 2117 ; semi-transparency, 2953
Eye-pieces, microscope, 6127
Eyes, of crustaceans, 3806, 3808
— fishes', adaptation in fish, 3070
— in forging, 2984, 2986, *2987*
— homologous and analogous, 1492
— human, arteries of *2401* ; attention, phenomena, 2258 ; care of children's, 4863 ; defects, 5180 ; diseases, 6264 ; physiological anatomy, *2401*, 2403 ; structure, parts, and action, 2952, 3178 ; visual cells, 3226
— of potato, function, 346
— primitive, of otter shell, 3285
— of scorpion, *3803*
— of spider, 3803
— in sculpture, modelling, 1511

FABRICS, mixed, design, *6595*, 6596 ; dyeing, 6501 ; printing, 6726, *6727*
— woven, design, 5979, *6592–6598*
— *see also* Textiles
Face, of crystals, definition, 766
— human, anthropological measurements, 1785 ; bones, 1604, *1605*
— mould, in joinery, 5297, *5299*
Face plate, lathe cross-slide testing, *3963*, 3966 ; wood-turning, 6854
— value of bill, 1130 ; discount, 1319
— of wall, fair, building, 2262
Facial expression, in singing, 6337
Facing, in building, 332 ; bonding of brick walls, 2176, *2177* ; quantity surveying, 6508, *6509*
— in machine tooling, 3319
— in masonry, varieties of, *2841*, 2842 ; use of terra-cotta, 2779, 2783
Factice, rubber, defined, 5309
Factor, in algebra, 2747, 2890 ; resolution, 2747 ; in equations, 3201
— in arithmetic, 90, 337
— in hardware trade, 3574
Factory, engineer's accountancy, 5592 ; building, 5590 ; light and ventilation, 5591 ; organisation, arrangement, and management, 5589, 6518, 6639, 6643 ; power, 5590
— fire protection, 4751
— inspectors, Home Office appointments, 3300
— labour, Shaftesbury's reforms, 6691
Faculty of Actuaries, examinations, 4729
Faculty, psychology, defects of, 2696
" Faëry Queen," Spenser's, 537
Faggoting, in needlework, *151*
Fagotted axle, material, 3326
Fahrenheit, G. D., thermometer scale, 1564 : *see* Thermometer
Faience, in building, *2783*, 2784
Fainting, treatment, 6473
Fair-cutting, in building, 1951
Fairy rings, cause, 1371
Faith, in Zoroastrianism, 502
—, in logic : *see* Rationalism
Faith healing, psychic remedies, 5699
Faking, in journalism, 4235
Falcon, 2213 ; pursuit of prey, 2493
Falkirk, battle of, 3075
Falkland Islands, described, 4289
" Fall of Babylon," *plate facing* 217
Fall, in drainage, table, 738
Fallacy, in logic, elimination, 6097 ; misuse of term, 6099, 6100
Fallacy of many questions, 6100
Fallow land, cultivation, 1230
Fallowing, object of, 1250
Falls, river, disadvantages, 4517
False cores, in casting, 2338, 2340, *2341*
— hem, in sewing, 152
— relation, in harmony, 364
Falsetto voice, in singing, 6182
Family, ideal type produced by monogamy, 4538 ; importance to the race, 4663 ; parental responsibility, 4666 ; unit of society, 4123 ; State's attempt to imitate, 4538 ; sociological importance, 4538
— in natural science, defined, 380
Famine, cause in monsoon areas, 4494
Fan, air, use in mines, 3310
— blast, cement mill, *1854–1858*
— lace, for hat, making, *5620*
— machine, shaft bearings, 962
— magnetic brake, inconvenience, *2813*
— pneumatic, *1807*, 1808
— in scaffolding, use, 1172
— ventilating, 6024 ; in mines, types, 3769 ; in trains, etc., 3024
Fancy fabrics, finishing processes, 4342
— goods store : *see* Berlin wool shop
— roller, wool scribbler card, 1545, *1546*
Fan-coral (*Gorgonia*), 4086, *4087*
Fandango, for guitar, *3762*
Fanning, in banjo music, 4312
— formula for flood discharge, 5114
Fan-stitch, *151*
" Far from the Madding Crowd," type of good novel, 3557
Farad, measure of, electric capacity, 3580
Faraday, Michael, career, scientific discoveries, 3852 ; electrical researches, 129, 949 ; development of electro-chemistry, 2752, 3261 ; first motor, 129, 1950 ; law of electric decomposition, 3261, 4563 ; law of electro-chemical equivalents, 3262 ; on magnetic properties of metals, 4244 ; on relation of magnetism and light, 3617
Faraday's ring, in electricity, *949*, 950
Farcy, disease in horses, 2620
Fare, railway passenger, defined, 5076
Farm, bailiff's duties, 5287 ; buildings, American and Dutch, 2997 ; buildings, plan, *25* ; holdings, Continental, size, 24 ; labourers, harvest wages, 1666 ; wages, allowances, duties, hours, in the U. Kingdom, 2999, *3001*, 3002
Farmers, education, 24 ; length of life, 4528 ; mortality from phthisis, 5409
Farming, agricultural, ancient, 21 ; in Australia, 3235 ; bibliography, 3470 ; buildings, 2997 ; in Canada, *3202*, 4066, 4068 ; cattle : *see* Cattle farming ; dairy : *see* Dairy farming ; ensilage, 1970, 1971 ; harvesting, 1662 ; machinery, 1846 ; milk : *see* Dairy farming ; New Zealand, 3466 ; servants, wages, allowances, duties, hours, etc., 2999–3002 ; in Tasmania, 3468
" Farnese Bull," statue, art period, 2930
Farquhar, George, dramatist, 1150
Farriers, employment conditions, 2645 ; of tramcars, wages, 4189
Fascia board, in roof work, use, 4254 ; use in gutter fixing, *5793*, 5955
Fashion-plates, women's salaries, 322
Fastenings, engineer's, kinds, 3003
Fat, clarifying, in cookery, 2336 ; constituents, 3485 ; dietetic value and function, 3109, 3111 ; digestive process of, 676 ; use in enfleurage, 4969 ; ether as solvent, 3139 ; effect of excess in human body, 867 ; extraction in industries, 4626 ; foods, chemical composition, classification, sources, 3112 ; frying, 1488 ; heat units, 439 ; hydrolysis, processes, 4835, 4836 ; in livestock feeding, 2703 ; synthesis, 3485
Fatalism, defects of the term, 2995
Fat-hen grass : *see* Goosefoot grass
Fatigue, in mechanics, 86 ; of metals, 1258
Fat-liquoring process, in tanning, 3162
Fats, animal, constants, 4833 ; books on, 4834 ; in chemistry, definition, constitution, hydrolysis, 4829 ; physical and chemical tests, 4834 ; physiological value, melting points, 3486 ; properties, production, 4829, 4830 ; rendering and purification, 4830, *4831* ; vegetable, 1032, 4833
Fatty acids, chemistry of, 3485 ; distillation, *4836*, *4837* ; pressing, *4837* ; substitution, 3487
— degeneration of heart, cause, 6039
Fault, in castings, 3962
— in geology, defined, *1352*, 1354, 1925
— in mining, 1925, 2378 ; properties and varieties of, *2378*, 2380
Fauna, 137 ; distribution, 628 ; geological agency of, 1814, 1817
Faverolle, fowl, points of breed, *4957*, *5090* ; weight of manure, 5874
Fawcett's fire-resisting floor, 4756
Fawkes, Guy, and Gunpowder Plot, 4551
Feather-bed, making, 6609, 6721
— edge of stone, 3143
Feather keys, slot-drilling, 3405
Feather star, *plate facing* 4081 ; description, 4081, *4083*
Feather-stitch, underclothing, *3337*, 3339
Feathers, of birds, 30, *2492*, *2495* ; cleaning, 6040 ; as clothing material, 4256 ; curling, 6041 ; dyeing, 6653 ; in hat trimming, 5506 ; kinds and sources, uses, 5120, 6041, 6608, 6715
— in carpentry, definition, 3848
— mason's tool, description, 2838
Features, in sculpture, 1510
Febrifuges, 6037, 6038
Feed, silent, of log frame : *see* Ratchet
Feeder, in mining, definition, 2379
Feed-shaft, of lathes, 4921
Feed-water heater, engine, 6070
Feeler, of Northrop loom, *3636*
Feeling-tone, theory explained, 2517 ; in relation to emotion, 2695
Feet, boots for defective, 4016 ; development, *1869* ; of horse, rhinoceros, tapir compared, 1179
— metrical : *see* Foot
Fehling's solution, dextrose test, 3705
Felidæ, species of, 1494, 1705
Felling, in needlework, *150*, 3336, *3337* ; in tailoring, 1110, *1111*
— of trees, 52
Felloe-piece, of wheels, 2830, 3126
Fellow's machine, gear cutting, 3630, *3632*
Felsite, classification, 1008 ; cleavage planes, 1925
Felspar, varieties, 768, 6738 ; in granite, 529 ; in Parian ware, 5607
Felstone, components, 529
Felt, in building, foundations and walls, 1169, 2264, 2268 ; dyeing, 5906, 6377 ; hairs with best felting properties, 1169 ; use by harness-maker, 4885 ; for hats, 1169, 6375 ; manufacture, 1995–2000, 6375 ; milling, 4108 ; for roofing, 1169, 4872 ; in walls, 2264, 2268
— dryers, paper, *6396*, 6399
— hatters, employment, 2651
— rubber, painter's tool, *5829*, 5830
Felting, process and machinery, 1995, *1996*, *1998*, *2000*, 4107
—hats, processes, 6375, *6376*
Felts, in paper machine, *6396*, 6390
Female, in botany, defined, 730
Feminine, Spanish formation, 2343
Feminine rhyme, 306 ; in Chaucer, 325
Femur, thigh-bone, anatomy, 1708, *1709* ; constructed to break shock to brain, 1799 ; head of, proportion in modelling, *1348*, 1349 ; man compared with mammals, *100*
Fence rail, of brougham, 2829, *2831*
Fencing, in railway construction, hedge, 3615 ; post and rail, *3612*, 3615 ; wall, *3612*, 3615 ; wooden, *3673*, *4646*

Fencing, wire, 5170
Fenestra ovalis and rotunda, 2533, *2534*
Fens, the, geography of, 1273
Ferdinand II. of Spain, 2946, 4396
Ferghana region, fertility, 2718
Ferment, in chemistry, action, 1445, 4135 ; not synthesised, 2712 ; in wheat, 914 : *see also* Enzyme
Fermentation, alcoholic, 1034, 1035, 1372, 2828 ; beer, 6057, 6230 ; in beet juice, prevention, 4161 ; bio-chemistry of, 4134 ; in dough making, 3392 ; of flax, 1385 ; in human body, digestive process, 674 ; of milk, cause and limit, 3534 ; wine grape, products, 6355
Fernlike plants, differentia, 165 ; structure and varieties, *1118*
Ferns, classification, 165 ; culture, 6493, 6532 ; structure, reproduction and varieties, *1116–1119*, *1310*
Ferreira Mine, Transvaal, *3769*, 3771
Ferret, method of testing drains, 783
Ferric chloride, gum arabic test, 5363
— nitrate, use by dyer, 5779
— oxide, gas purifier, 6722
— sulphate, use by dyer, 5779
Ferrite, component of iron, 3938
Ferro-aluminium, composition, 5992
Ferro-concrete : *see* Reinforced concrete
Ferro-manganese, composition, 4464 ; use in steel manufacture, 5013
Ferrous sulphate, formula, 1721 ; manufacture, uses, 1037 ; in dyeing, 5782 ; in ink, 5366
Fertilisation, of wheat, 913 ; of plants, *347*, 348 ; Mendel's biological experiments, 1481 ; of ferns, *1116–1118*
— in chara, 1370
Fertilisers, artificial, 1190 ; Atacama, 4287 ; potash salts, 5586
Ferrule, term in drainage, 736
Ferruling, in boiler work, *3101*, 3104
Fescue, 3890 ; seed, 875, *878*
Fessenden's wireless telegraphy, 3898
Festooning, in underclothing, 3340
Fetichism, in Egypt, 419
Fetish worship, in African tribes, 1790
Fettling, in iron manufacture, 4636 ; in open-hearth furnace, 2864
— machine, drain-pipe, 5777
Feudal system, William I. imposes, 2359 ; Henry II.'s policy, 2913
Feudalism, in China, 215
Fever, synthetic remedies, 5469
— continued, 5412
— relapsing, cause, symptoms, 5412
— yellow, incubation, 5412
Fibre, in brushes, tests for, 6110
— of metals, influence on strength of machinery, 211
— plants, of temperate regions, 5117, 5118 : *see also* Fibres
— in wood, 51, *53*
Fibres, classes of, 817, 1164 ; bast, plants with, 5637 ; for brushes, *6106* ; carding, 1541 ; microscopic structure, 820, 821, 822 ; recovery from effluents, 5766 ; testing, 1701
— animal, properties, used for dyeing, 5639, 5640
— artificial, 71, 72
— paper-making, 6278 ; beating, 6281 ; microscopic structure, *6279*, 6280 ; sizes, 6280 ; variation in, 6399
— solvents for, 6560, 6561
— textile, dyer's classification, 5637
— vegetable, classes for dyeing, 5637
Fibrin, in blood, formation, 954
Fibro-cartilage, physiological description, 435
Fibrous tissue, of human body, 196, *437*
Fibula, human anatomy, 1708, *1709*
Fichtel Gebirge, watershed, *1973*
Fiction, definition and ambiguity of term, 2961 ; elements considered, 107 ; English, origin, etc., 2961 ; English, prior to Scott, 3129 ; importance in modern literature, 2686 ; love of personalities the mainspring, 3986 ; Scott's novels, 3344 ; Scott to Stevenson, 3438
Ficus elastica, cultivation, 5046, *5047* ; *see also* Indiarubber plant
Fiducial edge, in surveying, 710
Field book, in surveying, 264 ; level field book, *373*
Field, in electricity, 562, 3894, *3895*
— of fire, in military engineering, clearance and obstacles, 6272
— fortification, trenches, 6270
— horsetail, structure, *1115*, 1310
— magnet, of dynamo, 1104, *1105* ; bipolar, multipolar, etc., 1106 ; of turbo-alternator, 1906, *1907*
— magnetic, 560, 2088, 3894, *3895*
Fielding, Henry, author, in drama, 1151 ; novelist, 3129, *3131*
Fife, musical instrument, *4567*
Fifeshire, coalfields, 1066
Fifth wheel, of vehicles, term explained, 3122 ; *see also* Wheel plate
Fifths, consecutive : *see* Consecutives
Fig, classification, 354 ; cultivation area, 4876 ; culture, 6677 ; sources, drying, 4845
Figure, in geometry, 285, *286*, *287*
— human, Gothic sculpture, *3517*
Figure, casting, 1509, 1510
Figured bass : *see* Bass, figured
Figures, in geometry, foiled, 1104 ; multilateral, 285, *287* ; non-plane, 4522, *4523* ; rectilineal, 285, *286*, *287* ; reduction and enlargement, *1255*, 1411 ; similar, 5472
Fiji, cotton production, 386 ; the Papuans, ethnology, 1788 ; products, *3902* ; craniology, *1787*
Filament, of flower, 346, *347*
Filassing, in silk manufacture, 584
File makers, employment, 2646
File-fish, effect on pearl fishery, 3960
Files, correspondence, 776
— tools, forms, 3687, 4582, *4583*, *4585* ; in sharpening saws, 3754, *3755* ; steel for, 4747 ; tempering, 4746
Filicinæ, 1116 : *see also* Ferns
Filigree, 5838 ; goldsmithing, 5687 ; Irish Celtic, 5528, *5529*
Filing, business letters, *193*
Fillet, bookbinding, *6776*, 6779
— cement, use in roofing, 4872
— in steel casting, 2699
— in slating roofs, 4865, *4867*, 4868
Filling, in textile industries, 3488
— engine, silk, *1245*, 1246
— up, in vehicle painting, 3479
Films, photo, 6679
Filter paper, in chemical analysis, 4404, *4405*, 4412 ; manufacture, 6401
Filter press, in earthenware manufacture, *5161*, 5162 ; sugar, *4163*
Filters, bacterial, sewerage, 4743
— water, 3380, *4097*, *5765* ; Berkefeld, *4100* ; Candy, *4097*, *4098* ; Jewel, *4098* ; Pasteur, *4099*, 4100, *4158* ; sand, *4157*, 4159
Filtration, in applied chemistry, 4316 ; in civil engineering, 4097
Fin, in forging, removal, *2989*, 2991
Final clauses : *see* Purpose, in grammar
Finance, municipal, staff, 1067–1069
— private methods of economising, 3222 ; *see also* Savings banks, *etc.*
Finance, books for actuaries, 4731
Finches, description, 2209
Fine arts, evolution, 181, 182
— in music, defined, 270
— stuff, in plastering, 648, 5499, 5500
— wool, definition, 1120
Fines, law of, 6846
Finger, human, bones of, 1708, *1709*
Finger and toe disease, 1200, *1667*, 1669
Fingerboard, violin, *2121*, 2122
Fingering, double-bass, *3167*, 3170 ; harmonium, 4179, *4180*, *4182*, *4183* ; harp playing, 3343 ; pianoforte, general rules, 1754, *1760*, 1888 ; violin, *2410–2413*, *2510* ; violoncello, *2968–2970*
Finger-plate, of saw bench, 6451
Fingers, musician's, 2741
— in pianoforte playing, position, 1415, *1506*, 1757, 1758 ; strengthening exercises, 1418
Finial, in roofing, 4868 ; tile gable, *4869*, 4871 ; wrought iron, *5795*
Finisher card, cotton, 1544 ; jute, 1887
Finishers, umbrella, wages, 5603
Finland, craniometry, 1786 ; ethnology, 1789 ; geography, 2408
Fink truss, loads, 2448, *2449*
Finland, ceded to Russia, 6201
Finnan haddies, fishery, 2527 ; splitting, salting, smoking, 5315, 5316
Fins, of fish, 30, 3065, *3068*
Finsen, light in therapeutics, 3372
Fiord, 1560 ; formation, 625, 1354 ; Norwegian, *980* ; as routes, 4498
— coasts, instances, 4498
Fiorin, grass, 876, 877, *879*, 3890
Fir, in building shores, 917 ; classification, 503 ; cutting into logs, *53*, 57 ; distribution, 625, 626 ; evergreen condition explained, 728 ; planting, 6318 ; timber, 55, 3434
— Baltic : *see* Scotch fir
— red : *see* Douglas fir
Fire, ancient methods of production, 5470 ; means of ventilation, 4020
— alarm, 6843 ; thermometer, 6129
— appliances, *6837–6843* ; hydraulic, 5677
— assessor, in insurance, duties, 4851
— bridge, boiler, 6875, *6876*
— brigades, staff and salary, 1497
— clays, 644, 1285 ; composition, 3942 ; in furnace construction, 234
— engines, *6838–6840*
— escape, *6840*, 6842 ; ladder, *2463*
— extinction, *6837–6843* ; London, 318
— insurance, 4849
Fire of London, destructiveness, 4762
— worship, 6772
Fire-box, of boiler, *3097–3101*, 3102, 6878 ; in technical drawing, 5040, *5042* ; flanging, *3100*, *3101*, 3107 ; locomotive, 6514, *6515–6517* ; in range construction, 2390
Firebricks, 644, 1285, 1948 ; composition, 3942, 4531 ; in furnace construction, 234 ; strength, 1520
Fire-damp, nature of, 232, 1158, 2714
Firefly, emission of light, 3511
Fire-grate, boiler, *3097*, 3102, 6875, *6876*
Fire-lighter, locomotive, *4596*, 4599
Fireman, brigade, 6837 ; marine, 6807
— railway, 4596, 4598, 4601
Fireplaces, in building, formation, *2387*, 2388 ; fittings, and air required, 5195 ; open, 6015 ; opening of, construction, 2388 ; quantity surveying, 6508 ; ventilator, 6019, 6020
Fire-proofing, asbestos for, 812 ; law of, 4751 ; uralite for, 813
Fire-resisting building, construction, 307, 1036, 4751, *4760* ; concrete for, 332 ; law of, 4751 ; materials, 4751
— flooring, 1167 ; manufacture, 649
— paints, composition, 1036
Firing, English china, 5606
Firmer, carver's tool, *5809*, 6044, *6045*
Firmer gouge, 3386, *3387*, 4150, *4151*
Firth, formation, 980
Fischer, Emil, on food synthesis, 2711, 4128, 4133
Fish, 29, 30 ; bird food, 2493 ; blood corpuscles of, 952 ; blood temperature, 439 ; boiling, in cooking, 1486, 3313 ; British, increase of, 5190 ; canned, poisoning, 5408 ; carving, *5935*, 5936 ; choice, 1281, 3717 ; classification, *3065–3070* ; colouration, 3068 ; cooking, 1873 ; dietetic value, 3311, 3381 ; digestibility, 866, 3314 ; diseases and parasites, *5315* ; eyes, 2403 ; fossil, 897 ; gill, respiratory system in, 1300 ; hatching, 5314 ; heart of, 956 ; immature, protection of, 5314 ; landing ports, 4991 ; as manure, 590 ; nitrogenous manure, constituents, 5587 ; marine hatcheries, 5314 ; market preparation, 5315 ; markets, 5316 ; nutritive value, 3381 ; poultry food, 5436 ; respiration and circulation, 3068 ; stuffing, processes, 6327, 6056 ; "wet" and "shell," 4989
— bony (Teleostei), 3065, *3067*, *3071*
— end-mouthed, 3065, *3067*, *3071*
— flying, description, 3068, *3069*
— fringe-finned, 3065, *3067*, *3071*

Fish, lung (Dipnoi), 3065, 3070, *3067*
— sea, scientific study, 5188; shoals, movements, 5188
Fish-curing, use of salt, 4718
Fisher, Bp., drawing by Holbein, *343*
Fisher, fur and skins of, 6426, 6430
Fisheries, British, *4989–4992*; Canadian, 4068; Grimsby, 1273; inshore grounds, nurseries, 5190; Japanese, 3159; law of, 5316; legislation, 5189, 5317; marked fish experiments, 5189, 5190; North America, 4065; over-fishing, 5190; regulation of, 5190, 5318; science and sea fishing, 5188, *5189*, 5190; schools and marine stations, 5188; territorial limits, 5317; United Kingdom, 987
Fishermen, Board of Trade certificates, 5316, 5317
Fish-glue, 811
Fishing, line, 4991: *see also* Fisheries
— boats, legal restrictions, 5317
— grounds, home and foreign, limitations, 5318; localities, 5121
— nets, creosoting, 5464
— tackle dealers, business of, 2524
Fishmongers, business of, 2826
Fishplate, use in carpentry, *3513*, 4446; in joinery, *4115*, 4116; in railway construction, 3253, *3254*; in roof construction, *5793*, 5794
Fission, reproduction by, 199, *381*; of bacteria, 166; of sea-anemones, 4083
Fissure, in geology, 1925; volcanic, 1207
Fissure of Rolando and Sylvius, 2146
Fistula, in horses, treatment, 2621
Fitch, in basketmaking, 5489, *5490*
Fitch, fur and skins, 6426, 6430
Fits, treatment, 6473
Fitter, head, dressmaker's, 2438
Fitter's assistant, railway, 4596
"Fittest," in biology, meaning, 824, 825
Fitting, in dressmaking, *474*
— in tailoring, a coat, 3014, *3015*
— in workshop practice, 3687, *3692*, 3694
FitzGerald, Edward, author, 2616
Fixed air, defined, 1159
— assets, explanation, 2758; of Parliamentary company, 3332
— liabilities, of companies, 3333
— oils, varieties, properties, 1032, 3485
Fixing work, in mechanical engineering, *3317*, *3320*, 3322
Five-eight rule, for calculating area. in shipbuilding, 5965, 5966
Fjord: *see* Fiord
Flag, in bootmaking, 4017
— ship's code signals, 6411
Flagellates, description, *4088*
Flageolet, musical instrument, construction, playing, 4485, *4487*
Flagstone, use, 1072; fireproof, 4752
Flake-white, pigment, 871
Flamboyant style, in architecture, 3374
Flame arc lamps, 2683, *2684*
— flower culture, 6529
— manometric, König's, *2318*, 2319
— sound, Tyndall's experiments, 2318
Flamingo, description, 2213
Flange bead, tool, use, *2457*, 2458
Flanged beam, strength of, 1986, *1987*
— castings, process, 2337, *2339*
Flanger, hydraulic, *3103*, 3106
Flanges, brazing, 3884, *3887*; cylinder, lining out and tooling, *3317*, 3324
Flanging, in boiler work, 235, *1221*, 3096, *3097*, *3100*, *3103*; in sheet metal work, process, 4521,
Flanging machines, function, 3096; in shipbuilding, *5741*
— press, hydraulic, 1220, 1223
Flannel, tearing, 3340; for undergarments, 3094
— long, layette, *3744*, 3746
Flannelette, 4357; for underwear, 3094
Flannels, washing, 2591
Flap, of boot, 4018; of saddle, 5341
Flapping machines, described, 2280
Flare skirt, cutting, *525*, 526
— of vessel, defined, 5609
Flashlight, photo, 6682, 6688
Flash point, petroleum products, 6148
Flashing, in glass manufacture, 4534
Flask, filtering, analysis, 4413, *4414*
— vulcanising, varieties. 6031, *6033*
Flat-bit tongs, described, 2984, *2985*
— carding engine, description, *1544*
— carving, *6044*, 6045, *6046*
— irons, dressmaker's, 185; laundry, 3031
— jigger, in pottery manufacture, 5233
— in music, 39; on pianoforte keyboard, 1212; tonic sol-fa, 924
— rammer, use, *2111*, 2112
— worms, 1492, 3958, *3960*
Flattener, in glass manufacture, 4534
Flattening, of boiler plates, 3100
Flatter, smith's, 2983, *2985*, 2986, 4586
Flatting, in painting, 5834
Flatulence, remedy, 5842
Flauti-traversi, musical instrument, 4568
Flavours, artificial production, 5468
Flax, fibres, 68, *69*, 716, *1025*; as clothing material, 4256; manufacture, 1168, 1385, *2098*; manufacture, history of, 716, 717; microscopic structure, 821, *822*; spinning, 2292, 2444; spinning and weaving, employment conditions, 2650; spreading, 1726; substitute fibres, 818; preparation for weaving, 2595: *see also* Linen
— New Zealand: *see* Phormium
— plant, classification, 353; cultivation, 716, *717*, 986, 1199, 5117; cultivation in Ireland, 986
— seeds, linseed oil, 1032, 4831
Flea, description, 3721, *3722*
Flea-beetle, description, *1667*, 1668
Flèche fowls, breeding, 4659, 4661; points of breed, *4858*, 4859, 4957
Fleece, 69, 70; clipping, 2366; shearing and washing, 220, 221, *224*; wool sorting, 1120, 1121, *1122*
Fleet, service with, 4265
Fleming engine, lubrication, *6069*
Flemish bond, in brickwork, *1451*, 1452
— language, classification, 1771
Fleshing fur skins, *6430*, 6431
— leather, 2856, 2856, 3163, *3164*, *3219*
Fletcher, John, dramatist, 846, *847*
Fletcher furnaces, pressure blast 2863
Fletton bricks, use, 644, 1947, *1948*
Flexor muscles, 1712; position, *1350*
Flexure of beam, 2737
Fliers, of staircase, construction, *5301*
Flies: *see* Fly
Flight, bird's, 2496; organs, 2677
Flinder's range, position, 3697, 3899
Flint, composition, 1074, *1075*, 6736; in earthenware manufacture, 5160, *5161*; formation, 767; specific gravity, 1704; structure, 897; use in walling, 3034, *3035*
— glass, composition, 358, 1160; manufacture, 4531, 4536; recipe for 4533; strength, weight, 1702
— makers, employment conditions, 2654
Flintshire, geography, 1277
Flipping fruits, seeds, 910, *911*
Flitch, in structural ironwork. *5793*, 5794
— of timber, definition, 3544
— frames, use in woodworking, 5900
Float, in marine surveying, 1017
— plasterer's, 5496, *5497*; nail, 5500
Floating assets, explanation 2758; of branch shops, 3418
— bodies, equilibrium, 5964; conditions of stability, 5968, *5969*
— coat, term in plastering, 648
— liabilities of companies, 3333
— out, in bridge construction, 1175
— outlet of reservoir, *4334*
— in plaster work, 5499
— rave stay, of van, 2828, *2829*
Flock papers, for walls, 5827, 5828
Flocks, upholstery, 6715, 6718
Flodden Field, battle of, 3650
Flong. printing, preparation, use, 5556
Flood discharge, formulæ, 5114
— plain, physical geography, 457
Floods, area and volume, statistics, 5116; importance in hydraulic works, 5113; river, damage by, 4497; storage of water, 4029
Floor, in building, *53*, 54, 4445, *4447*; brick arched, construction, *4753*, 4756; brickwork supports, 4446, *4447*; laying paving, 2515, *2516*; quantity surveying, 6510; surface-finishing, 4758; tiles for, 646; timber construction, *1453*, 1454; under-pinning, 918
Floor, in mining, definition, 2377
— concrete, 332, 334, 1450; armoured concrete construction, 1643, *1645*; reinforced, *1555*, 1557
— fire-resisting, construction, 4752, *4753*, 4755, *4757*; terra cotta for, *2781*, 2784
— framed, construction, 4445, *4447*
— marble, 3246, *3247*
— ship's, girder, function, *6224*; of steel sailing ships, 5400
— wood, design of section, *2128*
Floor-block, in coppersmithing, 3884
Floor-board of van, 2828, *2829*
Floor-brackets, of ship, marking, shearing, punching and bolting, 5739
Floorcloth, manufacture, 1026, 5122; printing, 5125: *see also* Linoleum, Oilcloth, Kamptulicon
Flooring, tiles for, mosaic work, 646
— boards, construction, laying, 4445
Floor-plate. construction and use, *5275*, 5277; machines, details and types. *5276–5280*, 5281
Floor-plates of ships, bending, drawing shape, shearing, punching, 5738; erection, 5740; inner bottom, 5740; of small vessel, *5616*
Flora, 137; disintegrating effect on soil and rocks, 1814
Florence, architecture, 3376; art treasures, 2230; cathedral, 3675; an independent state, 4322; modern painting, 3518; early Renaissance sculpture, 3676; Renaissance art, *3520*; Romanesque, architecture, 3232; touring, 947
Florid counterpoint, in music, 633
Florida, cotton industry, 223, 225, 383; geography, 4064; restored to Spain, 5846; sugar cultivation, 3831, 4172; tobacco, 4271
Florida water, perfume, recipe, 4972
Florin, Austrian, 409; Dutch, 410
Florists, business of, 2528, 6834; training, 322: *see also* Nurseryman
Floting, in knife manufacture, 5477
Flounders, choice of, 3717; hatcheries, 5314; sporozoan parasite, *5315*
Flounce, in dressmaking, 187, 862
— in textiles, weaving, 3155
Flour, adulteration, *3716*, 3717; for biscuit-making, 3593; buying, 933; choosing, 1228; dietetic value, 3312; weight of sack, 3282; sources, 4873; wheat statistics, 872
— milling, 3078, *3079*, 3281; Russian industry, 2408; in U.S.A., 4174
Flourball, wheat, *915*
Flour-beetles, classification, 3512
Flow-pipe, in domestic water heating, 6016, *6017*, 6018, 6019, 6022
Flower, term in timber cutting, 53, 56
Flower-dust: *see* Pollen
Flower garden, proportion of, 6205
Flowering plants, classification, 165
Flowering-rush, classification, 355
Flowerless plants: *see* Cryptogams
Flower-pot, manufacture of, 647
Flowers, dwarf garden, kinds and culture, 6490; economy, 6832; garden culture, 6487; general structure, 346, *347*; in living-rooms, 1159; pollination by insects, 730, 908; in town gardens, 6316
— artificial, use in millinery, 5506; cleaning, 6042
Fluate, properties, 534
Flues, air, construction and varieties, 2513, *2516*
— boiler, *3097*, 3102, *6874*, *6875*
— chimney, construction, 2388, 2389
— furnace 2390; Batho arrangement 5016; of boilers *3097*, 3102
— of kitchen range, definition, 1226
— of salt-pan, plan, *4717*
— in tobacco curing-house, *4273*
Flue-brushes, manufacture, 6110
Flue-cinder, defined, 4638
Flue-dust, lead smelting, 5986, 5987

Flugelhorn, musical instrument, form, place in a band, 5130, *5131*, 5140
Fluid, excess in human body, 867
— in physics, 1139 ; laws of, 1141, 1142 ; in motion, limit speed, 1143 ; perfect, definition, 1374 : *see also* Liquid
— pressure, 1139 ; law of, 1140
Fluke, sheep disease, 2364, 2625, *2627*
Flukes, (Trematoda), description, 3959
Fluoresceine, acid dye, 5955
Fluoride, defined, 839
Fluorine, action, 362 ; chemical properties, 1444
Fluorspar, 534, 768, 1041, 6736 ; fundamental form, 7661, *767*
Flushing, in drainage, defined, 572, 784 ; in sewerage, automatic, *4457*
— tank, automatic, 738 ; failure of traps in, 781
Flute, musical instrument, *5729* ; chromatic scale, *4569* ; manufacture, 6625 ; in orchestra, 5887, *5892* ; types, 4568, 5729
— harmonium stop, 4180, *4181*, *4182*
Flute-à-bec, defined, 4568
Fluter, carver's tool, *5809*, 5810
Flutes, in joinery, defined, 5179, *5181*
Flux, enamel, 6575 ; for glaze colouring, 5384 ; in iron smelting, 231, 4467 ; phosphatic, in slag manufacture, 2581
— magnetic, 560
Fluviatile clays, in brickmaking, 1278
Fly, *plate facing* 3361 ; blood-sucking, jaws, 3721, *3722* ; classification, 3362 ; description, *3721* ; and flowers, 908 ; fungus, 3721 ; Hessian, larvæ, 3721 ; as pollen-carriers, 731
Fly, of overcoat, *1756* ; of knickers, *1461*
Flyer, in spinning, *2289*
— buttress, history, *3373*
Flying machines, 2279 ; method of propulsion, 3984 : *see also* Balloons, Aeroplanes, Flapping machines
Fly-press, principle, 835
Fly-running, milliner's stitch, use, *4565*
Fly-sickness, tsetse-fly, 3721, 4089
Flywheel, engine, types, function, and action, 2018, *2019*, *4426*, 4428, 5641 ; of compound Belliss engine, *5750*, 5751
Foal, care of, 2078
Focal length of lens, definition, 2901
Focus, in conic sections, definition, 5783
— of human eye, 2401, 2402
— in geometry, of ellipse, 1411 ; of parabola, 1412
— in light, 2435 ; principal, virtual, and conjugate, *2735*, 2900, 2902
Fodder, cattle feeding, 2904 ; cow's, storage and preparation, 3673 ; dry, ensilage, system, 1970, 1971 ; oats, plants cultivated in Europe, 856 ; 873 ; trade in, 1991
Fog, definition, formation, 1900
Foil, use in enamelling, 5690
Foiled figures, geometry, 1014
Fold, in geology, cause, 1354, *1355* ; in lias beds, *2376-2377*
— in millinery, velvet, *5331*, 5332
Folder, bookbinding, *6776*
Folding, in cloth manufacture, *4343*
— in laundry work, *2910*, *2911*
Folding heads of carriages, 3022
Foliage, wood-carving in relief, 6137
Folio, in bookkeeping, 403
— in printing, defined, 5457
Folio sheet, in printing, *5458*
Foliation, geological, in schists, 1075
Follow-up system, advertising, 6861
Follower, of American clock, 5712 ; verge watch, 6082
Fomentations, use, and application,6286
Fontenoy, battle of, 5554
Food, adulteration, *3716* ; alkaloidal poisoning, 3826 ; animal and plant, 276, 4153 ; of animals, necessity for, 1491 ; Berthelot's tablets schemes, 203 ; chemical definitions, 3019 ; chemical discoveries, 238 ; chemical preservation, 3819 ; children's, amount and kind, 4864 ; cold storage, *5403* ; decomposition and putrefaction, 5403 ; digestion, process, 673 ; effect on body temperature, 440 ; effect of excess on human body, 867 ; factor, in animal evolution, 1761 ; and mental work, 6466 ; necessary to life-maintenance, 4133 ; nutritious elements in, 5434 ; nutritive values in, table, 3599 ; in old age, 4530 ; in physiology, 438–441 ; physiology of, circulatory system, 865–867 ; of plants, competition for, 503 ; of plants, general, *167* ; of plants, winter, *728* ; importance of proper quantity, 3598 ; preservation, books on, 3819, 3826 ; legislation, 5408 ; L.G.B. report, 3819 ; defined by Sale of Food and Drugs Act, 4715 ; salicylic acid as preservative, 3819 ; supply : *see specific subjects—e.g.*, Milling, Sugar, *etc.* ; trade returns, British, 6004 ; tablets, U.S.A. experiment, 3599 ; in travelling, what to eat and where, 514 ; vegetarian, importance of, 3601 ; the voice, effect on, 2539
Food and Drugs Act : *see* Sale of Food and Drugs Act
Foods, dietetic values, 3109 ; nutritive values, 3381 ; relative costs for daily supply, 3599 ; patent and breakfast, treatment of grains, 3084, 3085
— predigested, manufacture, 3085
— prepared, infants', 4683
Foodstuffs, adulteration, *3893*
Fool's gold, defined, 768
Fool's parsley, *349*
Foot, unit of, measurement, 1147
— of basket, round, making, *5490*
— of cylinder, *3317*, 3324
— in bootmaking, anatomy, 3875, 3876 ; measurements, 1329
— Guards, regiment, promotion, 3840
— human, bones, *1709* ; constructed to break shock to brain, 1799 ; joints, 1710 ; man, contrasted with mammal, *100* ; tendons and muscles, *1712*
— and mouth disease, in cattle, symptoms and treatment, 2623 ; in sheep, 2624
— in poetry, list of, English, 305
— pound, unit of work in physics, 289
— in prosody, defined, 1766
— of spider, *3804*, 3805
— of tusk shell and mussel, *3284*
Foote, Samuel, dramatist, 1150
Football, team, trainers, 6870
Footballer, professional, 6869
Footboard, of van, 2828, *2829*
— stay, of brougham, 2830, *2831* ; of elliptic spring fore-carriage, *3125*
Footings, in buildings, 335, 2261 ; laying, 2261, *2263* ; size, 331 ; of walls, 3033, *3035*
Foot-jaws, of cray fish, 3807, *3808*
Foot-lever brake, 830
Footman duties, 815
Footnotes, in printing, setting, 5159
Footpaths, laying artificial slabs, 2428, *2429* ; district councils and, 1979 ; L.G.B. by-laws, respecting setting out, 2425 : *see also* Paving
Footprints, of labyrinthodon, *1817*
Foot-rope, use in otter-trawl, 4990
Foot-rot, in sheep, treatment, 2364
Foot-stumps, of sea-centipede, 3956
Footstick, compositor's use, 5457
Foot-valve, bore-hole pump, 6062, *6064*
Foot-warmer, inefficiency, 3025
Forage crops, cultivation, 1197–1200 ; for cows, 3890 ; pea crops, 874
Foramen magnum, human, *1605*
Foraminifera, description, *4089* ; in carboniferous system, 2254
Force, in electricity, definition, 1590 ; lines and tubes of, *4023*
— in mechanics, 86, 411
— in physics, action on mass, 124 ; Newton's definition, 314
Force-pump, 830, 1080, 1141, *1142* ; in boiler testing, *3106*, 3107
Forced draught, 1808 : *see also* Fans
Forces, chemical, electrical nature, 2297
Forces, in mechanics, composition, 551 ; couples of, *413*, 415, *1834* ; definition, 411 ; equilibrium, 411, *413*, 553, *661* ; measurement, 552 ; moments, *413*, 415, 661, *1834* ; Newton's third law, 553 ; parallel, *413*, 414, 1833, *1834* ; parallelogram of, 411, *413*, *552*, 1833, *1834* ; polygon of, 412, *413*, 4337 ; reciprocal diagrams, *414*, 415 ; representation of, 411 ; resolution of, 412, *413*, 551 ; specification of, 1833 ; triangle of, 412, *413*, *533*, *1834*
Ford's silicate of limestone, 534, 1520
Fords, in military engineering, 6265
Foresight, in levelling, 374
Foreboard, of ropewalk, *5290*, 5291
Forecastle, of sailing ship, *5400*, 5401
Forehead-band, of harness, 4886, 5057
Fore-hearth, in copper reduction, 4127
Foreign exchanges, bill of exchange, bank draft, 3681, 3683 ; credit, coinage, note issues, 3971 ; long and sight, 4170
Foreign Office, appointments, 2934 ; Colonial appointments, 3548
Foreman, building,307; scaffolding, 1171
— railway, duties, 4591
— of tramways, wages, 4189
Foreman of works, in Army, 3841
Foremast, of sailing ship, 5399
Foreshore, erosion, 5577 ; protective works, *5577*, *5580*
— surveying, 1019
Forest service, Indian appointments, salary, 3477
Forestry, allied industries, 4604 ; books on, 4604, 4929 ; British and foreign returns, 4603 ; colleges, 4929 ; English and German, problems, 641 ; instruction, in, 4602, 4929 ; Japanese, 3159 ; as an industry, 4602, 4928 ; influence on labour, 4604 ; pests, 4925, *4927*, 4928 ; physical conditions, 4604 ; soil and climate, influence on, 4604 ; scientific treatment, 4602 ; sylviculture, *4676–4680*
Forests, connection between light and life of trees, 504 ; as denudation check, 456 ; distribution, 625, 4657 ; primeval formation of coal-fields, 1921 ; products, 4657 ; rainfall, effect on, 1814 ; submerged, 1354 ; thinning, 4680
Forewale, of horse's collar, 5192
Forfeiture, of shares, in limited company, 3188
Forge iron, production, *232* : *see also* Iron, wrought
Forgery of cheques, bank's liability, 3482
Forges, use of fans, 1808
Forget-me-not, 354 ; culture, 6491
Forging, *2984*, 3839 ; angle-iron, smiths' work, 3096 ; hydraulic presses, 1223 ; in ironworking, 235 ; in machine construction, 207 ; tooling allowance, 3316 ; wrought iron, 1044
Forging presses, 1224, 5676, *5678*
Fork, gardener's, 6315
— hangers, of bogie frames, 3122
— of pendulum clock, 5714
Forks, of bicycle frame, 3773, *3774*, 3777
— butcher's, *1429*
— nickel-silver table, 5477
Form, in design, 5820
— guide in gear cutting, 3630, *3632*
— and matter, in poetry, 305
— in sculpture, 1345
— suggested by shading, *2185*, 2187
Form milling, described, *3403*
Formaldehyde, formation, properties, 3020 ; as food preservative, 3819
Formalin, disinfectant, preparation, 3021, 5467 ; uses, 3021, 5408
Forme, compositor's, defined, 5159
— printer's, defined, 5458 ; locked up, *5459* ; electrotyping, 5559 ; stereotyping, 5556
Former, of dynamo armature, 1107
Formic acid, preparation and properties, 3021 ; synthesis, 2711
Formosa, description, 3161 ; products 5659
Formose, formation, formula, 3705

Formulæ, in chemistry, graphic, 2714
Forrest Fulton's Act, provisions, 1978
Fort William, railway, 1064
Fort William, Lake Superior, 1650, 4069
Forte, in music, 271, 5568
Forth bridge, dimensions, *2736*, *2739*, 2740; Inchgarvie caisson, *1403*
Forth, Firth of, depths, *457*
Forum, Rome, *2932–2933*
Forward bearing, in surveying, 267
Fourneyron turbine, *1689*, 1692
Four-in-hand: *see* Drag
Four-wheeler, defined, 2465; dimensions and weight, 2726
Foss Dyke, Lincs, 1273; canal, *5485*
Fossil meal, description, 813
Fossiliferous rocks, defined, *897*, 898
— slags, table of, 535
Fossils, in biology, 279; in calcareous sedimentary rocks, 1071, 1073, *1074*; Cambrian, *2253*; evidence of change of sea level, 1353; evidences of evolution, 1031, 1177; geological record of, 2066; index to upheaval of land, 618, 620, *621*; Old Red Sandstone, 2253, *2254*; origin, 1816; Silurian, *2253*; variation, 1924
Foudaco, dei Turchi, Venice, *3231*, 3232
Fouetté, style of violin bowing, *2743*
Foul brood, bee disease, *5963*
Fouls, of machinery, avoidance, 4428
Foundation, for machine or engine, laying, 3691
Foundation ring, of boilers, *3099*
Foundations, in bridge building, 2737
— in building, 143; artificial, 332; on compressible soils, 334; concrete, 649, 1449; concrete in damp, 334; natural, 331; quantity surveying, *6507*; removal of old, 329; for retaining walls, 3256, *3257*
— railway embankments, *3259*
Founder, in horses, treatment, 2621
Founders' shares, defined, 3186
Founding, methods, materials, processes, *2109*: *see also* Casting, Moulding, *etc.*
Foundry, 2108, *2866*, *2867*; compared with smithy, 2983; of engineers' works, *5591*, *5593*; ladles used, 2864; melting furnaces, *2862*; moulding boxes, 2697
— stereotype, equipment, 5556
— work, dictionary of, 2545
Fount of type, *5027*; variation, 6074
Fountain, brewery copper, *6058*
— in petroleum wells, definition, 3190
Fowl, dietetic value, 3311; digestibility, 3314; movement and skeleton, *2494*; roast, carving, 5934, *5935*; roasting, 1487: *see also* Poultry
Fox, Charles James, coalition ministry, 5555
— (canis), 6427, *6433*; skins, 6430
Foxdale lead mine, *3194*
Foxglove, *351*, 354; cross-pollination, *730*, 732; heart tonic, 4013; parasites in, *505*, 506; pollen protection, 1114; nectaries, 731; pollination arrested, 909; showing anthers, *plate facing* 728
Foyers, Falls of, aluminium works, 5308, 5756
Fra Angelico, painter, 3519, *3520*
Fractional distillation, in chemistry, 241
Fractions, decimal equivalents, 3006; French, 1620; in Latin, 1334; in mathematics, 546, 705
Fractured bones, kinds, treatment, 6472
Frame, braced, 4640, 4641
— cycle, importance of testing, 3778
— bars, of ships, *5737*, 5738
— saw, in log-sawing, 5900
— saws, wood-working, *6449*
— workers, umbrella, wages, 5603
Framed cabinet work, 6586, *6587*
Frames, carpet weaving, 3991
— engine, detail drawings, 4202, *4203*
— lace-making, 4879
— of ship, *5738–5742*; bending, 5738; curvature, 5738, 5739; girder function, *6224*; joggled arrangement, *5918*; preparation and punching, 5736, *5737*
Frames of steamer, form, 5402
— tension bridge, *6267*, 6268
Framing, in vehicle construction, 2834; of brougham, 2830; of elliptic spring fore-carriage, *3125*
Franc, Belgian and French coin, value, 337, 409; Swiss coin, value, 410
France, African possessions, 3278; Algerian rule, 3280; architecture, Gothic period, 3374, *3375*; banknote issues, 3973; beer consumption, 3377; coalfields, 5302, 5304; coins, weights and measures, 409; colonial possessions off Africa, 3587; craniology, 1786; economic divisions, 5824; forestry returns, 4603; geography, 1681, *1682*, *1683*; government by consuls, 5238; government, form of democracy, 5534; literature, 2787, 3780; meat consumption, 3381; medical profession, 5429; militarism, contempt for, 5097; iron ore output, 5307; mint par with England, 3972; mortality statistics, 2662; nineteenth century art, 4395; oil shales, 6009; painting, Empire school, 4394; painting and sculpture, fifteenth to seventeenth centuries, 4117; population, 628; Renaissance architecture and sculpture, 3946; Romanesque period, 3232; Russian trade, 5708; spirits consumed, 3315; touring directions, 714; trade, 5381, 5650, 5664, 5825; transit trade, 5824; West African possessions, 3454; West Indian possessions, 4178; wine consumption, 3315; wool industry, 69, 72, 221
— history: from Gauls to Hugh Capet, 2915; Belgium, a part of, 2948; in early Middle Ages, 2241; development of state in early Middle Ages, 2354; wars with Richard I. and John of England, 2914; Arab invasion, 2946; Hundred Years War, 3251, 3463; foreign policy of Henry VIII., 3832; designs on Scotland, 3833; in Middle Ages, 4101, 4320; reign of Henry of Navarre, 4320; influence of Richelieu, 5110; Henry IV. to Louis XVI., 5110; the Revolution, 5110: *see also* French Revolution; Napoleon Bonaparte, 5238; Bourbon restoration, 5239; second Republic, 5239; Franco-German war, 5240; third Republic, 5240; settlement in India, 6549
Franchise for women, Spencer's opinion controverted, 4977
Francis I. of France, wars, 4102; political rivalry, 3650, 3651; wars with Charles V., 4396
Francis turbine, mechanism, *1690*, 1693
Franco-German war (1870), 5240
Frankincense (olibanum), source and use, 4658, 4971
Franklin, Benjamin, explanation of lightning, 128; one-fluid theory of electricity, 4022; philosophical writer, 3781
Franks, classification, 2354; history of, 2240, 2915; rule Helvetia, 4399
Fraunhofer lines in spectrum, 3370
Fredensborg palace, Denmark, 1425
Frederick II., of Prussia, reign, 6302
Fredrikshall, siege of, 5397
Free Trade, Adam Smith, founder of theory, 2055; movement (1846) 6691
Free will, in sphere of intellect, 2404; limitations of doctrine, 2550; in psychic theories, 3289; psychological account, 2995
Free-fall appliances in mining, *2671*
Free-hand drawing, *109–114*: *see also* Drawing
Freelance, in journalism, qualifications and career, 4671
Freeman's white lead, 5988
Free-martin, in agriculture, 2238
Freestone, classification, stratification, 1072; in masonry, 1452; quarrying, 2956; splitting, dressing, and finishing surface, 2830, 2842
Freezing, physical account of, 1269; shaft-sinking by, 3460
— mixture, in physics, 1740
— point, in chemistry, 696; methods of marking, 1566, 6129
Freiburg, suspension bridge, 2498, *2499*
Freight cars, railway, use of, 2467
— charges, in bookkeeping, 2500
— notes, 6363
— of ships, arrangement, 6807; engagement and shipment, 6362
French Congo, 3582
French cookery, economical, 2335, 5581
— embossing, process, 5838
— hem, *152*
— language, accents, 123, 449; Latin and Greek roots, 6810; punctuation, 449; syllables, 448; tourist vocabulary, 1956; translation, charges, 1920; travellers' phases, 1956
— mile, defined, 1148
— polish, preparation, use, 1035
French Revolution, Burke's "Reflections," 2055; effect on English literature, 1305, 2308: *see also* France, history
— salad, recipe, 2004
— sixth, in harmony, 567
Fresco, mural painting, preparation of wall for, and method of painting, 1024; Pompeian, 2933
Frescoes, Fra Angelico, Lippi, da Vinci, etc., *3520*, *3793*, *3794*, *3795*
Fresh-air inlet, in drainage, use, 739
Fret, geometrical design, *2321*, 2397; showing use of line, *5820*, 5821
Frets, of banjo, 4310; of mandoline, function, 4308, *4309*
Fret-saw, machine, *6359*, 6360; metal, *5522*, 5524
Fretwork, cabinet-making, 6584
Frequency of electric current, 1357
Frequentative verbs, Latin, 1047
Freycinetia, description, 729
Friar bird, warning coloration, 2505
Friars, in printing, cause, 5868
Friar's balsam, source, 3708
Friction, 958, 3813; angle of, 959; belting, 962; brakes, 960; clutches, 960; coefficient of friction, 958, 3171; coil clutches, 962; devices to avoid, 210; effect on motion, 425; expanding clutches, 962; gears, 962; importance in engineering, 2108; importance in mechanisms, 86; kinds, 858; laws of, 959; of liquids, 959; machinery devices, drawing, 4002, *4004*; practical applications, 959; in pulley systems, 834; rolling friction, 964; Seller's disc, 962; shafting bearings, 962; of water flowing through orifice, 1573; in vehicles, 3126
— gear, 962, 5355
Friendly Societies, system, 3224
Frieze, carving, 6136; design, *5979*; relation to dado, 5980; stencilled, 6728, *6729*
— material, width of, 186
Frigid zone, heat and light, 293
Frill, in dressmaking, kilted and box-pleated, 968; to make and put on, 862; quantities of material for, 187
Frillings, used in underwear, 3094
Fringe-winged insects, *3564*, 3365
Fringing reefs, *558*
Frisian language, classification, 1771
Frisket, of printing press, 5744
Frit, china glazing, 5606; Parian ware, 5607; in pottery manufacture, 5237
Fritters, celery, recipe, 2126
Fritting, in glass manufacture, 4533; in pottery manufacture, 5237
Frizzled fowls, points of breed, 4958
Frocks, boy-baby's, *4195*; girls', 4472, *4473*, 4474; infants' short-coating, *3856*; young child's, *4050*, 4054
Frog, common, 2800, *2801*; blood corpuscle of, 953; heart, 956; stellate cells, 2952
— in bricks, *1948*, 1949
— for guiding electric trolley, 1935
— in railway construction, *3608*

Frog-bit, 355 ; sewage plant, 4549
Frog-hopper, larvæ, 3365
Froissart's " Chronicles," 1609
Front boards, of van, 2828, *2829*
Front strap, of harness, 4886
Frontal bone of man, *1348*, 1604, *1605*
— lobes, of brain, *2144*, *2146*, *2537*
— sinus, *2537*
Frost, effect on brickwork, 2268 ; geological effect, 302
Fronde, the, war of, 5110
Froude, James A., author, 2616, 2618 ; admiration for Tennyson, 1435
Fruit, British imports, 4844 ; canning, bottling, 4845 ; chemical classification, 3112 ; choosing, 1228 ; consumption of, 4875 ; dietetic value, 3312 ; growing, 6676, 6832 ; growth, process of, 348 ; markets in British Isles, 2532 ; motor carriage, 3904 ; preserving, 4844 ; pulping, 4846 ; refrigerating, 5404, 5405 ; salad of, recipe, 2003 ; sources, packages, and seasons, 2531 ; stains, removal, 2590
— bushes, culture, 6678
— candied, manufacture, 4848
— catapult, flipping, and sling, 910, *911*
— crushed, tinning, 4846
— desiccated, kinds, preparation, 4845
— essences and oils of, sources, 5469
— farming in Canada, 3204, 3206 ; in England, 986 ; in Europe, 855, 4873 ; in Tasmania, 3469 ; Western Australia, 8235
— glacé, manufacture, 4848
Fruit-bat, as pollen carrier, 729, 730
Fruiterers, business of, 2529–2532
Frustum, in drawing, 1747, *1749*
Fry, Elizabeth, prison reform, 4276
Fry of marine bivalves, 3285
Frying, method in cooking, 1488, 3314
Fungi, common types, 1371, *1373*
Fuchsia, 353 ; culture, 6492
Fuel, books on, 5595 ; consumption and hardness of water, 5761 ; in cupola furnace, *2862* ; gaseous, for furnaces, 3108 ; liquid, 6151, 6153 ; from slag, 639 ; problem of wasted power, 376
— gases, composition, 6817, 6829
" Fugitive Slave Law," 5975
Fugue, in music, 633, 583
Fujiyama, volcano, 3159, *3161*
Fukien province, China, 2976
Fulas, distribution in Africa, 3279
Fulcrum, 1797 ; theory, 684
Full-bore discharge, in drainage, 781
Full-stop, use, 1338, 6351
Fuller, smith s, 2983, *2985*, 2986
Fuller electric cell, 466
Fullering, 2986, *2987* ; in caulking of plates, 3108, *3096*, *3097*
— die, *2989*, 2992
— tools, edges, 211
Fulling, in clothmaking, process, *4106*
— stocks, leather, 2854, 3165, *3166*
Fullner fibre separator, 5766
Function, in biology, analogy, 379 ; distinguishing plants and animals, 276 ; specialisation, 278
Fundamentals, in harmony, 363, 2104
Fundy, Bay of, tides, 556
Funeral attendants' wages, 5785
— furnishers, trade with undertakers, *5785*
Fungi, as food to other plants, 503 ; classed economically as animals, 277 ; *forest* pests, 4925, *4927*, 4928 ; mycorrhiza, 503, *505* ; injurious to agricultural crops, *1667* ; *in plant classification*, 166
Fungiform papillæ, of tongue, 2535, *2536*
Fungus-animals, description, 134
Funicular polygon, 2197, *2199*
Funnels, of railway locomotives, Prof. Adams's invention, 520
Fur, 6426 ; cleaning, 6040, 6434 ; as clothing material, 4256 ; dressing and preparing, 6429–*6435* ; dyeing, 6429, 6432, 6433 ; imitation of, 3156, 6434 ; linings, manufacture, 6436 ; manufacture of articles, 6435 ; protection in mammals, 2156 ; rugs, manufacture, 6436 ; varieties, 2721, 6426
Fur, in boilers and kettles, 633, 4157
Fur-beetle, classification, voracity, 3511
Fur merchants, business of, 2720
— skin dressers and dyers, employment conditions, 2648
Furnace, blast : *see* Blast furnaces
Furnace, of boilers, *3101*, 6876 ; charging machines, *5017*, 5018 ; construction and materials, 3942, *4125*, *4126* ; cooling, 4626 ; fans, use of, 1808 ; flue, making, *3101*, 3102, *3105* ; forge and blast, contrasted, 4467 ; iron extraction, direct method, 4465 ; lining, brick used for, 1285 ; open hearth : *see* Open-hearth furnaces ; puddling : *see* Puddling furnaces ; reheating, use in iron manufacture, 4638 ; refuse-destructor : *see* Refuse-destructor furnaces ; reverberatory : *see* Reverberatory furnaces ; types used in steel manufacture, 4749 ; tilting, in steel manufacture, 4465, 4466
— calcining, 231
— carius, use in analysis, 4413, *4415*
— cementation, description, 4749
— electric, 3031, *3032*, 4532, *4533*, 5757, *5758*
— fritting, pottery manufacture, *5236*
Furnace-crown, in boilers, *3099*, 3100
Furnishing, business of, 3447
Furniture, auctioneer's inventory, cataloguing, 4983, 4984, 4985
— art, dealing in, 893
— bamboo, manufacture, 5725
— compositor's, use, 5252, 5459
— construction, 6579, *6581*, *6587*, *6589*
— household, valuation of, 5151
— shops, wages, and capital, 47
— stuffing, 6715
— vans, construction, 2558
Furriers, employment conditions, 2649 ; knives and tools, *6429*, 6432 : *see also* Fur merchants
Furrow, in agriculture, 430, 431, *1232*
Fürstenbund, Prussian history, 6302
Furze, as livestock food, 2905
Fuse, electric, *6620*, 6765 ; percussion, *6618*, 6820 ; safety, 6274, 6765
Fusee, in mechanical engineering, 832
— verge watch, *6081*, 6082
— drum, " sweeping-up " *2459*, 2460
Fusible metals, 360, 1162, 3941, 5988
Fusibility of metals, 239, 3837, 5523
Fusion mixture, analysis by, 4415
Fustians, finishing processes, 4342
Fustic dye, origin and use, 5907
Futchell, carriages, 3122–*3124*
— jaw stay, of brougham, 2830, *2831*
Future tense, German use of, 3501

G.C.M., meaning, 339
Gabbro, rock, classification, 1009
Gabelle, French tax, 5112
Gable, architects' drawings, *5693*, *5696*, 5698
Gad, tool, *532*
— steel miner's tool, *2583*
Gad-fly, in sheep, 2626, 3721, *3722*
Gaelic, bards, function of, 303
Gaelic language, classification, 1771 ; survivals in English, 1770
Gaff, of sailing ship, adjustment, 5398
Gaggers, in moulding, function, 2110
Gainsborough, Thomas, landscape painting, 4300, 4392 ; " The Blue Boy," *4393*
Galactose, cheese ferment, *4036*
Galashiels, industry, 1036, 2836
Galba, Sulpicius, Emperor of Rome, reign, 1939
Galena, lead extraction, 5754, *5755*, 5985 ; lead ore, 358, 1160, 3508 5985, 6737 ; smelting, 4303, 5986
Gales, effect on coast, 6218, 6219
Galicia, Austria, 2162, 2165
Galilei, Galileo, life and works, 35, 36, 551, 2949 ; Jupiter's moons and deductive logic, 6002 ; laws of motion, 312, 6119 ; on pressure of atmosphere, 1801 ; his telescope, 2903, 2949, 6119, 6241, *6242*
Gall, Aleppo, *5366*
— Chinese and Japanese, 5366, 5780
— of gall-fly, 3722
Gall, oak, gallic acid from, 3822 ; production, use, 5366, 5780
Gall-bladder, description, *576*, 580
Galleries, in military engineering, siege and defence, 6273
— in mining, making, 2666
Galley press, compositor's, 5252
Gall-fly, description, 3722
Gallic acid, sources, properties, 3822
Gallnuts, use in dyeing, 5780
Galloway boiler, 3108 ; tubes, *3097*, 3102, *6875*
Gallstone, accompanying jaundice, 6038
Galoon, in dressmaking use, 185
Galton, Francis, theory of eugenics, 3120 ; researches in heredity, 1316
Galton grate, use in ventilation, 3801
Galvanic battery : *see* Battery, electric
Galvanised iron, 359, 1045
Galvanisers' tools, *6164*, 6169
Galvanising, process, 4306, *6164*, *6168*
Galvanometer, 129, 464, *465*, 562 ; charging sheet of glass, 3579, 3580 ; indications in duplex telegraph working, 4607 ; in Lodge's oscillation transformer, *3895*, 3897 ; of Morse sounder, use, 5065
Galvanoplastic : *see* Electrotyping
Gama, Vasco da, founded church in Lisbon, 1134 ; his voyage, 201
Gambetta, Léon, French Dictator, 5240
Gambia, British possession, 3454 ; cotton production, *383*, 386
Gambia, river, 3452, 3453
Gambier, use, 4658, 5779, 5906
Gamboge, source of colour, 5145
Game, birds, etc., carving, 5934, *5935* ; choosing, 1228 ; cooking, 1874 ; dietetic value, 3311 ; kinds in season, 1531, 1532 ; sale by poulterer and game dealer, 4712
— birds (*Gallinæ*), description, 2212
— dealers, licence, 4712
— fowls, points of breed, 4953 ; English, 5624 ; Indian, 4660, *4662*, 5623 ; types, *5089*
Games, effect on character and physique, 4388 ; importance in life, 2672 ; psychological importance, 2548
Gametic purity, Mendel's discovery, 1484
Gamma rays, of radium, 2028
Gammot, in carpet weaving, 3357, 3992
Gang mill, in cutting, *2402*
Gangers, railway, 4591
Ganges, river, 2818, 2821, *2822*, 2818
Ganglia, of heart function, 1193
Ganglion cells, function, 1942 ; in brain, and association of ideas, 2805
Gangue, in metallurgy, 237, 3835
Gangway, railway carriages, 2555
Ganister, as furnace brick, 1045, 1285, 4749 ; description, use, 3941, 3942
Gannet, classification, 2213
Ganoidei, sub-order of fishes, 3065, *3067*
Gantry, in building, 1172, 1173, 1453
— masons' tool, 2840
Gap coefficient, of dynamo, 1109
Gaping, physical explanation, 1303
Garabit bridge, structure, *2739*, 2740
Garages, equipment, 3878, 3879
Garden, 6205 ; aspect, 6205, 6206 ; beds, 6206 ; borders, 6206 ; cost, 6832 ; flower and kitchen, proportion of, 6205 ; front, 6206 ; laying out, 6205, 6315 ; refuse destruction, 6204 ; rock, making, 6320, *6321* ; screen of trees, 6206 ; small, laying out, 6315 ; tools, *6315* ; trees in, 6316 ; walks and paths, laying out, 6206
Garden-cress, classification, 352
Gardener, duties, privileges, 1001 ; prospects, pay, etc., 6833
Gardenias, culture, 6533
Gardening, business of, 6832 ; digging, 6203 ; draining, 6203 ; flowers and ferns, 6487, 6488, *6489–6491*, 6492, *6493* ; levelling, 6203, *6204* ; preparation, laying out, and arrangement, 6203, *6204*, 6206 ; soil, 6203 ; trenching, 6203, *6204* ; women's training, 322
— jobbing, florists' side-line, 2528 ; by nurseryman, 6833
Garden-seat, omnibus, described, 2466

Garden-warbler, classification, 2210; nest, *plate preceding* 2497, 2506
Garget, in cattle, 2623
Garibaldi, Italian patriot, 6303
Garments: *see* Clothing, Dress, *etc.*
Garnet, composition, kinds, properties and sources, 5852, 5854, 5855, 6737
Garnet-paper, use in shoe factories, 813
Garnett, Richard, 2617; as poet, 1438
Garnierite, nickel ore, 5982, 6737
Garonne, river, course, 1684
Garrick, David, as dramatist, 1151
Gas, elastic force, Boyle's law, 5414; in power production, 5127; use in thermometers, 1566; wrought-iron tubes for, 5328; varieties of, 6817
— coal, analysis, 6823; balloon inflation, 3977; cost, 6152; burners for, kinds and fittings, 6026; as illuminant, 5193, 6025, 6822; manufacture, *6817*–6821; measurement with Lunge's nitrometer, *5587*, 5588; use as power for engine, 5414; tar, 1163: *see also* Coal tar; tests, 6823
— natural, occurrence and use, 5306, 6153, 6818; Appalachian wells, 6014
— *see also* Gases *below, and specific kinds—e.g.*, Producer, Water, *etc.*
— brackets, kinds, fittings, 5799
— burners, 6026
— carbon, 1157
— company, bookkeeping, 3332, 3569
— engine, 520, 6785; place in power development, 5010; for water transit, 2278
— engineers, municipal career, 575
— fire, advantage of, 5195
Gasfitters, employment conditions, 2644; work of, 2218
— fittings, fixing, 5799; pipes and fittings, 5798, 6831; use, 5327
— holder, *6823*; columns, 209
— lighting, first use in streets, 128
— lime, as manure, composition, 590
— liquor, products, *4775*, 4776; yield from varieties of coal, 5461
— meter inspectors, 1498
— meters, kinds, capacity, 5798, 6831
—, oil, uses, transport, 6149
— pendants, attachment, 5799
— pipes, capacity, 5797, 5798; fixing, 5798; screws for, 3004, *3006*; service and composition pipes, 5798
— stoves, for cookery, 3313; management, cleaning, 1227
Gascoigne, George, dramatist, 678
Gaseous fuel, for furnaces, 3108
— pressure in physics, 1267
Gases, Avogadro's law, 696, 1914; Boyle's law, *1802*, 1804; conductivity, 4103, 4699; critical temperatures, 1741; Charles's law, 1566, 1805; Dalton's law, 1805; diffusion of, 1302; distinction from other fluids, 1142; ionisation, 4103, 4699; kinetic theory, 1267; liquefaction, 4560; magnetic properties of, 4245; molecular motion, 1266; specific gravity, 799; volcanic, geological action, 1207: *see also* Air, Atmosphere, Pneumatics
Gasolene, 1164, 6148, 6818; motor, in submarines, 2280
Gassing, spun silk manufacture, *2596*, 2598; thread, 2708
Gastralgia, causes and remedies, 5842
Gastric juice, analysis of, 578; functions and action, 674
Gastric mill, of crayfish, use, 3807
Gastritis, in horses, 2620
Gasworks Clauses Act (1847), 1978, 6821
Gate, field, types, *4645*, 4646
Gate, in mining, 3561
— in railway construction, *3613*, 3615
Gate of Lions, Mycenæ, *2857*, 2858
Gateaux, petits, recipe, 2332
Gateshead-on-Tyne, industries, 1272
Gathers, in dressmaking, *3337*, 3338; milliner's, *4565*, 4566; in needlework, *151*; in underclothing, *3337*
Gattamelata, Donatello's equestrian statue, 3676, *3677*
Gauge, accuracy, 4710; carver's, *5809*, 5810; depth, *4705*, 4709; intermediate standards, 4702; use and varieties, 3386, *3387*, *3388*, 4701, 4702, 4707
— lens, testing, 6125
— limit, use, *4705*, 4710
— long tooth, in joinery, 5298, *5299*
— marking, use in planing, 3756, *3759*
— mortise, 4040, *4041*
— plasterer's, 5497
— plug and ring, use, *4705*, 4709, 4710
— points, use by compositor, 5159
— river, V-notch type, *5114*, *5115*
— rod, construction, *4705*, 4709
— screw-thread, use, *4705*, 4710
— in slanting, defined, 4866, *4867*
— snap, designs, *4705*, 4710
— spacing, use in railways, 4591
— surface, construction, *4703*, 4706
— wire, 5169, 5170
Gauge-board, plasterer's, 5496
Gauged stuff, in plastering, 649, 5499
— work, in building, *1950*
Gauge-hook, plumber's, 5029, *5030*
Gaul, early history, 2241
Gault, cement, 1579; strength, 1520, 1521
— bricks, description, 1947
Gauntlet, princess robe, *2206*, 2208
Gauss's method, of weighing, 62
Gautah, measure, 410
Gautama, Buddha, idea of organic evolution, 5386
Gautier, Peter: *see* Peter the Hermit
Gauze, weaving and design, *3156*, 3685, *3912*
Gaveston, Piers, career, 3075
Gavottes, practice for sight reading, 2024
Gay-Lussac, law, in physics, 1566; sulphuric acid apparatus, *4627*
Gaz pauvre, manufacture, 6818, 6827
Gazelle head, stuffing, 6328, *6329*
Géant, Glacier du, glacier, *461*
Gear, angle spur, 3922; automatic expansion, function and value, 5645; bevel, 3922, *3923*; bicycle, calculation, alteration, 3773, 3774, 3775; books on, 5595; chain, 5354; in friction gearing, 5355: *see also* Friction gear; helical, 3921, *3922*; internal, 3921, *3922*; of lathe, types, *4913*, *4914*, 4916, 4918, 4920; machine cut, 3656, 3657; mitre, 3922; raw hide, *3921*; screw, 3922, *3924*; spur, *3638*, 5208; stepped, 3921; toothed, 842, *3638*, 3657, 5354; worm, 3924, *3925*, 5354
— barring, of engine, 4427
— cutters, variety of, 3321
— cutting, *3630*, *3631*, *3632*
— drive, of lathe, action, *4914*, 4920
— wheel, calculating centres, 3692
— wheel blanks, milling, 3402
Gedda gum, 810
Geese: *see* Goose
Geikie, Sir A., geologist, 1007, 2786
Gelatin, chemistry of, 4134, 5361; casting mould with, 1673; a colloid, 4698; dyeing, 6770; manufacture and analysis, 5357; a protein, 4134; uses, varieties, 810, 5362
Gelignite, 6763
Gemini, sign of Zodiac, 6251
Gemmation, of cell, human, 199; reproduction by, *381*; of sea anemones, 4083; of yeast plant, 2878: *see also* Budding
Gemmules, of sponges, 4087
Gems: *see* Precious stones
Gender, in English grammar, 116, 123
— French irregular, 1052; nouns, 905
— German feminine, 1189; nouns, 1054
— Italian adjective, 2631; rules, 2192
— in Spanish, 2040, 2343, 3792; adjective forms, 2481
Genera, genus, in biology, 136, 380
General ledger, function, 778, *2981*
— adjustment account, purpose, 2982
General manager, railway company, 4227
— — retail business, duties, 6054
General Post Office: *see* Post office
— servant, duties and routine, 1091
Generalisation, in logic, defined, 6000; test by deduction, 6001
Generation, continuity of, *1314*; spontaneous, theory, 28, 96
Generator, of cycloidal curve, 1414
— in electricity, scope of term, 1104: *see* Dynamo
— gas, 6818
— in telegraphs, Wheatstone, *5177*, 5178
Genesis, Book of, 667
Genetic psychology, scope, 3117
Geneva, made a republic, 4399; international conference (1872), 5976
Geneva spirits, 859, 2879
Genghis Khan, campaigns in China, 218
Genitive case, government by, German adjectives, 3931
— Greek, 6526
— Latin rules and idioms, 900–901
Genius, how far due to observation, 1882; Myers' definition, 3183, 3383; due to psychical variation, 5387; transmission by books, 5388
Genoa, description, 2230; earliest history as a republic, 2946; loss and gain of prosperity, 4520; touring, 947
Genoese, shipping, 5256
Gens (French grammar), gender, 5512
Gentians, in botany, 354
Gentlemen's outfitters, business, 2722
Genus, in natural science, 136, 380
Geographical distribution, meaning, 279
Geography, cartography, 459, 460; definition and scope, 10; bearing on sociology, 3989; of countries, etc: *see under specific names*
— commercial, agricultural products, 4873; economic regions and their products, 5379; food crops, 4959; mineral products, 5302; natural products, 4873, 5117, 6880
Geological map of British Isles, *facing* 1921
Geological survey, agents, 1146; consultation by prospectors, 2581
Geologist, outfit of, 896
Geology, books on, 2255; dictionary of, 2257; disintegrating agents, 1499; distribution in time, 137; dynamical, volcanoes, earthquakes, 1205; earth's crust, changes, 1352, 1921; erosion, 1633, *1813*; glaciers, action, 1633; periods and fossils, resulting biological theories, 1177; palæobotanical periods, 1116; plant and animal agencies, 1813; relation in biology (palæontology), 1031, 1177; rocks, classification, 896: *see also* Rocks; strata, classification, 535; systems, survey of, *2253*; of United Kingdom, *528*
Geometrical drawing, 284, 470, 492, 739, 792, 1012, 1084, 1251
Geometrical progression, 3914, 5338
Geometry, plane, abbreviations, definitions, axioms, 4207; books on, 2033, 6790; application to design, 2321; glossary of terms, 285; prop. 1, 4208; propns. 2–5, 4330; propns. 6–9, 4331; propns. 10–14, 4477; propns. 15–18, 4623; propns. 19–21, 4624; propns. 22–24, 4723; propns, 25–28, 4724; propns. 29–30, 4905; propns. 31–32, 4906; propns. 33–36, 5043; propns. 37–39, 5044; propns. 40–44, 5197; propns. 45–49, 5198; propns. 50–51, 5337; propns. 52–54, 5338; propns. 55–59, 5472; propns. 60–62, 5473; propns. 63–71, 5635; propns. 72–77, 5783; propns. 78–85, 5943; Pythagoras theorem, 5043; ratio and area, 5635; ratio and proportion, 5337; linear perspective, 595, 600; postulates, 4208; problems, 4208; similar figures, 5472; theorems, 4208; *see also under separate headings—e.g.*, Angle, Circle, *etc.*
— practical, 280, 473; in drawing, 284; instruments, 284; use of scales, triangles, 494; use of sector, 494: *see also* Drawing
— solid, 1747; practical, 2005

George I., King of England, proclaimed, 4952; descent, reign, 5554
George II., of England, reign, 5554
George III., of England, reign, 5555, 5685, 5973
George IV., of England, reign, 5685, 5686; Holy Alliance, 5975
George I., King of Greece, rule, 6448
Georgia, state, products, 4172, 4174
Georgian pitch-pine, timber, *54*
Geotectonics, implements used in, 897
Geraniol, in essential oils series, 4968; use in perfumery, 4971
Geranium, culture, 6492; wild, *507*, 508
— order, classification, 353
Gerber, milk testing machine, 4038
German Empire, political entity, 1974, 6445; in Middle Ages, 4398; Spanish and French trade, 5823, 5824
— language, affirmation, 3502; English, relation to, 248; prefixes, verbal, 1878; punctuation, 4363; sentences, elliptic, 3789; tourist vocabulary, 1956; translation charges, 1920; travellers' phrases, 1956; words, position of, 3503, 3645
— sauce, recipe, 2004
German silver, 360, 1042, 3940, 5983, 6311; electric resistance, 672, 1397; electroplating, 3421, 3940
— sixth, in harmony, 567
Germanic races: *see* Teutonic
Germanicus and Roman frontier wars, 1830; Tiberius's jealousy of, 1831
Germanium, 401
Germans, phlegmatic temperament, 5701
Germany, aniline dye industry, 642; asphalte deposits, 1164; beer consumption, 3377; climate, 1974; coalfields, 5302, 5304; coins, weights and measures, 409; colonies (Africa), 630, 3278; New Guinea, 3697; craniology, 1786; dependencies (Pacific Islands), 3902; economic conditions, 5825; electricity, development, 131; engineering progress, 5594; forest industries, 641, 4603; geographical account, *1972*, *1973*, *1976*; gold points, determination, 3973; Gothic architecture, 3374; industrialism prostituted to militarism, 5097; iron and steel output, 5307; language: *see* German language; literature, 3780, 3782; literature, influence on modern English writers, 2308; medical profession, 5429; military system, 2947, 5096; Northern, geography of, 1975; painting, fifteenth century, 4117; petroleum deposits, 6008; products, 5825; population, 628; railways, high-speed electric, 2276; Rhine basin, 1836; Renaissance architecture and sculpture, 3946; science and manufactures, 3711; touring directions, 857; trade, 5826, 5825, 5826, 5381, 5659, 5708, 5664; Trajan's wars, 2060; woman question, 4976; wool trade, 72
— history of, earliest days to Otho I., 2947; early Middle Ages, 2241; Middle Ages, 4398; Thirty Years' War to William II., 6445

Girard turbine, *1689*, 1692, *1693*, 1695
Girder, books on, 5596; box, 544; in bridge building, tubular, 2498; in carpentry, 4640, *4641*; carrying capacity, *1987*, 1988; compound, 2198, *2199*; of engine frames, load calculation, 4206; fire protection, 4754; in floor construction, 4445, *4447*; in foundations, 335; framed, 542; punching, 1222, 3095; reamering, 3095; strength of, 1986, 1988, 2197, *2199*, 2200; stresses in steel construction, *2227*, 2228, *2229*; in structural ironwork, 5791, *5793*; Warren, 540, 541; web and flange, 544
— of ship, erection, *5740*; frame, use, 5400; intercostal, *5740*, 5741; stress calculation, 6223
Girder section: *see* Joist section
Girder tool, use, 2458
Girls, hygienic clothing, 4863; dress, *4472*, 4476; education, 3505; height and weight, 4529; physical exercise, 4388; wardrobe, *4473*
Girls' Public Day School Company, teachers' salaries, 6476
Girths, harness makers', 4885
Girth strap, of harness, dimensions, 4886; saddle, making, 5340, 5341
Gissing, George, novelist, 3442
Gizzard, of birds, 578
Glacé kid boots, 1326
Glacial Period, 2255; order, 2067
Glacier, description, formation, transport, 1636, 1638; erosion, 459, *461*, 1638; evidence of in Great Britain, 2255; movement, 1636, 1740
— Alpine, description, 1837
— Bondhouse, erratic blocks, *1635*
Glacier des Boissons, Switzerland, 946
Gladiolus, 355; culture, varieties, 6490
Gladstone, W. E., career, 6694
Glaire, in bookbinding, 6778
Glance, nickel ore, 5982
Gland, engine cylinder, use, *5641*
Gland, lymphatic, *1195*, *1196*
— milk, of mammals, 30
— saliva-forming, 577, 578
— vascular, 1194, 1195
Gland patterns, moulding, 2540, *2541*
Glanders, in horses, 2620, 5412
Glamorgan cattle, colour, 2236
Glamorganshire, geography, 1277
Glasgow, commerce, industries, 1066; municipal activities, 317; trade and imports, 6006; tramways, 573, 1498, 2274
Glasgow and S. W. Railway, signalling system, 4689
Glass, annealing, 4531, 4534; antique, use for stained windows, 4946; bevelling, 4932; black, composition, 4930; blown, manufacture, 4736; blue, composition, 4930; boring with sand, 4932; chemical composition, 1160; coloured, manufacture, 4930, 4045, 5838: *see also* Stained glass; constituents, properties, and varieties, 813, 4531; crackled, manufacture, 4930, 4931; cutting and decorating, 4931, 4932; dealers in, business, *1893*; as electrical insulator, 672; etching, 4932; fire-resisting, 4752, *4753*, 4754; furnaces, *4532*; gilding process, 4932; green, composition, 4930; heat and light rays, effect on, 5193; iridescent, manufacture, 4930; manufacture, *4531–4536*; muscovite as substitute, 812; ornamental, 4930, *4931*; platinising, 4932; prismatic, 5838, *5839*; in shop fronts, securing, *5295*, 5296; silvering on, 361; smoothing and polishing, 4931; soldering to metal, 6460; solvent, 5528; specific gravity, 1702; for spectacles, 3372; stained: *see* Stained glass; static electricity, charge, *3579*; strength, 1701, 1702; transparency of, 2436, 5838; water: *see* Water glass; weathering, 4531; weight, 1702; wired, manufacture and use, 4735
— *see also particular varieties—e.g.*, Astralite, Baryta, Crown, *etc.*
— bevellers, employment conditions, 2654
— bottles, manufacture, 4735, *4736*
— funnel, in analysis, *4405*, 4412
— houses, 6530; insurance, 6836
— mosaic, process, 5838
— papering, *6589*, 6591
— pots, manufacture, 4531
— trades, employment conditions, 2653
— tubing, manufacture, 4736
Glass-blowing, process, *4756*
Glass-cutting, 4146
Glass frame, of brougham, 2829, *2831*
Glassing, leather, *3219*, 3221
Glassworkers' tools, *4736*
Glauber salts, 6737; adulteration of soda, 4774; use in dyeing, 5637, 5780, 5954: *see also* Sodium sulphate

Glaze, china, preparation, 5606
— in faience, *plate facing* 2785
— Parian ware, composition, 5607
— pottery, *plate facing* 5233; composition and use, 5236, *5385*, 5777
Glazed bricks, 1520, 1948
Glazier, 5836; employment conditions, 2644; tools, 5836, *5839*
Glazing, bricks and tiles, 644–646
— in building, *5838–5840;* putty for, 649
— hollow china vessels, 5606
— leather manufacture, *3219*, *3220*
— applied to loaves, 3395
— pottery, materials and processes, *plate facing* 5233, 5236, *5337*
"Gleaners," Millet's picture, *342*
Glen Roy, parallel roads, *1353*, 1354
Glencoe, massacre of, 4843
Glenmore, geography of, 1064, *1065*
Gliding joint, 1709, 1710
Glissando, in harp music, 3529, *5734*
Glissé, in guitar playing, 3762

Globe fish, rounded body, *3067*, 3069
Globe granite, concrete, 534
— scrolls, of van, *2829*
Glochidium, life history, 3285, *3286*
Glockenspiel, 5568, *5734*
Glomeris, British millipede, 3362
Gloria, dress material, dyeing, 6503
Glossing, in laundry work, 2911
Glossites, disease, 6132
Glost firing, pottery, 5237
Glottis, *2539;* in singing, 6048, *6049*
Gloucester Cathedral, 1276, 3233, 3374
Gloucester cheese, composition, 4490
Gloucestershire, geography, 1276
Glover, business of, 2868
Glover tower, sulphuric acid, 4628
Gloves, leather, tawing process, 3163, *3164;* manufacture, 5479, *5481*, *5482*; use of ratskin, 966
Glow lamp, electric, manufacture, 2613
Glow-worm, emission of light, *3511*
Gloxinia, classification, 354
Glucose, in making caramel, 4165; duties on, 4558; in dyeing, 5782; in food manufacture, 4556; in jam-making, 4847; making and refining, 4555, 4558, *4559*, 5364; in marmalade-making, 4848; starch, conversion to glucose, 5364; test, 4557, 4558: *see also* Dextrose
— syrup, manufacture, 4557; use in manufacture of golden syrup, 4455
Glucosides, properties, products, uses, 4013, 4014; spelling rule, 3825
Glue, adhesive properties, 5362; ancient use, 5357; books on, 6689; chemical composition, 5360; chemical reactions, 5361; dissolving, 5362; dyeing, 6770; "fibrin," preparation, 5360; Kissling's test for tenacity, *5361*, 5362; Kjedahl estimation, *5361*; Lippowitz test for consistency, *5361*; making, 3846; manufacture, 5357, *5358*; preparation, materials, 810, 811; source and kinds, 5357; uses, 3846, 5362
—, bone, manufacture, *5357*
—, fish, manufacture, 5360
— "Russian," manufacture, 5359
Glue blocks, of brougham, 2829
Glue-tester, construction and use, *5358*
Gluing, in wood jointing, *3845*, 3846, 6580
Glume: *see* Bract
Glumifloræ, classification, 355
Glut weld, *2989*, 3096, 3108
Gluten cells, of wheat, 914, *915*
Gluten feed, as livestock food, 2909
Gluten, of flour, influence on bread-making, 3282
Gluten meal, constituents, 5436; cows' food, 3892; as livestock food, 2909
Glutin, in glue, 5360, 5361
Gluttony, harmfulness, 3600
Glycerides, chemistry of, 4829
Glycerin (glycerol), composition, manufacture, kinds, 4967; discovery, 61; dynamite, 4967; production, formula, properties, products, uses, 3271, 4967; saponification, 3485, 4967; soap-lye, 4967
Glycerol: *see* Glycerin
Glyceryl, formula, 3271
Glycocoll, formula, 3818
Glycogen, animal starch, 580; in human system, 677; production, relation to dextrose, 3706
Glycols, dihydric alcohols, 3142
Gnat, description, 3721, *3723*
Gnathic index, explained, 1786
Gnawers, fecundity, 2155; flying, *2037*
Gneiss, 898, 1075; constituents, 530, 535
Gnu, hide used for belting, 3712
Goaf, in mining, *3560*, *3561*
Goat milk, 3311; even-toed foot, 1870; skins and furs, 6427, 6430
Goat-moth, larva, 3514; pest, 4926
Goatsbeard, seed dispersal, *909*, 912
Goatsucker, classification, 2211
God, in Myers's theory of life, 3384
Godwine, Earl of West Saxons, 2358
Goethe, poet, eulogy on Carlyle, 2452
Goffering in laundry work, 2910
Goitre, Derbyshire neck, 1195
Gold, 6737; alloying, 5856; alloys, 5856; alluvial, proving, 2665; amalgamation, 5847; annealing, 5524; in art metal-work, *5521*, 5524; assaying, 5849; books on, 4860, 5860; bullion, 5848; Californian production, 5662; casting, 5858; check assays, 5850; chemical properties, 1448; colouring, 5858; conductivity, 672, 1397, 3838, 3839; crushing, 3770; cupellation, 5848; deposit in copper refining, 5754; deposits, 5307; distribution, 360, 3771; electrical resistance, 672; electro-chemical equivalent, 3262; as exchange medium, 5850; extraction, 360, 4305, 5755, 5847; fine, standard rates, 5857; gilding, 5858; "gold fevers," 5307; hall-marking, 5860; hydraulicing, *2959*; melting, 5858; micro-structure, 3939: *plate preceding* 3937; New Zealand output, 3902, 5661; occurrence, 1448, 4304, 5847; parting, 4305, 5848; physical properties, 672, 1396, 3837, 4304; placers, 2377; in pottery colouring, 5382; prospecting areas, 2581; properties, 4304; recovery by electricity, 5756; recovery, lead method, 4304: *see also* Gold extraction; refining, 4305, 5848; refining, electrolytic, 5848; sluicing, *2959*; solder, 5523; specific gravity, 799, 1078; strength, 1396; tooth-filling material, 5553; toughening, 5848; transmutation and the new alchemy, 1448; washing, 361, 3770; W. Australia export, 3900; world's output, 5307; Yukon, 4175
— amalgam, purification, 5847 *5849*
— carats of, 5523, 5856
Gold Coast, assistant district commissioner, 3548; cotton, 385, 386
— coinage, British, 360, 5850
— coins, composition, legal standard, circulation life, coinage, 5851
— leaf, making, 361; burnishing and stamping in illumination, 6276
— mine, initial cost, 2847; cautions to investors, 3484
— ore, assay, 5849; sampling, 5850
— points, foreign exchange, 3682, 3972
— quartz, gold extraction, 4304, 4305
— wire drawing process, 5857, 5858
— work, *5687*, 5856, *5857*; books on, 5860; nations productive of best collections, 5521; Greek, 2857, 2858; periods, 5856; modern, 5856
Goldbeater's skin, 361; for balloons, 3977
Golden eagle, 2213
Golden saxifrage, fertilisation, 730
Golden syrup, adulteration, 3718; manufacture, 4455
Goldfinch, 2209; *plate facing* 2209
Gold-silver button, in assaying, *5849*, 5850
Goldsmith, Oliver, poet, 994, 995; dramatic works, *1151;* prose works, *2053*; travels, simplicity, 213; "Vicar of Wakefield," 3131
Goldsmithing: *see* Gold-working
Goliaths, testing, 3966
Goloshes, manufacture, 5201
Gomme, G. Laurence, career, 81
Gommeline, uses, composition, 1169
Gonda cheese, composition, 4490
Goniometer, 766; use, 6122
Good, the, in Persian faith, 502; Plato's teachings, 976; ultimate triumph of, 5389, 5390
Goods account, defects of system, 2270, 2272; stock entries, 2418; relation to trading account, 2500
— in brewing, 6057
— delivery and acceptance, law, 6844
— depots, railway, 5073
— managers, railway, duties, 4227
— railway, 5068; automobile transport, *5078*; classification and rates, 5076; settlement of companies' accounts, 5101; traffic methods, 5073
— staff, railway, list and duties, 5072
— transport, law of, 6753; statistics of cost and speed, 2152
— trains, in railway traffic, 5068; equipment of waggons, 5070; express, *5073*, 5076; speed and carrying power, 2274, 5075
— vehicles, classification, 2462; description, *2463*; railway types, 2555
Goodwill, in balance-sheet, 2759; premium paid by new partner, 2980; value in shopkeeping, 702
Goose, bill, 2494; breeding, 5704; carving, 5934, *5935*; choosing 1228, 3717; classification, 2213; dietetic value, 3311; manure, 5874, 5875; roasting, 1487, 1874; varieties, 5704, *5705*
— tool, in tailoring, 1110
Gooseberries, bottling, 4846; culture, 6678; protection against insects, *1114*, 1115
Goosefoot: grass, *880*; a weed, 1378
Goose-grass, 354; seed dispersal, 912
Goose-neck ladle, foundry, 2867
Gordon Riots, account, 5555
Gordon's formula for columns, 540
Goreham process, cement, 1580
Gores, in box-pleated skirt, *2469*
— in technical drawing, 4522
Gorge, at Victoria Falls, *1634*
Gorgonia: *see* Fan-coral
Gorgonzola cheese, manufacture, 4490, 4574; dietetic value, 3311
Gorilla, skeleton, *1604*, *1871*; skull, *1787*
Gorki, Maxim, on education, 1743
Gorse, classification, 353; cross-pollination, 732; in dry and wet air, *506*, 508; as live-stock food, 2905; moisture supply, 727; protection against slugs, 1115; spines, function, 1114
Gossamer, spinning, use, 3805
Gosse, Edmund, author, 2053, 2687; as poet, 1438
Gossypium, cotton plants, 5637
Gothic architecture, history, in Europe, 3373, *3375*, *3517*; books on, 2034; *see also* Architecture
— art, history of, 3374, *3517*; sculptured ornaments, *1216*
Goths, invasion of France, 2915
Gouge, carver's, *5809*, 5810, 6045
— for casting pattern-making, 2453
— smith's, described, 2983, *2985*
Goujon, Jean, sculptor, relief, 3947
Gout, cause, 3600, 4008, 6037; and heredity, 1587, 2662; effect of hard water, 4158; symptoms, remedies, 6037
Government, forms of, relation to militarism, 5098; influence on character, 4371; sociological problems, 2549; monarchic and democratic forms, 5533; study by sociologists, 5533; various kinds, 629
— stock, British and foreign, 3484
Governor, engine, mechanics of, *2017*; Watts's invention, 5416
— gas, 5798, 6823
Governor gear, *5913*, 5914; Bellis engine, *5750*, 5751; Brotherhood engine, *6072;* Robey, *6070*, 6071

Gowns, infants', drafting, 3853, *3854*
Gracchus, Caius, tribunate, 1382, 1383
Gracchus, Tiberius, reforms, 1382
Gradient, pulling force required, 585; in surveying, 591; measured by clinometer, 803
Græco-Latin languages, list of, 1771
Grain, alcohol from, 1035; cows' food, 3892; dietetic value, 3312
— apothecaries' weight, 226
— system, in woollen industry, 2896
— of wheat, 913–915
— of wood, importance in carpentry, 3539, *3541*; planing, 3756, 3758
Graining, leather, 3221, *plate facing* 3217, 3219
— roller, painters', *5829*, 5831
— in house painting, 5834
Grammalogues, shorthand, list of, and rules for, 429, 691, 837, 1039, 1234
Grammar, analysis, 115, 1618, 760; Cobbett's works, 2450; in writing, 4579; parsing, 1617; value to logician, 6001
Gramme dynamo, 129, 1323
— Greek measure, 409
Granary, construction, 2999
Grand Alliance, object, 4843, 4951
Granite, 529, 535, 987, 1007; in artificial stone manufacture, 2428 in building, 2838; components, geology, 529, 535, *1007*, 1008; in concrete, 332; cutting, dressing and polishing, 2838; erosion, 1814 fireproof, 1752; foundations, 335 jointing, 1925; for kerbing, cost, 2327; for paving, 3244; safe load on building materials, 1519 strength, weight, 1518, 2838 structure, *896*, 897; weathering, 3771
— setts, road construction, 1980, 2181
— syenitic, varieties, use, 529
Granulose, potato, 3706; properties, 674
Grape, crushing for wine, 6355; cultivation in Ontario, 3205; cultivation, W. Australia, 3235; culture, *6676*, 6677; dietetic value, 3315; market price, 2536; sources, 4876; for wine, 6355
— juice, unfermented, 6355
Grape-sugar, manufacture, 4557
Graphite, 1046, 1157, 6737; geological classification, composition, 1074; for pencils, as paint, 1036; refractoriness, 3942: *see also* Plumbago
Grapnel, of balloon, 3979, 3980, 3982
Grass, albuminoid ratio, 2706; British varieties, cultivation of, *875–880*, 1379; as cattle food, 2904, 3890; dyeing, 6652; ensilage system, 1970; seed-sowing, 1847, 3256; structure, *351*
— order and group, 355
— walks, garden, making, 6206
Grasshopper, classification, description, *3363*, 3364, *plate facing* 3361
Grassing, flax, process, 1385
Grassland, cultivation, 1379
Grass-snake, feeding capacity, *2680*
Grate, fire, kinds, *5195*; modern, with economiser, 6015, *6017*; open, varieties, 6015, *6017*
Grating, cast-iron, uses, 5797; valved, use in ventilation, 6021
— interference or diffraction, 3369
— sewer, construction and use, 4459
Grave accent, 124; special rules, 449
Gravel, in building, 647; angle of repose, 2572; bearing power, 330; deposition, *1814*; in foundations, 143, 331; formation, 1072, 1813
— paths, construction, 2427, 2430
Gravel-dash, in building, 648
Graver, form and action, *4151*, 4153
Gravimetric analysis, in chemistry, purpose, 4411; apparatus, *4407*; examination of various substances, 4413; *see also* Chemical analysis
Graving dock, caisson for, 2889
Gravitation, law of, 663, 797; equilibrium under, 799; Galileo's experiment, and Newton, 35, 36; a generalisation, 6000; in hydrostatics, 1077; inverse squares law, 466; mass and weight, 312; Newton's induction, 6002; applied to planets, 6242; and radiation-pressure, 938, 939; result of universal application, 402; theories of, 936; truth of, 663; the sun, 664; universality, 6243; and weight, 423
Gray, Thomas, poet, 994
Gray's Inn, fees, 163
Grazing, cultivation of grasses, 875–879
Grease, properties, uses, 4832
— extraction in industries, 4626
— in horses, treatment, 2621
— stains, removal, 2590
— spot, Bunsen's photometer, 2436
— trap, in drainage, *571*, 572
Greaser, mercantile marine, 6807
Great Barrier Reef, *558*, 3700
— Bear, constellation, *6116*, *6117*
Great Britain and Ireland, afforestation, 4602; agriculture, pasturage, 986; beer consumption, 3377; climate, 984; cotton supply, 384; coal resources, *987*, 5302; craniology, *1786*; electricity statistics, 130; flax culture, import statistics, 716; exports and imports, 6004, 6005; hemp imports and former cultivation, 718; early inhabitants, 2354; geography, *980–983*; geological map, *facing* 1921; geology, 528; industrial centres, 6003; industries and trade, 6003; iron deposits, 5306; leather trade, 2851; linen manufacture, 1025; low lands, high lands, rivers, 984; population, 628; railways, 2274, 3052; rivers, 984; sea-fishery regulations, 5317; submergence in Primary age, 1817; submerging 600 ft., effect of, 982, *983*; telegraph and telephone statistics, 130; tides round coasts, *556*; timber supply, 4602; wheat supply, 872, 914; wine consumption, 3315; woollen industry, 72, 221; *see also* England
Great Central Railway, distinctive mark, 5069
Great circle, meridian, 709
Great Divide, of North America, 4062
Great dividing range, 3697, 3700
Great Eastern Railway, liquid fuel locomotive, *5106*, 5107; signalling system, 4688; six-a-side carriages, 2556
Great Northern Railway, express goods train, *5073*, 5076; fog signalling, 4692; steam rail motor car, *4811*
Great primer, type, *5028*
Great Wall of China, 216, 1278
Great Western Railway, "catcher" apparatus, *4692*, 4693; goods depot, 5073; locomotive testing plant, 5105; school of signalling, 4690, *4691*; signalling system, 4688; water softening plant, 5103, *5104*
Greatest common measure, 339
Greathead shield, description, 1824
Great man theory, in history, 3987
Greece, architecture, 2134; coins, weights and measures, modern, 409; craniology, 1786; constitution, 6448; economic conditions, 5822; ethnology, 1790; geography, 2165; population, 628; religion, Egyptian influence, 420; shipping, 5255; silk industry, 582; use of terra-cotta in, 2779; touring directions, 1525; trade, modern, 5822
— ancient, art and architecture: 2857; artistic design, *2321*; compared with Assyrian, 2658; drawing from life, 344, *345*; ethics of, 183, *184*; influence on Etruscan art, 2931; painting schools, 2930; permanence, 142; influence on Persia, 2659; sculpture, *184*, *345*; general history, 2929, *2930*, 2931; sculptured ornaments, 1216
— history, up to Macedon, 667; Marathon to death of Philip of Macedon, 772; Alexander the Great, 972, *973*; invasion by Normans, 2948; annexation, 1475, 6447; Turkish rule to present time, 6448
— literature, ancient, books on, 2787; classics of, 3781; Periclean Age, 774
— philosophy, Ionian philosophers, 34; psychology of, 2012; Socrates, Plato, Aristotle, Zeno, Diogenes, 975
Greek language, breathings, 5375; classical and modern, 5374; order of words, 6800; root words, 6810; syntax, rules of, 5520, 5657; translation fees, 1920
Green pigment, 871; for pottery colouring, 5382; symbolism, 725; manufacture, 5145
— sand, in moulding, 2110; in "sweeping up" moulding, *2459*, 2460
— core, explained, 2340
— spa, marble, *plate facing* 48)
— tea, defined, 3378, 6553
Greenfinch, nest, 2506; *plate preceding* 2497
Green-flowered plants, 354
Green fly, description, rapid propagation, 3365; extermination, 1666
Greengage, culture, 6678; preserving, 4846
Greengrocer, business of, 2869
Greenheart, timber, 57; strength, 1260
Greenhouse, cost, 6832; glazing, 5839; management, 6531
Greensand group, in geology, 535
Greenstone, 528, 535, 1008, 6737
Greenwich Hospital, grants to seamen and marines, 4266; school, for seamen's children, 4266
Gregorian calendar, adoption, 227
Greuze, painter, style, 4118, *4119*
Grey matter, of nervous system, *2143*
Greywacke, stone, 1072
Grilles, iron, construction, forms, *5795*, 5797
Grimm's law, rules and examples, 1771
Grimsby, fish trade, 1273, 5316
Grinder, of carving knives, duties, 5476
— pneumatic, construction, *5454*, *5456*
— in workshop practice, tests, 3965
Grinding, with drilling wheel, 5452
— in flour, milling machines, 3080, *3083*
Grinding machinery, implements, varieties and function, *3320*, *3401*, *3403*, *3405*, 5210–*5214*; disc grinder, *2792*, 5210; shaft bearings, 962; spring lever, 830
— mill, in brickmaking, 1282
— stone, painters', *5829*, 5830
— wheels, 2021, 4583; composition, 3406
Grindstone, form and use, 3388, 4583
Grip weld, *233*, 236
Gripes, in horses, treatment, 2620
Gritstone, composition, 1072
Grist, in brewing, treatment, 6057
Grist-mill, in agriculture, 1850; in brewing, 6058
Grizzles, bricks, colour, use, 643, 1947
Grizzly bear, fur of, 6426
Grocer, business of, 47, 3041, *3043*
— licensed, business of, 3045
Grocers' spirits licences, 5790
Groove, of machine table, 3042, *3043*
— rope pulleys, *3428*
Grooving, in vehicle construction, 2833
Grosbeak, communal nest, 2507
Gross profit, compared with net, 2271; trading account and trial balance, 2500; in relation to stock in hand, 2418; standard rate calculation, 2420, 2421
Grotius, Hugo, four kinds of war, 5245
Ground brushes, painters', *5829*, 5831
— colour, in vehicle painting, 3480
— ivy, classification, 354
— swell, cause and effect, 6218
Grounder, wood-carving tool, 6045
Groundnut: *see* Arachis
Groundsel, classification, 354; farm weed, 1378; pine blister on, 4928
Groups, in drawing, shading, *1536*, *1792*
Grouse, roasting, 1487, 1875; salmis of, cooking, 1875
— black and red, classification, 2212
Grove cell, electricity, 466

Growth, rate in children, 4864 ; peculiar to living things, 275 ; physiological account, 96
Groyne, types, *5577*, *5579*, 5580 ; use and construction, 5578, 6498
Grubber, in agriculture, 431, 1849
Grümenthal Bridge, dimensions, *2739*
Gruyère cheese, 4490 ; manufacture, 4575
Guanaco fur, 6427
Guano, ammonia from, 4774 ; geological classification, 1073 ; as nitrogenous manure, 5587 ; Peruvian, and fish, composition, 590
Guards, of railway goods trains, 5075 ; passenger, *4801*, 4804, 4805 ; light waggon, 2829, *2830*
Guardians, boards of, constitution and function, 1851 ; officers, 1926
Guard boards, scaffolding, 1170
— books, in bookkeeping, 2269
— invoice : *see* Invoice guard book
Guardi, Francesco, painter, 3797
Gudea, King, statue, 2657, *2658*
Guelphs and Ghibellines, struggle, 4320
Guernsey, building stones, 1518 ; dairy produce, 3551 ; geography of, 1367 ; history of, 2611
— cattle, described, *431*, 3667, *3669*
Guhr, in sugar making, 4353
Guiana, British, Dutch, and French, geographical account, 4282, 4287
Guide-books, for continental touring, list, 1812 ; general value, 391
Guide-plate, in die punching, 2992
Guides, engine frame, drawing, 4203, *4205*
— importance in travelling, 391, 392
— of van, *2829*
Guildhall School of Music, 163
Guillemot, classification, 2212
Guilloche, geometrical pattern, 2321, *2322* ; use in design, *5820*, 5821
Guinea coast, map, *3453*
Guinea, Portuguese, geography, 3454
Guinea-fowl, classification, 2212 ; eggs, 5706, 5873 ; points, rearing, 5706
Guinea-worm, description, habit, 3958
Guitar, playing and technique of, *3760*, *3761* ; manufacture, 6707
Gull, description, 2212 ; food, 2493 ; webbed toes, 2496
Gulden, coin, English value, 409
Gulder, Dutch coin, value, 410
Gulf Stream, course, 557, *1738*, *1740*
Gulf-weed, 166 ; Sargasso Sea, 1369
Gullet, human, 197, 198
— in mining, 2955
— riding saddle, 5339 ; making, 5340
Gully, of drainpipe, description, *571*, 572
— street, varieties, construction, *2324*, *2325*
"Gulliver's Travels," 1902, 2963
Gum, artificial, making, in dentistry, 5866, 6033 ; tropical, 4658 ; varieties, 810 ; in vegetable cells, 276
— arabic, 810, 5363 ; source, 4658, 5363 ; substitute for, 1169
— benzoin, 810
— copal, 1034
— dammar, use in varnish, source, 5835
— resins, 810, 1034
— senegal, 810
— tragacanth, distribution, use, 810
— tree : *see* Eucalyptus
— water, in laundry work, 2912
Gumming disease, sugar-cane pest, 3654
Gun, field, *6610*, *6611* ; heavy, construction, 1224, *6610–6617* ; Hotchkiss automatic machine, 6425 ; Maxim automatic, *6423–6425* ; mounting shop, Elswick, 833 ; quick firer, *6610* ; sporting, barrel (Damascus), *6422* ; sporting, 4421, *6422* ; steel for, 4747
Gun dealers, business of, 3149
Gun-barrels, use for gas tubing, 5319
— carriage, construction, *6611*, 6615
Gun-cotton, in blasting, 2587 ; in demolitions, 6274 ; manufacture, 1169, 6763, *6765* : *see also* Pyroxylin
Gunmakers, employment conditions, 2646
Gunmetal, composition, 3940 ; contraction, 1397 ; physical properties, 860, 1396
Gunner, mercantile marine, 6804 ; in Navy, 4266
Gunpowder, ingredients, 843, 6759, increases power of the nobles, 3605 ; invention, 3605 ; manufacture, 6757, *6759* ; use in demolitions, 6274
Gunpowder Plot, history, 4551
Gunter's chain, in surveying, 158
Gurnard, fish, form of head, 3069, *3071*
Gusset stays, boiler, *3097*, 3105, 3108
Gustavus Adolphus, of Sweden, 5396
Gut, biology, diagram, *30*
Gutta-percha, dielectric capacity, 3580 ; electric insulator, 672, 6795 ; in electrotyping, 3422 ; extraction, preparation, 809 ; in road construction, 2181 ; manufacturing processes, 5313 ; source, uses, 4658, 5313 ; specific gravity, 1704 ; strength, 1702 ; tooth-filling material, 5553, 5862
— tree, 809 ; varieties, 5313
Gutter outlets, roof, *5627*, 5796
Gutter and water tables, 2326
Gutters, quantity surveying, 6511, 6512 ; roof, forms, construction, *4251*, 4254, *5031*–5034, 5793, 5794
— paved, 2516
Gutturals, in grammar, 122
Gymnastics, effect on children, 4863 ; instructors, 6870 ; teachers of, 3742, 6479
Gymnosperms, 165 ; description, 503, *505* ; geological period, 1116
Gymnote submarine, described, 2280
Gypsum, 6737 ; in cement, testing, 1859 ; chemical composition, 590, 761, 1041 ; as manure, 590 ; for mack partition and ceilings, *4757*, 4759 ; used as plaster of Paris, preparation, 5497, 5498 ; in plastering, 648 ; specific gravity, 1704 ; typical specimen, *plate facing* 1345 ; *see also* Calcium sulphate *and* Plaster of Paris
Gyration, radius of, 2198, 2200

H.P.C., in surveying, 374
H-section : *see* Joist section
Haberdashers, business of, 3151 ; allied trades, 3151
Habit, ethical and educational value of, 2673, 2860 ; and health, 2795 ; and memory, 2259 ; physiology of, 2302, 2303
Hacking-out knife, glaziers', 5836, *5839*
Hackling, flax, 1386, *1387*
Hackney horse, 2074, *2075*, *2076*
Haddock, fresh, boiling, 1874 ; choice of good, 3717 ; cutlets, cooking, 1874 ; fishing grounds, 5121 ; frying, 1873 ; steaks, grilled, cooking, 1873 ; value of fishery in 1905, 4989
Hade, in geology, definition, 1925, 2378
Haeckel, Prof., doctrine of persistence of matter, 1376 ; chief biological work, 1791 ; "Law of Substance," 313, 2063 ; "Riddle of the Universe," 6464
Hæmatin, 5905
Hæmatite, composition, 767, 1044, 6737; deposits, 5306 ; occurrence, 767 ; in steel manufacture, 5013 ; varieties and distribution, 231
— brown, composition, source, 4466
Hæmatoxylin, properties, 5905
Hæmoglobin, cell formation and synthesis compared, 4130 ; characteristics, 953 ; composition, 696 ; iron in, 1046 ; affected by nicotine, 4010 ; affected by quinine, 4013
Hæmophilia, nature transmissibility, 1587 ; symptoms, cause, 6037
Hæmorrhage, treatment, 1195, 6471
Hag, fish, 3065, *3067*, 3070
Hague, The, 1836 ; touring, 858
Haiderabad State, India, 2818, 2972
Hair, animal, uses and countries exporting, 5119, 5120
— for brushes, 6106
— peculiarity of mammals, 30
Hair, human, care of children's, 4864 ; in sculpture, 1511, 1512 ; structure, 1419, 1420
Hair, plasterers' material, 5498
Hair-brush, finishing process, 6107, *6109*
Hair-cells, of ear, function, *2535*
Hair-cloth, in princess gown, 2059 ; upholstery, 6716
Hair-mortar, composition, 5499
Hair moss structure, etc., *1312*
Hairdresser, business of, 47, 3295 ; manicure practice, 3738 ; sidelines, 3296
Hairdresser-chiropodists, practice of minor surgery, 1896
Hairdressing, 3295 ; women's work, 822
Hairpin work, in underwear, 3094
Hake, boiling, 1874 ; carving, 5936 ; steaks, grilled, cooking, 1873
Half-sheet sixteens, in printing, 5458
Half-timbers, use in trestles, 1173
Half-tone, in drawing, 1534
— engraving processes, 6482, *6483*, *6485*
Halibut, boiling, 1874 ; fishery, value of, 4989 ; fishing grounds, 5121
Halide, in chemistry, defined, 839
Hallation, photo., 6682
Hallett's pedigree wheat, *915*
Hall-marking, of gold and silver, 5860
Hall process, aluminium extracting, 4306
Hallucinations, evidence in support of telepathy, 3662
Halogen, in chemistry, defined, 839 ; compounds, 1600
Hals, Frans, painter, style, 3949
Halving principle, in shorthand, 1038
Halvings, in pattern-work, 2454, *2455*
Ham, carving boiled, *5935*, 5936 ; using cold, 2335
Ham, tribe of, in Egypt, 419
Hamadryad, cobra, striking, 2679, *2680*
Hamburg, 1974 ; trade, 1976
Hamburg fowls, 4659, *4661*, *4856* ; comb, *4857*, 4858 ; egg, weight, 5873 ; points of breed, 4956 ; black, breeding, *4859*
Hamite, race, *627* ; ethnology, 1790
Hammer, *2019*, 2022 ; forms and action, 4584, *4585*, 4586 ; parts and use, 3108 ; temper, tempering, 4746 ; art metal-work, *5525* ; belt, 960 ; bootmaking, 4434 ; club, 1950, *1951* ; carpenter's, *3388* ; claw, 3844, *3845* ; in die forging, 2991 ; drop, 960 ; in forging, 2984, 2990, *2991* ; geological, 896 ; mining prospector's, *2380* ; planishing, *3888*, 3889 ; quarry, *2956* ; plasterers, 5496, *5497* ; plumber's, 5029, *5030* ; pneumatic, types, *5454*, *5455*, 5456 ; slater's, 4865, *4867* ; tilt, 234, 4637 ; trip, 232 ; scabbling, *532*, *2837*, 2838 ; scaffolding, 1170 ; shoemaker's, *3875*
Hammer beam, timber, *4253*, 4254
Hammer bone, of ear, *2533*
Hammer tongs, described, 2984, *2985*
Hammering, in art metal-work, *5524* ; in plate-levelling, defects, 3100
Hammond typewriter, 1918, 1919
Hand, in hoofed mammals, 1869
— human, anatomy, *99* ; bones, 1708, *1709* ; nerves, *1941* ; tendons and muscles, *1712*
— verge watch, 6081
Hand-carts, construction, 2830, *2832*
Hand-iron, harness, 4784
Hand loom, mechanism, *3492*
Handbells, form, manipulation, 5571, *5572*
Handling, in tanning, 1165
Handlebars, of bicycles, 3773, *3774*
Handles, of tools, forms, *4151*, 4152
Handrail, staircase, 3242, 5300
Handscrew, use, *3388*, 3845, *3846*
Hanger, sewing in coats, 1553, 2058
— for suspending pedestal, 3268, *3269*
— in roof construction, 5794
Hanks, of yarn, weight, 222, 5507
Hannibal, passage of the Alps, 76 ; Punic wars, 1204, 1381, 2646
Hansom, 2466 ; dimensions, 2726
— motor, regulations, 4189
Harbours, 6330, *6331–6335* ; classes and construction, 6220 ; surveying, 1018
Hard fern, structure, 1116
Hardanger Fjord, touring, 859

Hardness, in solids, 1374; Mohs' scale, 1374, 5852, 6730
Hardwar store, American, stocking, *3572*
Hardy, Thomas, novelist, 3555
Hare, carving, 5934; choosing, 1228; evolution of, 826; cooking, 1875; fur of, 6127; protective colouring, 2156; roasting, 1487
Hare's foot fern, 6532
Hargreave's spinning jenny, 223
Haricot bean starch, micrograph, *5365*
Haricot mutton, cooking, 1736
Harmonic, in banjo music, 4312; double-bass, 3170; in guitar playing, 3762; in harp, *3527*, 3529, 5734; in violin playing, *2511*, *2512*, 5727, *5728*; *see also* Overtones
Harmonical progression, 3915
Harmonium, account of, 3950, *3952*, 4179, *4180–4183*; books on, 4183; manufacture, 6714
Harmony, in music, 363; law of, 2103; physical explanation, 2319; relation to discord, 2319; in tonic sol-fa notation, 925; value of study for sight-reading, 1059, 4179
"Harmsworth Encyclopædia," journalist's reference book, 4236
HARMSWORTH SELF-EDUCATOR, purpose and plan, 1
Harness, body, dimensions, 4886; cart, 4886, 4889, 4890; cleaning and care of, 1001; looping, *4887*; making, tools, *4783*, *4784*, *4885–4887*; van and cab, dimensions, 4886, 5342
— in textiles, loom, construction, *3910*
— grease, recipe, 5150
— maker, business of: *see* Saddlers
Haroun-al-Raschid, character and life of, 2353, 2354
Harp, account of, 3341, *3396*; books on the music, 3525, 3527, 3528; fingering, 3527; Gustave Lyon's chromatic, 3526; harmonic sounds, *3527*, 3529; homophones, *3529*; manufacture, 6707; modulation of keys, *3526*, 3528; in orchestra, 5731
Harpagophyton, habitat, *911*, 912
Harpsichord, music adaptable to pianoforte, 2023
Harrier, pursuit of prey, 2493
Harris tweed, manufacture, 1064
Harrow, 1231, *1379*; varieties, 1849
Harrowing, in agriculture, 258, 431, *1229–1233*
Harrows, in dredging, 5336
Hartnell spring governor, *2019*, 2020
Hartshorn, spirits of: *see* Ammonium carbonate
Hart's tongue fern, 1116, 6493
Hartz Mountain Railway, 3814
Hartz mountains, Germany, 1973, 1976
Harvest, labourers' pay, 1666, 3002
Harvester, self-binding, *24*, 1662, *1663*
Harvesting, crops, 1662–1666
Harveyised steel, 234
Harwood, bacteria test for milk, 4036
Hashish, bhang, narcotic, 718
Hastings, Battle of, 2358
Hat-brims: *see* Hats
Hatchet, tool, 3386
Hatchett's classification of bituminous substances, 6010
Hatching, in drawing, *5421*
Hatters, business of, 3443
Hats, felt, manufacturing, *6375*; renovating, 6041; stiffening, 6376
— hygienic, 4257
— in millinery, brims, bead trimmings, 5330; brims, 5036, *5037*, *5329*, 5330, 5941; brims, linings, *5329*, 5330; brims, making up, *4767*, 4769; brims, shapes, 4766, *4767*; brushing, 6042; chiffon, making, *5219*; copying children's by measurement, *4767*; covering, 5036; crowns, 4766, *4767*, *5037*; fancy shapes, 5219; flop, reshaping, 6041; head linings, 5037; lace, 5218; lace trimmings, *5620*, *5621*; linen, 5219; motor, 5219; patterns, 4766, *4767*; picture, *5219*; shape-making, *4767*, 4769; shapes, 4860, *4861*; shapes, copying by measurement, 4766, *4767*, 4768; side-band, *4767*, 5036, *5037*; tip, 4766, *4767*, 5036 (cleaning), 6040; trimmings, ornaments and flowers, 5506; velvet, renovating and altering, 6041
— silk, manufacture, *6154*, *6156*
— straw, making, 5218, *5219*; manufacture, *6160*; patterns of rough straw, 4766, *4767*; cleaning, 3704; renovating, 6041, 6042; shape making, 5217
Hatter, business of, 3443
Haulage, in coal mining, 3566
Hauling-gear, of coal-cutter, *3564*
Haulm, 355, 874; as livestock food, 2909
Hautboy: *see* Oboe
Haversian canal, in bone, 435, *436*
Hawaii, island, products, *3902*
Hawk, pursuit of prey, 2493
— plasterer's, tool, 5496, *5497*
Hawkers, conditions of trade, 5582
Hawking machine, use in dyeing, 6370
Hawk moth, 732
Hawksley's drought formula, 4027
Hawsers, manufacture, 5292
Hawthorne, 353; garden, 6318
Hay, meadow, chemical constituents, 1629; grass crops for, 3890; as horse rations, 2077; as livestock food, 2704; making, 1628, 1630, 1848; manuring, 1378
— barns, construction, 1631
— crops, British, 1379, 1628
— elevator, *1629*, 1630
— load, weight, 1628
Hay fever, 3720; treatment, 6132
Hay-ropes, used in casting, 2338, *2339*
Hayti, discovered by Columbus, 3606
"Haywain," Constable's picture, *4301*
Hazel, catkin, *351*; flower, 355, *plate facing* 728; fertilisation, 729
— tree, strength of timber, 1260
Hazlitt, William, essayist, 2310, *2619*
Head, of bicycle frame, 3773
— block, of light waggon, 2829, *2830*
— of butterfly, *3512*, 3513
— of carriages, described, 3022, *3023*
— collars, harness, 5342
— of culvert, railway, 3614
— in drainage, 782
— flannel, infant's, *3744*, 3745, 3854
— of gutters, painting, 5834; use, fixing, protection, *5793*, 5796
— human, *98*, 197, *2144*; joints, 1710
— of lathe, poppet, evolution, 4912
— in metal casting, 1404
— panel, of light waggon, 2829, *2830*
— of room partition, 4448
— in sculpture, armature, *1510*; modelling, 1510
— in slating, 4866, *4867*
— of water, in hydraulics, *1573*
Headache, symptoms and treatment, 6261; synthetic remedies, 5469
Header, in building, 2168, *2169*, 2170, *2171*: use in walls, 2261, *2263*
— in masonry, coursed header work, 3034, *3035*
— timber used in tunnelling, 331
Heading machines, in mining, 3563
Headings, newspaper, 4233, 4235, 4236
Head-line, of otter-trawl, use, 4990
Head-metal, in casting, *1405*
Headpiece, of harness, 4886
Headstock, of bogie frames, 3121
— of lathe, 4914, 4916; improvements, 4918; loose type, *4913*, 4918
Head-strap, harness, 4886, 5057
Heald, doup, in weaving, *3912*; of hand loom, 3492; of loom, *3684*; use in weaving, 3909
Healders, calculations, 5508
Health, affected by atmospheric humidity, 1900; definition of, 2661; effects of soil and climate, 5273; exercise, rest and sleep, 4387; laws of, 2664, 2794, 5702; relation to marriage, 4529: *see also* Hygiene *and under separate headings—e.g.*, Air, Disease
Health Acts, nuisances, 5056
Hearing, defective, in children, 4862
— organ of: *see* Ear
Heart, frog's, growth of, 2801
Heart, human, *30*, *953*, 956; action of, 957, 1192, 1193; action, influence of will, 5841; effect of alcohol on, 3377; anatomy, *953*, 956; beating of, number per minute, 96; effect of digitalis and strophanthin, 4013; diseases, 6038, 6039; enlargement, cause of, 5540, 6039; muscles, 1711; nerves, sympathetic, 1944; nutrition, *676*, 677; physiological description, 198; rest periods, 4391; weak, 6039; valvular disease, 6038
— of snail, 3113
Heart cam, defined, 832
Heart shakes, in timber, *52*
Hearting: *see* Core
Heart-wood, of trees, 52; rot, 4928
Hearth, in building, formation, 2388, *2389*; stone, *3243*, 3244, 4440
— in metallurgy, 4125; of blast furnace, 4469, 4470
— furnace, Moffat type, *5986*
Hearthstone construction, *3243*, 4446
Heat, absorption, 2061; atomic, law of, 1914; in chemical processes, Boyle's discoveries, 59; colour and temperature, 236; conduction, 440, 1563, 1738, 2061, 5194; conductors, good and bad, 1563; convection, 1738; and dynamics, 314; effect on earth's crust, 302; and electricity, 288; expansion of gases, Charles's law, 1805; form of energy, 2061; latent, 1740; mechanical equivalent, 2061; molecular motion, 1266; physical account, 315; power agent, 5413; radiant, 3617, 5195; transmission, compared with light, 2060; radiation, 2060, 5194; the science of, 1563; specific, 1564, 1739
— bodily, 439, 5194; temperature, 96
Heater-room, on trains, 3025
Heating, of buildings, by pipes, use of fans, 1808; systems, 5195, 6015, *6017*, 6022; books on, 6349; engineer's factory, 5591; of vehicles, 3025
Heath, 354; culture, *6530*, 6532; pollen, 1114
Heathen peoples, distribution, *629*
Heathenism, *3279*: *see also* Paganism
Heather, 354; moisture supply, 727
Heave, of vein, in mining, 2380
Heaven, in Persian religions, 502
Heavy spar: *see* Barytes
Hebrews, art of, 2660; history, 665
Heck, in weaving, 3491
Hedge mustard, charlock, *882*
Hedgehog, description, *plate facing* 1491, *1763*; spines, 2156
Hedges, garden, making, 6318
Hedge-sparrow, classification, 2210; nest, *plate following* 2496, 2506
Hedonism, doctrine of cynics, 976
Heel, of boot, making, 4139, 4140
— human anatomy, 1709
Heel board, of brougham, 2829, *2831*
— straps, of king post roof, *4249*, 4252
— shave, shoemaker's, *3875*
Heeling, in boot-making, *4543*, 4544
Hegel, philosopher, contempt for science, 2553; Hegelianism, 6469; idea of creation, 6470
Hegelian system of philosophy, 6101
Heidelberg, castle of, architecture, 3946
Heifer, in agriculture, application of term, 2238
Helical spring explained, 3121
— steel tube, manufacture, *5322*
Helicon, musical instrument, 5131
Heliostat, use in surveying, 594
Heliotrope, perfume, 5469
Heliotropin, perfume, 4971, 5469
Helium, 1916; discovery, 401, 1296; disintegration, product of radium, 1916, 2392, 4105; non-liquefaction, 1916, 4560; occurrence, 839; in periodic system, 1446
Helix, of screw, 686
Hellebore, *plate facing* 728
Hellenism, Alexander's Empire, 974; in India, 418; in Roman art, 2931, 2933; sculpture, 2930
Helmet, of cassowary, 2214

Helmholtz, H. von, theory of colour vision, 3730; theory of partial deafness, 2316; theory of solar energy, 664
Helots, definition, 668
Hem, false, in sewing, 152
Hematite: *see* Hæmatite
Hemisphere, in drawing, 5041, *5042*
Hemispheres, of earth, explained, *12*
Hemlock, 353; source of conine, 4011
— bark, cultivation, 6066
— extract, tanning, 6066
— fir, bark as tanning agent, 3012
— spruce, timber, 55
Hemming, gloves, 5482; in underclothing, 3336
Hemp, 717, *881*, 5117, 5639; bleaching and dyeing, 5639; classification, 355; cultivation, 1190; drawing process, *2099*, 2100; dressing, 1388; fibres, 68, *69*, 717, 1168; in foundry work, 2546; rope spinning, 1885; ropes, testing, 1699; sources, 5117, 5639; spinning, 2292; weaving, 2595
— Canadian, Manilla, Deckannee, Sunn, *etc.*: *see* Canadian, Manilla hemp,

— New Zealand: *see* Phormium
Hemstitching, in underclothing, 3336, 3338
Hen, egg-laying, 5623, 5626; food, 5093, 5133; sitters, 4569, 5091: *see also* Poultry
Henbane, described, 354, 4009
Hencoops: *see* Coops, poultry
Hennebique system, in building, 1557, *1559*; 1643, *1645*
Henrietta Maria, Queen, 4552; miniature of, *1062*
Henry I., King of England, reign, 2674
Henry II. of England, reign, 2609, 2913
Henry II. of France, recovery of Calais, 4102
Henry III. of England, reign, 3073
Henry III. of France, character, 4102
Henry IV. of England, life, 3250, 3251
Henry V. of England, early years of reign, 3251; hundred years' war, 3463, 3464
Henry VI. of England, hundred years' war, 3464; Cade's revolt, 3465
Henry VII. of England, accession, 3604; marriage, character, 3649
Henry VII.'s Chapel, Westminster Abbey, architecture, 3374; stone pendants, 2835, 3146
Henry VIII. of England, reign, 3649, 3832; literature, 328
Henry of Navarre, reign, 4320
Heptarchy, the, foundation of, 2242
Heracleitus, Greek philosopher, fire doctrine, 60; idea of organic evolution, 5386
Herb Robert, 508; pollen, 1114
Herbage, Rothamsted experiments, 1378
Herbalists, business of, 3445, 3446
Herbert, George, poet, 539
Herculaneum, destruction of, 2068; fresco paintings, 2933
Hercules (Heracles), the Heraclidæ, 668
Hercules beetle, description, 3510
— turbine, mechanism, *1689*, 1693
Herdwick sheep, 2363, *2365*
Hereditary succession in China, 215; in Germany, Middle Ages, 2947
Heredity, alcoholism, 5674; books on, 1791; a condition of organic evolution, 5388; Darwinian theory, 824, 1313; Galton's law, 1313; "inborn" and "acquired," 485; influence on capacity for mental development, 3118; in Lamarckianism, 653; line of, 1315; longevity, 2662; Mendel's experiments and law, 1481; practical issues, 1586; in relation to education, 2861; relation to health, 5701; social: *see* Social heredity
Hereford cattle, 2235, *2237*, 2240
Hermaphrodite, in botany, 730
"Hermes," statue by Praxiteles, *345*
Hermit crabs, habits, *3806*, 3808
Herodotus, historian, 774
Heroic verse, defined, 306
Heron, description, 2213; food, 249[illegible]
Heroult aluminium furnace, *4306*, *5989*
Herrick, Robert, poet, 539
Herring, choice of, 8717; classification, 3066, *3068*; fishing grounds, 5121; grilling, 1873; immature, protection, 5314; nutritive value, 3599; preserving, 5316; shoals, movements of, 5188; U.K. fisheries, 987
Herringbone stitch, *3337*, 4566
Herring-boning, needlework, *151*
Hertz, detectors, *3895*; electro-magnetic wave discoveries, 3851, 4021
Hertzian waves, ether and, 935
Hesperornis, order of birds, 2214
Hevea brasiliensis (rubber tree), 808, 5046, *5047*; cultivation, 5049
Hewitt's mercury vapour lamp, *2683*
Hexagonal body, planes, 4522, *4523*
— prism, projection, *4523*, 4524
— system, in crystallography, 766, 6730
Hexameter verse, 1435, 1767
Hey's saw, carver's, *5809*, 5810
Hide trades, employment, 2648
Hides, for belting, 3532, 3712; breaking over, 2854; depilation, 2854; in glue manufacture, 5357; leather manufacture, processes, [illegible]5, 3010, 3218, 3713; effect of lime on, 2855; polishing, 3455; soaking and softening, 2853; sources, 5119; South American, special treatment of, 3218; tanning, 3013, 3162; varieties and structure, 2852
Hieroglyphics, Egyptian, 935
High Court of Justice, clerkships, 3301
High school teachers, women, 323
High water mark, mean, 1146, 6662
Highest common factor, in arithmetic, 339; algebra, 2891
Highest plane of collimation (H.P.C.), in surveying, 374
Highland cattle, *432*, 2236, 2240
Highlands, of Scotland, 1064, *1065*
Highways, 2422; dedication of new roads as, 2425
Highways, general history, 1977
Highways Act, 1878, provisions, 1978
— surveyor of, duties, 454
Hilliard, miniature work, 1061, *1062*
Hilum, in anatomy, 1602
Himalaya Mountains, description, 2562; rainfall, *296*, 4495
Hind bar of van, *2829*
Hind tugs, of harness, dimensions, 4886
Hindostan: *see* India
Hindu, in ethnology, 1790; philosophy and religion, 417: *see also* Brahmanism, Buddhism
Hinge, back flap, *5183*, 5184; butt, 3547, *5183*, 5184; cross garnet, 3547, 5184; field gate, *4645*, 4646; fitted to stand out, *5183*; straps: *see* Strap hinges; verge watch, 6081
— joint, human, anatomy, 1709, *1710*
Hip, of gutter, *5031*, 5034
— human, *1708*; leverage, 1798, *1799*
— iron and oak, use in roofing, 4870
— tiled, use in roofing, 4868, *4869*
— roof, length and angles, *5185*, 5187
— tiles, *644*
Hipparion, in horse-evolution, 1179
Hipped roof, construction, *4253*, 4254
Hippopotamus, *plate facing* 1491, 1761; hoof, 1870; ivory from, 811; swimming apparatus, 2038
Hippuric acid, composition, 3818
Hire-purchase system, 704; house furnisher's business, 3448
Hire-purchase accounts, in bookkeeping, 3917, *3918*
Histology, scope, 136; book on, 5422
History, American authors, 3781; bacteriological influence on, 6782; bibliography, modern, 2618, 2787; cautions as to reading, 107; English writers, living, 2785; the "great-man theory," 3987, 5388; intellectual value of study of, 2404; modern conception, 4122; philosophy of, 3987; a series of sociological experiments, 3872; Spencer's conception of, 3985, 3987; trivialities of, 3985; unscientific methods, 3871
History, natural: *see* Natural history
"History of Civilisation in Europe" (Buckle), 3989
"History of English Literature" (Taine), 3783
Hit-and-miss grating, *6017*, 6021
— ventilator, position, 3024
Hitches, sailor's, 6406, *6407*
Hives, bee, 5957, 5958, *5960*
Hoarding, in building, 308; rent of licensed, 4987
Hoar-frost, formation of, 1900
Hob, for cutting dies, 4480, *4481*
Hobbema, landscape painting, 4299
Hobbs, Thomas, psychological theory, 2013; conception of the state, 5246; works, 1640
Hobbies, value, 2548
Hob-grate, construction, 6015, *6017*
Hock, of horse, 1870; diseases, 2621
Hod, in building, use, *1951*, 1953, 5497
Hoe, horse, in agriculture, 431
Hoe printing machines, *5869*, 5871
Hoff, Van 't, and stereo-chemistry, 2714
Höffding, Prof., ideal society, 5245; relation of ethics and sociology, 4277
Hoffmann brick kiln, *643*, 1284, 1730
Hog, in farming, 2367; meat industry, 5119
Hog-hair brushes, 1020, 6109
Hogarth, William, painter, *4392*
Hogg, James, poems, 1304
Hogshead, of tobacco, defined, 4274
Hogskin, use for riding saddle, 5339
Hogweed, biennial weed, 1378
Hoist, hand, 832; hydraulic coal-tipping, *5676*; jigger, 1220
Hoisting apparatus, in engineers' factory, 5589, 5590; pulley blocks and tackle, 3694; pneumatic machines, 1807
Holbein, Hans, *343*, 4117, *4118*; miniature work, 1061, *1062*; portraiture, 4392
Hold, of four-masted barque, *5400*; steamer, position, *5401*
"Holder-on," of riveter, *1804*, 1807
Holdfast, iron, for fixing joinery, 2514, *2516*; in shoring buildings, 916
Holdings, small: *see* Allotments
Hole grinding machine, *5212*, 5214
Holes, boring, in mining, 2667
Holidays, proper use of, 65, 4391
Holing, in mining, *3561*, 3563
Holland, architecture, 3374; bibliography, 859; coins, weights and measures, 410; Dutch school of painting, 3949; geography of, *1836*; population, 628; reclamation from sea, 1814; Rhine delta, *1836*; thread industry, lace-making, 224, 225; touring, directions, 858: *see also* Dutch
— history of, up to 1385, 2948; revolt against Spanish rule, 4397; 1584 to 1890, 6304; republic, 6304
"Holland," submarine, described, 2280
"Hollander" machine, *6282*, *6283*
Hollow tools: *see* Swages
Hollow-bit tongs, described, 2984, *2985*
Hollowing, in metal work, 4522
Holly, 353; leaves, 1114; garden hedge, 6318; wood, 57
Hollyhock, classification, 352
Holmes, Oliver Wendell, 3780
"Holy Family," Murillo's, *4120*
Holy League, against Charles V., 4102, 4396; joined by Henry VIII., 3650
Holy Roman Empire, dispute for, 4320
Holyhead, 1277; breakwater, 6335, harbour regulations, 6220
Homan's fire-resisting floor, *4753*, 4755
Home, importance to journalist, 3812
Home Office, appointments, 3300
Home Rule Bill, 6694
Homer, 904, 2962; Chapman's translations, 848, 849, 3781; English translations of, 668
Hominy, product of maize, 4874
Homœopathy, system, training, 5430
Homoiothermal animals, 439
Homology, in biology, 379, 1492
Homophones, in harp music, 3529
Honduras mahogany, *56*; in vehicle construction, 2827

Hone, oilstone, use, 3388
Hone's coal grab, *6818*
Honey, adulteration, 3718; comb and run, 5959; comb, extraction, 5960; countries exporting and producing, 5120, 5121; extractor, 5960, *5962*; grading, 5962; granulated, liquefying, 5961; lævulose and dextrose from, 3705; marketing, 5962; ripener, 5960, *5961*
Honey agaric, fungous pest, 4928
Honeycomb, description, 5957, *5958*
Honey water, recipe, 4972
Honey-dew, origin, 3365
Honeydew tobacco, manufacture, 4373
Honey-guide, classification, habit, 2210
Honeysuckle, 354, *plate facing* 728; climbing, 504; pollination, 732; protective structure, 1115
Honeysuckle, Greek ornament, *5818*
Hood, infant's, *3745*; 3746
— in vehicle construction, 3023, 3622
Hood, Thomas, poet, 1309
Hoofed mammals, swimming, 2038
Hook and eye, in dressmaking, *152*, 154, 185; how to put on, 475
— gauge, explained, *1577*
— letters, in shorthand, 586, 689
— stone, of gates and doors, *3244*, *5795*, 5797
— tanning, *3219*
— wall, in fixing pipes, *5629*, 5632
Hookah, pipe, construction, 4378
Hooker's green, pigment, 871
Hook-setting machine, boot, 4437
Hoop, of balloon, 3978, 3980, 3982
— pressed cheese, *4573*, *4574*
Hoop iron, scaffolding, 1170; shoring, 917
Hoopoe, *plate facing* 2209, 2211
Hoopsticks of vehicles, 2555, 3023
Hoose, cattle disease, treatment, 2622
Hoove, in sheep, treatment, 2625
Hop, 354; climbing, 504; cultivation, 980, 1199, 3205, 4960; melting, 6228; use, 6057, 4960; "winged" seeds, *911*, 912; storage, 6059
— back, use, in brewing, 6057
Hopper, cement, *1733*, *1853*
— railway cars, *2463*, 2467
— splayed work, 5296, *5299*
— of water closets, kinds, 5052, *5053*
— ventilator, 6021
Hopping, physiological account, 1800
Horace, in Augustan Age, 1829; Smart's translation, 2141; typical ode, to Lyce, 1335
Horatius, story of the bridge, 1136
Horizon, *11*; apparent and astronomical, 6244, 6245; dip of, 1016, *6665*; "sensible," 1016, *6665*
— glass, of sextant, 1016
Horizontals, in staging, 1174
Horn, animal, carving, 6300; dyeing, 6767; uses, 811
— of animals, *2155*, 2156
— of cattle, broken, treatment, 2624
— musical instrument, *5731*; orchestral use, 5732, 5887, *5893*; transposition, 5443
— French: *see* Horn, valve
— valve, musical instrument, 5444; manufacture, 6622; playing, *5445–5447*
Horn bar, of brougham, 2830, *2831*; in elliptic spring carriage, 3124; of undercarriage, 3122; of van, 2828, *2829*
Hornbeam, 355; "winged" seeds, *911*, 912
— wood, use of, 57
Hornbill, 2211; nest, 2507
Hornblende, mineral, 768, 812, 6738
Hornet, *plate facing* 3361; nest, 3725
Horology: *see* Clockmaking *and* Watchmaking
Horse, 1761, *2073*, *2075*, *2076*, *2079*; bibliography, 3471; breeding, 987, 2078; breeding for speed, 827; diseases, 2620; evolution of, evidence of fossils, 1177; feeding, 1001, 2074, 2076; foods for, 873, 2904, 2905; foot, modification and evolution of, 1869; grooming, 1001; management of, 2073; parasites, 2626, *2627*; parts of, *2079*; points of, *2076*; power, 5011; stabling, 2998; as means of transport, 2152, 2154; urine, analysis of, 433
— in leather manufacture, 3217
— in mining, 2378
Horse bean, classification, 353
Horse chestnut, 353; autumn twig and winter buds, *728*; wood of, 56
— collar, making, *5191*, 5192
— whim apparatus in mining, 3190
Horsehair, uses, 5119, 6715, 6718; tests for brushes, 6110
— artificial, forest industry, 4928
— beetle, classification, voracity, 3511
— cloth, use in dressmaking, 186
Horsemen, in farming, 2999
Horse-power, unit of power, 291; brake (B.H.P.), 3967; compared with kilowatt, 290; indicated (I.H.P.), 3966; testing, 3964; Watt's definition, 1590
Horse-rake, in farming, 1630, 1848
Horseshoe arch, introduction, *3092*
Horsetail, *1115*, *1119*; farm weed, 1378; structure, etc., 1310
Hose-pipe of balloon, 3979, 3980
Hosier, business of, 2869
Hosiery, 2869; elastic, *5492*; fancy trade, 4619; finishing, 4765
Hosiery, machines, 4763, *4764*, *4765*
— weavers, employment, 2651
Hospital, air in, 3800; bookkeeping for, 3567; dental, training and fees, 5770, 5773; drainage system, 784; homœopathic, 5430; hypnotism, 3663; medical students' fees and training, 5424; nurses' wages and training, 323; Poor Law, 1929; municipal, staff and salary, 1496; naval and military, nurses' appointments, 6172
Host, in botany, 506
Hostels, women's, 5720
Hotel de Jacques Cœur, Bourges, 3374
Hot water, heating systems, 6016–*6017*
Hot-bed, garden, making, 6320
Hothouse, management, 6533, 6833
Hotels, catering accommodation, 5583; comparison of charges in European countries, 515; bookkeeping, 3567; management and catering, 5720; tourist vocabulary, 1960; visitors' accounts, 3568
Hot-short, in metallurgy, 3838
Hottentot race, distribution, 627, *3279*; ethnology, 1789; nasal index, 1786
Houdan fowl, *4957*, 5090
Hour, in table of time, 226
House, architects' detail drawing, 5542, *5546*, *5693*; country, plans and elevations, *2128*, 2132; defence against attack in war, 6273; elevations, 5542, *5546*, *5693*; hygienic and non-hygienic sites, 5274; numbering, 2424; plans of, 5542; sanitary requirements, 5050, *5052*; site and aspect, 144; stone, in primitive ages, *2132*, 2134
— fly (*musca domestica*), *3721*, *3722*
— furnishers, business of, 3447
House of Keys, Manx, 1367, 2611
— property, investment in, 3225
House-sparrow, classification, 2209
Housebreaker, clearing sites, 309
Household finance, general rules, 3222
Household Troops, 161
Housing, carpentry, 4044, *6581*, 6585
Housings, of cart saddle, making, 5341
Housekeeper, duties, 762
Housekeeping: *see Group Index and under separate headings*
Housemaid, duties, 1003
House-martin, nest, 2507
House-parlourmaid, duties, 1005
Hoven, cattle disease, 2623, 3891
Hover-fly, as pollen carriers, 731; protective colouring, 3721
Hovis bread, 933, 3312
Howe truss, 2228, *2229*
Howitzer gun, use, *6614*, 6615
Hudson, T. J., theory of psychic phenomena, 3287
Hughes type printing telegraph, 5393
Huguenots, persecution of, 4102, 5110; in Ireland and Scotland, 1025; rising, 5110
Hull, fish sale, 5316; harbour regulation and revenues, 6220
"Hull," grinding wheel, *5476*
Human nature, changing character, 4371; the key to sociology, 4369
— race, factors affecting distribution and development, 4493
Humanism, in modern literature, 2686
Humanitarians, attitude towards sociology, 4276
Humble-bee, cross-pollination by, 732; description, nest, 3723
Hume, David, historian, 2054
Hume, Martin, historian, 2785
Humerus, human, *1348*, 1349, 1708
Humidity of air, 1899
Humming-bird, description, 2211, *plate facing* 2209; colouration, 2505; as pollen-carriers, 730
Humus, vegetable mould, fertility, 4497
Hundred Years War, Edward III. share in, 3076, 3077; Henry V., 3463; Henry VI., 3464
Hungary, books on, 1250; craniology, 1786; ethnology, 1789; economic conditions, 5710; geography of, 2162; manufactures, 5710; medical profession, 5429; touring directions, 1249
— history of, formation of state after subjection to Rome, 2354; until part of political system of Germany, 2947; Middle Ages, 4399; Austrian conquest, 6447
Hunger, physiological definition of, 866
Huns, invasions of, 2241, 2947; ravage Helvetia, 4399
Hunt, Holman, "Lady of Shalott," 722; "The Light of the World," *plate facing* 624; pre-Raphaelite school, 4394
Hunt, Leigh, poems, 1308; portrait, *2619*; works and criticism, 2451
Hunter spiders, tarantula, 3805
Hunting, place in evolution, 4515
Huntingdonshire, geography, 1273
Hurdles, embankment revetting, 6271
Husk, cattle disease, 2622; in pigs, 2625; in sheep, 2624
Husk-worm, *2627*
Huxley, Thomas Henry, clotting of blood experiment, 954; doctrine of mind as epiphenomenon, 2116; on importance of reasoning faculty, 2805, 2993; on removal of upper brain of frog, 2299; on rhetoric, 3987; on sea fishery law, 5317; on secret germination of ideas, 3184; on study of natural science, 4089; zoological works, 1791
Hwang-ho, river, 2564, 2974, *2977*
Hyacinth, *plate facing* 728; classification, 355; garden culture, 6489; wild, in woods, 504
— perfume, source, 5469
Hyæna, varieties, 1765
Hyaline cartilage, histology, *435*
— membrane, of animals, 2852
Hydra (biology), reproduction, *381*, 382: *see also* Polype, fresh water
Hydrant, street, 2326, *2327*
Hydraulic accumulator: *see* Accumulator
— engineering, scope, 157, 5676
— force pump, 1082
— gradient, in water supply, *4336*
— intensifier, construction, *5675*
— jack: *see* Jack, hydraulic
— machinery, 1080, 1685
— mean depth, of river, 5114
— gradient, definition, 1575
— power, 5675; application, *5676*; books on, 4339; from natural sources, 5678
— press, 1076, 1142, 1223, *2992*; in making lead pipes, *357*, 359
— pressure, in boiler-testing, 3106; in mains, 5675, 5676
— ram, construction, 1220, *5932*, 5933
Hydraulicing, in mining, *2959*, 2960
Hydraulics, 1574, 5113, 5675; books on, 5576, 5596

Hydrocarbons, aromatic group, 3707, 5461 ; and carbohydrates, 2713 ; chemical composition, 3112 ; constituents of body, 439 ; derivative, 2713 ; digestibility, 866 ; digestion of, 673 ; organic acids derived from, 3704 ; petroleum, 6010 ; in standard diet, 3380
Hydrochloric acid, from chloroform, 3270 ; commercial properties, 4634 ; composition, 1037, 4633, electrolysis, 3260, 4022, 5753 ; preparation, 695, 1445, 1598, 4633 ; properties, 1598 ; reagent and test, 4404, 4110 ; in stomach, 1598, 2878 ; uses, 1037. 1598, 4633
Hydrocyanic acid, characters, antidotes, 3536 ; in medicine, 3537 ; properties, 3536 ; a protoplasmic poison, 3017 ; synthesis, 3538
Hydro-extractor, in dyeing, *6371* ; machine silk manufacture, 1246
Hydrofluoric acid, 813, 5528 ; formation, 1444 ; in glass polishing, 4931, 4932
Hydrogen, 840 ; atom energy, 2393 ; electro-chemical equivalents, 5262 ; in human body, 438 ; ions, speed of, 4563 ; liquid and solid, 841 ; in living things, 275 ; occurrence, 839 ; plant food, 167 ; preparation by electrolysis of water, *3260* ; proportion in earth's crust, 239, 624 ; unit of atomic weights, 518
— gas, inflation of balloons, 3977
— peroxide, 692, 1718 ; catalytic decomposition, 4135 ; in bleaching, 6199
— sulphide, properties, 1718 : *see also* Sulphuretted hydrogen
Hydrography, 159, 1016 ; and sea fishery, 5188
Hydroid zoophytes, description, *4086*
Hydroids, description, 4083, *4086*
Hydrokinetics, in Physics, 1143
Hydrolysis, ferment action, 4135
Hydrolytic sewage tank, 4743, 4744
Hydrometer, 798, *799* ; the Beaumé, 1036, 4554 ; glue tester, *5358*, 5359 ; Nicholson's, 1078 ; syrup testing, *4848*
Hydrophobia, incubation, 5411 ; Pasteur treatment, 3274
Hydrostatic machines, *1142*, 1685
— paradox, 1076, 1142
— press, invention, 1076
Hydrostatics, 1076, 1141, 1220, 1801 ; in engineering, 1076, 1402 ; retaining walls, 1077 ; water-power, 1080 : *see also* Fluids, in Physics, *and special applications*
Hydroxyl, formula, 1721
Hydroxylamine, formula, *1721*
Hygiene, book on, 5424 ; cash value to the nation, 4530 ; and longevity, 2662 ; women's training, 322
Hygrometer, 6131 ; in balloon observations, 3982 ; Daniell's, *1899*
Hygroscope, forms, *1899*, 1900
Hymenoptera : *see* Membrane-winged insects
Hymn tunes, organ music, 3863, *3864*, *3955* ; transposition, 2312
Hyoid bone, human, 1603, *2144*
Hyperbola, drawing, 1411, *1413*, 4933, *4935* ; in conic sections, 5783
Hyperbrachycephalic, defined, 1786
Hyperdolichocephalic, defined, 1786
Hypermetropia, meaning, 3179 ; cause, correction, 6264 ; testing for, 4143
Hyperspace (math.) explained, 2119
Hypnotic drug, varieties, 4128, 4129
Hypnotic suggestion, non-physical basis, 4449
Hypnotism, nature, 2549, 3289, 3602 ; book on, 4449 ; modern theories, 3288 ; use of term, 4449
Hypochlorites, manufacture, 5759, *5760*
Hypochlorous acid, properties, 4778
Hypocycloid, definition, drawing, *1414*
Hypogene action, volcanic, 1206–1208
Hypogynous flower, *347*, 350
Hypophosphites, defined, 1161
Hypotenusal error, in surveying, 263
Hypotenuse, of triangle, definition, 4330
Hypothesis, in geometry, 4208
Hypsometer, for determining heights, 159, *593*
Hysteria, causes, 6263 ; importance in psychical research, 3665
Hysteron-proteron, in grammar, 1616

I.I.M.T.A., meaning of, 1069
Iambus, iambic, 305, 328, 1766
Iberia peninsula, geography 2232, *2233*
Ice, 1738 ; density, 798 ; influence on navigation. 4498 ; regulation of, 1740 ; in sick-room, 6287 ; specific gravity, 799, 1704
Ice Age, in British geological history, 1817 ; in Northern Europe, 2255
Ice-wafer, biscuits, 5495 ; machine, *3597*
Icefall, cause, 1638
Icebergs, transport of rock, 1814
Iced coffee, recipe, 2333
Iceland, fissure eruption, 1207 ; geography, 1562 ; language affinities, 1771
Iceland spar, 768, 3849, *4554*, 6738
Ichneumon fly, 3722, *3723*
Ichthyornis, order of birds, 2214
Ichthyosaurus, 2677 ; fossil, 2250 ; skeleton, *plate facing* 4065
Icosahedron, in drawing, 1747
Idealism, defined, 6464 ; Berkeley's theory, 6468 ; in Greek sculpture, 2929 ; as opposed to materialism, 6467 ; philosophy of, 6257
Ideas, practical value of, 75 : *see also Group Index, page 6897*
— in philosophy, Kant's theory, 2013 ; Locke's theory of 2013, 6256 ; natural selection in, place in social progress, 5390 ; subconscious element, 3183 : *see also* Innate ideas *and* Association of ideas
Identity, in algebra, 2381 ; in logic, 6100
Ides, Roman calendar, 1182
Idiot, weight of brain, 2144
Igneous rocks, 528, 535, 2581 ; classification, 898, 1007 ; jointing, 1925
Iguanas, description, 2678, *2679*
" Il Penseroso," Milton's, 991, 995
Ileum, human, length, *576*, *579*, *580*
" Iliad," 3781 ; Chapman's translation, 848, 849
Ill-health, contrasted with disease, causes, 5700 ; functional and organic, 5700 ; how life is shortened, 2794
Illuminants, for buildings, kinds, 6024
Illumination, MSS., *6275* ; books on, 6728
Illumination : *see* Lighting
Illustrating, women's work and wages, 322 ; for the Press, 6102, *6103*
Images, in light, formation, 2600 ; real and virtual, *2600*, 2902 ; retinal, 2601, 3227
Imagination and apparitions, 3625
Immortality, in physical sense, amœba, 278 ; higher animals, 484
Immunity, 6542, 6781 ; evolution doctrine, 1030, 1587 ; moral, 6783
Impact test, machine for, *1393*, 1394
Impaction, in cattle, treatment, 2624
Imparisyllabic, Latin nouns, 442, 754
Impellers, in rotary pumps, 1686
Impenetrability of matter, 1265
Imperative mood, English, general rules, 608, 755 ; French formation, 3060 ; German, 1342
Imperfect chord, in music, 363
— indicative, French verbs, 2486
— tense, German use, 3501
Imperial Civil Service, 3476 ; Colonial services, 3548, 3741
Imperialism, imperfect form of government, 4371
Impersonal verbs, English, 902 ; German syntax, 2490 ; Latin, 1047
Imposing stones, in printing, 5252
— table, compositor's use, 5159 ; in stereotype foundry, 5556, *5557*
Imposition, in printing, 5458
Impressionism in art, French, 724, 4302, 4394 ; its nature, 4302
Imprest system, bookkeeping, 2202
Improvers, in dressmaking, 2438
Improving, spun silk, *2597*, *2598*
Impulse turbines, *1688*, 1691
" Inborn " characters, definition, 485
In-calfer, definition, 2238
Incandescent gas burner, construction and use, 6026
— lighting : *see* Gas
Incense, recipe, 4972
Inceptive verbs, Latin, 1047
Inch, unit of measurement, 226, 1147
— tool, *532*
Inchgarvie caisson, *1403*
Incidence, angle of, in light, 2599, 2600
Incised carving, wood carving, *6046*
Incisor teeth, 577, *578*, *1605*
Inclined plane, 684 ; application, 687, 834
Income, taxable items, 3335
— tax, abatement and exemption conditions, 3335 ; incidence, returns under schedules A, etc., 3333 ; relation of stock in hand and profit accounts, 2421
Incubator, use, construction, *5263*
Incus bone, of ear, *2533*, 2534
Indefinite adjective, article : *see under* Adjective *and* Article
Index, in algebra, 1818, 1994, 3412
— in anthropology, explained, 1786
— in arithmetic, explained, 1264
Indexes, numbers of entries in well-known books, 4820
Indexing, in business, 6520 ; card system, 4819 ; journalist's method, 4817 ; pay for women, 322
India, aborigines, description, 1789 ; carpet manufacture, 3360 ; Chinese trade, 5659 ; civil appointments, 3476 ; coalfields, 2820, 2822, 5304 ; coins, weights, and measures, modern, 410 ; commercial opportunities, 6212 ; cotton industry, 222, *383*, *385*, 386 ; craniology, 1785 ; Dutch trade, 5826 ; economic conditions, 5380 ; English empire founded, 5555 ; flax industry, 717 ; forestry, 4602 ; geography of, 2818, *2819*, *2820*, 2972 ; goods transport method, 2153 ; hemp production, 718 ; history of, 417, 974, 6549 ; books, 2618, 5555 ; irrigation, 5483 ; labour conditions, 6629 ; population, 628, *630* ; ramie cultivation, 720 ; salt tax, 1600 ; sea fishery, 5318 ; silk industry, 1247 ; trade, character of, 5379 ; wools, 72, 220
Indian army, promotion, 4200
Indian civil service, 2251, 3476
— cress, 353 ; climbing, 504, *505* ; nectaries, *730*, 731
— forest service, 4929
— game, fowls, 4660, *4662*, *4954*
— hemp, 6885
— ink, drawing with, 284, *1792*, *1794*, 5365 ; for model drawing, 2729 ; shading medium, 1533
— medical service, 5428
— mutiny, 2786, 6550
Indian Ocean, continental shelf, *298* ; currents, fig., *557*, 558
— police appointments, 3478
— shot, 355 ; culture, 6492
— staff corps, career in, 161
— yellow, pigment, 871
Indians, American, distribution, *627*, 629, 4065 ; ethnology, 1789 ; origin, 215 ; skull measurement, 1785
Indiarubber, artificial, Fenton's, 5309 ; artificial production, and cost, 5311 ; block, production, 5048 ; blooming, 5313 ; Brazil, exports, 5380 ; ceara, 5048, 5049 ; chemistry of, 808, 5311 ; composition, 808, 5311, 6030 ; Congo Free State, exports, 3583, 5380 ; crude, 5311, 5313 ; destructive distillation, 5312 ; in drain construction, 782 ; drawing with stumps and chalk, 1537, 1538 ; hard, 5310 ; industry, origin and growth, 5045 ; insulation, 672 6793 ; latex collection and preparation, 5046 ; manufacture, *5199–5203* ; moulding, 5201 ; packing in dentistry, 6031 ; Para, preparation, 5047; physical characteristics, 5313;

Indiarubber—continued
pigments, 5203 ; preparation, 808 ; raw, 5199 ; recovery, 5309 ; root, extraction, 5048 ; semi-hard, 5310 ; sheets, manufacture, 5200 ; S. American, 4287 ; source, 4284, 4658, 5045 ; specific gravity, 1704 ; substitutes and their manufacture, 5309 ; tapping tree, *5049* ; uses, 4658, 5310 ; varieties, 808 ; vulcanisation, 4658, 5201, 5312, 6030, 6032 ; waste, 5309 ; waterproof industry, 5045
— erasers, introduction, 5045
— plant, 354, 5045 ; cultivation, 5046, 5049 ; wild, Paraguay, 4288
— tiling, use and laying, 5310, *5311*
— workers, employment, 2656
Indicative mood, English, general rules, 608, 755 ; French, 2924, 3060, 3211 ; German, 3502
Indicator, railway, 4688
— telephone, 5683, *5684*
— test, for machine tools, *3963*, 3965
— Wheatstone ABC, 5177, *5178*
Indicolite (tourmaline), 5853, 5856
Indifference point, psychology, 2518
Indigestion, causes, 867, 2878, 3600, 5841 ; diseases due to, 5842
Indigo, dye, artificial, 5463 ; preparation, 6196 ; Indian exports, 5381 ; natural, 5781, *5782*, 6885 ; test in cloth, 5599 ; in textile printing, 4501
— pigment, 871
— plant, 353 ; gum in India, 2820
Indigofera, dye plants, 5781
Indirect expenses, in bookkeeping, *3419*
Indirect speech : *see* Oratio obliqua
Individual, relation to society, 5245, 5247 ; welfare of the "self," 5247
Individualism, social force, 5533
Individuality, a case of heredity, 5386 ; condition of human progress, 5388 ; transmission to offspring, 5386 ; in study of sociology, 4278 ; worth to society, 5388
Individuation, in woman and man, 4827
Indo-China, geography of, 2972, *2973*
Indo-European languages, 1771
Indo-Europeans, ethnology, 1790
Induction coil, invention of, 129
Induction, in electricity, 949 ; alternating, 1357 ; right-hand rule, 1105
— in logic, 5999 ; application to sociology, 3872 ; in chemistry, 401 ; formation in logic, 6007 ; imperfect, 6000 ; test of, 6003
— motor, *1909* : *see also* Three-phase
Indus, river, course, 2563, 2818, *2821*
Industrial assurance, system, 3224
— careers, employment conditions in British trades, 2641 2642,, 2656
— labour, kinds of, 6519
— shares, co-operative value, 3484
Industrialism, highest end of, 5097 ; compared with militarism, 2393 ; prostituted to militarism in Germany, superior in U.S.A., 5097
Industries, British, shopkeeping, 43
— origin of, 4516
Industry, classification, 1
Inertia, 312 ; Newton's first law, 424 ; moment of, 1985, *1987* ; in relation to oscillation, 3747, 3748
Infancy, heredity, and capacity of making acquirements, 1586
Infant, clothing, *3744*, *3853* ; feeding, 674 ; nursing, 4682 ; open air exercise, 4683 · tear secretion, 2400 ; temperature of, 440
— mortality, 2794, 4528 ; from fermented milk, 3535 ; from improper feeding, 4681 ; need of medical women, 4974 ; result of mother's employment, 4667 ; a social problem, 4124
"Infant Samuel," picture, by Sir Joshua Reynolds, *4393*
Infantry, corps, service and pay, 4198 ; Foot-guards, 3840 ; Line, 3840
Infection, resistance to, 6543
Infectious diseases, caused by bacteria, 166 ; in evolution of man, 1029
Inferior maxilla, human, 1604, *1605*, *2144*
Infinitive mood, English, 608, 756 ; French, 2048, 2924, 3353 ; German, 1621, 3501 ; Latin syntax, 1048, 1334
Inference, in logic, defined, 5999
Inflexion, in grammar, explained, 116
Inflexions, of verbs, English, 608
Influenza, 5412 ; effects, 6260
— in cattle, treatment, 2623
Ingestion, biology, definition, 276
Inhalations, in nursing, 6288
Inhibition, mutual, of two reflex actions, 2258 ; in psychology, 2117, *2118* ; in relation to free-will doctrines, 2996 ; relation to will, 2993 ; of one sense by another, 2258
Ink, 5365 ; in architect's drawings, 5421 ; black, recipes, 5366, 5646 ; coloured preparation, 5367 ; in engraving, 6112, 6483 ; kinds, 5365 ; materials for, 5366 ; press illustrator's, 6104 ; recipes, 5366, 5367 ; stains, removal of, 2590 ; sympathetic, composition, 5985 ; in technical drawing, 2793 ; for vellum, 6275
— printer's, 1037, 5462, 5745 ; preparation, 5367
— writing, 1037 ; chemistry and preparation of, 5366, 5367
Inland Revenue department, typical career, 2250 ; staff, 2765
Inlaying, cabinet making, *6581*, 6583 in jewellery, 5858
Innate, in biology, definition, 485
— ideas, Locke's regulation, 2013
Innominate, hip-bone, *1708*
Inns of Court, fees, etc., 162
Inorganic chemistry, 237 ; scope of, 135 ; *see also under* Chemistry
Inquisition, in Spain, 4396, 4397
Insalivation, process of, 577, 674
Insanity, caused by alcoholism, 5815 ; book on, 5424 ; forms, treatment, 6261 ; importance in psychical research, 3665
Inscribed circle, in geometry, 744
— figures, in geometry, 1084
Insect pests, principles of extermination, 1666, *1667*, 1668
— trap, of arum, *plate facing* 728
Insectivora, characters of, 1493, 1763 ; development of claws, 1871 ; parachuting apparatus, 2037 ; swimming apparatus, 2038
Insects, 3361 ; in agriculture, 1666, *1667* ; evidence of consciousness, 3117 ; eyeless, 2403 ; food of birds, 2493 ; forest pests, 4925, *4927* ; fossils, 2254 ; function in plant propagation, 348 ; membrane-winged, *3722–3727* ; plants which eat, *507*, 508 ; plants, protection against, 1114 ; as pollen-carriers, *730* ; societies of, 4123 ; timber, deterioration from, 3545
Insertions, infant's garments, *3746* ; for underwear, 3094, *3589*
Inspection-chamber, drain, 734, *735*
Inspector, Board of Education, 3303
— of engineer's workshop, 3961
— locomotive, duties, salary, 4601
— of nuisances : *see* Nuisances
— police, qualifications, salary, 1407
— railway, wages and duties, 4591
— of weights and measures, 787
Inspiration, physiological, analysis of air in, 1302 ; mechanism of, 1300 ; through the nose, 2538
— psychological, 3184
Instinct, biological theories, 1588 ; and health, 2664 ; opposed to intellect, 1945 ; relation to emotions, 2694
Institute of Actuaries, 4729, 4730
Institute of Chartered Accountants, 148, 3919, 3920
Institution of Civil Engineers, 157, 160 ; value of diploma, 453, 574
Instrumental case, Greek, 6668
Insulation in electricity, 464, 672, 1660 ; cables, 6546
Insulators, electric, 672 ; cable, 6547, 6795 ; tramway, *1935*, *1963* ; telephone wires, 6324, *6325*
Insurance, 4894 ; in bookkeeping, on balance-sheet, 2882 ; branches of business, 4725 ; general advice as to, 3223 ; industrial : *see* Life assurance, industrial ; literature, 4725 ; scope, 4725 ; suspense account, in bookkeeping, 2882
— offices, clerk's wages, 44 ; posts, salaries, 162, 4725
— *see also* Fire insurance, Life assurance, *etc.*
Intaglio, wood carving, 6137
Integer, mathematics, defined, 546
Integrator, use in railway locomotive, 5105
Intellect, distinguished from mind, 3118 ; practical relations of judgment and criticism, 1945 : *see also* Psychology, Reason, *etc.*
Intensification, photo., 6682
Intercepting-chamber, drain, *735*, 738
Intercostal muscles, 1300, *1302* ; nerves, *1941*
Intercrossing, of species, 1030
Interest, in bookkeeping, on deposit receipts, 4444 ; adjustment in partnership concerns, 2978
— in arithmetic, rules, 1127
— rates in Rome, ancient, 1334
Interference, in physics, 2319, 3229
Interjections, English, 116, 1337 ; French, list, 5229 ; German, 2926, 3789 ; Italian, 6524 ; Spanish, list and use, 5229
International indebtedness, factors, 3973
Internodes, stem, 170 ; suppression of, forming rosettes, *171*, 173
Interpretations, Bacon's argument, 6000
Interrogation, English grammar, 1471 ; English pronouns, 605 ; Esperanto, 5088 ; French, 3500 ; French pronouns, 2047, 2636 ; German, 1055 ; German pronouns, 2488 ; in Italian, 2046 ; Latin, 603, 1470
Interval, in music, general account, 273, *2311* ; in harp playing, *3398* ; pianoforte playing, *1507*, 1508
Intestines, digestion, 675 ; structure, *576*
Intima of blood-vessels, *953*, 955
Intonation, violin, 2311 ; testing, 2413
Intra-atomic energy, meaning of, 36
Intra-cellular respiration, 1295
Intransitive verb, 608 ; German syntax, 2489, 3355 : *see also* Verbs
Introspection, in psychology, 2012
Intuition, psychic theory of, 3288
Inventions : *see* Ideas *and* Patents
Inventory, auctioneer's, 4983
Inverse squares, law of, in astronomy, 6242 ; in gravitation, 664 ; in light, 2435 ; in sound, 2101
Inversions, in harmony, 366, 566, 631 : *see also* Bass, figured
Invert sugar, source, preparation, and use, 3653, 3705, 4166
Invertebrates, general description, 31 ; compared with vertebrates, 275
Inverted commas, use of, 1471
Investment, general principles of, 3225, 3482 ; how shown on balance-sheet, 2758 ; "reserve fund" problem, 2883
Invoice, as a business contract, 658 ; filing methods, 2270 ; foreign, 3683 ; guard book, journal, 2269 ; loose-leaf, 6522 ; railway consignment, 5072, 5073 ; rules, 977
— book, function, 778 ; use and example, 978
Involuntary muscles, human, 1711, *1712*
Involute, in geometry, *1413*, 1414
Involution, in algebra, definition, 3411
Inwood's valuation tables, 5152
Iodine, antiseptic value, 3271 ; from "caliche," 5587 ; chemical properties, 1445, 4403 ; from seaweed, 1369 ; in testing starch, 4557
Iodoform 3271 ; test for alcohol, 3019
Ion, in physics, 3260, 3261, 4022, 4563 ; in gases, 4104, 4699 ; movement, 4022, 4563 ; in solutions, 4698

Ionic order of architecture, *2035*, *2858*, *2859*; Roman, 2932
Ionic volute, problem, *1413*, 1414
Ipecacuanha, drug, 6885
Ireland, afforestation, 4602; agriculture, 986; climate, 984, 985; coalfields, 5304; communication by river, canal, and rail, *1367*; educational facilities, 483, 1777, 1781, 3505, 3508; farm servants, wages, 3001; geography of, 984, 1365; imaginary submergence to 600 ft., 982, *983*; industries, 1025, 1365; local government, 317; mortality statistics, 2662; police forces, 1406, 1409; provinces, *1365*; triangulation survey, 1145; universities, 483, 1782
— history of, to conquest by Henry II. of England, 2608; Robert Bruce crowned, 3075; Richard II., 3250; rebellions in Elizabeth's reign, 3999; James II.'s campaign, 4842; rebellion of 1798, 5973; famine (1846), 6691
Iridium, chemistry of, 1446; melting point, 3837: *see also* Osmiridium
Iris, of eye, anatomy, *2400*, 2401, 2952
— garden culture, 6489, 6490
— order, classification, 355
Irish, high ideal of parentage, 4665
— language (Erse), classification, 1771
— moss, habitat, use, 3491, 6885
Irish Sea, geology of inlets, 1354
— stew, cooking, 1737
Iron, account of, *231–236*, 1044, 4464; analysis of, 4413; in art metal work, 5687, *5689*; barffing, 6577; bowling, process, 4636; in bridge building, 2498; blowing, in steel production, 4907; blueing, 6573; cast, casting: *see below*; chemistry of, 1044, 1045, 4466; conductivity, 1397, 3839; corrosion, 6571; crystals in, 3838; distribution, 3771; distribution in Great Britain, *987*, 988; early history of use, 4465; in earth's crust, proportion, 239, 624; electric refining furnace, 5757, *5758*; electric resistance, 672; electro-plating, 3421; extraction, 1044, 5757; food of plants, 167; French manufacture, 1681; graphite moulds, 1157; in human body, 438; lamination, 3108; latent heat, 1740; in living matter, 1046; magnet, 559; magnetic deposits, 5306; magnetisation, 6245; malleable, structure of, casting, 3938; *plate following* 3936; manganese in working, 362; melting-point, 3837; mining, 2847, *2848*; occurrence, 624, 839, 5757; painting, 5834; physical properties, 1396, 3837, 4464; pig: *see below*; properties, 4464; proportion in earth's crust, 239, 624; puddled, hammering and rolling, 4637; recarburisation, 5014, 5015; reduction methods, 4466, 5753; refining processes, 4465; electric, 5758; reheating, 4638; rustless, 1332; in shipbuilding, advantages and disadvantages, 5260; smelting industry, 5306; smithing, 5687, *5689*; in smiths' work, 3108, 5687, *5689*; compared with steel, 2022, 2083; in sun's spectra, 4136; tensile strength compared with nickel, 5901; test, 4409; welding, 2990, 6453; world's supply, 5306
— "building-in" brickwork, 2513
— cast, *231–236*, 4464; aluminium in, 5993; in art metal-work, *5689*; in building construction, 1454; cheapness, 206; chilled, 235; components, 3938; compression tests, *1392*, 1394; contraction in cooling, 1397, 2342; how indicated, *2792*; friction data, 959; fusing point, 5981; "head" casting, 1404; malleable, 235, 1394, 4465, 5993; and manganese, 362; manufacture, 1044; in pattern-making, 2456; paper manufacture, *5319*; resistance to stresses, 208; soldering, 6459; strength statistics, 1393, 1396; sulphur, phosphorus and manganese in, 1044; testing, 1394; variations in strength, 211; varieties, 235
Iron, corrugated, 359, 2998
— founding, cupola furnaces, *2862*
— foundry, *2866*, *2867*
— galvanised, 359, 6168
— ores, analysis, 4415; composition, table, 4466; Cumberland deposits, 2379; distribution and varieties, 231, 5306; iron percentage, 3835; reduction, *232–236*, 4466, 5753; world's production, 5307
— oxide, paint, 1036, 3942
— oxides, composition, 4466; distribution, 231; composition, 767
— phosphates, in clay, 1179
— pig, Bessemer, 4907; German varieties, 4465; grey, phosphoric, composition, 4910; production, 4466; in steel manufacture, 5013; varieties, 4464
— pyrites, composition, 768, 840, 1044, 4466; in Oxford clay, 1279; in sulphuric acid manufacture, 1287, 4625; typical specimen, *plate facing* 1345; use, 5306
— sulphate: *see* Ferrous sulphate
— wrought, 231; aluminium in, 5992; in art metal-work, 5688; Bessemer process, 1045; in building, 1454; composition and properties, 3938, 4465; cold-shortedness, 362; compressive strength, 1392; finery method of production, 4635; friction data, 959; magnet, 560; manganese in, 362; manufacture, 1044, 4635; puddling, 4635, *4636*; source, welding, 5688; specific gravity, 799, 1396; strength, *1391–1393*, 1396, 1397
Ironfounders, employment, 2645
Ironing, laundry, 2476, 2910, 2966, *2967*
Ironmonger, business of, 47, *3572*
Ironplate workers, employment, 2647
Irons, in bootmaking, 4018, 4140; in dress, 1553; in tailoring, 1110; laundry, 2476, *2477*; milliner's, 4565; shoemaking, *3875*, 3876
Ironsides, Cromwell's, 4553
Ironstone, iron ore, 231, 4466; working, *2848*, 3771
— miners, employment conditions, 2642
Ironwood, strength of timber, 1260
Ironwork, books on, 2764; builder's structural, 5791, *5793*, 5794, *5795*; ornamental building, kinds, *5795*, 5796: *see also* Art metal-work; in carpentry, *3543*, 3546; ugliness, 5688
Irregular figures, in geometry, 1252
Irrelevant conclusion, in logic, 6100
Irrigation, 5843; agricultural, 1379; Babylonian system, 17; in early Egypt, 420; Egyptian methods, 3451; in India, 2818; methods of, 4497
Irritability, property of protoplasm, 276
Irving, Washington, essayist, 3781
Isinglass, from sturgeon, uses, 811, 5360
Isis, goddess, in Egyptian religion, 420
Island, geographical definition, 460
Island of rheil, in cerebrum, 2146
Isobars, 300; of the world, *297*; of British Isles, *985*
Isoclinic lines, definition, 4246
Isochronous oscillations, 2017
Isogonic lines, definition, 4246
Isolation, in evolution theory, 1030
Isomerism, in chemistry, 3141
Isoprene, sources, use, 5311, 5312
Isosceles triangle, 494; definition, 4330
Isothermal lines, of gases, 1806
Isotherms, Asiatic, *2564*, 2565; of British Isles, 985; of Europe, 853; of Germany, 1974; meaning and uses, *297*, 300; North America, 4064; of the world, *297*
Israelites, history to Babylonian captivity, 665; slavery in Egypt, 421
Italian language, English importations, 1770; idiomatic expressions, 4793; idioms with regular verbs, 3643; Latin and Greek root words, 6810; pronunciation, 2043; tourist vocabulary, 1957; translation charges, 1920; traveller's phrases, 1957; titles of address, 6524
— sixth, in harmony, 567
— warehouseman, trade merged in grocer's, 3041
Italy, beer consumption, 3377; bibliography, tourist's, 948; climate and travel, 394; coins, weights and measures, modern, 410; economic conditions, 5823; geography, 2230; map, *2231*; Gothic architecture, *3375*, 3376; Gothic art, 3518; Greek remains, 2859; population, 628; Romanesque architecture, 3231; silk industry, 582; touring directions, 947; trade, 5659, 5823
— history, after Roman Empire, 2354; to ninth century, 2945; in Middle Ages, 4320; 1529 to 1900, 6303
— literature, 3780; influence on Chaucer, 325; influence on English fiction, 2962; modern, 3781
Item in hot-air systems, 1808
Ivan II., III., and IV. of Russia, 6200
Ivory black, pigment, 812, 871, 1167
Ivory, 6886; carving, 3518, 6290; Congo exports, 3583, 5380; dyeing, 6767; fans, manufacture, 6300; imitation, 6299; for penknives, 5474; of razor, manufacture, 5478; sources and countries producing, 3583, 5121, 6299; specific gravity, 1704; substitutes, 6299; varieties, uses, 811
— of teeth: *see* Dentine
— vegetable: *see* Vegetable ivory
Ivy, 353; growth, 504, *505*; leaf mosaic, *505*, 506

JACK, hydraulic, 1220, 5677, *5679*
Jack plane, use, 3385, *3387*, 3756
— telephone, arrangement, use, *5880*
Jackdaw, 2210, 2495
Jacket, combing, *3591*; man's lounge, 2752, *2753*; sacque, *2470*
Jacquard, of looms, 4970, 4980
— loom, 224, *3684*, *3685*
— textile machine, 3909, 3911, 3912
Jalap, uses, 6886
Jam, adulteration, 3718; making, 4846; preservatives, 4847
Jamaica, geography of, 4178
Jambs, in building, bonding, 2784; window, 1949, *1950*; quantity surveying, *6509*, 6510
James I., of England, reign, 4551
James II., of England, reign, deposition, 4841; Irish campaign, 4842
James, Henry, novelist, 3780
James, Prof. Wm., on acquisition of physical habit, 3183; on cases of "indomitable will," 2993; on conception, 2804; on emotion, 2695; on habit and memory, 2259; on pragmatism, 6470
January, origin of name, 1182
Japan, ancestor worship and family life, 4665; art training, 341; coalfields, 3161, 5659; coins, weights and measures, 410; earthquakes, 1208; economic condition, 5659; geography, *3158*; history, 6694; increase of trades, 1156; landscape painting, 4302; population, 628; trade, 5379, 5659; trade with U.S., 5664
— wax, properties, use, 1033, 4835
Japanese, art, brush drawing, *113*; industrial skill, 3161; skull measurement, 1785; language, note on structure, 1789; stencilling, 5977
Japanese leather papers, wall, 5828
Japanners' gold size, painters', 5832
Jargoons, precious stones, 5852, 5853, 5855, 6738: *see also* Zircons
Jarrah, 6886, acreage, W. Australia, 3235, 4658; timber, 57, 1261
Jasmine, perfume extraction, 4960
— cultivation, 6322

Jasper, precious stone, 5855, 6738
Jaundice, 5842, 6038; remedies, 6038
Java, coins, weights and measures, 409; geography, 3161; nasal index, *1786*
Java sparrow, classification, 2200
Jaw, of arthropod and backboned animals, 3361; as basis of anthropological classification, 1786
— human, bones of, 1604, *1605*; condyle of, 577, *578*; joint of bones, 1709; modelling, 1511; in singing, *6049*
— teeth cutting, 576
Jaw, shearing machine frame, *4204*
"Jaw crusher," in building, *1582*
Jay, classification, 2210
Jeating, term in tailoring, 2874, *2875*
Jeffrey, Francis, Lord, statesman and litterateur, 2309
Jeffreys, Judge, career, 4841
Jejunum, human, *576*, *579*, *580*
Jellies, fruit, kinds, manufacture, 4848
Jelly-fish, 4083; description, *4086*
Jerboa, development of limbs, 1871
Jerrold, Douglas, author, 1152, 3439
Jersey, Channel Is., 1367; history, 2611
Jersey, cattle, description, 3667
Jerusalem, captured by Nebuchadnezzar, 667; the Crusades, 2674; taken by Titus, 1940
Jerusalem artichokes, à la creme, 2127
Jet, 5856, 6886
Jettison, in marine insurance, 4854
Jetty, timber construction, *1453*, 1454
Jewel water filtration system, 4099
Jeweller's tools, *5857*
Jewellers, business of, 47, 3732; combined with watchmakers', 5788; employment conditions, 2647; silver and electroplate department, 5223
Jewellery, 5858; books on, 5860; centres of production, 5856; hall-marking, 5860; hand and machine made, 5860; nations productive of best, 5521
Jewels, goldsmithing, 5687, *5688*, 5858
Jewish ministry, 6602
Jews, ancient art, 2660; continuity of race and family life, 4664; in England during William I.'s reign, 1066; ethnology, 1790; Hadrian's attempt to suppress, 2069; history of, 665; regard for parents, 4665; rising under Vespasian and Titus, 1940; in England in Middle Ages, 146
Jib, of crane, 542; cast iron, 544
— cranes, in foundries, *2866*
— forces acting on, 416
— timber, 4644, *4645*
Jibboom, sending out and in, 6409
Jig, in workshop practice, *3634*
Jigger, hydraulic, 5676, *5677*
— dyeing machine, *6368*, 6370
— in wireless telegraphy, *3895*, 3897
Jiggermast of sailing ship, 5399
Joan of Arc, 3464; death, 715
Jobmasters, business of, 4189; trade

, recipe, 4972

, of
173,

Joggling, in masonry, *3035*, 3038
John, King of England, 2914
John II., King of France, 3076

Kauri gum, 810, 1034, 5123, 5147
— pine, 6886; timber, *56*, 1260, 1393, 2828
Keating's cement, manufacture, 648
Keats, John, poet, 1309; "Letters," 2787; Shelley's "Adonais," 1308
Keel, bat's breast-bone, 2038
— of ship, *5609*, 5610; laying, 5736; plating, 5740
— bar, of sailing ship, 5400, *5736*
— block, 834; laying, 5735, *5736*
Keelsons, of sailing ship, *5400*, 5401; drawing, 5615, *5616*
Keene's cement, 648, 1332
Keep, axle-box, 3265
Kelp, iodine from, 1369, 1446
Kelt: *see* Celt
Kelvin, Lord, absolute temperature scale, 1566; on atomic size, 2028; on earth's duration, 2027; energy dissipation theory, 1298; "ex nihilo nihil" proof, 34; on ether-vortex theory, 936; mariner's compass, 4246
Kemps, of wools, dyeing, 5640
Kennedy's tube-bending machine, 5328
Kent sheep, 2362, 2367
— slab, fire-resisting material, 4760
Kentish rag, 533; in masonry, 1452
Kentledge, use in balancing crane, 1176; for cylinder sinking, 6495
Kep, in mining, use, 3305, 3766
Kephir, 3536; preparation, 6441
Kepler, John, life and discoveries, 662; laws of planetary motion, 2298, 6241, *6242*; telescope, 2949
Keratin, albuminoid principle, 811, 1420
Kerb stones, quarrying, 2955
Kerbing, granite, 3244; overflow gullies, *2324*, 2325; laying specification, 2327; marble, 3246
Kerosene, 6148; production, 1164, 6147; purification, 6147
Kerry cattle, 2240, *3667*, 3670; cross breeding, 2236, *2237*
Kestrel, classification, 2213
Ketch, type of rig, *5398*, 5399
Ketones, tertiary alchohols, 3142; relation to aldehydes, 3270
Kettle drum, construction, compass, use, *5565*; tuning, 5565; in orchestra, 5566, 5733, 5888
Key, in tightening joints, *4115*, *4116*
— engineers', 3003, *3007*, *3008*
— fitting, *3687*, 3688
— of flute, 4569
— in harmonium playing, 4179, 4180
— in mechanical engineering, 834
— in music, 2312; signature, 272; in tonic sol-fa, 805, 922: *see also* Transposition
— organ action, 3857; manual and pedal, *3862*
— pianoforte, 1210
— railway construction, 3430, 3431
— structural ironwork, 5792, *5793*
— of "winged" fruits, *911*, 912
Keyboard, of musical instrument, 1059
— of organ, 3858; pedal, 3859
— perforators, telegraphic, 5392, *5393*
— of pianoforte, 1210
— telephonic arrangement, *5880*, 5881
— of typewriter, 1527, *1529*
Key grooving, of shafts, *3403*
Key-seater machines, *3403*, 5209
Keyhole saw, use, 3385 5180, *5181*
Keying, in launching ships, 5923, *5924*
— in plastering, 5500
— in sculpture, 1509
Keynote, in music, 273
Keystone of arch, 2762, *3039*, 3144
Keyway cutters, key-seating, *3403*
Khasi Hills, 2972; rainfall, 2818, 4494
Kiauchow, German port, 5658
Kibble, use, 3190, 3305, *3307*, *3457*
Kidderminster carpets, design, 3360
Kidney cotton, length of staple, 386
Kidney iron ore, 231; characters, 6739
— vetch, 940; *see also* Vetch
Kidneys, human, structure, *1602*, *1603*
Kidneys à la maître d'hôtel, 1737
Kief, Russia, 1524; industries, 2408
Kier, in "wetting out" cotton, 6197
Kieselguhr, in dynamite making, 3272, 6761; in water filtration, 4100
Kieserite, Stassfurt deposit, *5585*, 6739
Killarney, Lakes, *1366*
Killigrew, Thomas, dramatist, 1149
Kiln, brickmaking, 643, *645*, 1278, *1283*, 1284
— cement making, *647*, 648, *1581*, 1728, *1729*, *1730*
— char revivifying, *4452*
— iron smelting, 231
— lime burning, types, 1456, 4161, *4164*
— muffle, in firing pottery, 5384, *5385*
— ore roasting, 3771
— revivifying, in glucose manufacture, 4558
— rotary, cement burning, 1728, *1731–1733*, *1853–1858*
— terra-cotta manufacture, 5778
Kilowatt, unit of electric power, 290
Kilowatt hour, 291, 292, 2812
Kilt, little boy's, *4196*; origin of Scottish, 69
Kilting, in dressmaking, quantities of materials, 187; lace, ribbon, etc., making, *5620*
Kimmeridge shale, oil yield, 6151
Kimono, infant's, 3590, *3745*, 3855
Kindergarten teachers, women, training and prospects, 323
Kinematics, 422: *see also* Kinetics
Kinetic energy, in physics, 290, 315, 4133; of flywheels, 2018, 2020; human, and cerebro-spinal system, 1941; molecular, in physiology, 438; pendulum and spring, 3748
— friction, defined, 958
— stability, defined, 553
— theory of gases, in physics, 1267
— — of mind, 2115
Kinetics, 422: *see also* Dynamics
King bolt, of roof truss, *4251*, 4253
King chaudron, shaft sinking, *3460*, *3641*
King crab, classification, 3361, *3806*
— leg, of derrick staging, 1176
— post, in roof truss, 4250, *4251*, 4252; ironwork of, 5792, *5793*
— roof, construction, 4247, *4249–4251*
— truss, 2446, *2447*, 2497, *2499*, *4249*
King's scholarship examination, 164
King's touch, auto-suggestion, 3663
King's yellow, manufacture, 5144
Kingdom, in natural science, 380
Kingfisher, description, 2211, *plate facing* 2209; food, 2493; nest, 2507
Kingsley, Charles, divine and novelist, *3441*; poems, 1438
Kipling, Rudyard, novelist, 3557; poet, 1438
Kippers, preserving, 5316
Kirkcaldy, industry, 1066; shipping tonnage (1904), 6005
Kitasatos porous tubes, 5765
Kitchen, aspect of, 2131; care of, 1002; utensils for, 1225
— garden, proportion, aspect, *6205*
— maid, duties, 1003
— range, management, 1226
Kiwi, *2213*, 2214; beak and nostrils, 2494
Kjedahl flasks, glue analysis, *5360*, 5362
Klein laboratory filter, *5766*
Knapweed, perennial weed, 1378
Knee, of horse, 1870
Knee, human, bones, 1708, *1709*
Knee-jerk, psychological account, *2994*
Knee-room, of motor-cars, 2557; of railway cars, 2555
Knee-swell, in American organ, 3952
Knickers, for boy's suit, 1461, *1752*; infant's first, drafting, *3856*; little boy's suit, 1289, *1291*, 4196, 4357; school boy's, *1551*, *1552*
— underclothing, *3473*, *3474*
Knife roller gin, cotton, 390
Knitted fabrics, hand made, 4619, 4620
Knitting, 4620, 4621; hand, 4619; ribbing machine, *4621*
— frame, 4620, *4622*, *4763*, *4764*
Knives, basket-making, *5489*
— currier's, *3219*
— flint, early Egyptian, 2519
— plasterer's, 5497
— plumber's, 5029, *5030*
— scrieve, use, *5616*
— shoemaker's, use, *3875*, 3877
— for sole cutting, *4540*
— table, manufacture, *5475*, *5476*
— wood cutting, 4582, *4583*
Knopping, in textile manufacture, *2594*
Knotgrass, *880*, 1378
Knots, sailor's, kinds, 6406, *6407*
— in timber, *52*, 3540, *3541*, 4445
Knotters, in papermaking, 6398
Knotting, in house painting, 5834
"Know Thyself," origin of the phrase, 2012
Knowledge, compared with belief, 28; criticism and science of, 6254, 6256; its limitations, 6256; scientific, rapid growth, 2553
Knowles, J. Sheridan, dramatist, 1151
Knub, waste silk, 584
Knuckle, joint, human, *1710*
Kohl-rabi, description, *942*, 944; live-stock food, 2704, 2906
Kola nut, 3454, 4962, 6885
Kolinski, fur and skins, 6427, 6430; hair, for brushes, 6106, 6109
Kominor, ball mill, *1583*, *1853*
Koran, the, teaching of, 2243; Sale's translation, 2141
Korea, geography, 2977, 5659; language structure, 1789; history, 6694
Kotyra, telegraphic system, 5392, *5393*
Koumiss, production, 2880, 3653, 6441
"Kraft" paper, manufacture, 6401
Krakatoa, Mount, eruption, 1206, 1207; sunset effects, 3729
Kronstadt, fort and port, 1524, 2408
Krupp, armour plate, 4750, 5984
Kryptol, electric heater, 3031
Kryogenes, dye, preparation, 5953
Krypton, element, 401, 1296; in periodic system, 1446; possible cause of Aurora Borealis, 2027
Kublai Khan, Mongol ruler, 218
Kupfernickel, nickel ore, 5982
Kuro Siwo, marine current, course, 558
Kurds, ethnology, 1790
Kwangsi, province, China, 2976
Kwenlun mountains, China, 2562, 2974

L. abbreviation in botany, 136
L, in shorthand, 586, 837
La Flèche, fowl, weight of egg, 5873
La Plata, river, course, 4284, 4286
"L'Allegro" (Milton), 991, 995
Label, adhesive, gumming, 810
Labials, in grammar, 122
Labium, cockroach, 3363
Laboratory, chemical, description, 61
Labour, civil engineering, 6629, 6630; efficiency of, factory expenses, 6642; efficient, promotion of, 6519; organisation, 6519; Oriental, 6630; the three ends of, 5096; unproductive, in production, cost, 6642; unskilled, classes, 6629; waste by militarism, 5097
— manager, duties, 6519
— master, workhouse, 1928
Labour-saving machinery, beneficial effects, 6518; in factories, 6644
Labourers, building, 307; farm, wages, 2999; harvesting, 1666; London, 4528
Labourers Acts, in Ireland, 3002
Labrum, cockroach, 3363
Labyrinthodon, fossil footprints, *1817*
Lac resins, source and colour, 1035, 5121, 5147; use in varnish, 5835

Lace, 4877, *4980*; guipure, *4980*; hand-made, 4870; history of industry, 224; imitation, 4878; knitting frame, *4879*; lappets, *5621*; machine-made, 4763, 4878; making, 4877, *4980*; in millinery, *5620*, *5621*; pillow, 4877; point, 4877: in underwear trimming, 3094; in vehicle trimming, 3624; washing and ironing, 2911; weaving and ornament, 3156, 3157
Lacewing, 3365, 3366; *plate facing* 3361
Lachrymal bone, human, 1604, *1605*
— gland, of eye, 2400, *2401*
Lacing stitch, milliner's, *4565*, 4566
Lacquer, 5148, 6573; Japanese, 6576; removal from brass, 3421; in varnishes, 5835
Lacquering processes, 6373
Lacteal, 1196; fat digestion, 676
Lactic acid, 3534, 4782; in milk, 4036
Lactometer, use, 798, 4034, 4038
Lactose, 3534, 3653; properties, 3706
Lacuna, in bone, 435, *436*
Ladbroke, landscape painting, 4301
Ladder, fire escape, *2463*, 6841, 6842
— in scaffolding, 1172
"Ladder of Learning," opportunities for girls, 3505
Ladle, in foundry work, 2864, *2865*
— plumbers', 5029, *5030*
Ladybird, 3511; use, 4926
Lady clerks, openings for, 192
Lady fern, culture, 6493
Lady's finger, cross-pollination, 732
"Lady of Shalott," picture by Holman Hunt, composition of, 722
Lady's maid, duties, 814
Lady's mantle (botany), *506*, 508
Lady's slipper orchid, *6533*, 6534
Lady's smock, flower, 352
Lælia orchids, culture, 6534
Lævulose, sources, 3653, 3705
Lag, grey, classification, 2213
Lager beer, dietetic value, 3315
Laggings, in building, 2385, *2387*
Lagging, in mechanical engineering, 4201
— in mining, 2666
Lagging-up, in casting, 2338, 2454
Lake, in physical geography, 458, 1815; prehistoric British, 1817; for transport, 4518
— pigment, 5145; alumina, 1043
Lake District, physical geography, *1271*; rainfall, 4024
— dwellings, European art period, 2479
— quillwort, structure, etc., *1118*
Lamarckianism, account, 653, 823
Lamb, braising and stuffing, 1736; care of, 2364; carving, *5935*, 5936; choice of, 3717; leg of, roasting, 1487; rations for, 2364, 2366; skins, use for fur, 6330, 6427; tawing skins, 3146, *3164*; wool, 1120; weaning, 2364
Lamb, Charles, author, 2310, 2786; poems, 1307; portrait, *2619*
Lambing, in farming, 2363, 2364; straining after, treatment, 2625
Lamellibranchia, 3284: *see also* Bivalves
Lamina, in cartilage, 435, *436*
Laminæ, in geology, 768, 1924
Lamination planes, in geology, 530
Lamp, brougham, 2829, *2831*
— cycle, 3779
— electric, *2682*; arc, 2414, *2683*; books on, 4298; incandescent, *2612*, 3030
— household, care of, 1004
— motor vehicle, repairing, 3325
— outdoor, 6152
— ship, 6152
— table, care and use, 6152
Lampblack, 1157, 5154, 5461
Lamphole, drain, 734; of sewer, 4459
Lamprey (fish), 3065, 3070, *3071*
Lamp shells, description, 3953, *3959*
Lancashire, coalfields, 1271; cotton industry, 223, 385; felt industry, 1997; iron industry, 1271; physical geography, 1272; police force, 1409
Lancashire boiler, 6874, *6875*; Galloway type, 3108; riveting and caulking, *3104*
Lancashire and Yorks. Rly. mark, 5069; signalling system, 4688
Lancaster, House of, Henry IV., Henry V., 3251, 3603
Lance-corporal, rank, 4030
Lancelet, biology, description, 31, *3072*
Lancret, painter, style, 4118
Land, cultivation, drainage, manures, 430, 1229; distribution, 4493; manuring, 589; purchase of, in Australia, 3235, 3236, 3238, 3240, 8467, 3469; Roman agrarian law, 1382; valuation, 5153
— and estate agency, business of, 5286
— measures, 1146
— property, investment in, 3225
— spring, 781
Landau, axle dimensions, 3326; dimensions and weight, 2558, 2726; door section, *2727*; dress, 3122, *3123*; head mechanism, *3022*; lock and lever lifts, 3022; structure, 2465
Landaulette, hood, *3623*
—motor, 2464, *2465*; doctors, 3904
Landing board stays, of van, 2828, *2829*
Landings, of ship, fairing and scrieving, *5616*, 5617; marking position, 5739; sheering, *5743*
— of staircases, 5300, *5301*
Landlord and tenant law, 6846
Landor, Walter Savage, author, 1307, 2451; portrait, *2619*
Landore, Siemens steel, 234
Landowner, rights of, 1979
Landrail, classification, 2212
Landscape drawing, 343
— painting, evolution and schools, 4299, 4300; early nineteenth century, 4393; impressionism, 4302
Landseer, Sir E., animal painting, 4393
Landslip, destructive effects, *1505*
Lang, Andrew, author, 2687, 3129
Lange, F. A., on emotion, 2695
Langshan fowls, breeding, 4659, 4661, *4859*; points of breed, 4955; weight of egg, 5873
Language, analysis of, value in logic, 6001; written and spoken, 4578
Languages, foreign, importance in travel, 514; for journalists, 3974; logical method of teaching, 5998; main families, 1771; traveller's phrases, 1956
Lankenvelder fowl, *5090*
Lantern-fly, *plate facing* 3361, 3364
Lantern lights, in joinery, *5185*, 5187
— slides, making, 6683
"Laocoon" statue, *2930*
Lap alloy, composition, 3940
— joint, 2832, 4039, 4111
— seam, in boiler-making, *3099*, 3100
— steam engine valve, 5642
— winding, of dynamo, 1321, *1322*
Lapel, man's frock-coat, *2754*
Lapis lazuli, characters, 5856, 6739; source of ultramarine, 4455
Lapland, craniology, 1786; ethnology, 1789
Lappet, lace, in millinery, *5621*
— weaving, principle of, *3155*
Lapping, in hemp manufacture, 1885
— compared with grinding, 3408
— in tailoring, *2207*, 2208
Larch, 503, 4676, 4679, 6883; insect pests, 4926, *4297*; tanning bark, 1166, 6066; timber, 55; timber, strength, 1260
— canker, 4926, *4927*, 4928
Larch-moth, size, 3516
Lard, 4832; specific gravity, 1078
— oil, production and uses, 1033
Larkspur, carpel, 348, *349*; classification, 352; garden culture, 6529, *6534*; nectar, 730, 731
Larry, plasterer's tool, *1951*, 5496
Larvæ, agricultural pests, 1666, *1667*, 1668; of ants, bees, wasps, 3722, 3725; of various flies, 3721
Laryngitis, symptoms and causes, 6132
Larynx, human, 197, 577, *579*, *2144*: construction with regard to speech, 2537, *2538*; mechanism, 2106; respiratory function, *1299*; in singing, 6047, *6048*, 6190
Laryngoscope, 2537
"Las Hilanderas," Velasquez's picture, *723*
Last, boot, 4137, *4138*, 4242, 4541
"Last Supper," fresco, by Leonardo da Vinci, 947, 3796
Lasting, in boot-making, 4138, 4541
— pincers, and tack, shoemaker's, 3875
Latch, vehicles, 3022
Latent heat, discovery, 60; of evaporation, 1742; of fusion, 1740
Lateran, baptistery of, Rome, *3090*
Latex, of rubber, 5046; sulphur addition, 5203
Lath, plasterer's wood and metal, 5498; in slating roofs, 4865, *4867*; in tiling, *4869*, 4870
Lathe, 4912, *6756*; American type, *4915*, 4921; automatic, operation, 3631; axle turning, 830, *4917*, 4922; bench, form, 4915; build and modifications, *4915–4923*, 4924; Clements' driver, 830; compared with milling cutters, 3402; engineers', 4916; friction, 964; back gear, *4913*, 4916; in grinding, 5213; lead screw, 835; first milling machine, 5204; pulley-turning, 4922; rests, kinds, *4913*, 4919; running mandrel, 4912; saddle or carriage, *4913*, 4919, 4920; screw-cutting, 3629, 4919; sliding, 4919; specialised forms, *4917–4923*; tests, *3963*, *3965*; turner's, in pottery manufacture, 5233, *5234*; in tooling, *3317*, *3319*, *3321*; turret, structure, and operation, 3621, *3632*; wheel-driven, 4912
Lathe-bed, casting, 2338, *2341*, 2342
— poppet, drawing, 2790, *2791*
Lathing, dovetailed metal, *4753*, 4756
Latimer, Hugh, martyrdom, 3834
Latin language, 443; books on, 1617; diffusion in the West, 1768; English Renaissance words, 1769; grammatical terms, 1616; idioms, miscellaneous, 1615; pronunciation, 118; Roman calendar, 1182; Roman money, 1333; roots, 6810; supines, 1334; tense-formations compared with English, 758; tenses, sequence of, 1334; translation fees, 1920; verse and metre, 1766
— literature, list of classics, 3781
Latins, the, history of, and Rome, 1135: *see also* Romans, Rome
Latitude, definition, *13*, 6244
— determination in navigation, 6659
— in plotting surveys, 369
Latrines, in building operations, 308
Lattice, in framings of machinery, 208; of girder, 544
— girder, in bridges, 208; under various conditions of load, *2227*
Latus rectum, of a conic, 5783; of parabola, 1412
Laughing gas: *see* Nitrous oxide
Laughing, physical explanation, 1303
Launching ships, method, 5923
Laundry, *2475–2477*; work and business of, 1005, 2964, *2965*
Laundrymaid, duties, 1005
Laundry work, 1005, 2964; women's training and salary, 322
Lava, definition, 459, 1207; fertility, 4497; in volcanic rocks, 1006, 2060
Lavatory, quantity surveying, 6512
Lavender, 6675, [illegible]
— essence, use for pottery lustre, 5385
— oil of, uses, 1033
— water, recipe, 4350, 4972
Lavoisier, services to chemistry, 61, 1157
Law, 675, 6844; aa a profession, 163, 6746; dictionary of, 6851
Laws of friction, motion, *etc.*: *see under* Friction, Motion, *etc.*
Laws of Nature, logical discussion of term, 6000
Law Courts, London, architectural design, 2283, *2284*
Lawn, used for underclothing, 3094
Lawns, making and mowing, 6319, 6320
Lay, of hand-loom, 3492
Layer, in papermaking, 6397
— pit, in tanning, 3013
Layette, articles for, 3744
Le Bon, Gustave, on the atom, 2396

Le Sage, theory of ether, 939; theory of gravitation, 937

Le Sidanier, intimist painting, 4395; style, 724

Leaching, defined, 3770, 3771

Lead, 358, 1160, 5985; alloys, composition, 3941, 5987; analysis, 4413; ancient use, 5985; books on, 5993; casting, shrinkage in, 1397, 2342; compounds, kinds, preparation and uses, 5988; conductivity of, 1397, 3839; corrosion, 5985; cupellation, 4303; in cupellation, 5848, 5987; deposition, 4303; deposits, Derbyshire, 2379; distribution, 3771; in drawing, indication, *2792*; dust, condensation, 5986; dust, diseases caused by, 3798; evolution, theory, 239; in gold and silver extraction (cupellation), 5848; micro-structure, 3939; *plate preceding* 3937; ore, lead, contents, 3835; ores, 5985; ore-hearth reduction, 5986; in patternmaking, 2456; Phœnix extracting process, *5755*; physical properties, 1396, 3837, 4303; in pottery glazing, 5236; properties, 5985; Prussian deposits, 2379; refining processes, 5754; relation to radium, 1916, 2392; in roof plumbing, 5029, silver recovery, 5987; smelting, 4303, 5986; smelting, blast furnace, *4125*; "softening," 5987; specific gravity, 799, 3838; test for in water, 4158, 4159; uses, 5987; water, action on, 1160; workings in U.K., 988

— acetate, 1160, 3652; in dyeing, 5779; painters' drier, 5832

— in building, protecting horizontal surfaces, 5035

— burning, 6454; joints, 5032

— carbonate, 5988: *see also* White Lead

— cast of, in navigation, 6662

— oxide, reduction, 358

— pipes, manufucture, *357*, 5326, 5627

— plaster, production, 3707

— poisoning, 1153, 1160; sulphuric acid antidote, 1720

— in railway construction, 3611

— red: *see* Red lead

— screw, defined, 688; of lathe, 835, 4915, 4921

— of steam engine valve, function, 5642

— sugar of: *see* Lead acetate

— White: *see* White lead

Leaded lights, making, 5840

Leading seaman, Navy, 4266, 4267

Leads, printers', 5028, 5252

Leadwork of slate roofs and gutters, *5031*

Leaf, alternate and opposite, 350; causes of fall, 728; in classification of plants, 350; in classification of trees, 3542; competition for light, 504; dripping points, 727; in plant structure, *169*, 170, *171*; prickly, protective function, *1114*; reproductive and covering, 346; mosaics, *171*, 173, *505*, 506; of xerophytes, 727

— of loom: *see* Heald

Leaf-butterfly, mimicry, *3515*

Leaf-insect, *plate facing* 3361, 3362, 3364

Leaf scar, defined, *728*

Lean-to roof, construction, 4247, *4249*

Leap year, explained, 226, 227; Roman calendar, 1182

Leapers, insects, description, *3363*, 3364

Leasehold tenure, effect on quality of building, 142

Least common multiple, rules, 339; in algebra, 2892

Leather, 2851, 5119; alum tannage, 3163; artificial, American cloth manufacture, 1166; ammonia from, 4775; for belting, 3712; bleaching, 5646; bookbinding, 6778; breaking-over, 2854; chrome tanning, 3162; as clothing material, 4256; colouring processes, 3455; cutting, 3713, 4016; depilation, 2854; dictionary of, 5647; dressing, 3217; dull lustre, recipe, 5646; dyeing, 3164, 6649; fat-liquoring process, 3162; fleshing and deliming, 2855, 2856; glover's, kinds of skins, and preparation, *5479*, *5480*; graining, 3221, *plate facing* 3217; joining, 3714; lacing, 3714, *3715*; manufacture, history, 2751; mordants for dyes, 6650; oil tanning, 3164; polishing, 3455; recipes, 5646; riveting, 3715; shaving, 3713; splicing, 3714; stitching, *3713*, 3714; tanning, 52, 1165, 3012; trimming, 3713; upholstery, 6716, 3479, 3621

— ropes, strength, 1699

Leather-jacket, larvæ of crane fly, 3721

Leblanc soda process, 4770

Lebrun, Charles, designer, 4118

Leclanché cell, electric, 464, *465*, 466

Lechler's spray, in papermaking, *6397*

Ledger, *488*, 777; bad debt entries, 1568, 3569; bank accounts, 1866, 1967; bank bookkeeping, 4439, *4440*, *4442*; classification of in large businesses, balancing systems, 2980; in consignment accounts, 3679, *3680*; contrasted with journal, 1750; of contractors' business, 3420; current, 6521, departmental accounts system, 3416; of branch shops, 3417 hire purchase accounts, 3917, *3918*, hotel bookkeeping, 3568; indexing, 778; in limited company, bookkeeping, 3186; loose leaf, 6521; old and new methods compared, 1864; relation to petty cash book, 2201; relation to trading account, 2500; in single entry, 3916; tabular, uses, 3567, 3569; transfer, loose leaf, 6521

Leeches, description, 3956, *3958*

Leeway, in navigation, defined, 6665

Lefebvre, painter, his art, 868

Leffel turbine, mechanism, *1689*, 1692

Left handedness, physiology of, 2301

Leg, of bird, 2494

— in cabinet work, levelling, 6588, *6589*

Leg, human, anatomy, *100*; bones, 1708, *1709*; leverage, 1798; muscles, 712; in sculpture, influence of femur, *1351*

Leg of mutton sleeve, drafting, *188*, *522*

— room, of cars, 2557

Legal appointments, 6748

Legato, in music, 271; harmonium practice *4182*; in organ playing, 3863; in singing, 6336; in viola and violin bowing, *2742*, *2825*

Leger lines, in music, 270

Leghorn fowls, points of breed, *4955*; analysis of carcases, 5093; weight of egg, 5873; useless breed, 5624

— black, breeding, 4859

— brown, 4659, *4660*

Legislation, character-making its aim, 4371, 4372

Leguminous crops, 877, *881*; suitable for milking cows, 3891

Leguminosæ, 940; food supply, 503; nitrifying bacteria of, 238: *see also* Pea

Leicester sheep, *258*, 2362

Leicestershire, wool, *71*, 221, *224*

Lemon, 6886; areas of cultivation, 4876; citric acid from, 4782; classification, 353; dietetic value, 3312 expression of essential oil, 4969

— perfume, source, 5469

— squash, recipe, 2333

— yellow pigment, in oil painting, 871

Lemonade, effect on blood alkalinity, 3016, 3017; recipe, 2333

Lemur, 1493; climbing, *1870*, 1871

Lenard rays, and cathode rays, 4091

Lenses, 2949, 6122; achromatic, *2951*, 4730, 6123, *6124*; chromatic aberration, 2950; concave, 2903; convex, 2902; defects, 6122; of eye, human, 2401, 2952; for long or short sight, 3179; manufacture, 6122, 6123, *6124*; measure, Brayton, 6122, *6123*; photo., 6127, 6684; varieties, 2901, *6122*

Leo XIII, pope, character, 213

Leo, sign of zodiac, 6251

Leopard, aggressive coloration, 2157; fur and skin of, 6427

Lepanto, battle of, 1571, 4397, 6447

Lepidoptera: *see* Moths, *and* Butterflies

Leptorhine races, 1786

Lessing, philosopher, on truth, 6255

Letter of allotment, 3186

— book, 776, 778; indexing, 193

— of credit, banker's issue, 4294

— founts, classification, 6076

— of hypothecation, banker's, 4295

— of indication, in banking, 4294

— office, filing, *193*

— patent: *see* Patents

— punch, cutting, 6073, *6075*

— writers, English, 18th century, 2139

— writing, business correspondence, 6350; common errors, 1472; incapacity for, 3974

Lettering, in drawing, system of, 1747

"Letters of Junius," authorship, 6550

Leucocyte, *953*, *954*; effect of alcohol on, 3019; effect of quinine, excretion of uric acid, 4013; evidence of consciousness, 3117; function, 6543, 6544; potential chemical energy in, 4013; in digestion of fat, 676; in lymphatic glands, 1196: *see also* Phagocytes

Leucomaine, unsuitability of term, 3826

Leucocythæmia, symptoms, cause, 6037

Levanting, leather, 3455

Levels, in building, fixing, 309

— in mining, *3190–3194*, 3561

— dumpy, 372

— flying, in surveying, 373

— spirit, 3386, 4701, *4703*; plasterers', 5497; in theodolite, 267

— staff, in surveying, 373, 711

— in surveying, contouring, 591

— "Y," description, 372

Levelling, in bootmaking, 4542

— in building, method, 329

— in erecting, 3691

— of plates, boiler work, 3100

— in surveying, 158, 372, 591; use of barometer, 592; gradients, 591; H.P.C. method, 374; hypsometer, 593

Lever, application in practice, 687, 828; Archimedes, 34; classes of, 684; physiological orders of, 1797, *1798*; principles of, 662; in theory of machines, 684

— bevelling, use in shipbuilding, 5738

— brakes, mechanism, 3128

— of flutes, kinds, 4569

— lifts, in landaus, 3022

— spring, 830

Leverage, in machinery, 828; in physiology, mechanism, 1797; tools, forms, and uses, 4586

Lever's, lace loom, 4978

Levigation, of mineral pigments, 5141

Lewes, George Hy., author, 2616

Lewis, chain, mason tool, *2837*, 2840

Ley, 875; seed mixtures for, table, 877

Leyden jar, 3581, 3749

Liabilities, contingent, bills of exchange, 1319, 1320; of limited company, bookkeeping, 3189; of parliamentary company, 3333; ranking on balance sheet, 2758; rent, rates, taxes etc., 2882; statement in bankruptcy, 3570

Liability, limited, explained, 3185: *see also* Limited companies

Lias lime concrete, in construction, 1449

— mortar, strength, 1521

Liberalism, innovating force, 5530; place in organic evolution, 5388

Libertarianism, doctrine stated, 2996: *see also* Free will, Determinism

Liberty, social, growth, 5388

Librarian, public, 320, 6871; women's training, 322

Libraries, Babylonian, 17

— public, 1495, 6871

Licences, game dealers', 4712

— liquor, conditions, 3735; transfer renewal and forfeiture, 3736

Licences, wine and spirit, retail, 3045, 5789
Licensing Acts, 3734, 5789
Licentiate of dental surgery, 5772
Licensed victuallers, business of, 3734
Lichens, characteristics, 166, *1371*; climatic limitation, 4493
Licker-in, textile, 1543, *1546*, *1886*
Liddell, Mark H., theory of poetry, 304
Liebig, chemist, artificial manure, 203; on "substitution," 2714
Lies, dealing with, 5530
Lieutenant, Army, 4199, 4200
— naval, training, pay, 4267, 4401, 4402
— Royal Naval Reserve, 6366
Lieutenant-colonel, promotion, 4200
Life, animal and plant, geological agent, 1499; biological account, 134; Chinese ten periods, 5700; elixir of, 59; inter-relation of animal and vegetable, 4132; mystery of, 3287; in Myers's theory of personality, 3384; organic functions of, 1491; origin, 28, 2030; physical characteristics, 275; physiological, 95; psychological, 3664; scientific aspect, 28; shortening of, 2794
— assurance, principles, openings, and examinations, 4725–4729
Lift, hydraulic, 1223; use in canals, 5486; hydraulic ram, 1220
— in mining, defined, 3562
— pneumatic power, 5356
— sewerage, *4463*
Lift bridges, construction, 2889
Lift-pump, 1080, 1141
Lifters, of Brett's drop hammer, *2991*
— in moulding, 2110, 2112, 2697
Light, absorption, 2436; chemical action of rays, 3372; complementary colours and colour reproduction, 6483; corpuscular theory, 937, 2431; diffraction, 3368; dispersion and its correction, 2734; distinction from vision, 3181; divergent and convergent rays, 2435; effect on human eye, 3226; electromagnetic theory, 3851, 3943, 4021; filters, in colour reproduction, 6483, 6484; and gravitation, 938; identity with radiant heat, 2060; influence of magnetic force, 3618; intensity, 2435; interference phenomena, 2432, 3229; and matter, 938; measuring sun's distance by, 6404; measuring star distances by, 6696; necessity for plants, 173, 504; Newton's theory, 935; objective reality of, 2431; parallel rays, 2434, *2435*; polarised, 2432; pressure, 36, 549, 937, 3619; radiation and N and Röntgen rays, 3943; radiation pressure, 938, 3620; radiometer, 938; rays without heat, 3372; rectilinear propagation, 2432, 2434; reflection, 2436, 2599, 2735; refraction, 2432, 2599, 2732, 2899; relation to electricity, 2434; relation to sound, 2433; scattering, 2599; similarity of Röntgen rays to, 4092; speed, 2433; in therapeutics, 3372; total reflection and angle of incidence, 2599; transverse motion of waves, 2432; undulatory theory, 3943; ultra-violet, in lupus and cancer, 3617; visible and invisible, 4094; wave length and limit of vision, 3228, 3229; wave lengths, shortest and longest appreciable, 3369; wake lengths of various colours, 3369; wave theory, 935, 2431, 3849; wave vibrations and colour, 3728
— and shade: *see* Chiaroscuro
— reflected, in chiaroscuro, 1534, 1540
"Light of the World," Holman Hunt's, *plate facing* 624
Light-year, astronomical, 6696
Lighthouses, construction, 1452, 6498; staff and salaries, 1497
Lighting, artificial, nature and qualities, 5193; systems, 6024
Lighting, in building, books on, 6349; Building Acts regulations, 6024; minimum, per unit area, 6025
— methods in drawing, 1534
— in mines, 3769
Lightning, conductor, invention, 128; telephone poles, 6324
— stage, lycopodium flash, 1310
Lights, ship's, varieties and uses, 6411
Lightships, staff, 1498; use, 6498
Lignite, characters, 6739, 1073; distribution, 5305; paraffin from, 4837
Lignomur, use for walls, 5828, 5830
Lignum vitæ, wood, 57, 1260, 6687
Ligule, grasses, *351*, 355
Likenesses, origin, in individuals, 484
Lilac perfume, source, 5469
Lillikins, milliner's, 185, 4565, 5036
Lily, classification, 355; bulb, function, *728*; garden culture, 6487; sewage plants, 4549; varieties, 6488
Lily of the valley, 355; culture, 6490; pollen, protection of, 1114
Lime, analysis, 1435, 1459, 4415; in blast furnace, 1044; brickmaking, 1282; burning, 1458; blue lias, in cement, 1856; in cement manufacture, 1728, 1857; characteristics, 3941; "fat," 1457; intermediate, definition, 1458; in manures, artificial, 589; mortar matrix, 1952; preparation, 1455; in rubber manufacture, 5203; slaked, 844, 1456, 1457; slaking, 1458, 5498; soil, effect on, 257; in sugar cane culture, 3654; sugar, clarifying, 3827; varieties, 647: *see also* Calcium *and* Quick lime
— chloride of, 2590, 4777
— concrete, mixing, 1449; testing, 1523
— fruit, 6687
— hardening of, 1578; slaking, 1457
— milk of, formation, 844; manufacture, 4163; wood distillation product, 5456; uses, 4163, 5781
— mortar, strength, 1521
— order, classification, 352
— putty, plasterer's, preparation, 5498
— tree, 6687; attraction for bees, 353; dripping points, *727*; pollen protection, *911*, 1114; "winged" seeds, *911*, 912; wood, 57, 1260, 5809
Lime-juice, 4876; for scurvy, 3704
Limelight, 841; use of oxygen, 1294
Lime-pits, leather, 2854
Limestone, analysis, 4415; in brick clay, 1280; of Buxton deposit, 1455; calcium in, 843; carboniferous, 647, 1924; in cement manufacture, 1579, 1853; compressive strength, 1518; crystalline forms of, 1074; deposits in England, 1455; for footpaths, 2430; friction data, 959; geological classification, properties, 1073; geological formation, 1815; in iron smelting, 232; jointing, 1925; quality of lime yielded, 1456; marble from, 1075; quarrying, 3191; specific gravity, 1518; in steel manufacture, 5013; varieties, classification, 532, 535; weathered, 1502
— sheep, 2363
Lime-water, in infant's milk food, 4682
Limit gauges, use, 3694
Limited companies, 6801; book-keeping, 3186; chartered accounts of, 3920; formation, prospectus, etc., 3185; function of "sinking fund," 2885; "guarantee" companies, 3331; income-tax, 3335; loans on debentures, 3330
Limmer, asphalte-stone, 1164, 2179
Limoges enamelling, 3234, 5690
Limonite, characteristics, 768, 6739
Limousine, motor-car, 2464, *2465*
Limpet, shell, 3114, *3115*
Lincoln, Abraham, life, 5676
Lincoln, 1769; tramway system, 2274
— Cathedral, 3144, *3147*, 3374
— sheep, *431*, 2361, *2517*
Lincolnshire, geography, 1273; wool production, *71*, 72, 221, 224
Lincrusta Walton, for walls, 5828
Linden: *see* Lime tree
Lindsay's fire-resisting floor, *4753*, 4756
Line, in architecture, balanced, 2284, *2286*; vertical and horizontal, *2283*; in Greek architecture, 2859
— in art, uses of, *182*, 5522
— in design, *5818*, 5820
— in drawing, 108, 343; intersecting, 1747, *1749*; suggestive of form, *2184*, 2186; wavy, zigzag, 2321
— drawing, Press illustration, 6102
— engraving, *6111*, *6112*, 6114
— in etching, 6113
— in geometry, 4207; bisection, 470, 4331; division in a given ratio, 5338; parallel, 4623; theory of, 4477, 4478; perpendicular, 472, 4623; segments, division, 5337
Linear measure, table, 226
— perspective, 595
Lined paper, textile, 2939, *2940*
Linen, as carpet warp, 3991; as clothing material, 4256; countries manufacturing, 5117; drawing, *2098*, 2099; dyeing, 5638, 5956; ironing, 2966; loom, 3912; manufacture, 1025, 4365; in paper-making, fibres, *6279*, 6280; in dressmaking, 3340; reeling, 2592; rubber coating, 5201; sizing, 3491; spinning, 2444; for under-clothing, 3094; warping, in weaving, 3489; waterproofing, 808; yarn counts, 2896, 2897
Liners, of ship, shell plating, 5921
Liniments, oil, 1032
Lining, boot, cutting and sewing, 4437
— in dressmaking, bodice, *788*; materials for, 186: knickers of boy's suit, 15[illegible]1; for skirt, 526
— felt, 1169
— mine shaft, process, 3457, *3459*
— in tailoring, princess robe, 2206
— vehicle, making, 3623
Lining-work, in vehicle painting, *3481*
Link, definition, 1147; enginemen's, 4600; in linear measure, 226; of slide valve gear, 6139
Link and cam work, described, 3404
— motion, in machinery, 209, 3690
Link-work, in applied mechanics, 88
Linnæus, his botanical classification, 135; on man in Nature, 1788
Linnet, classification, 2209; nest, 2506; *plate preceding* 2197
Linoleum, in carriage trimming, 3621; cork in, 5898; laying, 6723; manufacture, 1026, 1166, 5118, *5122–5126*
Linotype machine, *5249*, *5250*; combination with telegraph, 5395
Linseed, as cattle food, 2907; microphotographs, of, *3893*; oil in, 2704; oil extraction, 4830; source, 5117
— cake, as livestock food, 2704, 2907; micrographs, *2893*
— meal, as calves' food, 2907
— oil, for linoleum manufacture, 1026, 5123; in paints, 871, 5146, 5831; preparation, 1032, 1199, 4830; source, properties, uses, 4831, 4833, 5118; varnish solvent, 5147, 5835
Lintel, of arch, 2385, *2387*, 3243; of floors, 4756
Linville system, stresses, 2228, *2229*
Lion, in Assyrian art, 2657, *2659*; in Mycenæan art, *2857*, 2858
Lion, *1490*; African fauna, 3277; fur of, 6427; papillæ of tongue, 2535; protective hair, 2156
— head of, study, *2185*, 2187
Lips, modelling, in sculpture, 1511
Lippi, Filippino, painter, 3793, *3795*
Liquation, in metallurgy, process, 3836
Liquefaction, in physics, 1268
Liquid, excess in human body, 867
Liquids, buoyancy, 1078; change of state, 3837; conductors of electricity, 3260; definition and classification, 1076; expansion under heat, 1788; friction, 959;

molecular motion, 1268; physics of, 1142; sound transmitting medium, 2101; surface tension, 1270; volatile, 1741; volume measure, 63
Liquorice, source, uses, 6687
Lisbon, 1134, 2234; earthquake, 1208; shipping, 5823; trade, 4520
List, in textile manufacture, 3489
Listel, form of moulding, 5297, *5299*
"Listening Girl" (Greuze), *4119*
[illegible], Lord, antiseptic treatment, 202
[illegible]ture, American, 3780; Augustan age, 1829; bibliography, 2787; [illegible]cal, Greek and Latin, 3781; [illegible]arative, 3780; Continental, [illegible]; English, birth of, 3077; [illegible]rians, living, 2785; living prose writers, 2685, 2785; place in life, 103; poetry: *see* Poetry; scholarship in eighteenth century, 2141; scholars, living, 2786; technical, 5594: *see also* Drama, Fiction
Litharge, 1160; in metallurgy, 358; properties, uses, 5832, 5988
Lithographic inks, 6636
— stones, 5308, *6635*, *6636*, 6739
Lithography, aluminium in, 5993, 6638; books on, 6638; printing machinery, *6636*, *6637*, 6638
Lithopone, composition, use, 1036, 5143
Lithosphere, area, 302, 622
Litmus, 1158
Litotes, grammar, 1616
Litre, unit of capacity, 337, 422
Liver, human, *576*, 580, 677; diseases of, 5842; as thermogenic centre, 439
Liver-rot, in sheep, 2625, 3959
Liverpool, 1272; afforestation, 4603; trade, 6005, 6006
Livestock: *see* Cattle, Pig, *and* Sheep
Liverworts, 1311, 1368; classification, 165; sewage plant, 4549
Lizards, description, 2677, *2678*
Llama, distribution, use, 220, 628
Llanos, distribution, 627; Mexican, 4176; S. American, 4283, 4287
Lloyd's, 4853, 6363
Lloyd's register, 6221, 6363
Load, of beams, 1984, *1987*, 2197; in bridge-building, 2762, *2763*; building materials, 1519; in engine frames, 4206; non-axial, 2200; steel-framed structures, 2226, *2227*
— factor, in electricity, 2816
Loaded governor, formulæ, 2018, *2019*
Loading-gauge, railway, 5075
— rack, of van, *2829*
Loaf, names of various, 3392, *3393*
Loam, in agriculture, 255, 258; in brick-making, 1279; in casting, 2112, 2338, *2339*; geological classification, 1072; formation, 1815; "sweeping-up" patterns, *2459*
Loans, bank, 4167, 4292
— international, in banking, 3973
Lobelia, culture, 6320, 6491
Lobes, of cerebrum, anatomy, *2144*, *2146*
Lobnitz rock cutter, 1826, *1827*, *1828*
Lobster, 31; choice of, 3717; classification, 3361, 3806; cutlets, cooking, 1874; fishing, 4991; hatcheries, 5314; sources, 5121
Local authority, control of building work, 307, 308, 331; control of drain-laying, 733; control of engineering schemes, 1237; education scholarships, 481; engineers, surveyors, 451; teachers' inspectorships, 6479
Local government, classification of authorities, 316
Local Government Act, 1888, county councils, 317, 318; provisions, 80; roads, provisions, 1978
— — 1894, provisions, 80, 1979
— — (Ireland), 1898, provisions, 317
Local Government Board, audit of local accounts, 316; control of municipal health departments, 697, 786; and municipal service, 82; direction of poor law relief, 1851; nurses' appointments, 6172
Locality indicator, locomotive, 5105
Locative case, Greek, 6668; Latin 754
Lochs, formation, 980, 1354: *for separate lochs, see* Lomond, *etc.*
Loci, in geometry, finding, 4905
Locks, canal, construction, types, 5486
— in carpentry, 3547
— of vehicles, 3022
Locke, John, definition of memory, 2304; empirical theory confirmed by modern embryology, 2116; origin of ideas, 6256; psychology of, 2013; works, 1641
Locker, of stocking frame, *4620*, 4622
— system, in railway construction, 3816
Lockhart, J. G., Scott's biographer, 2310, 3347
Locking, of vehicles, 2557, 2558, 3122
Locking-bar, railway, 3610
Locking-frame, signal cabin, 4686
Lockjaw: *see* Tetanus
Lockyer, Sir Norman, on coronium and atomic evolution, 4135, 4136; on education and instruction, 2603; transmutation of elements, 4561
Locomotion, of certain bivalves, 3286
— human mechanical laws, 1797
Locomotive, electric, advantages over steam, *2086*, *2087*; in mining, *3565*; recent tractors, *2275*; speed, *2085*
— railway, *6515–6517*; Adams's funnel, 520; axle-box, 3266, *3267*; boilers: *see* Boilers; contractor's, 1821, *1823*; driving wheels and counterbalance weights, 2021; fire-box, *3101*; management, *4592*, *4599*; modern types, 4226; in mountain railway, 3815; oil-fed, *5106*; power transmission, 5353; pneumatic power, 5356; rack railways, *2275*; shunting arrangement in temporary line, 3254, *3255*; testing plant, 5105; tests of power, speed, locality, work, etc., 5104, *5105*, 5106; weight of, 2274, 6517
— superintendents, railway, duties, 4231
— system, human, 1603, *1708*, *1709*; control by will, 5841; muscles, 1710; organs, 197
Locomotor ataxia, symptoms 2120
Locus, in geometry, definition, 4724
Locust, 3277, 3364
— bean, 6887; as livestock food, 2909
Lode, in mining: *see* Vein
Lodestone, 559; chemistry of, 1045; properties, 768, 4243
Lodge, Sir Oliver, on persistence of "self," 3665; speed of electrons, 2028; wireless telegraphy *3895*, 3896
Lodge, Thomas, author, 1641, 2963
Lodge-Muirhead wireless, 3898
Loess, 1073; fertility, 4497; formation, 1921; nature and cause, 1500
Log-carriage, band saw, 5996, *5997*; circular saws, *6144*
Log-feed, rope, 5996; steam, 5997
Log-frames, varieties, 5900, *5901–5904*
Log-loader, construction and use, 5997
Log-mill, driving arrangements, 6144
Log-sawing machines, *5899*, *5900*
Logarithms, 6500, 6627; Chambers's tables, 6627; nautical use, 6659; proportional differences, 6627
Logic, Bacon's system, 6000; deduction and induction, 5998, 6097; definition, 5999; fallacies, 6099; logical sense, 6099; Mill's system, 6001; nature and value of, 5998; relation to other sciences, 5998; symbolic, 6099; value to student of science, 5998
Logogram, in shorthand, position, 1235
Logs, defined, 3544; board-cutters and band saws, *5994*; breaking down, 5900; circular sawing, *6143*; saw loading and rolling, 5997; sawing, *5899*; stability conditions, 5968; weight estimation, *5964*
Logwood, 6687; in dyeing, 5145, 5905, 6433; in textile printing, 4501
Loin straps, of harness, 4836
Lollards, the, in Richard II.'s reign, 3250; Henry VI.'s reign, 3464
Lombardy, geography, 2230; architecture, 3232, 3376
Lomond, Loch, 1065
London, Alfred the Great fortifies, 2355; basin, strata of, *528*, *2255*, 4156; bridges, structure, 2497, 2498, *2499*; children's entertainment, 6417; City of, Corporation: *see* City Corporation, London; County Council: *see* London County Council, *below*; education statistics, 319; geography, 1274; geological formation, *528*; harbour regulations and revenues, 6220; housing problem, 519; municipal enterprise, 318; omnibus statistics, 2153; police, Metropolitan and City, 320, 1406; poor law asylums and hospitals, 1929, 1930; Port of, administration, 320; road cleaning, 1980; roadways, ancient, 1977; Roman occupation, 2242; site, cause of, 4519; soil, peculiarity of, 143; subways for underground pipes, 2325; telegraphic intercommunication, 5537; telephones, 5600; tramway statistics, 319, 2153; transit trade, 6005; transport and traffic problems, 2153; water filtration, 4097; water, supply, 4027, 4156, 4158; water, underground, *4156*
London Bankers' Clearing House, 3971
London Bridge, 2497, *2499*; foundations, 2737; Thames, at, 1274
London, Brighton & South Coast Railway, petrol motor-cars, 4812
London Buildings Act, 519, 2261
London Chamber of Commerce, examinations, 148
— clay, classification, occurrence, 2254
London County Council, architects, 785; asylum officers' salaries, 699, 1496; careers offered by, 318; chemists' salaries, 787; clerkships and salaries, 1214; education department, 1678; education scholarships, 481; electrical engineer's salary, 573; engineering works, 318; finance department salaries, 1067; fire brigade, 1497, 6837; gas meter inspectors, 1498; history and duties, 318; indexers, women, 322; inspectorships, minor, 788; medical officer's salary, 698; officials and salaries, 318; sanitary inspectors, 699; solicitor's salary, 1410; surveyors, 455, 785; school teachers' salaries, 164; tramway manager's salary, 573; tramways staff, 1498; weights and measures, inspector of, 788
London & North-Western Railway, *4801*, *4802*, 4809; coach slipping, 4805; distinctive mark, 5060; dynamometer car, 5104, *5105*; engine gear, arrangement of, 4600; goods depot, 5073; passenger engines, shifts, 4598; rail rolling mill, 5103; short haulage, 5070; shunter, *5070*; signalling system, 4688; time-tables, diagrammatic, 4803
London & South-Western Railway, engine gear arrangement, 4600; premium awards, 4594; track inspection, 4593
— stocks, bricks, 1280, 1519
London University, matriculation examination, 149; sociology adopted as academic subject, 4123: *see also* University College, London
Long clothes, infant's, drafting, 3853
— division, explained, 92
— dog, carver's screw, *5810*
— flannel, infant's drafting, 3854
— primer, type, *5028*
— sight: *see* Hypermetropia
— stroke stationary engine, *5912*, *5913*
— tandem engine, construction, *5913*
— tom, in mining, 2665
Longcloth, uses, 3093, 6796
Longevity, 2661, 2797; and heredity, 2662
Longhorn cattle, 2236, *2237*

Longitude, explanation, 13, 14; in astronomy, 6244; determination in navigation, 6659, 6663, 6665
— difference of, defined, 6665
Longwall working, in mining, 3191, *3560*
Lonk sheep, 2362, 2365
Lonsdale waggonette, described, 2464
Loom, automatic, *3635–3637*; Brussels carpet, *3990*, 3992; Compton, *3992*, 3994; Dobcross, 5511; curtain, 4980; gauze, *3912*; hand, *3492*; Jacquard, *3684*, *3685*; jute, 3912; lace, 225, 4879, *4978*; Lever's lace, *4978*, 4980; linen, 3912; mechanism, *3684*; power, 3492, *3493*; primitive, 3488; velveteen, 3685, *3686*; warp and web beams, 3686; weaving shed, *3911*, 3912
Loom-pickers, manufacture, 3715
Loop, blind, underclothing stitch, *3337*
— of harness, making, 4887
— letters in shorthand, 427, 587, 689
— stitch, *150*
Looper, stick-caterpillar, *3514*
Looping wires, in carpet weaving, *3991*
Loose-leaf system, in office work, 6521
Loose pieces, in casting, 2338, *2341*
Loquat, tree, 6687
Lorain system of tramways, 2273
"Lorenzo and Isabella," Millais' picture, *4394*
Lorraine, province, Germany, 1975
Lots, auctioneers', 4984, 4985
Lotus flower, 352; in architecture, 2520
Lough, formation, 980
Louis IX., of France, war with Henry III. of England, 3073; reign, 4101
Louis XI., of France, wars, encouragement of learning, 4102
Louis XIII., of France, reign, 5110
Louis XIV., treatment of James II., 4842; war of Spanish Succession, 4951; and Peace of Utrecht, 4952; reign and character, 5110
Louis XV., of France, reign, 5110
Louis XVI., of France, character, 5111; execution, 5112
Louis the Great, of Hungary, rule, 4309
Louisiana, state, products, 4172; purchase by U.S.A., 5974
Louping ill, sheep disease, 2625
Lourdes, miracles of, explanation, 3663
Louse-wort, description, 506
Louvre, art collection, 870, 3946, *3949*
Love-bird, classification, 2211
Low German, classification, 1771
Low-pressure heating system, *6017*, 6022
— temperature, chemistry, investigations of Moissan and Dewar, 1444
Lowell, J. Russell, on Chaucer, 324; essayist, 3780; on Pope, 993
Lowestoft, harbour construction, 6330; herring industry, 1274
Lowmoor iron extraction, 4636
Lubricants, for axles, 3328; petroleum, 6151, 6152; varieties, 1032, 1033
Lubricating oils, flash-point test, 6149; production, 6147; varieties, 6148
Lubrication, automatic, engine and tool, *5750*; of shaft bearings, 3264; importance, 2108
Lucas, Seymour, painting by, *plate facing* 2353
Lucca, oil, 2230; silk industry, 582
Luce-Rozan silver recovery, 5987
Lucere (Italian verb), conjugation, 6378
Lucerne, grass: *see* Alfalfa
Lucifer matches: *see* Matches
Lucknow, relief, 6552; manufactures, 2820
Lucretius, Roman poet, and atomic theory, 1596
Lug-worm, description, *3956*
Luggage, railway treatment, 5108; touring parties, 1810, 1812
Lumachelle marble, *plate facing* 480
Lumbar plexus, human, *1941*
— vertebræ, human, *1605*, *1606*
Lumber, defined, varieties, 4657
— trimmers of saws, 6358
Lumbering, centres of, 5662; North American, 4065, 4066, 4068
Luminous paint, manufacture, 1036
Lunacy: *see* Insanity
Lung, in fish, 3070
— frog's, growth of, 2801
— human, anatomy, *1299*, *1300*; blood circulation, 1192, *1195*; function, in singing, 6048, *6049*, 6052; physiology, 197; rest periods, 4391
— pigs, inflammation, 2625
— of reptiles, amphibians, etc., 30
Lung-book of scorpion and spider, *3803*
Lung-fish, respiration, *3067*, 3070
Lung-snail, breathing, 3115
Luo (Greek verb), conjugation, 5520, 5657, 5808, 6094
Lupine, pollination, 732; culture, 6529
Lupus, Finsen treatment, 3372; Röntgen rays treatment, 4093; ultra-violet light treatment, 3617
Lustra cellulose, production, 6562
Lustre-mercerisation, 6197
— in pottery decoration, 5385
— worsted material, warp, 2594
"Lute," in balloon construction, 3978; in sulphuric acid plant, *4628*
Lute, strings of, 2968
— sounds, in harp music, 3530
Luxor, obelisks of, 420; temple of, as artistic creation, 2519; wall painting, *plate facing* 2041
Lyall, Sir Alfred, as poet, 1438
Lycopodium powder, use, 1310
Lydia, Cyrus's conquest of, 20; Greek civilisation, 2858
Lyddite, manufacture, 6765
Lye, soda, soap manufacture, 4964
Lyell, Sir Charles, doctrine of Uniformitarianism, 1205
Lyly, John, drama, 679, 849; dramatist, influence on Shakespeare, 2963
Lymph, 1195
Lymphatic glands, physiology, *1195*
Lymphatics, *1195*; in fat digestion, 676
Lynx, skins and fur, 6427, 6430
Lyra, constellation, location, 6117
Lyric poetry, characteristics of English, 1307; meaning of term, 306
Lysippus, sculptor, 2929
Lytton, Edward Bulwer, Lord, plays, 1152; failure in poetry, 1309

MSS., illumination, 6275
Mabuse, painter, style, 3948
Macadam roads, 1977; construction of, 2181, *2182*; cost and life, 1980
Macaroni, dietetic value, 3111, 3312, 3601; digestibility, 3314
— à l'Americaine, recipe, 2334
— carver's tool, *5809*, 5810
Macarthy double-roller, gin, *389*, 390
Macaulay, Lord, *2619*; criticism of Faëry Queen, 538; on eighteenth century drama, 1149; poetry, 1309; works, importance, 2615
Macaw, 2211, *plate facing* 2209
McCarthy, Justin, historian, etc., 2785
Macdonald, George, novelist, 3442; poems, 1438
McDougall, psychologist, feeling-tone theory, 2517; on ganglion-cells and associations, 2804
Mace, *4721*, 4722
Macedonia, conquest by Pyrrhus of Epirus, 1203; Persian invasion, 772; Philip II.'s reign, struggles with Greece, 774; reign of Alexander the Great, 972
Machicoulis, military blockhouse, 6273
Machine man, printer's, work of, 5026
— shop, *3316*; departments, subdivision, 3634; dictionary of, 3409; interiors, *3692*, *3693*, 3694, *5591*, *5593*; turnery work, *3628–3634*
— tools, dictionary of the practice, 5215; electrically driven, *5448–5452*, 5453, 5455; in pattern-making, for casting, 2453; pneumatic portable, *5452–5456*; portable, types and uses, *5275–5283*, *5448–5452*; reciprocating and rotary, *4999*; testing, *3963*, 3965, 3966; *see also* Lathe
Machinery, allowances against renewal, financial, 2885; concrete beds for, 334; drawings of engine details, *4423*, 4428; in civil engineering, *1821–1828*; civil engineer's knowledge, 157; testing, 3961, *3963*, 3964, *3965*; wear and tear, allowance, 2759
— artificer, army, promotion, 4031
Machines, arrangement in engineers' shops, 5590; drawing of details, *4323*, *4329*; factory expenses, 6641; portable, *5448*, *5455*, 5456
— theory, 85, 684; applications of, 828
Machinists, army, 3840
Macintosh, C., first waterproofs, 5045
Macintosh cloth: *see* Waterproof cloth
"Mack" fire-resisting partitions, 4759
Mackerel, carving, 5936; choice of, 3717; classification, 3065; fishing, 2527, 5121; grilling, 1873
Macronucleus, of paramœcium, *381*
Macrurus, fish, description, 3070, *3071*
Macula lutea, in optics, 2402, 2954
Mactear's mechanical furnaces, 4634
Madder, pigment, 871; sources, use, substitutes, 5118, 5906
— artificial: *see* Alizarine
— plant, classification, 354
"Madonna," Botticelli's picture, 3793
— Correggio's picture, 3796
"Madonna with SS. Jerome and Dominic," Lippi's picture, 3793
Madras, presidency, 2818, 2972; ceded to England, 6549; exports, 5381; siege raised, 5555
Madras muslin, designs, 6593, *6594*
Madreporic disc, of starfish, 4081
Magazines, effect on book output, 2686
— engineering, 5594
"Magdalen," Correggio's picture, 3796
Magenta dye, 3711, 5908, 5953
Maggots in sheep, symptoms, 2625
Magistracies, stipendiary, 6748
Magna Charta, 2915
Magnesia, characteristics, 3941; properties, preparation, 1042
Magnesian limestone, 234, 1073, 1520
Magnesite, analysis, 4415; characters, 6739; in Wellman furnace, 5017
Magnesium, 1042; analysis, 4413; extraction and manufacture, 5756; percentage in earth's crust, 239, 624; properties, use, 3837, 4307
— carbonate, in brick clay, 1280
— ribbon, manufacture, 4307
— sulphate: *see* Epsom salts
Magnet, 559; electro: *see* Electro-magnet; Faraday's spark from, 951; field: *see* Field-magnet; induction by, *950*, *951*; natural and Sturgeon's discovery, 129; properties, 4243
Magnetic belts, impotency of, 4245
— bias, in telegraphy, 5066
— course, in navigation, 6661, 6665
— dip, 4244, 4246
— drag, in armature, *1591*, 1592
— equator, defined, 4244
— equilibrium, unstable, 5066
— field, 560, 3619
— flux, 560; three-phase currents, *1908*
— lines, 560
— meridian, defined, 4244, 6665
— poles, in navigation, defined, 6665
— variation, correction in triangulation surveys, 594
Magnetism, 4243–4246; books on, 4298; effect on polarised light, 3852; relation to light, 3617; *see also* Electro-magnetism
— personal, discussion of term, 4450
Magnetite, 768, 1045, 6739; composition, source, 4466; distribution, 231; use in magnetite lamp, 2684
Magneto-electric machines, inventions, 129, 1104, 1325
Magnets, Mayer's, in chemistry, 2391; molecular, theory of, 4245
Magnitude, absolute, in algebra, 1819
Magnolia, 352; bed culture, 6530
Magpie, classification, 2210; nest, 2507
Magpie moth, chrysalis warning coloration, 3515; colour of adult, 3516
Magyars, 2354; in Hungary, 2162, 2948
Mahogany, 6887; for carving, 5809; in dyeing, 5906; strength, 1260; timber, 56; varieties and use, 4658, 6579, 6582

Mahomet: *see* Mohammed
Mahrattas, 1790; Moguls overthrown by, 418
Mahua butter, source of oil, uses, 4832
Maidenhair ferns, culture, 6532
Maignen's Anti-calcaire, 4158, 4255
— filter, report of 1894 on, 3380
Mail axle, *3326*
— order business, 5930, 6861
— phaeton, described, 2466, 2726
— shells, 3113; description, *3286*
— under-carriage, 3123, *3124*
"Main de Dieu," Rodin's, *1675*
Main carriers, in sewage farming, 4549
— distributing frame, telephonic, *6078*
— line circuits, telegraphic, 4607
Mainmast, of sailing ship, 5399
Mains, in water supply, distributing, sizes, construction, 4337; water pressure, 5675
Mainspring, verge watch, 6082, 6083
— watch, replacing and repairing, 6083
Maize, 1198, 4874, 6887; climatic conditions, 4493, 4874; cultivation, 855, 1198, 4874; dietetic value, 3312; ensilage system, 1970–*1971*; cows' food, 3890; extraction of starch, 4556, 5364; grown for starch, 5364; improvement by selection, *637*; as livestock food, 1198, 2075, 2904; 2909; manufacture into glucose, 4557
— meal, cows' food, 3892
— oil, source, properties, 4831, 4833
— starch, 5364; micrographs, *5365*
Major, in tonic sol-fa notation, 924
— chords, 363; in setting melodies, 631
— premise and term of syllogism, 6098
— scale, in music, 272
Malachite, characters, 4127, 6305, 6739
Malacostens, fish, 3070, *3071*
Malar, cheek-bones, structure, 1604
Malaria, causes, and protection from, 3721, 4089, 5410;
Malay Archipelago, ethnology, 1788; geography, 3160, 3161
— Peninsula, geography, 2973
Malays, fowls, *4954*, *4957*
Malays, race, distribution, *627*, 629; ethnology, 1789; skull measurement, 1787, 1786
Male fern, structure, 1116
Malic acid, occurrence, natural and artificial, 3704; in plastered wines, 2879; source, 3112
Malleability, of metals, 240, 1375; in art, 5523
Malleable cast iron, shrinkage, 2342
Mallein, definition, 2620
Mallet, 3388, 4584, 4586
— carver's, *5809*, 5810
— compositor's, use, *5457*
— mason's tool, *2837*, 2839
— plumber's, 5029
— in quarrying, *532*
Malleus bone, of ear, *2533*, *2534*
Mallow, *349*, 352; as weed, 1378
Malm bricks, description, 1947
Malpighian corpuscles, kidney, 1602
— layer, of epidermis, *1420*
Malt, 874, 2880; in brewing, 6228; grinding in brewing, 6057; as livestock food, 2704, 2908
— beer, how to make, 3315
— combs, 874; cows' food, 3892; as livestock food, 2704, 2908
— extracts, in breadmaking, 3394
— flours, in breadmaking, 3394
Maltose, conversion from starch, 3085
Mammals, 29, 30; adaptability of limbs for progression, *1869*; brain development, 2155; chronological order, 2155; circulation and respiration, 2155; classification, 380; coloration, 2156; comparative anatomy, 98; egg-laying, abandonment of, 2155; milk diet of young, 2155; orders, characters of, 1493; means of progression, 1869; swimming apparatus, 2038; temperature of blood, metabolism, 439; weapons and colours, *2155*
Mammoth, engravings on bone, 2479, *2480*; ivory from Northern Siberia, 811; prehistoric portrait on ivory, *2256*, 6299, *6300*
Man, air used in repose, and at work, 3801; anatomy, 97, *1603*, 1708; arboreal ancestry, traces of, 1871; brain development, 2155; brain weight, 2144; in classification of animals, 1788; influence of climates on, 4494; future evolution, 3118; geological agent, 1814; height and weight, 4528, 4529; interdependence, 5100; length of life, 4527; materialist's view of, 3665; period of development, 2255; physically perfect, 4527; place in animal kingdom, 1493; power of, 5011; prehistoric, early art, *2478*; prehistoric implements, 2255; product of progressive natural selection, 5387; psychological differentia, 2373; respiration, 1301; strength statistics, 3049; tripartite division, 4527
Man, Isle of, geography, 1367; history, 2610
Manatee, description, 1762, *2039*
Manchester, cotton industry, 223; industries, 1272; linen industry, 1025; municipal staff salaries, 452, 573, 698; shipping, 6005
— Ship Canal, construction, 5486, *5487*; cost, 4519; engineering, 1826
Mandibles, of beetles, 3510, *3511*; cockroach, *3363*; of crayfish, 3807
Mandoline, 4308; manufacture, 6707
Mandrel, of capstan lathe, *4913*, 4917; in dead-centre grinding, 3408; of lathe, *4913*, 4916; in pipe bending, *5629*, 5630; plumber's, 5029, *5030*; in tube manufacture, 5321
— block, in coppersmithing, 3884, *3889*
— press and stand, use, 5214
Manet, Edouard, painter, 4394, *4395*
Manganese, 1043; in Bessemer pig iron, 4907; distribution, 3772; in iron and steel, 234, 362; proportion in earth's crust, 239; in puddling, 4637; in steel, 4747, 5014
— bronze, properties, uses, 3940, 6309
— dioxide, for chlorine, 4776
Mange, in horses, 2621
Mangel, *942–944*; cultivation, 1230, *1232*, *1233*; drilling, 1847; harvesting, 1665; as livestock food, 1198, 2704, 2904, 3891; manuring, 589, 590; poultry foods, 5436
Manger, in cattle house, 2997, 3672
Mangle, in laundry work, *2475*
Mangling, cloth manufacture, *4343*, 4345
— rollers, in shipbuilding, *5920*
Mangrove trees, bark for tanning, 6066
Manhole cover, 734, 3243, 5797
Manholes, of boilers, *3103*, 3106
— in drainage, *571*, *736*; construction, 734; of house drain pipes, *5051*, 5052; of sewer, construction, 4458; specification of construction, 2324
Manicurists, business of, 3738, 3739
Manifolding, in typewriting, 1698, 1919
Manilla, fibre, 5639; in plastering, 5498
— hemp, 6887; dressing, 1389, 5118
— rope, in scaffolding, 1170, 1699
Manioc, cassava, cultivation, 4959
Manitoba, agriculture, 3206; geography, 4066
Manna, 6887
Mannesmann tube-making process, *5324*
Mansard roof, *4253*, 4758
Mantissa, of logarithm, 6627
Mantle, of mussel, 3284
— Welsbach burner, 6026
Manufacturer, development from retailer, 5926; hire-purchase accounts, 3917, *3918*; stocks for wholesalers, 6207
Manufacturer's agent, 659
Manure, 256; analysis, 433; artificial, 589, 5585; books on, 3471, 6689; cotton cake, 1032; farmyard, constituents, 5587; garden, 6204, 6836; liquid, 3890; nitrogenous, 589, 5587; phosphatic, 589; manufacture, 5586; poultry, 5874; Rothamsted experiments, 1378
Maories, ethnology, 1789; nasal index, 1786; in S. Australia, 3236
Maple, 353, 6887; "keys," seed-dispersal, *911*, 912; timber, *57*, 1260; sugar from, 4351
Maps, *457–459*; enlargement and reduction, 494; equal-area projection, 4514, 4520; Mercator's projection, *4514*, 4520; survey, 158
Marathon, Battle of, 772
Maranham cotton, 384, 1701
Marble, 3245; artificial, 6636; as building material, 3245; dyeing, 6766; formation, 1075, 1355; in Greek buildings, 142; in lime-making, 1455; in paving, 2516; quarrying, 2955, *2956*; sculpturing in, 1675; staircases, steps and thresholds, 3248; varieties, 533; weathering, 2835
Marbles, glass, manufacture, 4736
Marconi, wireless telegraphy, 3896
Marco Polo: *see* Polo, Marco
Marcus Aurelius, Roman emperor, 2070
Margarine, adulterant of butter, 3333, 3716; boric acid as preservative, 3820; countries producing, 5119; dietetic value, 3311; digestibility, 866; manufacture, 1032, 4832, 4833; sale of, 1624
Margin plate, of ship, fitting, 5741
— in slating, 4866, *4867*
Marine boilers: *see* Boiler
— engines, crank, 2021; triple expansion, 6293, *6294*, *6295*
— glue, use, constituents, 811
— insurance, principles, 4849, 4853
— superintendent, railway, 4227, 4231; of shipping, 6361
Marine surveying, 159, 1016
Marinoni printing machine, 5869
Marjelen See, *461*
Market-gardening, 6673–6677, 6835
Marketing, domestic shopping, 1227
Marking, cotton for, 3093
— out, in joinery, 5298, *5299*
Marl, 258; in cement manufacturing, 1579; colours from, 5776
Marlborough, Duke of, character and career, 4843, 4950
Marlborough, Sarah, Duchess of, 4950
Marlowe, dramatist, 679, 849
Marmalade, manufacture, *4847*, 4848
Marmot, fur and skins, 6427, 6430
Marquetry, defined, 6583
Marriage, American, 4663; animal, relation to monogamy, 4538, antiquity of, 4535; best age and condition, 4529; biological sanctions, 4538; books on, 4539; in Brahmanism, 418; failure of false systems, 4539; a fundamental institution, 4372; historical development, 4536; indestructibility, 4539; influence of Christian Church, 5531; law of, 6848; "leasehold," 4537; sociological evolution of, 3871; sociologist's attitude, 4538; aid to "survival of the fittest," 4539; upheld by conservative forces, 5389
Married Woman's Property Act, 6849
Mars, planet, 6250, 6567; canals, *6569*; artificial production of similar appearance, 3181; nebular hypothesis, 620, 6702; position in solar system, *11*
Marsh cranesbill, seed dispersal, 910
— gas: *see* Methane
— test for arsenic, 4630
Marsh-mallow, classification, 352
Marsilia, fern, full account, *1118*
Marsupialia, order of mammals, 1763; development of extremities, 1871; species of, 1494
Martelé, violin bowing, *2742*, 2743
Martens, skins and furs, 6427, 6430
Martin, classification, characteristics, 2210; food, *2493*; nests, 2507
Martineau, Harriet, authoress, 3439
Martin's cement, 5500, 5506
Martynia, seed dispersal, *911*, 912
Marvell, Andrew, poet, 992, 995
Marver, in bottle-making, 4735; in crown glass manufacture, 4534
Mary, Queen, reign, 3834
Mary, Queen of Scots, affianced to Dauphin, 3833; life, 3997

Masculine cæsura, defined, 306
Mash, brewer's, 6228
Mash-tun, brewing, *6057*
Masham, silk waste utilisation, 585
Mason, importance of his work, 2635
Mason's scaffold, 1171
Masonry, architect's detail drawing, *5695*; books on, 6349; construction, in civil engineering, 1452; dictionary of, 1954, 2843; loading factor of safety, 210; materials, tools and processes, *2835–2842*; protection from frost and injury, 3245; shoring in, 920
Mass, in architecture, 2286, *2288*
— in drawing, function, 108
— in physics, defined, 312; force, 552; new conception of, 4883; unit of measurement, 422, 428
Massage specialists, business of, 3739
Masseter muscle, *578*
Massicot, preparation, uses, 358, 5988
Massinger, Philip, dramatist, *846*
Masson, paper bleaching tower, 6284, *6285*
Mast, engine frame, load calculation, 4206
— of ships, kinds, 5398, 5399
Master, workhouse, 1928
Master and servant, law, 6845
Mastic, appearance, use, 810, 5835
Mastication, process of, 577, 674
Mastodon Americanus, skeleton, *plate facing* 2065
Matchbox, making, *5471*
Matches, manufacture, 362, 5470, *5471*
Matching: *see* Grooving
Mate, 6804, 6805; R.N.R., 6366
Maté, Paraguay tea, 4407, 4961
Materialism, 2016, 6257; controverted by study of energy, 2064; in modern philosophy, 6465, 6466; replaced by "monism," 6259; nineteenth century, 6259; opposed to idealism, 6487; and problems of life, 3664; and modern physics, 1376; and psychical phenomena, 4450; psychical research and, 3384; refuted by physics, 6537
Materials and structures, books on, 2034, 2764, 5595; civil engineer's duties, 157; of engineering, 2107; stability of structures, 1984, *1987*, 2570, 2760; characteristic strength, 210; testing strengths, 210, 1391, 1517, 1699
Materials, dressmaking, widths, 186
Mathematics, actuaries' books, 4730; astronomical requirements, 6243; books on, 6790; deductive science, 6002; in early China, 216; Galileo's services, 35; nature of its truths, 2806; relation to modern physics, 36; value to shipbuilder, 5254: *see also separate branches, e.g.*, Algebra, Geometry
Matriarchy, theory of, 4825
Matrix, in concrete, 332
— in metallurgy, 2378, 3835
— in printing, 5556; linotype, *5249*, *5250*; making, justifying, 6073
Matron, hospital, in colonies, 374; Poor Law, 1929, 1930; prison, 3001; workhouse, 1928
Matter, in physics, atomic theory, 312; chemical and physical differences, 1144; conception, new, 4883; corpuscular theory, 2294; definition, 312; dematerialisation, 2395; divisibility, 1265; electrical theory of, 2028, 2294, 2395, 2551; electrical stimulation, response to, 4561; electricity, negative, 313; electricity, relation to, 4105; energy, relation to, 313; ether, relation to, 935; as ethereal vibrations, 2396; evolution of, 313; inertia and mass, 312, 4104; molar and molecular force, 1144; molecular motion, 1266; nature of, 4021; properties, 1144, 1265, 1374; the states of, 1268; "ultimate atom" and modern investigation, 1376; "ultimate unit" of, 2395
— in philosophy, defining, 1833, 3287; mind contrasted with, 2115; mind, interaction on, 6538; mode of energy, 6465; philosophic controversy, 6254, 6465
Matter, conservation of: *see* Conservation
— and force, in engineering, 86
— and form, in poetry, 305
— living, chemistry: *see* Vital chemistry
Mattresses, upholstering, 6715, *6726*
Maxilla, structure, 1604, *1605*
Maxillæ, of crayfish, 3807, *3808*; cockroach, *3363*
Maximilian, Emperor of Mexico, attempt to govern, execution, 5240
May, Phil, drawing, 343, *344*; press illustration, 6102, *6104*
Mayer, Prof., experimental atoms, *2295*
May-fly, description, *3365*, 3366
Maynooth College, Ireland, 483
Mead, production of, 2880
Meadow, agricultural, cultivation, 1378: *see also* Pasturage
— foxtail, description, 875
— grass, for pasturage, *875*, *879*
— saffron, perennial weed, 1378
— sage, cross-pollination, *730*, 732
— thistle, weed eradication, 1378
Meal, oil, extraction, *4830*
Meals, children's, 4864; invalids, serving, 6178; regularity and kind, 3601; tourist vocabulary, 1962
Meander, use in design, *5820*, 5821
Measles, 5409; evolution of, immunity from, 1030, 6543, 6782; symptoms, infection, 5411, 5412; symptoms and treatment, 6260
— in pigs, 2626
Measurement, quantity surveying, 6506
— standards, kinds, 4701, 4702
Measures, bootmakers', *4015*; decimal system, 1148: *see also* Weights
Measuring machines, 688, *4705*, 4710
Measuring scale, use by compositor, 5459
— tools, classification, description, 4701
Meat, boiling, 1485; carving, *5935*, 5936; choosing, 1227; cold, using, 1530, 2335; cooking, 1736, 1872, 3313; desirability as food, 3607; dietetic value, 3112; digestibility, 866, 3314; excessive eating, 3601, 3705, 5841; extracts of, stimulants, but valueless as food, 3705; industry, countries engaged in, 5119; nutritive value, 3381; refrigeration, 5404, *5405*; tinned, poisoning, 5408; unsound, 1429; wholesome and unwholesome, 3717
Mecca, 2817; and Mohammedanism, 2243, 2244
Mechanical advantage and disadvantage, 684
Mechanical engineering, 83; books on, 5596; dictionaries, 5596; materials and mechanisms, 205, 211; training, 5592; unity of practice, 5589: *see also* Machine tools, Smith's work, *etc.*
— powers, the six, 684
Mechanics, applied to mechanical construction, 411; books on, 2764, 5595; fundamental principles of machinery, 85; scope of, 314; statics, 1833: *see also* Machine, elementary theory, *and* Motion
Mechanism, defined, 205; materials, 206, 209; rigidity and elasticity, 209; tests of finished, 3962, 3964
Medical officer, qualifications, 82, 320, 697
Medical profession as a career, 162, 5422; colonial, 5428; London poor law appointments, 1928; women's training, 322
"Medici Venus" statue, 2932
Medicinal barks, kinds, 6067
Medicine, administration, 6178; books on, 5424, 5427; forensic, books on, 5424; the profession, 5422-5432
Medicine-man in religions, 6774
Mediterranean Sea, currents, 558; French coast, 1681; geography, 460, 853; geological formation, 1815; temperature, *554*, 555; tidelessness, 556
— countries, economic conditions, 5822
— peoples, ethnology, 1786, 1790
— type of land, products, 5660
Medlar, fruit, 6887
Medulla, human, 197, *2144*, *2299*; nerves, *1941*
Medullary rays, 51, *53*; in stem, *169*
— sheath, of nerves, 1942, *1943*
Meerschaum, 1042, 6740, 6887; use, 4378
Megacephalic skulls, defined, 1785
Megatherium Americanum, skeleton, *plate facing* 2055
Melancholia, psychological symptoms, 2119; in pessimism, 2517
Melanesians, craniology, 1786
Meldola, Prof., on relation between fatty and aromatic hydrocarbons, 3708; on vitalism, 2710, 2712
Melicerta, wheel-animalcules, 3957
Melilot, common, weed, *883*
Melinite, manufacture, 6765
Melodic minor scale, harp music, *3524*
Melody, setting, 631; transposition, 1057
Melons, culture, 6677
Melon cactus, *727*
Membranes, of brain, anatomy of, 2144
— semi-permeable, 4562
Membrane-winged insects, 3362
Memlinc, painter, 3948, 4290
Memorandum of association, 3185
Memorial, in bookkeeping, origin, 1467
Memory, Locke's definition, 2304; psychological account, 2259; relation to reason, 2803; compared with reflection, 2137; training of 2304, 2372
— drawing, 341
— images, explained, 2259
Menai Bridge, engineering, 2498
— Straits, tidal power, 5128
Mendeléeff, D. I., on mercury, 1447; on periodic law, 400, 1446; petroleum formation, hypothesis, 5915
Mendel's law, 1481; statement of, *1483*
Mendelssohn, organ compositions, 3866; "Songs without Words," 2023
Meningitis, symptoms of, 6261
Meniscus, in burette, *63*
Men's hats, making, *6154–6375*, *6160*
Menservants, duties and wages, 761 764, 815, 1001
Mental energy, nature of, 6466
— work, and physical energy, 6466
— inertia, observations, 425
Menu terms, dictionary of, 5937
Mercantile law, 146, 6751, 6844
— marine, 6365, 6803; entrance to Navy from, 4265; service in, 6366
Mercaptans, properties, products, 3140
Mercator's projection, 4514
— sailing, rules for, 6660
Mercerisation, of cotton, 5638; in paper-making, 6561
Merchant, definition of term, 659
Merchant bar, in iron working, 232
Merchant Shipping Act (1894), scope and provisions, 6363, 6364
Merchant Taylor's (London) School, 481
Merchantmen, construction, 5256, *5259*
Mercury 361, 1447, 4307, 6740; analysis, 4414; Boyle's law, *1802*, 1804; capillarity, *1374*; distribution, 3772; electrical resistance, 672, 3838; electrons in atom, 2295; in gold and silver extraction, 3836 5847; occurrence, 839, 4307; physical properties, 1396, 1738, 3837; in silvering mirrors, 4932; in thermometers, 1564; uses, 4932, 5308
— planet, 6402, 6702; distance from sun, 6121, 6250; nebular hypothesis, 620; orbit and revolution, 6121, *6403*; phases, 6403, *6405*; position in solar system, *11*
— vapour lamps, electric, 2682, *2683*
Meredith, George, 3555; critical work, 2686; on "leasehold" marriage, 4537; as poet, 1438
Meridian, explained, 14, 6115; celestial, *6243*, 6244
— in navigation, *6665*; calculation, 6660; prime, defined, 6665
— in surveying, 369, 709
Meringues, recipe, 2002
Merino sheep, *70*, 72, 221, *1121*
Mermaid's purses, 3066, *5071*
Merrythought, of bird, 2494

Mersey, river, harbour revenue system, •6220 ; transporter bridge, 2889
Méryon, C., etching, 6112, *6113*
Merz, Dr. J. T., " European Thought in XIXth Century," 2062, 2553, 3371
Mesaticephalic races, 1786
Mesenterics, of sea-anemone, 4083
Mesh-grouping of dynamo windings, 1907
Meshing, by lace loom, *4881*
Mesmer, A., 3363 ; theory of animal magnetism, 4449
Mesmerism, 4449 : *see also* Hypnosis
Mesocephalic races, 1785
Mesognathous races, 1786
Mesohippus, fossil horse, 1177
Mesozoic period, in biology, 1177
— rocks : *see* Secondary rocks
Messa di voce, in singing, 6336
Messengers, State service, 2252, 2575
Messina, Antonello da, introduction of oil painting, 3795
Metabolism, of human body, 437 ; cell-life, 199 ; of protoplasm, 275
Metacarpal bones, human, 1708
— hand of pig, *1869*
Metacarpus, bones of, *99*, 1708, *1709*
Metacentre, in hydrostatics, 1080 ; of ship, 800 ; of ship, calculation of height, *5971*
Metal, expanded : *see* Expanded metal
— road, method of quarrying, 2955
Metal-work, 4521 ; art, 5521, 5687 ; Mycenæan Age, 2858
Metal-working, tools, *4151*
Metallic minerals, list, 3835, 6731
Metallography, 235, 3937
Metalloids, in chemistry, 240, 362, 1161
Metallurgy, 3835 ; books on, 5860, 5993 ; microscopy in, 3937 ; processes, classification, 3836
Metals, 356, 362 ; alloys, 3939 : *see also* Alloys ; in art-metal work, 5523 ; boiling out, 5528 ; brittleness, 3839 ; bronzing, 6576 ; casting : *see* Casting ; chemistry of, 239 ; cleaning, 5528, 6573 ; coating and colouring processes, 6571, *6578* ; coloration, lustre, and transparency, 3837 ; conductivity, 2061, 3839 ; contraction in cooling, 1397 ; crystalline structure, 4560 ; definition, 240 ; ductility, 5169 ; electrolytic deposition, 3421 ; forging, 3839 ; furnaces, *2862* ; fusibility, 239, 3837 ; grain, varieties of, 3839 ; hardening, 210 ; in human body, 438 ; malleability, 239, 3838 ; microscopic examination, 3937 ; physical properties, 3836 ; pickling, 5528, 6573 ; polishing, 6573 ; recovery processes, 4303 ; series in spectra, 3618 ; sheet, dimensions, 5524 ; sheet manufacture, 5524 ; sheet rolling, *5522*, 5524 ; soldering, 360, 3839 ; strength, 1393, 1396 ; structure and fractures, 3839 ; temperature testing, 3835 ; tensile testing machine, *3838* ; texture problems, 1405 ; welding, 3839, 6453 ; working processes, *5522–5525*, 5526
Metamorphic rocks, 898, 1074
— system in geology, 530, 535
Metamorphism, in geology, 1074
— in zoology, butterfly, 3514
Metaphysics, 6253 ; birth of, in Greece, 34 ; Haeckel's monism, 6464
Metatarsus, bones, *1348*, 1349, *1709*
Metazoan, in biology, defined, 380
Meteorites, 6570, 6695, *6696*; orbits, 6250
Meteorology, present scope of the science, 1900 ; law in, 4882 ; sunspots and, 6252 ; *see also* Rainfall
Meters, electricity, 2812, *2813*, *2814*
— river, current, *5116*
— telephonic call, *6079*
— waste water, use, 4337
Methane, chemistry of, 2713, 2876, 6817, 6827 ; in mines, 3768 ; production, 5758
Methyl acetanilide, uses, 5460
— alcohol, wood spirit, production, properties, 2877, 5464 ; rectifying, *5466*
— chloride, 2876 ; action of, 3142
— theobromine, caffeine equivalent, 4008
Methylated spirit, 1035, 2817 ; manufacture, 5147
Metre, poetry, 305 ; Chaucer's, 325 ; English, 328 ; Latin, 1766 ; Wordsworth's theory, 1305
Metre, unit of length, 337, 422, 1148
Metric system, 337, 501, 1148 : English equivalents, 1148 ; table of weights and measures, 409
Metronome, explanation and use, 41
Metropolitan Asylums Board, constitution, functions, staff, 320, 1929
Metropolitan Fire Brigade, 1497
Metropolitan Police, 320, 140 ; river and mounted, 1407 ; surgeon, 699
Metropolitan-District Railways, signalling system, 4688
Metropolitan Water Board, 320
Mexico, coal deposits, 4176, 5305 ; geography, 4061, *4173*, 4176 ; Maximilian, Emperor, 5240 ; war with U.S.A., 5975
Meynell, Alice, essays, 1438, 2785
Mezereon bark, source and use, 6068
Mezza manica, violin, *2411*, 2412
Mezzo-forte, in music, 271
Mezzo-piano, in music, 271
Mezzo-soprano clef, 1059 ; voice, characteristics and compass, *6050*, *6183*
Mezzotint, engraving, 6114, 6289, 6290
Mica, *1007*, 6740 ; in electric condenser, 3580 ; as electric insulator, 672
— group, properties, varieties, 768
— schist, 530, 535
Michaelangelo, painting, *3796* ; style and works, *3674*, 3678
Microbes : *see* Bacteria
Microcephalic races, 1785
Micrometer, screw, 688, 855
Micronucleus, of paramœcium, *381*
Microscopes, kinds and construction, 2902, 6126, *6127* ; fishery, *5189*, metallurgical, 235, 3938, 4560 ; resolution of, 3227 ; use in textile trades, 820
Microscopic examination of food, *3893*
Midden, sewerage system, 4457
Middle term, of syllogism, 6098
Middleton, T., playwright, 846, *847*
Middlings, cattle food, 2704, 2908, 3892
— in milling, 3078
Midland Railway, distinctive mark of sheets, 5069 ; goods depot, 5073
Midnight sun, appearance, 1560
Midshipman, training, pay, 4401, 6365 ; R.N.R., qualifications, 6366
Midwifery, student's training, 5424
Mignard, painter, portraiture, 4118
Milan, cathedral, *3375*, 3376 : as a state, 2945 ; touring, 947
— Duchy of, independent state, 4322, wars for possession of, 4396
Mildews, 166 ; destruction, *4927* ; stains, 2590
Mile, foreign miles, 1148 ; linear, 226 ; nautical, 6665
Militarism, and industrialism, 2393, 5096, 5097 ; inimical to society, 4371 ; decay, 4664 ; social conditions under, 5095 ; stage in social evolution, 2393
Military band, instruments, pitch, 1058
— engineer, training and duties, 6265
— engineering, active service, 6265
— spirit, destruction of, 5100
Militia, commissions, 4199
Milk, adulteration, 3716 ; bacteriology of, 3273, 3534, 4036 : analysis, 4038 ; casein in, 4033 ; in cheese-making, 4492 ; chemical classification, 3111 ; coagulation by rennet, 4489 ; cooling and aerating, 4034 ; condensed and preserved, 3552 ; constituents, 4033 ; dietetic value, 3311 ; digestibility, 866, 3314 ; fat in, 4035, 4038 ; fermented, infant deaths, 3535 ; heating, 4571 ; as infants' food, 4681 ; lactic acid in, 3534, 4782 : nutritive value, 3381, 3599 ; pasteurisation, *1037* ; pasteurised infants' food, 4681 ; as poultry food, 5433, 5436 ; preservation, 3819, *1037*, 5105 ; refrigerating, 5406 ; sale of, 2218, 3553 ; sour, 2336, 3536 ; specific gravity, 799 ; sterilisation, *4035*, 5407 ; testing, 4034, *4038*, 4281 : *see also* Dairy farming
— bread, recipe, *3393*, 3394
— cart perambulator, *2832*
— condensed, 4681 ; Swiss, 1839
— fever, in cattle, 2623
— glands, of mammals, 30
— human, dietetic value, 3311
— humanised, infants' food, 4681
— powder, manufacture, 4556
— skimmed, 4637
— sugar, 4033 ; composition, 4035
— teeth, 576, *578*
Milky Way, 2949, 6700–*6702* ; location, *6117*
Mill, John Stuart, compared with Bacon, 6001 ; on the ether, 935 ; on free will, 2995 ; definition of matter, 312 ; on logic, 2081, 5999 ; " System of Logic," 6001
Mill, in brickmaking, 1282, 1285
— in cement-grinding, 1734, *1853*
— *in metal rolling*, 4638, *5522*, 5524
— in milling, 3078, 3082, *3085*
— pug, earthenware, *5162*
— rubber rolling, *5199*
— wire-making, *5168*
Millais, Sir J. E., painter, *4394*
Millerite, nickel ore, 5982, 6740
Millepora, coral, 4086, *4087*
Millers, workshop, tests, 3965
Millet, J. F., painter, *342*, 868, 4301
Millets, cultivation, uses, 4875, 6887
Milliners, business of, 47, 3739, 4564
Millinery, 4564 ; examinations, 6042 ; instruction, 3739, 3740 ; renovation, 6040 ; requisites, 4565 ; stitches, *1565* ; women's training and prospects, 322 : *see also under separate subjects—e.g.*, Hats
Milling, in cloth-making, 4106, *4107*
— flour, systems and machinery, 3078
— cutter, compared with slot-mill, *3403*, 3405 ; forms and construction, 4259, *4261* ; uses, 3630, 4259, 5204 ; machines, forms, *3320*, *3401*, 5208, *5210* ; portable, *5278*, 5820 ; screw, 835, 3648, 5280 ; use, 5448
Millipede, description, 3361, *3362*
Millstones, cement, *1582*, 1734
Milton, John, poet, *991*, 995 ; " Areopagitica," 1641 ; influence of works, 4762 ; travels, 212
Mimeography, speed and fees, 1919
Mimetesite, 5985, 6740
Mimicry, 2157 ; butterfly, *3515* ; snakes, 2679
Mimosa, bark in tanning, 1166
Mind, action on matter, 6538 ; Berkeley's idealistic idea of, 6469 ; and body, 2014, 6537 ; Büchner's definition, 6259 ; dual nature of, 3288 ; elementary forms of, 3117 ; evolution theory of, 1588, 1705, 3119 ; fallibility, 6537 ; kinetic theory, 2115 ; and matter, physiological account, 198 ; nature of, 6466 ; necessity of rest, 3183 ; parallelism with brain and matter, 6538 ; psychological problems, 2014 ; psychology of : *see* Psychology ; psycho-physical interaction, 6536, 6537, 6538 ; relation to brain, 6535, 6536 ; speculations concerning, 6465 ; subconscious element in, 3183
Miner's actinomycosis, 3768
Mineral deposits, proving, 2582
— glue, 4931
— oils, 1033
— traffic, railway, 5068
— waters, dietetic value, [illegible] ; domestic and automatic aeration, 6393, *6394* ; manufacture, *6391*
Mineralogy, 765, 6730 ; books on, 2256
Minerals, characters, tables of, 6731–6745 ; chemical elements, 624 ; crystal systems, 765, 6370 ; definition in respect of shape, 275 ; distribution, 3771 ; dyes, 6766 ; in earth's crust, 765 ; general characteristics as opposed to animals and plants, 275 ; geological definition, 624 ; mining of, *3304–3310* : *see*

also Mining; rock-forming, 765; tables of, 6371; weathering, 3771
Mines, accidents in boring, 2846; Home Office inspectorships, 3300; lighting, 3769; machinery, 960, *3766*; plan and action, 3306, *3309*; sinking, *3190*; surface works, *3766*; surveying, 159, 803; ventilation, 3767, 5356
— in military engineering, 6273
Miniature painting, 1061, *1062*, *1063*
Mining, 2846, 3304; adits and day levels, 3192; aided by faults, 1925; books on, 3772; boring, *2582*; development, 2375; dictionary of, 2588; plant, 3766; prospecting, *2581*; quarrying, 2955, 2960; shaft-sinking, 3193, *3457–3462*; surveying, 159, 803; terraced workings, *2849*, 2850; underground working, 3190; vein mining, 3192
— stocks, cautions as to, 3484
Minium, 1036, 5832, 5988, 6740
Mink, skins and fur, 6427, 6430
Minor, in tonic sol-fa notation, 924
— chords, 363; in setting melodies, 631
— premise, and term of syllogism, 6098
— scale, in music, 272; chords, 364
Minorca fowls, breeding, *4858*, 4956
Mint, 354, 909, 6675
Mints, London and branch, 5851
Minuet, guitar, *3763*; sonata, 634
Minute, in architecture, 2135
— in physic. geography, 14
— in time measurement, 226
— in trigonometry, 6085
Miocene system, 2067; rocks, 2254
Miohippus, fossil horse, 1177, 1178
Miracles, bath theory, 3652
Mirage, explanation of, 2734
Mirbane, essence of, 5468
— oil of, 4971
Mirrors, 2901; silvering, 361, 4932
Misfit, in tailoring, 3014, 3015
Mispickel, 1162, 6740
Mississippi, river, 4061; current movement, 1816; deepening, 5333
Mist, definition, 1900
Mistletoe, description, *505*, 506
Mistral, effect on agriculture, 4495
Mitafifi, cotton, *383*, 384, 386
Mites, kinds, habits, *3804*, 3805; parasite of red ant, 3727
Mitis castings, 235, 5992
Mitral valve, *955*, *956*, 957
Mitre, in vehicle construction, 2833;
— block, 3386; in joinery, 4112; plumbers, *5629*, 5630; in sawing-boards, 3754, *3755*
— box, 3386; bamboo, *5725*; in joinery, 4112, *4113*
— shoot, in joinery, 4112, *4113*
Mitring, in cornice work, 5501
— tools, plasterer's, 5496, *5497*
Mixer, in brick-making machinery, 1282
— biscuit-making, *3593*, *3594*
— metal, steel manufacture, 5017
Mixing, in cement manufacture, 1583, *1855*
— in paint-making, 5143, *5147*
Mixing-box of paper machine, *6396*
Mixture, in chemistry, 692
Mizzen-mast, of sailing-ship, 5399
Mnemonics, defects and dangers, 2304, 2372
— in telegraphy, 4606, 4902, 5242
Moa, description, 2214
Moabites, David's conquest, 666
Mocking-bird, classification, 2210
Mode, in tonic sol-fa notation, 923
Modelling in clay, 1216, 1345, 5980
Model drawing: *see* Object drawing
Models, in sculpture, engagement, 1512
"Modern Commerce," picture by Brangwyn, *plate facing* 4657
Modification, acquired characters, 485
Modified vowels, in German, 252
Modulation, in music, 568, 922
Modulator, in tonic sol-fa, 806, 923
Module, in architecture, 2135
Modulus, in engineering, 86, 3964
— of elasticity and rupture: *see* Elasticity *and* Rupture
Mohair sheep, wool, *71*, 72
Mohammed I., of Granada, 2946
— the Prophet, history of, 2243, 2353
Mohammedanism, in Africa, *3279*; and art, 3092; distribution, *629*; compared with Hinduism, 419; influence in Middle Ages, 2354; teaching, 2243, 2244
Mohammedans, art, 3092; invasion of India by, 418
Mohr's Burette, *62*, 63
Moissan, H., electric furnace, 3031; fluorine researches, 1444
Moisture, measurement, 4414
Molar teeth, human, 576, *578*, *1605*
Molar force, in physics, 1144
Molasses, 3831, 4116, *4353*, 4164
Mole, 1765, *1870*, 1871; development of digging claws, 1871; skin and fur, 6427
Mole-cricket, *plate facing* 3361, 3364
Molecular attraction, 1144, 1269; combination law, 695; motion, 1266; weight, 402, 694
Molecule, 134, 695; Avogadro's law, 696, 1914; dissolution, 4698; mean free path, 1267; motion, 1266; structural formulæ, 2714
Moleskins, finishing processes, 4342
Mollusca, bivalves, *3113–3116*, *3284–3286*; characters, 1492; geological agents, 1814
Molluscoida, characters, 1492
Mollweide, equal-area projection, 4520
Molybdenum, distribution, 3772; effect on steel, 4748
Moment, in mechanics, 415, 661; of a plane, formula, 5969
— bending of beams, 1984, *1987*, 2197
— of buoyancy, ships, *5970*
— of force, *1834*
— of inertia, of beams, 1985, *1987*
— of resistance, of beams, 1984
— of volumes, calculation, 5970
Momentum, in physics, 551
Monarchy, unprogressive form of government, 5533
Monazite characters, 2581, 6740
Mond gas, 6818, *6828*, 6785; nickel process, 4306, *5982*
Monet, Claude, painter, 4302
Money, standard and token, 3969; Roman scale, 1333; saving, 3225; English, 226; in travelling, 515
Mongoloid races, ethnology, 1789
Mongols, craniology, 1785; distribution, *627*, 629; early civilisation, 215, 218; at Delhi, 418
Monism, 6259, 6464; supported by psycho-physical parallelism, 6538
Monkey, 1763; climbing, *1870*; fur and skin, 6427
— driving tool, in mining, 2667, *2669*
— in pile driving, 1558, *1453*, 4642
"Monna Lisa," Da Vinci's picture, 3796, *3797*
Monochord, principles of, 2104, 2105
Monoclinic system of crystals, 766, 6730
Monocotyledon, 350, 355
Monogamy, effect on infantile mortality, 4537; *factor* in social evolution, 3871; influence on character, 4537; importance to race, 4539
Monolith paving, laying, 2426
Monotheism, religion, 6773
Monotony, psychological and sociological problems, 2548
Monotremata, 1765; species, 1494
Monotype composing machine, 5251
Monsoon, *294*, 296; bursting of, 2715; influence on rainfall, 2818
— lands, economic conditions, 5380
Monsters, extinct, *plate facing* 2065
Month, lunar and sidereal, 6121
Months, in Roman calendar, 1182; Spanish names, 2041, 3792
Montreal, 4068, 4520; touring, 1650
Mood, in grammar, English, 116, 608, 755; French, 3211, 3353; German, 3502
Moon, 6561–*6567*; compared with sun, 6250; declination, 6664; eclipse, *11*; evolution of, 621; Galileo's study of, 2949; heat; radiation, 2060; motions, 6121, 6243; tidal friction, 620; and tides, 555, *556*, 1017; volcanoes in, *1206*
Moonwort, structure, *1118*
Moorish art, 1132, 3092
Moors, history and origin, 215; in Spain, 2946, 4396
Moraine, 459, *1636*
Moral ideas, Westermarck on, 4124
Morality, sociology, 4121, 4275, 4277; relation of religion, 6773
Morality plays, account of, 678
Moray, James Stuart, Earl of, rebellion against Mary, 3997, 3998
Mordant, definition, 1721; in dyeing, 5779; in textile printing, 4501; varieties, 5779
— colours and dyes, 5956
Mordente, in singing, *6336*
— in violin playing, 2508, *2509*
More, Sir Thomas, author, 1609; poet, 328; political career, 3832
Morocco, geography, 3279, 5822
— leather, finishing, 3456; grain, *plate facing* 3217
Morphine, 3824, 4006, 4960; poisoning antidote, 1043
Morphinomania, psychological phenomena, 2993; symptoms and treatment, 4006
Morphology, scope, 95 136, 278
Morris, William, poet, 1438
Morris decoration, criticised, 6103
Morse code system, *4382*
— telegraph sounder, 4904
Mortality tables, graduation, 4731
Mortar, in brickwork, 1952, 1953; composition and manufacture, 648, *649*, 1952; disintegration, 1502; preparation, 1458, 1952; strength, 1521
— board, use, 1953
— mill, *647*
Mortgage, bond, security, 4294; conditions of sound investment, 3225; debentures, 3330; valuation, 5151
Mortise chisel, 3386, *3387*, 4040, 4150, *4151*
— and tenon joint, 1176, 4039, *4041*, 4044, 5180-*5184*, 5294, 6585; in fences, *4646*
— saw, 3385, *3387*
Mortising machines, *6754*, *6755*
Mosaic, Byzantine, *3091*; Greek, 2931
Mosaic gold, composition, 3940
— law, moral code, 665
— leaf, *171*, 173, *505*, 506
— in paving, 646, 2516, 5776
Moscow, geography, 2408; Napoleon's capture, 5238
Moses, history of, 665
Mosque, architecture, 3092
Mosquitoes, 5721; agent in disseminating disease, 203, 4089
Mosses, in classification, 165; colonies, 1368; as farm weed, 1378; structure, generation, etc., 1311
Moss-polypes, description, 3956, *3958*
Moss-spores, *1312*
Moths, 3362, 3512, *3516*; colour in courtship, 3516; distinguished from butterflies, 3514; eggs, *3513*, 3514; as pollen carriers, 731
Mother-of-pearl, carving, 6300; dyeing, 6769; sources, 5308
Motherhood, importance to race, 4667, 4828; legal protection of, 4976
Motion, amœboid, 954
— in harmony, 365
— laws of, 424, 549, 920; Galileo's and Newton's contributions, 3536
— perpetual, principle of, 2062
— in physics, 86, 290, 315, 422, 546, 1833
— planetary, 662
— in psychology, 2115
Motive, in relation to will, 2994
Motor, electric, 949, 1104, 1590; alternating, 1595; back-voltage, 1593; continuous, 1590; construction, *1592*, 4296; Faraday's invention, 129; induction, *1909*; portable, *5448*, *5449*; single-phase, reversal, 2089; three-phase, 1907, *1908*, *2089*, 2090; railway, 2087, *2088*; series, 1594, 1931; shunt and series wound, 1594, 1931; starter, automatic, *1594*; tramway, 1931

Motor-bicycle, 2153, 2463; trade in, 3878
Motor-'bus, 2273, 4187; structure, *2463*, 3904
Motor-car, 2557, 3903; basket, *5563*, 5564; châssis dimensions, 2557; classification, *2463*, *2465*; commercial traveller's use, 3904, 6212; embellishment, 3906; petrol rail, *4801*, 4812; passenger road, *4802*, 4812; pneumatic power, 5356; steam rail, *4801*, 4810
— dealers, business of, 3878
— fishing boats, 4989
— nerves, human, 1943, *2117*, *2143*, 2302
— traction, *5078*, *5079*
— spirit, production, 6147
Motor vehicles, 2153, 2728, 3023; brakes, 3128; metal-work, 3325; painting, 3479
Mottled soap, manufacture, use, 4964
Moufflon, skins and fur, 6427, 6430
Mould, brick, 1950, *1951*, 2782
— cheese: *see* Penicillium glaucum
— cheesemaking, 4572, *4574*
— on food, cause, 5403
— gelatin, in sculpture, 1509, 1673
— plaster, pottery manufacture, 5234
— sand, in casting art metal, 5526
— terra-cotta, *5777*
Moulder, carvers', *5809*, 5810
Moulders' tools, forms and uses, *4585*
Moulding, casting, *2109*, 2237, *2457*; dictionary of terms, 2545; machine, *2540*, *2543*; pattern construction, *2453*; tools, 2457: *see also* Casting *and* Founding
— architectural (Greek), 5980; drawings, 5692, 5698; functions of, 2129, *2288*
— in joinery, 4111, 5180, *5181*, 5297
— machines, 2540, *2541*, 6655, *6656*
— in masonry, *3037*, 3039; stopped, 2784; string courses, 2266; underside, 2837; of vaulting ribs, 3145, *3147*
— Roman and Greek 2567, *2569*
— tools, definition, 4149
— wood-carving, *6136*
Moulding-box, 2110, *2541*, *5319*; types, construction, 2697
— cutters, 962
Moulds, characteristics, 166
Mound builder, 2212; non-sitters, 2506
Mountain, atmospheric temperature, 294; systems, *851*, *855*
— chains, elevation, subsidence, 1922
Mountains, 458, 4495; barriers of, effect on rainfall, *296*, 298, 4495; erosion, 458; geological formation, 1355, 1922; highest, compared with deepest sea, *12*; upheaval, 2254
Mounted police, duties, 1407
Mousebird, classification, 2211
Mouth, human, digestion in, *673*, 674; modelling, 1511; structure, 576
Mouthpiece of cornet, 5441
— of trumpet, *5437*
Movement, in musical form, 634
— in art work, representing, 5522
Mowing, methods, *1629*; machine, 1848
Mozart, sonatas, 634
Mucous membrane, *675*, 676
Mud, deposition, *1814*
— fever, in horses, 2621
Mud fish, respiration, *3067*, 3070
Mud lava, formation, 1207
Mudge, G. P., on bathmic theory of evolution, 653; on hydra, 382; on evolution of horse, 1177; on laws of chance, 650, 651
Mudguards, of motor vehicles, 3325
Muffle furnace, *357*, 359, 3942; assaying, *5849*, 5850; enamelling, 6575
Muffs, fancy, *5775*; fur, making, 6435
Mulberry, 355, 6888; uses, distribution, 4876
Mulberry, silk moth, *582*
Mule, labour in construction, 6681
— spinning, cotton, 2441, *2442*; doubling threads, 2594; wool, 2444
Mullein, description, *351*, 354
Muller, painters', 4147, *5829*, 5830
Mulling, in millinery, *4767*, 4769
Mullion, *5185*, 5186; terra cotta, *2781*, 2783
Multinomial, in algebra, 1818; square of, 2150; square root, 3411, 3412
Multiple proportions, in chemistry, 695
— tools, advantages of, 3322
Multiplication, in algebra, 1993; in arithmetic, 90, 93; compound, 229; of fractions, 548; of recurring decimals, 885; table, 90
Multipolar nerve cell, definition, 1942
Multitubular boilers, *6876*, *6877*
Mumps, treatment, 6261
Municipal civil service, 80, 316; advice to candidates, salaries, examinations, 451; analysts, 786; asylum officials, 1496; baths and washhouses, 1496; chemists, 786; clerkships, 1214; colonial, 3741; coroner, 1495; draughtsmen, 1214; education department, 1677; electrical, water and gas engineers, 573; engineers and surveyors, 452, 573; hallkeepers, 1498; junior clerks, 1213; municipal treasurer, 1067; parks and gardens, 1496; police, 1406; poor law officials, 1851, 1926; public libraries, 1495, 6873; salary system, 2158; water inspectors, 1498; town clerk, 989; weights and measures inspector, 787; women typists, 1215: *see also* London County Council
Municipal trading, 80, 317, 1067
Muntz metal, 360, 1396, 3940
Mural decoration, Assyrian, 2658; fresco, 1024; history of wallpaper, 1168; Pompeian frescoes, 2933
Muriatic acid: *see* Hydrochloric acid
Murillo, painter, *4120*
Muscle, human, changes accompanying psychic phenomena, *2694*; chemical composition, 1712; contractibility, 1711; co-ordination in simplest movement, 2120; leverage, 1797; reflex action in psychology, *2117*; striped and unstriped, 956; varieties, structure, *1349*, *1710*
Muscovite, mica, uses, 768, 812, 6740
Muscovy duck, points, 5706
Muscular sensation, importance, 2118
— tissue, of human body, 196
Museums, state appointments, 3302
Mushroom, 166, 6888; with buttered eggs, recipe, 2331; culture, 6674; curried, recipe, 2126; growth and structure, 1371
— coral, *4084*
Music, 37, 270; abbreviations and rests, *5131*; and applied mathematics, 2103; classics, prices, 2024; copying band parts, 5134, 5891; dictionary of terms, 41; examinations and diplomas, 2025; as a profession, 163; reading, 274, 2024; salon, composer recommended, 2023; sheet, sale of, 3881; teachers' guides, 2023
— dealers, business of, 3879–3883
Musical forms, 634
— instrument makers, business, 3879
— instruments, brass, 5726; brass, acoustical properties, 5444; manufacture, 6621, 6704–*6714*; orchestral, classification, 5726, 5733; sale of, 3881; stringed, 5726; transposing and non-transposing, 1060, 5728; wood-wind, 5726, 5728
Musicians, touring engagements, 6867
Musk, 4971; artificial, 4971, 5469
— beetle, description, *3512*
Muslin, design, 5980, 6593; washing, 2688
Musquash, skins and fur, 6427, 6430
Mussel, 3113, *3284*, 3285
— edible, fixture, *3285*
Mussel-shrimp, description, *3809*
Must, of grapes, fermentation, 6355
Mustard, adulteration, 3718, 5581; cultivation, 1198, 4721; properties, 4717
— and cress, classification, 352
— hedge, *882*
— oil, composition, 5469
Mutation, De Vries' theory, 1181
Mutilation, in law of heredity, 1586
Mutton, carving, *5935*, 5936; choice of, 1228, 3717; cooking, 1736; dietetic value, 3112, 3599; digestibility, 3314; exporting countries, 5119; fattening, 2360
Mycelium, in cheese curd, 4492; in white mould, 1372
Mycenæ, ancient dome structure, 3146; archæological remains, 1526; Lions gate, *2857*, 2858
Mycoderma aceti, action, 3021, 4719
Mycorrhiza, functions, 503, *505*
Myers, F. W. H., personality theory, 3287, 3382; on spiritual evolution, 3665; on subliminal self, 3183; on want of study of the soul, 3625; on ghostly phenomena, 3625; on the term "telepathy," 3661
Myopia, 3179, 4862; cause and correction, 6264; testing for, 4143
Myrtle, 353; wax, 1033, 4835

N-RAYS, alleged discovery, 3181, 3943 characteristics, 3943
Nobonidos, Babylonian Sovereign, 20
Nails, in carpentry, *3543*, 3546; in furniture-making, *6581*, 6584, 6591; in jointing woodwork, 3843, *3845*; in plumbing, 5030; in roof slating, 4868; wire, manufacture, *5173*
— human, structure, 1419
Nail-brush boards, filling, *6110*
Nail-head, in geometrical drawing, 2321, *2322*
Nantes, edict of, confirmed by Henry IV., 5110; purpose, 4320; revocation, economic effect, 1025
Nantille, lake, S. Wales, *1277*
Nantwich, industry, 1272; salt, 768
Naphtha, production, uses, 1164, 5462, 6150
— deodorised: *see* Benzoline
Naphthalene, 3824, 5463, 5953
Napier's diagram, use, 6664
Naples, earliest history as a State, 2915; independent, 4322
Naples, Bay of, geological history, 1353
Naples yellow, pigment, 871, 5144
Napoleon Bonaparte, life and career, 5238; aids Irish rebellion, 5973; Spencer's opinion of, 4121
Napoleon, Eugène Louis, 5240
Napoleon, Louis (III.), career, 5239; Franco-Prussian war, 6445
Narcissus: *see* Daffodil
Narcotic poisoning, cause of, 1303
Narcotics, abuse, 5672
Nares, human, sense of smell, 2536
Narwhal, elongated incisor, 2156; ivory from, 811
Nasal bone, human, 1604, *1605*, *2144*
Nasal index, explained, 1786
Nasal cavities, function in singing, *6049*
Nascent elements, in chemistry, 693
Nasmyth's membrane, 577
Nasturtium, 353; leaves, 5581
Natal, economic conditions, 5660; geography, 3586; police, conditions and wages, 3550; rainfall, 3586
National Assembly, French, 5112
National civil service: *see* Civil Service, *and separate headings*
National Debt, British, basis of, 1262; establishment, 4843
Natural, in music, 38
Natural history, dictionary of, 174; scope and problems, 6: *see also* Biology, Botany, Geology, Zoology
— philosophy, 33: *see also* Physics
— scale, in music, 272
Natural selection, law, applied to atom, 2295; civilisation, effect of, 1029; Darwin's theory, 823; Darwin's and Reid's theories compared, 1180; illustrative of the law of progress, 5386; and infection and immunity, 1029; law of, 5386; applied to human race, 4826; in mind development, 3119; application to radium, 2030; in social evolution, 3872; *see also* Evolution
Naturalism, Gothic sculpture, 3517
Naturalists, business of, 4055

Nature, continuity of, 2554 ; energy, economy of, *277* ; logical interpretation, Bacon's induction, 5999 ; orderliness and intelligibility, 2553 ; laws, generalisations, 6000 ; phenomena, relations of, 6253 ; problems and philosophy, 6 ; study by artist, 5522 ; uniformity, assumption of, 6001
Nature-worship, 6772
Nautical almanac, astronomical tables, 6243 ; in navigation, 6658 ; in surveying, 709
— instruments, 6658, 6664
— rules, 6659
— terms, dictionary of, 6413
Nautilus, pearly, shell, *3116*
Naval officers, training and pay, 4400
Nave, in architecture, vaulting of, 3231
Navicular disease, in horses, 2621
Navigation, 6658 ; dictionary, 6665 ; training of officers, 4401
Navvy, machine, steam, electric, *1822*
Navy, British, Admiralty appointments, 3195 ; assistant clerkships, 3196 ; bandsmen, 4269 ; branches of the Service, 4401 ; as a career, 163, 712 ; Civil Service posts, 2575 ; entrance, 4265, 5427 ; medical service, 5427 ; officers' career, 4400, 4402 ; R.N.R., 6366
Neap tide, cause of, 556
Nebuchadnezzar, life, 18, 600, 667
Nebulæ, *6699*, *6700*
Nebular hypothesis, 620, 1923, 6701 ;
Ne
Ne
Ne
Necrosis, toxin action, 6544
Nectar, in botany, 347, 348,. *730*, 731 ; of Christmas rose, *plate facing* 728 ; insects, 731 ; protection from insects, etc., 1115
Needle, dressmaking, 185, 3093 ; manufacture, *5172* ; milliner's, 4565
— of knitting frame, 4621, 4622
— lace loom, 4979
— system, in telegraphy, *4903*, 4904
Needle-shedding fungus, pest, 4928
Needlework, accessories, 185, 187 ; plain, *150*, 3093 ; for women, 323
Negative, Esperanto, 4800 ; French, 1476, 6088 ; German, 3502 ; in Greek, 6669 ; Italian, 2046
— electricity, defined, 288
— photo, 6679 ; in photo reproduction, 6481–6484
— quantity, in algebra, 1819
Negroes, distribution, *627*, 629, *3279* ; ethnology, 1789 ; as labourers, 6630 ; skull measurement, 1785 ; thumb of, 4310
Nematine worms, 3072, 3956, *3960*
Neo-Darwinism, compared with Lamarckian theory, 825
Neolithic Age, implements of, *1075* ; condition of man, 2255
Neon, discovery, 401, 1296 ; in periodic system, 1446
Neptune, temple at Pæstum, *2859*
— planet, 6250, 6569 ; discovery, 552, 6097 ; and nebular hypothesis, 620, 6701 ; orbit and revolution, 6121 ; position in solar system, *11*
Nernst electric lamp, 2682, *2683*, 2684
Nero, Emperor of Rome, 1937
Neroli, artificial perfume, 4971, 5469
Nerve cells, anatomy, 1942, *1943* ; indivisibility of, 3118
— currents, physiological account, 1943
— deafness, cause, 2103
— diseases, organic, functional, 6261
— fibre, anatomy, 1941, *1942*
— impulse, electrolytic theory, 4699
—, motor, paralysis by alkaloids, 3825
— spinal, *2143*, 2302
Nerves, human, 1747, *1941* ; brain, *2147* ; centripetal and centrifugal, *2117* ; toxin action on, 6544
Nervous debility, causes, 6261, 6263
— system, human, 101, 197, *1941* ; brain the centre, 29 ; control by will, 5841 ; effect of alcohol, 3377 ; preservation and expenditure of force, 3048 ; functions, *2299* ; psychological study, 2116 ; and instinct and emotions, 2694
Nervous temperament, value, 6263
— tissue, human, 196
Nesfield's process, purification, water, 4158
Nest, ant's, *3726* ; birds, *plates following* 2498, *2506* ; water spider, *3804*
Net, of balloon, 3978, 3979
— in drawing, kinds, *2320*
— in fishing, 4989, *4990*, 5184
— joining, *5621*
— in lacemaking, *4879*, *4881*
Net profit, compared with gross, 2271
Netherlands, history, 2948, 4397, 4951, 5554, 6304 ; trade, 5664, 5825
Nettle, 345 ; farm weed, 1378 ; fertilisation, 729 ; fibres, 720, 817
Net-winged insects, 3362, *3364*
Neural tube, anatomy, *30*, *101*
Neuralgia, remedy, 5469
Neurasthenia, 6263
Neurites, cause, treatment, 6261
Neuroglia, in anatomy, 1942, 2143, 2147
Neuron, injury to, *2994*
Neuroptera : *see* Net-winged insects
Neuter verb, 608
Neutral axis, beams, 1258, 1984, *1987*
— equilibrium, in mechanics, 661, 1080
Neutralising, in tanning, 3162
Névé (firm), cause, 1636
New Caledonia, geography, *3902* ; nasal index, 1786 ; the Papuans, 1788
English, 5975 ; cotton export, 4174

Nigeria, government, 3278 ; resources, 3454
Night, cause of, 11
Night-soil, as manure, 590
" Night Watch," Rembrandt's, *724*
Nightdress, making, *3475*, *3588* ; girl's, 4472 ; infants', *3744*, 3746, 3584, layette, *3744* ; young child's, *4056*
Nightingale, classification, 2210
Nightshade, black-berried, *883*
— deadly, 354 ; tropine from, 4009
Nihilism, Russian, 6301
Nilgherry nettle, fibre from, 819
Nineveh, 500 ; bronzes, 6161 ; Cyaxares' conquest of, 502 ; reliefs from, 2657, *2659*
Ninth, discord of, in harmony, 361, 566
Niobe, statue by Scopas, 2929
Nippers, dental, 6027, *6028* ; metal-worker's, *5521* ; mason's, *2837*, 2840 ; millinery wire, *4564*, 4565
Nirvana, in Buddhism, 417
Nitrates, distribution, 3772 ; exhaustion of supply, 238 ; food supply of plants, 504, 1599
Nitrating plant, 6759, *6761*
Nitre : *see* Saltpetre
Nitric acid, chemistry of, 1718 ; electric formation, 3032 ; effect on iron, 231 ; manufacture, *4633*, 5760 ; salts, 5588 ; specific gravity, uses, 4633 ; tests, 4411, 5588
— ether : *see* Ethyl nitrate
— oxide, 60 ; formation, 5588
Nitrification, soil, bacteria, 255, 6440
Nitrites, estimation, 5588 ; formation, 1719 ; physiological effect of, 3273 ; in soil, 277 ; in water, 4158
Nitro colours, manufacture, 5953
Nitro-benzene, 3710, 5468 ; dye production, 5468, 5953
Nitro-benzol, discovery, 5908
Nitro-cotton, manufacture, 6763
Nitrogen, 1161 ; in atmosphere, 239 ; compounds, 438 ; discovery, 60 ; earth's crust, 239 ; fixation, 238, 5588 ; as element in living things, 275 ; in human body, 438 , in artificial manures, 589 ; occurrence, 839 ; oxides, 1161 ; oxides, electric formation, 5588 ; plant constituent, 167, 2702, 5585
Nitro-glycerin, 2587, 6759–6761 ; chemistry of, 3272
Nitrometer, Lunge's, *5587*, 5588
Nitrous acid, composition, 1719, 3141
— oxide, in air, 3720 ; as anæsthetic, 1719, 3139 ; chemistry of, 695, 1161
Node, electric oscillators, *3895*, 3897 ; in sound vibrations, 2105 ; in stem-structure, 170, 173
Noil, manufacture, 2898 ; felt, 1997 ; silk, 1247 ; woollen, 71
Nomination, civil service, 2161, 2252, 2575
Nominative case, in grammar, 246
Non sequitur, fallacy, in logic, 6100
Non-conductor in electricity, 464
Nordenfelt, submarine navigation, 22[illegible]

Norie's tables of logarithms, 6659
Normal, in conic sections, 5783; of ellipse, 1411
Norman architecture, 3232, 3233
— conquest of England, 2358; effect on commerce, 69, 146; effect on English language, 117, 324, 1608, 1768
— kings, England under, 2674
Normandy, and Channel Islands, 2311; cotton manufacture, *1241*; England loses, 3465; Henry I., wars with, 2674, 2675; and the Hundred Years War, 3463; products, 1681; and William the Conqueror, 2358
Norsemen, the, nationalities of, 2354
North America, area, 460; climate, 4064; coalfields, 5302, 5305; cotton production and trade, 22, *383*, *384*; economic conditions, 5661; fauna, 628; forests, 626; furs, 4065; geography, 4061, *4063*; petroleum deposits, 5306; physical features, 4061; races, 4065; vegetation, 4065: *see also* Canada *and* United States
North Eastern railway, autocars, *4801*, 4812, *5078*, *5079*; signalling system, 4688, *4690*; traffic management, 4230
North Island, N.Z., geography, 3900, 3902
North, magnetic, orientation, 267
North Pole, day and night, 293; position, *13*
North Sea, 460
North, true, ascertaining, 265
Northern hemisphere, *13*
Northmen, invasions of, 2354
Northrop loom, *3635*, *3636*
Northumbria, and Alfred the Great, 2355; Malcolm III. invades, 2674
Norway, coast-line, 980; coins, weights and measures, 410; craniology, 1786; economic conditions, 5709; geography, 1560; history of, 2948, 5396, 6446; language affinities, 1771; timber, 54, 4602; touring directions, 859; union of Calmar, 2948
— maple, dripping points, *727*
— spruce, timber, *55*
Norwegian language, translation, 1920
Nose, breathing through, 2538; diseases, 6132; in race classification, 1786; respiratory function, 1299, 6132; in sculpture, 1511; sense of smell, 2536, *2537*; structure, 1604, *1605*
Noseband, 4886; making, 5057
Nostril, human, *2144*; in breathing, 1299; position of, 577, *579*
Notation, in mathematics, 89; in music, *37*, 805
Notching, 2832; wood-carving, 6044
Notes, in banking, 3970; issue, 4440
Notice, by servant, law of, 611
Notional verbs, English, 902
Notochord, of back-bone, 29; vertebrate animals, 3070, 3072
Notre Dame, Paris, 3374, *3375*
Noun, 110; English, 247; adverbs, formation, 1185; classification, 122; verbal, 756
— Esperanto, 4512, 6381
— French, 5512; gender rules, 905, 1052, 5512
— German, gender forms, 1054, 1180; plural, 1878, 2488, 2638; regular declension, 747, 1342; weak declension, 1621
— Greek, 5375, 5518, 5655, 5951
— Italian, gender rules, 2192; plural forms, 2346, 2485; suffixes, 3209
— Latin, declension of, 118, 242, 442; irregular, list, 753
— Spanish, plural and gender, 2343, 3792
Nova Scotia, agriculture, 3203, 3204
Novel, definitions and general nature, 2961; foreign, 3780; evidence of love of personalities, 3986; good, 3557; historical, 3558; modern, excellence of, 3555; problem, harmful views, 4535; society, chief writers, 3558: *see also* Fiction *and* English Literature
Novelists, present day, 3555
"Novum Organum" (Bacon), 5999
Nucellus, of flower, *347*, 348
Nucleo proteids, in animals and plants, 4008; uric acid from, 3704, 3705
Nucleo proteins, classification, 4134
Nucleus, of animalcules, *4088*; of cells, 199, 1953; plant cells, *168*, 348
Nuisances, inspector of, 699; law concerning, 5056
Number in grammar, 116; in English, 245; verb inflexion, 758
Numbers, in mathematics, 89
Numerals (Esperanto), 4943, 5232, 5654; French, 1619, 1772; German, 2050, 3063; Greek, 5952; Latin, 601; Spanish, 2768
Numeration explained, 89
Numerical adjectives, Italian, 2919
Nummulites, in limestone, 4088, *4089*
Nuremberg, architecture, *3374*; centre of arts and crafts, 3947, 4117
Nurse, duties, 1093, 6172; hospital, 6172; training, 6171, 6172; requisites, 5491
Nursery, infants', hygienic, 4683
— sylvicultural, *1677*
Nurseryman, business of, 6834
Nursing, appointments, Indian service, 3478; baths, 6286; branches of, 6172; Colonies, openings in, 3742; home, 6172; night duties, 6175; poor law asylums and hospitals, 1929; poultices, 6286; sick-room, care of, 6174; municipal hospitals, 1496; training, fees, etc., 323
Nut oils, painters', 5832
— patterns, 2540, *2541*
Nut-hatch, 2210, *2492*
Nutmeg, *4721*, 4873
Nutrition, of animals and plants, compared, 276; physiology of, 865; in Weismann's theory, 1180
Nuts, engineers', drawing, 3003, 3004, *3007*; of screw, 686; testing, 1703
Nux vomica, 6888; poisoning, 4012

OAK, description and culture, 4678, 6888; bark used in tanning, 1165, 3012, 6065; classification, 355; galls, 3013, 3722; insect pest, 4926, *4927*; soil, 4604; woodplanting, 6317
— timber, annual rings, 51, 53; in building shores, 917; in cabinet-making, 6579; for carving, 5809; cutting, 53, 55; friction data, 959; fuming, 6138, 6653; secondary importance of, 3542; strengths of varieties, 1260, 1261, 1393
Oakum, in ship deck-laying, 5922, 5923
Oases, African, 3276, 3280; Egyptian, 3452; irrigation, vegetation, 627
Oat grass, *875*; cows' food, 3890
— starch, micrograph, *5365*
— straw, as livestock food, 2909
Oatmeal, food value, 3381; production, 26, 873
Oats, *873*; climatic conditions, cultivation, areas, 874, 1230; dietetic value, 3312, 3599; fungous pests, *1667*, 1669; germination, 635; good seed, 636; harvesting, 1663; as livestock food, 1198, 2704, 2909; rolled, preparation, 3084; structure, *351*
Obelisk, Assyrian, *2660*; Egyptian, 420; quarrying blocks for, 2955
Object (grammar), in analysis, 1618
Object drawing, 280, 468, 496, 739, 794, 1010, 1086, 2728; *see also under separate headings—e.g.*, Cube
Objective case, in English, 247
— genitive, in Latin, 901
— mind, Hudson's theory, 3288
Oblate spheroid, explained, 12, 13
Oblique motion, in harmony, 365
— muscles, of eye, 2400, *2401*
Oboe, construction, playing, *4891*, *5729*; manufacture, 6621; in orchestra, 5887, *5892*
Oboe d'amore, basso and da-caccia, relation to other instruments, 4895
Observation, value, training, scope, 1881; value in logic, 6002
Obsidian, rock, 766, *767*, 6741; volcanic glass, 1008
Obturator, in gun construction, 6612
Ocarina, manipulation, 4569, *4570*
Occipital bone, structure, 1604, *1605*
— lobes, of cerebrum, *2144*, *2146*
Occipito-frontalis, position, *1350*, 1351
Occlusion of hydrogen, 841
Occupations and longevity, 4528
"Oceanic," steamship, boiler, *3104*, 3106
Oceanography, causes of change of level, 1355; chart of depths, *457*, 459, 554; temperature, 555; tides, *556*
Ocean, 460; chemistry of, 555; depths, 554; period of distribution, 2254
Octagon, geometry of, 744
Octahedron, *765*, 766, 1747, *1749*
Octave, 270; in tonic sol-fa, 807
Octavius: *see* Augustus
Octavo sheet, in printing, 5457, *5458*
Octopus, 3115, *3116*
Odontograph, in drawing, *3460*, *3461*
Odontoglossum, culture, 6534
Odontoid process, of vertebra, *1606*
Odontolite, 5853, 5856
Odour, animal, recognition by, 2157
Oersted, discoveries in electricity, 129, 562, 4902
Œsophagus, description, *576*, *579*
Offal, in flour milling, 3078, 3282
Office, business, staff and departments, 659; management, 6518
— boy, duties and career, 192
— keepers, appointments, 2252, 2575
Officers, army, commissions, pay, 4197
— mercantile marine, 6803
Official receiver, in bankruptcy, 3569
Off-set, rainwater pipe, *5793*; surveying, 158, 262, 370; of wall, 3033
Ogee arch, introduction, 3092, *3092*
Ohio, geography, 4174; history, 5974
Ohm, electrical unit, 671, 789
Ohm's law, in electricity, 670
Oil and colourmen, business, 47, 4059
Oil engines, types and operation, *6786*
— fuel, uses, 6153
— gas, as illuminant, 6153
— painting, 1020, 1021
— seeds, of fibre plants, uses, 5118
— shale, 1073; occurrence, 6009; yield, 6149; industry, 6149, 6150
— volatile: *see* Essential oils
— wells, Baku, description, 6009
Oil-tanning process, 3164
Oil-cake, 2704; manufacture, 1032, 4830
Oil cloth: *see* Linoleum
Oil-fields, geological strata, 5916
Oil gas, 6818, 6824, *6825*, 6829
Oils, acid constituent, 3485; adulteration, 4060; analysis, 4414; animal, constants, 4833; books on, 4834; chemistry of, 4829; in dyeing, 5780; essential: *see* Essential oils; fixed, 1032, 3485; illuminating, 1164; as insulator in electricity, 672; light, distillation fractions, 5463; as locomotive fuel, 5106; marine, kinds, 4833; mineral, constituents, 5193; painters', kinds, 5146, 5831; ; in power production, 5127; pressing, extraction, rendering, *4830*; reservoirs, 2108; separators, 5214, 5764; tests, 4834; tree, varieties, uses, 4658; vegetable, 4833
Old age, care of, 4530; temperature in, 440
Old English, period defined, 1770
Old English game fowls, 4954; comb, *4957*
Old Red Sandstone, deposition, 1817; description, 2253, fossil, *2254*; relation to coal measures, 2067
Old World, in physical geography, continents and oceans, 460
Olefiant gas: *see* Ethylene
Olefines, chemistry of, 3706
Oleic acid, chemistry of, 3707, 4837
Oleo-margarine, manufacture, 4832
Oleo-resins, 3487; varieties, 1034, 4969
Oleo-stearine, manufacture, 4833
Olfactory, nerves, human, *2146*, 2536
Oligocene System, 2067, 2252
Oligocase felspar, 6741; cleavage, 768

Olive, cultivation, 4493, 4876, 6888 ; tree, oil from, 1032, 4830
Oliver, miniature artist, 1061, *1062*
— typewriter, 1528
Olives, stuffed recipe, 2003
Olivine, characters, 768, 5855, 6741
Omnibus, 2153 ; dimensions and, weight, 2726 ; employees, 4185, 4186 ; lighting, 3025 ; suspension, 3121, *3124* ; various types and structures, *2463*, *2465*, 2466
— motor : *see* Motor-bus
Onion, 355 ; culture, 6673 ; market returns, 6836 ; sauce, recipe, 2004
Ontario, agriculture and farming, 3205 ; geography, 3203, 4066, 4068
Ontology, use of term, 6253
Onyx, stone, 767, 6741
Oolite, 844 ; varieties, 533, 535
Opal, 766, *767*, 5308, 5855, 6741
— glass, recipe, 4533, 4930
Opaqueness, meaning, 2436
Opener, cotton machine, description, 1241, *1242* ; wool, *1123*, 1124
Open-hearth furnaces, construction and working, 2864, *5013–5017*
— process, steel production, 234 ; influence on machinery design, 209
Openings, quantity surveying, 6508
Opera, glass, construction, 2903
Operatic salaries, 6868
Ophthalmia, in children, 6264
Opie, John, portraiture, 4393
Opinions, banker's inquiry, 4293
Opium, 4006, 6888 ; abuse compared with alcoholism, 5672 ; cultivation areas, 4960 ; sources of, 352, 4960 ; traffic, in China, 6690
Oporto, 2234, 2946 ; touring, 1134
Opossum, 1763 ; skins and fur, 6428, 4430 ; swimming apparatus, 2038
Optative subjunctive, Latin, 1183
Optic chiasma, *2401*
— nerves, anatomy, *2146*, 2147, 2400
Optical instruments, 2949, 3369
— square, surveying, 158, 263
Opticians, business of, 4717, 4143
Optimism, in mental evolution, 3119 ; physical and rational causes, 2517 ; physical basis, 2374
Orange, sources, 4844, 6888
— colour, symbolism, 725
— marmalade, recipe, 4848
— oil, expression of, 4969
— pekoe tea, 3378
— tree, 4876, 6888 ; classification, 353
Orange, William, Prince of, leader of Netherlands against Spain, 4397
Orange-tip butterfly, 3516
Orange River Colony, geography, 3587 ; history, 6693, 6694 ; teachers' openings, 3741
Oratio obliqua, in Greek, 6670 ; Latin rules, 1048
Orbit of earth, *15*
— human, function, 2400
Orbital index, 1786
Orchards, culture, 6676
Orchestra, 5726 ; full, instruments and conducting, 5885 ; reading score, 1060 ; small, 5889
Orchestration, art of, *5726–5734*
Orchid, 355 ; epiphytes, 506 ; genera, chief, 6534 ; culture, 6534 ; seed dispersal, 910
Order, in architecture, *2858*, *2859*
— cheques, explained, 3482
— guard book, explained, 776
— in natural science, 380, 6254
Orders, retail business, systems, 6055
Ordinal numbers, French, 1620 ; German, 3063 ; Italian, 2920 ; Latin, 601 ; Spanish, 2768
Ordinary seaman, mercantile, 6803
— survey, 158, 1146, 1238 ; railway surveying, 801 ; maps, 370 ; triangulation of U.K., 1145
Orderlies, R.A.M.C., pay, 4031
Ordinary shares, 1262, 3185, 3484
Ordinate, in conic sections, 5783 ; of ellipse, 1411
Ore, electric, prospecting, 2582 ; kinds, 3835 ; roasting, *3770* ; sampling, 4416 ; working deposits, 2847, 3301, *3306*, 3835
Oregon, state, 4175 ; ownership, 6975
Oreide, properties, 3940
Orford nickel process, 5982
Organ, 3858, 3866 ; construction, 3857 ; manufacture, 6712, *6714* ; recitals, 3868 ; tuning pitch, 1058
— American, 3950, *3952* ; bellows, 6714
Organic chemistry, 135, 516, 2554, 2710 ; intelligibility, 3138 ; reasonableness, 3142 ; simplicity, 3138
— compounds, synthesis, 2711
— evolution : *see* Evolution, Variation, *etc.*
— molecules, asymmetry, 3534
— sensation, relation to self-consciousness, 2374 ; in psychology, 2118
Organist, 3860, 3868
Organ-pipe, overtones, 2106
Organ-pipe coral, 4086, *4087*
Organs, homologous and analogous, 1492
Organzine, manufacture, *2597*, 5640
Oriel window, *3374*
Orientalists, painting school, 4395
Origin point, in surveying, 369
"Origin of Species," 486, 823, 3783
Original entry, bookkeeping, 777, 1467
Orizaba, volcano height, 4064, 4175
Ormolu, in cabinet-making, 6584
Ornament, in design, *5818*, *5820* ; geometrical, *2320–2322*, 2398, *2566* ; lines, curves, and plant, 5821
— bookbinding, *6776*, 6779
— in singing, 6336
Ornamentation, in architecture, 2288
— in music, 271
Ornithorhynchus, 2038
Orohippus, fossil horse, 1177, 1178
Orpiment, 6741 ; pigment, 871
Orpington fowls, breeding, *4858*, 5623
Orthoclase, mineral, 768, 6741
Orthophosphoric acid, 4779, 5586
Orthoptera : *see* Straight-winged Insects
Orthorhombic system, 766, 6730
Osborne College, admission, 4400
Oscillation, electric, conditions, frequency, etc., 3748, *3749*, 3894, *3895*
— mechanical, 3747, 3748
Oscillators, Hertz, Lodge, etc., 3894, *3895*, *3897*
Osiers, for basket-work, 5488 ; sewage, crop, 4549
Osler, Prof., on alcohol, abolition, 5815
Osman kiln, in brickmaking, 1284
Osmiridium, gold alloy, use, 5849
Osmium, chemistry of, 517, 1446 ; in electric lamp, 2682 ; wire, 5171
Osmosis, 168 ; in digestion process, 675
Osmotic pressure, laws of, 4562
Osprey, feathers of, use, 6040, 6608 ; food, 2493 ; skeleton, 2494, *2495*
Osseous system, human, 1603, *1708*
Ossification, of bone, cartilage, *436*
Ostrich, *2212*, 2214 ; feathers, 6608 ; nesting habits, 2506 ; skeleton, 2494 ; toes, 2495, *2496*
Otter, description, 1764 ; skins and fur, 6428, 6430 ; swimming apparatus, 2038
Otter shell, siphon, *3284*, 3285
Otto of roses, 4968, *4969*
Ottoman, in upholstery, 6719
Otway, Thomas, dramatist, 1150, *1151*
Ounce, avoirdupois, 226 ; troy, 226
— system, in yarn counts, 2896, 2897
Ouse, river, Yorks, 984, 1272
Outcrop, in geology, 1921, 1924, 2379
Outdoor relief, 1851 : *see also* Poor law
Outerside, geological section, *1354*
Outfall, in drainage, 781
— flap, in drain pipe, 571, 572
Outlet, of sinks, basins, etc., 5633, 5634
Outlets, of water reservoir, *4332*, 4333
Outrigger hinge, in vehicles, 2829, 3022
Outward flow turbines, definition, 1691
Ovary, of flower, *347*, 348, *349* ; of hydra, *381*, 382
Oven, baker's, output, 932
— breadmaking, type, 3395
— kitchen, management, 1226
— steam, in analysis, *4412*, 4413
Oven-bird, nest, 2507
Overall, girl's, *4473*, *4474*, *4475*
Overcasting, needlework, 150, *151* ; for underclothing, 3338
Overcoat, boy's, *1754* ; man's, *2872*
Overdraft, in ledger, 1967 ; ledger loans in connection with, 4292
Overgraining, in painting, 5834
Overlays, in printing, 5867
Oversewing, milliner's, *4565*, 4566
Overshot wheels, principle, 1690
Over-tones, production of, 2104, 2105
Overture, in musical form, 634
Oviparous, explained, 30
Ovipositor, of insects, 3722
Ovo-viviparous, explained, 30
Ovules of flowers, *347*, 348 ; in gymnosperms, 503 ; of pine, *505*
Ovum of hydra, *381*, 382 ; of plants : *see* Egg-cell ; germination, *1315*
Owl, description, 2211 ; food, *2492*
Ox, horns of, structure, 811 ; labour in construction, 6631 ; power, 5011
Oxalates, uses, 4782
Oxalic acid, antidote, 3704 ; chemistry of, 3704 ; manufacture, 478, 4928 ; reagent and test, 4410 ; sources, 3112, 4781
Ox-eye daisy, 354 ; weed, 1378
Oxford, University, first charter, *3073* ; scholarships, 482
— clay, 1279 ; use, 643
Oxidation, 1295 ; geological, 1502 ; in metals, 356 ; physiological, 439 ; in plants, 173
Oxides, reduction, in metallurgy, 3836
Oxus, river, course, 2563, 2564, 4495
Oxygen, in air, 3719 ; atomic weight discussed, 518 ; chemistry of, 1294 ; discovery, 60, 840 ; in earth's crust, 239, 624 ; as element in living things, 275 ; in foodstuffs, 3109 ; molecule, 696, necessity of life, 277 ; occurrence, 839 ; percentage in human body, 438 ; and plants, 167, *171*, 172 ; preparation, 1294 ; respiratory function, 1301 ; standard of atomic weight, 694 ; utilisation by living organisms, 1491 ; in water, 4159
Oxyhaemoglobin, formation, 953, 3018
Oxyhydrogen jet, 841 ; welding, 6455
Oyster, description, 3113, 3285 ; choosing, 1228 ; culture, 3286, 5316 ; closing, 3284 ; dietetic value, 3311, 3381 ; disease, communication, 5315 ; fishing, 2527 ; pearl-bearing, 5856 ; sources, 5121
Ozokerit, characters, 1165 6741 ; nature, 4835 ; mining, 4014
Ozone, chemistry and production, 693, 1295, *5760* ; in air, 3719
Ozoniser, in water sterilising, 5760

PACIFIC ISLANDS, geography, *3902*
Pacific Ocean, 460 ; currents, 558 ; Continental shelf, *301* ; depth, 302 ; geological formation, 1815 ; principal deeps, 554
Pacinotti's dynamo armature, 1323
Packers, railway, 4592
Packing, in hydraulic jacks, 1220
— in key-seating, 3403, *3687*
— in mining, in blasting, 2584
— wholesaler's, imperfections, 6208
Padding, in textile dyeing, 4502, *6370*
— in tailoring, *1111*, 1112
Paddle-wheel, ship's, *6226*, 6227
Page, domestic servant, duties, 816
— printed, make-up, 5159, 5459
Paid-up capital, explained, 3185
Pain, sense of, 1422 ; psychological theory, 2517 ; value, kinds, 5539
Paint, anti-fouling, 6571 ; chemistry of, 5141 ; house, 1035, 5831 ; protective, 5148 ; stains, removal, 2590 ; tests, 5146
— spraying machine, 5831
Painter, house, duties, 5830 ; employment conditions, 2644 ; tools, *5829*, 5830 ; wages, capital, 47
— brushes, *6108*, 6110
Painters and decorators, business, 4145
Painting, in art, Barbottine, 5382 ; Barbizon School, 4301 ; composition, colour, symbolism, 722 ; decorative wall, 4395 ; Dutch School, 3948 ; early Christian, 3091 ; Flemish School, *3947* ; "Empire School," France, 4394 ; German 15th century, 4117 ;

Greek schools, 2930; impressionism, France, 4394, *4395*; modern, 3518, 4393; Norwich School, 4300, *4301*; Orientalists, 4395; pre-Raphaelite, 4394; as a profession, 164; Renaissance, 3793; Roman, ancient, 2933; in Spain, 4119
Painting, in building, 1035, *5829*, 5835, 6513
— of vehicles, 2730, 3479
Palaces, Florentine, 3675, *3676*, *3678*
Palæolithic age, instrument, *1075*; condition of man, 2255

Palæozoic period, in geology, 1177
Palatal bone, human, 1604, *1605*
— index, 1786
Palate, human, *2144*; function in singing, 6049, 6190; soft, 577
Palatine arch, function in singing, *6049*
Palestine, geography, 2719
Palette, cleaning, 871; setting, *1020*
— knife, painter's, *5829*, 5830
Paley, William, 2141, 4884
Palgrave, Francis Turner, poems, 1438
Palings, of fences, construction, *4646*
Palisade layer, of plants, 170, *171*
Palladium, 1446; alloy with hydrogen, 1722; in art work, 5524; properties, 1397, 3837, 3839
Pallets, of clock, 5712, 5714, *5715*; repairing, making, 5882
Palliasse, upholstering, *6721*
Palm, Carnauba wax from, 4835
— coconut, sugar from, 4352
— date, *351*, 4352; sugar from, 3652, *plate facing* 3649
— Palmyra, description, sap, 4352
— sago, sugar from, 4352
— oil, source, 1032, 4831
Palm-kernel oil, 4832
Palmitic acid, in cod-liver oil, 3486
Palmitin, in milk fat, 4035; in tallow, 1032
Palmnut cake, as livestock food, 2704, 2908, 3892; oil in, 2704
Palpitation, of heart, causes, 578, 6039
Pamirs, Asia, 2560, 2562, *2563*
Pampas, Argentina, 627, 4283
Pamphleteers, English, 1641, 1901
Pan, mining prospector's, *2380*
Panama Canal, dredgers used in, 5336
Pancreas, *576*; ferments, 3486, 3706
Pancreatic juice, description, 580, 675
Panel, cabinet work, 6586, *6587*
— of doors and screens, 5179, *5181*
— geometrical design, 2321, *2398*, *2399*; proportion, value of, 5980
— glazed, 5840
— of motor vehicles, material, 3325
— of saddle, making, 5340, *5342*
— saw, defined, 3385
— sunk, mouldings for, *1949*
— in vehicle construction, 2834
— wood carving, *6043*, 6135, *6136*
Panelled frames, *5293*, *5295*
Panelling, wood, fire-resisting, 4752
Pangenesis, Darwin's theory, *1314*
Pangolin, scales, 1871, 2156
Pansy, classification, 352; culture, *6489*, 6490; nectar, *730*, 731
Pantechnicon, *2463*; dimensions, 2726
Pantheon, Paris, architecture, 3946
— Rome, dome, *3147*
Pantiles, roof, description, *4869*, 4870
Pantograph, in surveying, 158, 371
Papacy, the, earliest history, 2945; independent state, 4322; political power ended, 6303
Paper, books on, 6689; use in clothing, 4257; dyeing, 6650; as electric condenser, 3580; filter, solvent for, 6560; as insulator in electricity, 672, 6795; manufacture, 1167, 6278, 6395–*6398*; representative papers, 6401; standard sizes, 5457
— bags, manufacture, 6557–*6562*
— box making, 6560, *6562*
— currency, in banking, 3970
— drawing, 109, 113, 1540, 2730; for brushwork, 2691; for pencil shading, 2188; preparation, 1793
Papermakers, employment, 2654
— photographic, 6401*6*, 6681, 6688, 6686
Papering, problems, 1547
Papin's engine, 5415
Papuans, ethnological account, 1788
Papyrus, how made, 355; plant, 1167
Par of exchange, 3681
Para rubber, production, 808
Parabola, 1412, *1413*, 5943; in conic sections, 5783; in designing, 2198, *2199*; development, 4934, *4935*; drawing, 1411, *1413*
Parachute, description and use, 3982
Parachutes, birds, 2496; in mammals, 2037
Paradigm of Greek verbs, 6096
Paraffin, as electrical insulator, 672; manufacture, 1164, 4837; properties, 4838; refinement, 4837; solid, classed as wax, 4834; uses, 5306
— lamps, burners, 6152
— oil, 1164, 6150
— wax, 6147; nature, 4835; source, 5306, 6149
Paraffins, in chemistry, 2876; derivatives, 3138, 3705; formulæ, 3020; unsaturated compounds, 3706
Paragraphing, in business letters, 6351
Paraguay, economic conditions, 5660; geography, 4282, 4288
Paraguay, river, course, 4284, 4288
Paraldehyde, hypnotic, 4128
Parallax, 266, 6404, *6665*
Parallel forces, in dynamics, 414, 1833
— roads, geological explanation, *1353*
— sailing, in navigation, factors, 6660
— straight lines, theory of, 4477
Parallelogram, *4723*; area, 1251, 4905
— of forces, 411, 552, 1833, *1834*
— of velocities, in mechanics, 552
Para-magnetic metals, list of, 4244
Paramœcium, reproduction, *381*
Paranucleus, of animalcule, *4088*, 4089
Parapet, field trench, 6270, *6267*
— wall, *1949*, 2267
Parasites, 166, 3958, *3959*, 6441; in live stock, 2626, *2627*; plants, *505-508*; spore-producing, 4089
Paratylene, acetylene production, 6025
Parcelling, of ship ropes, 6408
Parcels post, difficulty of working, 5102
Parchment paper, 6401, 6560
Parent and child, in biology, variations, 652; law of, 6850
Parentage, Irish ideal, 4665; natural selection and mental evolution, 3120; racial obligations, 4663; sociological value, 4665
Parental responsibility, limitations, 4666
Parenthesis marks, in letters, 6352
Parging, in building, *2387*, 2390
Parian cement, manufacture, 648
— ware, description, manufacture, *5607*
Parietal bones, structure, 1604, *1605*
— layer, of pleura, anatomy, 1300
— lobes, of cerebrum, *2144*, *2146*
Parietales, group, 352
Paring, in bootmaking, 4139
— chisel, 3386, *3387*, 4150, *4151*
Paris, description, 1682; geological strata of basin, *2235*; nasal index of inhabitants, 1786; tourist directions, 715
— history of, Roman times, 2242; capital of France, 2916; recovered from England (1436), 3465; resistance to Charles X., 5239; commerce, 5240; occupied by Prussians, 5240; Peace of (1763), 5846; Treaty of (1898), 5976; capture by Prussia, 6445
Parish, in local government, 316
— council, and meeting, duties, 316
Parisyllabic (Latin nouns), 442
Parks and gardens, staff, 1496
Parkes, silver recovery, 5987; vulcanisation method, 5045
Parkesine, description, 5310
Parliament, Barebones, 4761; first of Great Britain, 4952; opposition to Charles I., 4552; origin, 3073; Simon de Montfort, 3073; standing orders on private bills, 1237
Parliament, Houses of, 1275
Parliamentary powers, in civil engineering, account of and varieties, 1237
— work, in surveying, 1237
Parlourmaid, duties of, 1004
Parrot, 2211; toes and beak, *2492*, 2495; vegetarian feeder, 2494
Parsing, grammar, 760, 1617, 1618
Parsley, *349*, 353; culture, 6675
Parsnip, 353; cultivation, 945, 6673; harvesting, 1066; as live-stock food, 2704, 2905, 3892; market garden returns, 6836; nectar, 731
Parson's steam turbine, 130, *1906*, 5011
Part playing, pianoforte, 1891
Parthenon, Athens, 1525, *2858*, 2929
Participial adjectives, Esperanto, 6237, 6380
— adverbs, Esperanto, 6381, 6382; Spanish, 4222, 4797
Participle, English, 756; Esperanto, 6237; French, 3854; German, 134; Greek, 6094, 6095, 6096; Latin, 604
Parting, in assaying, 2377, *5849*, 5850
— tool, carver's, *5809*, 5810
Partition, in mathematics, 229
Partitions, between rooms, *4447*, 4448; fire-resisting, 4752, *4757*, 4759; quantity surveying, 6510
Partitive article: *see* Article
— genitive, in Latin, 900
Partners' drawings, ledger entries, 1569
Partnership, in banks, 4167; bookkeeping, etc., 2978; profit, division, 2756; in shopkeeping, 702
Partnership Act (1890) provisions, 2978
Partridge, 2212; carving, 5934; salmis of, cooking, 1875
Partridge, Bernard, line drawing, 6103, *6105*
Parts, in music, 364; counterpoint, 632
Parturient fever in sheep, 2625
Pascal, Blaise, hydrostatic investigations, 1076, 1141, 1801
Pass-book, bank, 778; bookkeeping, 4443; current depositor's, 4291; discount debit entries, 1466; English and Scottish, 1966, 1967
Passenger agent, railway, 4230
— traffic, railway, *4801*; accounts, 5101
— vehicles classification, 2462
Passengers, ship's, regulations, 6365
Passes, Alpine, notable, 1838
Passing notes, 567; in setting melodies, [illegible]
Passive voice, English, 608; German, 3355; Latin, 603; Spanish, 4222
Passiveness, importance in mental activity, 3183
Paste gems, 358, 5852
Pastel work, 1061
Pasteur, Louis, bacteria classification, 1294; discovery of first germs, 202; lactic acid fermentation, 3535; theory of life, 28; researches, 3273
Pasteur-Chauberland filter, 3380
Pasteuriser, milk, use, *4037*, 5405
"Paston Letters," account of, 1609
Pastry, making, 1530
Pasturage, cultivation of, 1378–1380; grasses for, *875–880*
Patella, human, *1709*
Patent agent, qualifications, fees, 1610
"Patent" leather, manufacture, 3455; recipe for keeping soft, 5646
— medicine, meaning of term, 1400
— office, appointments, 3302; advice to patentors, 1399, 1400
— offices, in United Kingdom, 1401
Patents, 1398; in bookkeeping, 2759; exploiting, granting, taking out, 1610; foreign and colonial, list, 1611; typical agreement between patentee and manufacturer, 2270; void, law as to, 1401
Pâte-sur-pâte, pottery, *5607*
Pathology, 5424
Paths, garden, *6318*, 6319

Philip IV. of France, wars with Edward I. of England, 3074 ; reign, 4101
Philip Duke of Burgundy, alliance with Henry V. of England, 3463
Philippi, battle of, 1672
" Philippics," the, 775, 1671
Philippine Islands, acquired by U.S.A., 5976 ; geography, 3161
Philistines, Israel's wars with, 666
Philology, defects of as a science, 1607
Philosopher's stone, 59
Philosophy, books on, 5816, 5817 ; definition and scope, 2016, 6253 ; dependence on physics, 4882 ; dictionary of, 2015 ; eighteenth century philosophers, 2054 ; function of psychology (*q.v.*), 3117 ; idealism, 6467 ; materialism, 6465 ; Nature and problems, 6253 ; new school of, 6470 ; nineteenth century philosophers, 2618 ; relation to the new chemistry, 2552 ; relation to physical science, 33 ; in religion, 6773 ; service to mankind, 6539 ; synthetic, Spencer's, 4122
Phlebitis, causes and symptoms, 6036
Phlogiston, in Stahl's theory, 60, 61
Phœnicia, history, 501
Phœnicians, art of, 2660 ; characteristics of, 1204 ; ethnology, 1790 ; in Spain, 2946 ; shipping, 5254 ; silk trade of, 582 ; trade in Britain, *plate before* 1, 145 ; traditional settlement in Ireland, 2608
Phœnix, silver recovery process, *5755*
Phonetic spelling, rules of, 122
Phonography : *see* Shorthand
Phormium, fibre industry, 355, *817*, 6889 ; fibres, dressing, 1389
Phosgene : *see* Carbonyl chloride
Phosphates, analysis, 4414 ; in manures, 5586, 5587 ; as poultry food, 5434
Phosphatic rock, in manure, 5586
Phosphine : *see* Phosphoretted hydrogen
Phosphor-bronze, composition, 3940 ; preparation and uses, 1447, 6309 ; properties, 360, 396
— tin, preparation, 6309
Phosphoretted hydrogen, 1722
Phosphoric acid, in manure, 433, 589 ; sources, preparation, 4779
Phosphorite, uses, 4779, 5586
Phosphorus, 1161 ; allotropy, 1046 ; compounds, 1161, 1722 ; distribution, 239 ; in human body, 438 ; in iron, 234, 4907, 4910 ; manufacture, 4779, 4780 ; in nerve matter, 1942 ; oxides, 1161 ; plant constituent, 167, 5585 ; proportion in earth's crust, 239 ; in puddling, 4637 ; red and yellow, 1161 ; retorts, *4779* ; sources, 4778 ; in steel, 234, 1045, 4747, 5019
Photo-engraving, processes, 6481, *6486*
Photogrammetry, use, 6634
Photographers, apprenticeship, 4417 ; business of, 47, 4417
Photographic dealers, business, 47, 4419
— apparatus, 6679
— paper, manufacture, 6401 ; printing, 6681
— plates, 6682 ; physics of, 3228
Photographs, copyright, 4418
Photography, principle of, 6679, *6684*, *6685*, *6687* ; application to phonograph, 2319 ; amateur *versus* professional, 4417 ; books on, 6689 ; colour, 4527 ; developers, 5467, 6680 ; lenses, 6127 ; portraiture, 6681, 6687, 6688 ; press, 4419, 6102, 6686 ; surveying by, 6634 ; telescopic use, 6247 ; women's training and prospects, 323
Photogravure, processes, 6486
Photo-lithography, process, 6183
Photometer, use, 2435, 4810
Photometry, books on, 4298
Phraseograms, in shorthand, list, 1464
Phrases, in harp playing, *3398*
Phrasing, in pianoforte playing, 1889
— in singing, 6337
Phrenic nerve, human, *1491*
Phrenology, origin, method, 2016 ; compared with psychology, 2011
Phthisis, causes, 3798, 5409, 6134 ; diagnosis, Röntgen rays in, 4093 ; and heredity, 1587, 2662 ; immunity, evolution of, 1030, 6781 ; prevention, 5409 ; mortality, 5409, 5412 ; symptoms, 6134 ; voice production as preventive, 2538 : *see also* Tuberculosis
Phylum, in botany, 165 ; in zoology, 1492
Physical culture, women's training and prospects, 323
— energy, unrelated to psychical, 6466
Physical geography : *see* Geography
Physical science, limitations of, 3287
Physicians : *see* Medical profession
Physicists, notable, 3850
Physics, books on, 4884, 5422 ; compared with chemistry, 58 ; development of higher, 4450 ; interplay of Nature's laws, 551 ; relation to chemistry, 402, 1144, 2080, 2084, 2391 ; relation to other sciences, 4882 ; relation to psychology, 2012 ; technical terms, 3121
Physiology, books on, 5423, 5771 ; dictionary of, 102 ; relation to various parts of biology, 95, 137 ; relation to physics, 33 ; scope and definition, 95, 137, 279
Physique, effect of exercise, 4387
Pi, numerical value, 6085
Pia mater, membrane, anatomy, 2145
Piano : *see* Pianoforte
Piano, term in music, 271
Pianoforte, 1210 ; compositions, 1211 ; construction, 1210 ; examinations, 2025 ; graded studies, 2032 "laying" a scale in tuning, 6442 ; manipulation of keys, 1415 ; manufacture, 6708, *6710*, *6711* ; octave tuning, 6442 ; as organ substitute, 3858 ; practice, 2025 ; registers, 1059 ; string adjustment and chipping up, 6442 ; teaching, 2024 ; tuning, 3880, 6442, 6709, 6712 ; wire, 5170
— makers, employment conditions, 2656
Piassava, source and uses, 5118, 6889
Piat furnaces, construction, 2863, *2865*
Picaresque novel, origin, definition, 2962
Picariæ, order of birds, 2210
Picchettato, in singing, *6336*
Piccolo, musical instrument, compass, *4568*, *5729* ; orchestral use, 5729
Pick, kinds, in mining, *2580*, *2583*
— mason's, *2837*, 2838
— in railway work, *3172*
— scabbling, serrated, *532*
Pickaxe, in railway work, 3172, *3172*
Pickling, metals, 5528, 6169
Picks, in textile industry, 2939
Picric acid, 6765 ; in dyeing, 5468, 5908 ; manufacture, 3709, 6765
Picts, invasions of Britain, 2241 ; invaded by the Scotti, 2607
Picture framers, business of, 4609
— frames, making, 4610
— postcard dealers, business of, 4611
Pictures, ancient Egyptian, 2522 ; diversity of values, 5151 ; scale by framer, 4609
Picucules, nest, 2507
Piddock, boring apparatus, *3284*, 3285
Piece mould, in sculpture, 1509, 1510
— work, 6643
Pier, in building, 2168, *2171* ; bonding of, *2175* ; crib, 6268 ; Dover, 6333, *6335* ; foundations, 332 ; harbour, 6220 ; shoring, 920 ; stagings used in construction, 1172 ; underpinning, 918
— in masonry, dome supporting, 3148
— of suspension bridge, stresses, 2764
Pierhead, construction, 6266
Piers, seaside, uses, *5580*
Piezometer, for testing pressure in water-pipes, *1574*
Pig, 1761 ; black, *2365*, 2368, *2369* ; books on, 3471 ; breeding, 2367–2371 ; even-toed, digits of hand, *1869* ; exhibitions, Smithfield, 2371 ; farming in Great Britain, *2365*, *2369* ; housing, 2370, 2998 ; large black, 2386, *2369* ; large white, 2367 ; middle white, *2365*, 2367 ; ringing, 2370 ; small white, *2365*, 2368 ; sucking, age for market, 2370 ; white, 2367
— bed, in iron smelting, *232*, 4470
— iron, 232, 1044 ; lifting, 563 ; for puddling, 4637
— in laundry work, material, *2476*
— skin, grain, *plate facing 3217*
Pigeon, 2211 ; carving, 5934, *5935* ; digestive apparatus, *2492*, 2494
Pigments, in art, 725 ; in building, 1035 ; copper, 6307 ; manufacture and properties, 5143 ; in oil painting, colours to be avoided, 871 ; organic, 5145 ; in paints, 5141, 5831 ; setting the palette, 1020 ; test, 5146
Pike, bony, classification, 3066, 3067
Pilch, infant's, 3746, *3856*
Pile, of Brussels carpet, 3992
— cloth, weaving, 3156, 3157
Pile-driving, 2022, 4642 ; wedge, 835
— engine, *1453*, 1454
— screw, principle, 835
— fowl, *5089*
Piles, 1173 ; in bridge construction, 2737, *2738* ; in building foundations, *335* ; in carpentry, 4642, *4645* ; hydraulic, 2767, *2768*, materials, 4642 ; reinforced concrete, 1557, *1558*, 1643, *1645* ; timber, 1454
" Pilgrim's Progress," 1640, 2963
Pillar plate, of brougham, 2829, *2831*
— and stall working, *3191*, 3561, *3562*
— steel construction, strength, 2226
— of vehicles, 2725, *2727*, *2739*, *2829*

Pillar, verge watch, repairing, 6082
Pillars, clock, 5884
— electro-magnetic drilling, *5450*, 5453
Pillow lace, 224
Pillows, materials, in upholstery, 6722
Pimento, source, *4720*, 4722, 6889
Pin, in carpentry, 3546
— of crank, 828
— verge watch, 6081
Pinafore, child's, *4050*, *4473*
Pincer tongs, 2984, *2985*
Pincers, use, 3388, 4586
Pinchbeck, composition, properties, 3940
Pine, tree, 4657 ; in building shores, 917 ; classification, 503 ; cutting, *53*, 57 ; distillation products, 5465, 5466 ; evergreen condition explained, 728; oil, production, 1034 ; pests, 4926, *4927*, 4928 ; its timber, 54 ; strength, 1260 ; wood fibre, in papermaking, 6280, *6281*
— dwarf, distribution, 625
— Scotch : *see* Scotch fir
— Weymouth and white : *see* Weymouth pine
— yellow, strength of timber, 1260
Pineal gland, *2400*, *2403*
Pineapple, 6889 ; canning, 4846 ; distribution, 4876 ; essence, source, 5469 ; leaves as fibre, 818
Pinion, of clock, 5711 ; repairing and making, 5717, 5719, 5884
— leaf, watch, repair, 6084
— engine, action of, *3814*, 3815
— raw-hide gear, *3921*
— of toothed gear, 3638
Pink, flower, *351* : fertilisation, *730*, 732 ; order of, 354
Pink-eye, disease, in horses, 2620
Pinking iron, in upholstery, 6722
Pinnacle, in architecture, *3373*
Pinnipedia, species of, 1494, 1765 ; suitability for aquatic life, 2038
Pins, materials, manufacture, *5170*
— clock pillar, making, 5717
Pinturicchio, painter, 3794
Pinus sylvestris : *see* Scotch fir
Piombo, Sebastiano del, painter, 3796
Pipe arch bridge, structure, *2739*, 2740
Pipe-fish, form of body, 3069, *3071*
— nails, use in foundry, 2547
— pattern, for moulding, *2455*, 2457
Piperin, source, 4717, 4720
Pipes, anti-syphonage, *5631*, 5634 ; drawing, 5041, *5042* ; bending, *5629*, 5630 ; copper, plumber's, 5627 ; copper, working, 3884, *3885* ; drainage, 569, *571*, 736, *5051* ; drainage, road, 2323 ; flanged, manufacture, 5320 ; hot-water, arrangement, 6022 ; hot-water, fitting, 5627 ; hydraulic, strength formula, 1704 ; iron, plumber's, 5627 ; in mining, defined, 2378, 2670, *2671*, 5319 ; overflow, *5629*, 5632 ; plumbing, fixing, 5632 ; rain-water, 781 ; rain-water, quantity surveying, 6512 ; roof, kinds, *5793*, 5794 ; sewer, 4460 ; soil, 5053 ; soil, jointing, 5628 ; soil, connection, *5631*, 5634 ; tobacco manufacture, 4378 ; waste, use and fixing, 5633 ; tests, 1082, 3964
Pipette, in chemistry, 1140
Piping, in carriage trimming, 3622
— in dressmaking, 152, *153*, 863 ; of widow's bonnet, 5774
Pipit, classification, 2210 ; nest and eggs with cuckoo egg, *2507*
Pique, in glove sewing, 5482
Pisa, 2230 ; cathedral and leaning tower, 3231–*3233* ; sculpture, 3518 ; touring, 947
Pisano, Andrea, painter, 3519
Pisano, Giovanni, sculpture, 3518
Pisano, Vittore, medallist, 3678
Pistil, of flower, *347*, 348 ; male, female and hermaphrodite, *730* ; nectar production, 5731
Pistols, Browning's, 6418 ; Colt, *6418* ; Mauser, *6417* ; present type, *6415*
Piston, of pneumatic tools, *1803*, 1806
— of steam-engine, *4424*, 5414 ; Belliss engine, *5750*, 5751 ; Brotherhood engine, *6071*, *6072* ; Ramsbottom type, *5641*, 5643 ; speed in locomotive engines, 6516 ; triple expansion marine, *6294*, 6295
Piston rod, *5641*, 5643 ; diameter formula, 4425 ; triple expansion, *6294*
— glands, drawing, 4203, *4205*
— valves, 5749, *6515*, 6516
Pit, bell, in mining, working, 3190
— railway locomotive shed, 4599
— sand, constituents, 647
— saw, use, 3385
Pitch, in coal-tar distillation, 5462 ; production, 1163, 5465 ; source, 4658 ; specific gravity, 1704 ; for timber and iron coating, 5836 ; testing, 1702 ; uses, 1163, 5464
— of gears, 3656, 3923, *3924*
Pitch in music, 37, 1058 ; pianoforte, tuning, 6442
— of screw, forms, 686, 835
— pine, *54* ; cutting, *53*, 57 ; in staging, 1176 ; strength, 1260, 1393
— in sound, 2102, 3620
— of voice, 6047 ; modulation of, 2538
Pitch blende, radium from, 2028, 2031, 2581
Pitcher, in haymaking, defined, 1630
Pitcher-plant, *507*, 508
Pitching tool, mason's, *532*, *2837*, 2839
Pitchstone, rock, 1008, 6742
Pith, plant, 170 ; in trees, 51, *53*
Pit-head gear, mine construction, 3767
Pitman, Sir Isaac, shorthand system, 48
" Pitman's Journal," 403
Pitot's tube, stream velocity, 1576
Pits, in mining, working, 2847
Pitt, William, ministry, 5555, 5685
Pitt, William, Earl of Chatham, ministry, death, 5554, 5555
Pitti Palace, Florence, 948, 3675, *3678*
Pivot, of clocks, repairing, 5716, 5718
— of gates and doors, *5795*, 5797
— holes, of clock, 5883 ; watch, 6083
Pizzicato, double-bass, 3170, 5728 ; violin, *2512*, 2744, 5727
Place bricks, 643, 1947
Placket fasteners, 185 ; making, *654*
Plagioclase felspar, cleavage, 768
Plague (1665), mortality, 4762
Plaice, fish, 3069, *3070* ; choice of, 3717; fisheries, 5190 ; fishery, value, 4989 ; floating eggs, 5189, *5190* ; frying, 1873
Plains, diluvial and alluvial, 4497 ; of Europe, 854 ; fertility, 4497
Plait, in bordering baskets, 5562, *5564*
Plan, in architecture, *2129*, 2283 ; of architects' detail drawing, *5693*, 5698
— in building, 5542, *5543*
— in drawing, 1747, *1749*
Planarian worms, classification, 3959
Plane, of crystals, 766
— curves, problems in, 1411, *1413*
— in drawing, 1747, *1749*
— faces, of envelopes, 4521, *4523*
— figure, in geometry, 4208
— in geology, 1924 ; formation, 1816
— irons, kinds and use, *3757*, 3758
— tool, varieties and uses, 3385, *3387*, 3756, *3757*, *3845*, 3848, *4151*, 4152 ; " hollows " and " rounds," *4151*, 4153, 5179, *5181*
— table, in surveying, 159, 594, 710
— tree, 6889 ; strength, 1260 ; shearing cut, 4584 ; use for carving, 5809
Planers, machine tools, 3319, *3317*, *3321*, 4909, *5002*, *6451*, 6654, *6656* ; compared with milling cutters, 3401 ; portable, 5276–*5279* ; rotary, 5205 ; tests, *3963*, 3965
Planetary motion, laws of, 662, 6241
Planets, *11* ; *plate facing* 6241 ; comparative statistics, 6250 ; gravity, action of, 6242 ; heat radiation, 2060 ; list of, 6116 ; movements, 6115, 6241, *6242* ; nebular hypothesis of, 620, 6701 ; order, 6250 ; revolution, 6121 ; satellites, 6250
Planimeter, river section area by, 5115 ; in ship calculations, 5966 ; in surveying, 158, 370
Planing machines : *see* Planers
— metal, tools, *4151*, 4153
— wood, 3756 ; according to grain, 3540 ; inverted plane, *6581*, 6585
Plank, curving, 3539, *3541* ; distinguished from board, 3544
Plankton, in fishery, *5189*
Plano-milling machine, 3324, 5205, *5207*
Plans, of building, 2790, 5542, *5543*
— mine, 3306, *3309*
— in surveying, 370
Plant : *see* Plants
— depreciation allowance, 3420
Plant form, in design, 5821, *5978*, *5979*
Plantagenet kings, England under, 2913
Plantain, 882 ; cows' food, 3890 ; seed dispersal, 910
Plantation, making, 6317 ; rating, 4603
Plant-bug, *plate facing* 3361, *3363*, 3364
Planté's accumulator, *3086*
Plant-lice, description, 3365 ; attacked by ichneumon fly, 3722, *3723*, *3726*
Plants, atmosphere and, 1298 ; biological classification, 29 ; carnivorous, *507*, 508 ; collectors and dissipators of energy, 4132 ; chemical manures, 5585 ; desert and moorland, *727* ; disintegrating effect on soil, 1814 ; classification, 165 ; extinct marine, 535 ; fertilisation, 346 ; food, 276, 2702 ; general characteristics, 275 ; gymnosperms, 503 ; insect pollination, 346, 731 ; limitation of range, 493 ; influence of water, wind, animals, insects, *727*–*732*, 908 ; in living-rooms, 1159 ; male, female, and hermaphrodite, 730 ; nitrogen absorbed, 238 ; oxygen given off by, *171* ; parasites, *505* ; protection against wind and animals, *1114* ; reproduction, 346 ; structure and food, *166*–*173* ; synthetic chemical processes, 2711, 4014, 4133
Plaque, copper, enamelled, *5691* ; electrotyping, 3422
Plasma, of blood, properties, 952, 954
Plassey, battle of, 5555, 6549
Plaster bedder, in firing china, 5606
— cast, colouring, 1673
— casting in, 1218, 1509
— fire protection, 4754
— in mural decoration, 1024
Plaster-of-Paris, 648, 1041 ; in bronze casting, 1674 ; dentist's use, 5862, *5863*, 6028 ; manufacture, 5497, 5586 ; in moulding, 2110 ; quarrying, *2850* : *see also* Gypsum
— of walls, 5499 ; air permeability, 6020 ; repairing, 5829
Plasterers, employment, 2644
Plastering, in building, 648, 5496, *5497*, 5498, 6513 ; books on, 6349 ; climate effect, 6349
— wines, 2879
Plastic clay, in sculpture, 1217
Plasticity, definition, 1375
Plate, face, for lathe testing, *3963*, 3966
— girders, stresses, 2198, *2199*
— glass, manufacture, *4734* ; polishing, 4735, 5837 ; recipe, 4533 ; strength, 1702 ; vans for, construction, 2558
— moulding, described, 2540, *2541*
— old Sheffield, manufacture, 5860
— reversing eccentric, *5644*
— ship's, strength, 6221
— verge watch, removal, *6081*
Plateau, advantages, disadvantages, 4497
Plate-bending machine, *5920*
Plated work, in machine building, 206
Plate-edge planing machine, 3098
Platelayer, railway, duties, 4230, *4591*
Platen printing machine, *5872*
Plates, boiler, working, *3097*, 3100
— china, manufacture, *5606*, *5607*
— circular, wooden, 5296, *5299*
— earthenware, pressing, 5233
— in joinery, *4115*, 4116
— metal, drawing, 5042 ; thickness, 3095 ; *see further under* Plating
— photographic, use and varieties, 6679 ; collodion, 6481 ; in photo reproduction, 6482, 6485, 6486
— shell, of ship, *5918*–*5922*
— steel, test pieces, 3961
Platform, of dress landau, 3122, 3123
— railway, dimensions, *3616*
— in scaffolding, 1170

Plating, *3095*
— shell, of ship, *5917*, *5918*
— shop, 3098, 3109
— silver: *see* Electro-plating
— of vessel, *5618*
Platinoid, 672, 3837, 3941, 5984
Platinum, 4305, 5849; books on, 5860; chemistry of, 1446; conductivity, 1397; electrical resistance, 672; in electrolytic apparatus, 240; expansion under heat, 1738; leaf burnishing, 6277; in metallurgy, 361; micro-structure, 3939; *plate preceding* 3937; occurrence, 839, 5849; ore, sources, 5849; strength, 1396; tools for, *5521*, 5524; welding, 6454; wire, use, 5171
Plato, conception of society, 5246; life and teachings, 976
Platypus, *1494*, 1765; skin, 6428
Play, problem, harmful, 4535
Playwriting, 6866
Pleasure, æsthetic value, 180; in philosophy: *see* Hedonism; physiological causes, 2517; sense of, 1422
Pleat, for dressing gown, *3590*; in girl's skirt, *2468*, *2469*
Pleating, in millinery, 5620, *5621*
Plebeians, the, and agrarian reforms, 1382, 1383; Decemvirate, 1201; rise of, 1136
Plectrum, mandoline, 4808, 4809; zither, 3763
Pleiades, 2949, 6700
Pleistocene, geology, system, 2067, 2255
Plesiosaurus, 2677; occurrence, 2254; skeleton, *plate facing* 2065
Pleura, human, 197, 1300, 1710
Pleurisy, 6133, 6134
— in horses, treatment, 2621
Pleuro-pneumonia, in cattle, 2623
Pliers, function, 4586; dental varieties, 6028, *6029*; metal-worker's, *5521*; in saddlery, 4784; slide, *5521*· smith's, 2984, *2985*
Plimer, miniature by, ·*1063*
Plimsoll mark, of ships, *6364*
Plinth, in building, 2266; binding of, *2177*, 2178; bricks for, *1948*, 1949
— in joinery, 5293, *5295*
Pliny the Elder, death, 2068
Pliocene system, 2067; rocks, 2254
Pliohippus, fossil horse, 1177
Plique a jour, enamelling, 5687, *5690*
Plotting, in surveying, 264, 389, 591
Plough, in agriculture, *1846*, *1849*, *1850*; steam, 430
— in tramway conduit, 1936
Ploughing, systems of, 430, 1200; for cereals and root crops, *1229*, 1233
Ploughman, wages, duties, etc., 2099
Ploughshare, *1849*
Plover, order, 2212; nesting, 2506; recognition markings, 2505
Plug and feathers, tool, *532*
Plum, cultivation, 855, 4875; garden culture, 6676, 6678
— cake, recipe, 2331
Plumatella, description, *3958*
Plumb bob, use, *4703*, 4706
— line, in erection, *3689*, *3690*, *3691*; in mine surveying, 804
— rule, use, *4703*, 4706
Plumbago, 1157; in foundry work, 2547: source, 5308; specific gravity, 1704: *see also* Graphite
— plant, sticky fruit, *911*, 912
Plumbers, business of, 47, 2218, 4612; employment conditions, 2644; Navy, 4265, 4269; tools, 5029
Plumbing, books on, 4615, 6349; business of, 4612; external, *5029–5035*; internal house, 5627; internal, quantity surveying, 6512
Plummer block, 3263, *3264*; cutting process, *3317*, 3320, 3324
Plumule, of barley, 874; of plant, *347*, 350, 635; of wheat, 913, *915*
Plunger and bucket pump, 1081
Plural, in English, 245; French, 1187; German, 1878, 2488, 2638; Italian, 2346; Spanish, 2343, 2481
Pluralism, in philosophy, 6464
Plush, upholsterer's varieties, 6716; weaving and design, 3156, 3157
Plutonic rocks, 1006, *2065*, *2067*
Plymouth, breakwater, 6335; harbour regulations and revenues, 6220
Plymouth rock fowls, *4857*, 5623
Pneumatic chemistry, origin of, 60
— drill: *see* Drill, pneumatic, *etc.*
Pneumatics: *see* Hydrostatics
Pneumogastric nerves, 1944; and digestion, 674
Pneumococci, in bacteriology, *6540*
Pneumonia, 6133; immunisation during, 6544; organisms, *6540*
— in cattle, 2623
— in horses, symptoms, 2621
— in sheep, 2624
Pockets, of trawl net, *4990*
— in dressmaking, making, 655
— in mining, 2378
— prints, in casting, 2340, *2341*
— of sliding sash, *5183*, 5186
— in tailoring, 1289, *1292*; boy's suit, *1460*, 1552, 1754; lounge jacket, 2753
— wall, in floor construction, 4446
Pocket-knife, manufacture, 5475; plumber's, 5029, *5030*
Pod-plants, 165: *see also* Angiosperms
Podophyllin, 6889
Poetry, 303; American, 3780; Browning's theory, 1436; Elizabethan age, 536; Elizabethan drama, 678, 845; English nineteenth century, 1304; English, Milton to Cowper, 991; English Restoration drama, 1149; influence on modern English prose, 2309; pre-Elizabethan, 324; Tennyson's theory, 1434; value of learning to write, 4577; Victorian poets, 1434; Wordsworth's theory, 1305
Poetsch shaft sinking process, 3460
Poisoned wounds, treatment, 6472
Poisoning, treatment, 6473
Point, in geometry, definition, 4207
— mason's tool, *2837*, 2839
— path, and instantaneous centre, 88
Pointed arch, introduction, 3092, *3092*
— architecture, history, 3373–3376
— paper, textile, 2939, *2940*
Pointer, in measuring sculpture, *1676*
— of typewriter, *1529*
Pointing, in sculpture, 1676
Points, in optics, corresponding, 3182
— railway construction, *3608*; interlocking with signals, 4646; rack, on Abt system, *3816*; on temporary line, 3253
— in printing, 5868
Pointsmen, tramway, wages, 4189
Poisons, antidotes to, 3704, 3537, 3823, 4006; effect on body temperature, 440; most powerful, 4012
Poland, craniometry, 1786; geography, 2408; history of, 2948, 6202
Polar bear, skins and fur, 6426, 6430
— distance, in astronomy, 6244, 6665
— regions, 5379; physical conditions, 4494
Polarisation, of light, 3849; effect of magnetism, 3852
Polariscope, 3850, *4554*, *4555*
Polarising angle, 3850
Polarite, in filtration, 4097, 4100
Pole, of field magnet, 1106
— arms, telephone, construction, 6324
— plate, of roof, *4249*, 4250, *4251*
— roof, construction, 6324
— socket, in futchell carriage, *3125*
— spring, in mining, 2669, *2670*
— star, 6250; in determining latitude, 700, 6663; position, *6116*, *6117*
— of van, structure and fittings, 2828
— tie, sleeper, defined, 3434
— celestial, defined, 6116
— geographical, *11*, 293, 625
— magnetic, 559, 1357, 4244; reversing, 1324
— telegraph, and telephone, *6323*, *6324*
Police, colonies, 3549; London and provinces, 81, 320, 1406; civil appointments, 2575; railway, 5108; Roman, 1829
— surgeons, salaries, 699
Policies, accident insurance, 4852; fire insurance, 4849; life assurance, 4727; marine insurance, 4853
Policies, value, explanation, 4728
Poling, in copper smelting, 356
— boards, in building, 330, 331
Polish, fowls, varieties, *4855*, *4957*
Polishes, boot, etc., recipes, 5149, 5150
Polishing, art metal work, 5528
— in bootmaking, process, 4545
— cabinet-making, 6591
— of metals, 3937, 5528
Polishing machines, *3455*, 5214
Political economy, Adam Smith, founder of, 2055; Hindu, 418; in Assyria, 501
Politics, foreign, false ideas, 5100
Pollajuolo, sculptor, 3678, 3793
Pollard, in milling, 3079
Pollen, in flower structure, 346; in gymnosperms, 503; carried by water, wind, animals, 729; protection from damp, *1114*
— flowers, insects, 731
— grains, 346, *347*
— sacs, 346, *347*; of Scotch pine, *505*
— tube, 346, *347*, 348
Pollination, 348; wheat, 913
Pollinium, of spotted orchis, *730*, 732
Polo, Marco, at Khan's court, 218
Polo pony, description, 2074, *2075*
Polonium, 1917; radio-activity, 2029
Polyandry, in marriage, 4536
Polycleitus, sculptor, 2929
Polydoros, sculptor, 2930
Polygamy, effect on infantile mortality, 4537; in history of marriage, 4536
Polygon, 739, 2321, 4330; circles inscribed and circumscribed, 744, 1013
— of forces, stated, 412, 553
Polygonal forms, drawing, 5163, *5165*
Polyhalite, 6742; deposit, *5585*
Polynesian language, importations, 1770
Polynesians, ethnology, 1789; skull measurement, 1785
Polype, *3958*, *4086*; coral, 4084, *4086*
Polypetalæ, defined and classified, 352
Polypi, treatment, 6132
Polypody, *1115*, 1116; culture, 6493
Polytheism, in Babylon, 17; in Phœnicia, 501
Pomegranate, bark, source and use, 6068
Pommel, of saddle, manufacture, 5340
Pompeii, destruction, 2068; excavations at, 2932; fresco paintings, 2933; wall decorations, 2930
Pompey, C. M., career, 1514, 1670
"Pond," Corot's picture, *4300*, 4301
Pons varolii, of brain, *2144*, *2146*
Pont d'Evèque cheese, 4490, 4576
Pontoon bridges, construction, 2889
— of docks, 6497, 6498
Poop, of sailing ship, *5400*, 5401
Poor law officials, 1851, 1926, 1930
— rate, administration, 1851
Pop-gun, in band, *5569*
Pope, Alexander, author, 668 993
Pope, 4320; in Early Middle Ages, 2241: patrons of art, 3675; transfer to Avignon, 4101, 4320
Poplar tree, 6889; bark as tanning agent, 3013; timber, strength, 1260; timber, use, 57, 2827; wood fibre, in paper making, 6280
Poplin, design, 2940, *2941*; dyeing, 6503
Poppet, of lathe, 4912, *4913*
Poppy, *349*; eradication, 1378
— oil, painters', 5118, 5146, 5831; in varnishes, 1035
Porphyry, rock, 529, 1008
Porpoise, 1763; swimming-apparatus, *2039*
Porridge, oatmeal, recipe, 2331
Porbeagle shark, skeleton, *3065*
Porcelain, English, 5606; in dentistry, 5553, 6033; as insulator, 672
Porch, Gothic, 3517
— stone, lead work protection, 5035
Porcupine, quills, 1762, 2156, *2157*
Pore, of skin, structure 1422, *1423*
Pork, choosing, 1228, 3717; carving, *5935*, 5936; dietetic value, 3112, 3381; digestibility, 675, 3314; measly, cause, 3960
Port cylinder, 5642; marking out, 3318

Portamento, in saxhorn playing, 5138, in singing, 6336; in viola bowing, *2825*; in violin playing, 2412
Porter, alcohol in, 1035
— bar, of gluts, 3096, 3108
"Porter" bee escape, use, 5960, *5961*
Porters, railway, 4304
Portland, breakwater, 6335; harbour regulations, 6220
Portland cement, 1856; analysis, *1857*; in damp course of walls, 2265; manufacture, 648, 1578; matrix for mortar, 1952; in plastering, 5500; standard specification, 1862; testing, 1521; use, 1332
— concrete, 334; in construction, 1449
— screw, fossil, *533*, 2836
— stones, *533*, 535; Jurassic, 2254
Portmanteau makers, 2649
Portraits, photographic, 6689
Portraiture, British, school, 4392; in Roman plastic art, 2932, 2933
Ports, British, shipping (1904), 6005; sites, causes of, 4520
Portugal, coins, weights and measures, 410; economic conditions, 5822; exports and imports, 5823; geography, 2232, *2233*; history, mediæval, 2946; from discovery of Brazil to the present time, 5397; navigation in Middle Ages, 5256; population, 628; possession by Spain, 5397; settlements in India, 5397; Spanish trade, 5823; touring directions, 1133
Portuguese E. Africa, geography, 3584
— language, English importations, 1770
Positive, in grammar, 116
— electricity, 288
Positivism, account of, 3869
Possessive case, in grammar, 246
— genitive, Latin rules, 900
Post, of paper, 6397
— boy, in offices, duties, 193
Post office, growth, 2807; staff and salaries, 2150, 2472, 2807; women clerks' salary, 321
— — corps, recruits' standard, 3840
— — savings bank, rules, 3222
— — sub-agents, business of, 4617
— — telephone call offices, 5599
Postage account, bookkeeping, *403*, 2204
— book, in business office, *194*, 977
— stamp dealers, business of, 4615
Postal orders, crossing, 1966
Postcards, picture, trade in, 895, 4419
Poster, designing, 6860; printing, 5872
Posting, ledgers, 490; cautions, 2503
Postludes, list of, 3867
Postmen, appointment of, 2252; examinations, 2811; as sorters, 2809
Postulates, in geometry, 4208
Pot-pourri, recipe, 4972
Potash, use in glazing potash, 5236, 5237; sugar cane culture, 3654; in live-stock excreta, 433, 842; as manure, 590, 4048, *5586*; sources, *5585*; *see also* Potassium
— alum, 4780; as mordant, 1721
Potassium, 842, 5756; extraction, 5757; food of plants, 167, 5585; proportion in earth's crust, 239, 624
— bichromate, ions movement, 4563; use in electric cells, 467
— bitartrate, uses, 1675, 4782
— chlorate, 843; manufacture and uses, 4778, 5760; use, 5586, 6758
— chloride, from carnallite, 5586
— cyanide, 3538; in electroplating, 3421; in gold extraction, 5756
— ferrocyanide, 3537; in dyeing, 5781
— ferrocyanide, characters, 3537
— formate, formation, 3021
— iodide, showing starch in plants, 172
— nitrate: *see* Saltpetre
— oxalates, use, 4782
— permanganate, 1043, 2590, 5055; in opium poisoning, 4006
— sulphate, use, 5586
— salts, 5585; distribution, 3771
Potato, boiling, 1485, 2126; choosing, 1228; croquettes, recipe, 2335; cultivation, *945*, 6674; cultivation area, 4959; cultivation for spirit, 2879; dietetic value, 3312, 3381, 3599; digestibility, 866, 3314; disease, 1372, *1373*, 1669; harvesting, 1665; as livestock food, 1198, 2704, 2905; manuring, 589, 590; market garden, returns, 6836; planting, 431; plough, 1665; raisers, machines, 1847, *1848*; reproduction, 346, *347*; starch from, 3706, 5364; starch, underground branches, 909
Potato, kidney, cultivation, 945
— plant, *351*; classification, 354
Potential, in electricity, 291
— energy, 60, 315, 4133; pendulum and spring, 3748; physiological, 438
— subjunctive, Latin, 1183
Pots, crab and lobster, 4991
— glass, manufacture, 4531
Potter's fire-resisting floor, 4756
Potter's wheel, use, 5233, 5234
Pottery, architectural, 5776; biscuit, 5606; crushed mortar aggregate, 1952; Chinese, 5385; classes, 5778; dealing in, 893; defined, 5160; firing, manufacture, 5160, 5233, 5382–*5385*, 5606; books on, 5778; modern examples, *plate facing* 5233
Pouched mammals, 2037
Poulterers, business of, 4711
Poultices, uses and varieties, 6286
Poultry, breeding, *4659*, *4855*; breeding for utility, *5622*; breeds and their points, *4659*, 4855, *4953*, *5089*; carving, 5934, *5935*; choosing, 1228, 3717; cooking, 1874; *4957*; cross-breeding, 4857; cross-breeds, 5623; exhibition fowls, 4856; fattening, 5877; feeding, 4662, 5093, 5433; food, proportion to carcase, 5094; foods, 5433, 5873; hatching, early, 5626; the incubator, *5263*; killing, 5877; manure, 3010, 5874; parasites, 5091, 5093; preparing for market, 5877; rearing, *5091*; small breeds, *5625*; sources of, 4712; table, points, 4660, 5624; tailless, *5625*; types, *5089*; useless breeds, 5624; *see also* Fowls
— brooders, construction, 5876, *5877*
— farming, methods, *5873–5877*
— fatting pens, construction, 5876
— houses, materials, construction, varieties, 5091, *5092*, *5874–5877*
— pens and coops, 5875
— rearers, construction, 5876
— runs, 5873; fencing, *5876*
Pouring-stick, in soldering, 5628
Poussin, Gaspard, painter, 4299
Poussin, Nicolas, painter, 4118, 4299
Powder, use in demolitions, 6274
Power, definition, 290, 1590, 5010; animal, 5011; development and utilisation, 4516, 5010; electric, measuring, 2812; electrical transmission, 5355; hydraulic transmission, 5356; liquid air transmission, 5356; newer forms, 5010; pneumatic transmission, 5355; shafting transmission, 5353; sources, 5010, 5127; transmission in future, 5011; transmission, methods, 5353; water, 5011; wind, 5012
— in algebra, definition, 1818
— hammer, in forging, 2984
— house, for electric traction, 1931
— installations, engineers', 5589
— loom, 224, 3492, *3493*
— magnetic, stating, 1592
— in physiology, definition, 1797
— in theory of machines, defined, 684
Powers, rules and symbols, 1264
Poynting, Prof., theory of radiation pressure, 939, 3619
Pozzolana, 648; cement, 1578; in Roman building, 142
Practice, in arithmetic, rules, 886
Præsepe, star cluster, *6699*, 6700
Pragmatism, in philosophy, 6470, 6535
Prairies, American, 4064
Pratt truss, 2228, *2229*
Prawn, classification, coloration, 3806
Praxiteles, sculptor, 2920; statue of "Hermes," *345*
Prayer-book, Cranmer's edition, 1640
Praying mantis, 3363, *plate facing* 3361
Pre-Raphaelite painters, 4394
Precious metals: *see* Gold, Platinum, Silver
— stones, 5852–*5854*; books on, 5860; identification, 5853; imitation, 5852; kinds and sources, 5308; setting, 5859, *5860*; sluicing, 2959
Precipitate in chemistry, 1162; formation, typical, 4404, *4405*
Precision grinders, description, 3405
Predicate, in grammar, 608, 760, 1618
Predicative dative, in Latin, 900
Preference shares, 1262, 3185, 3484
Prefix, in shorthand, 1102
Prefixes, in chemical notation, 1045
— Esperanto, 4656, 5373; of German verbs, 1878
Premium, foreign bills, 3682; insurance, 3223, 4726; stock at, 1262
— payment, plans, 6643, 6644
Preparation, of discords, 566
Prepositional phrases, French, 5227; Spanish, 5086
Prepositions, English, 116, 117, 1336; Esperanto, 4655, 5805, 6667; French, 5227, 6089; German, 1342, 1774, 2489; Greek, 6382; Italian, 2045, 5225, 5368, 6234, 6378; Latin, 119, 1470; Spanish, 5085
Presbyopia, 3179; correction, 6264
Presbyterian Church, ministry, 162, 6607
Present worth, explained, 1129
Preservatives, chemical, 5408
Press agencies, list, 4669
— bookbinding, *6776*, 6777
— cylindrical printing, 5383, *5384*
— hay and straw, 1848
— illustration, 6102–*6105*, 6728
— photographic agents, 6688
— photography, 6686
— mould, in electrotyping, 5559
— liberty of, 4843
Pressed glass, manufacture, 4736
Presser-board, of moulding machine, *2541*, 2542
Pressing, in cloth-making, 4106, 4110
— felt hats, 6377
— in iron working, 236
— pad, in dressmaking, 1843, *2059*
Press-spahn, electrical insulation, 672
Pressure, of gases, Boyle's law, 1804; Dalton's law, 1805
— in geology, 898; action on limestone, 1355; underlying strata, 1356
— in mechanics, definition, 1833
— in physics, correlation with temperature, 1740, 1741
— sensation of, physiology, 1421
Preventive service, customs, 2767
Prevention of Corruption Act (1906), quotation, 6211
Price book, use, 776, 6522
Price cutting and maintenance in shopkeeping, 179, 3575, 6208
— lists, wholesalers' periodical, 6209
Prices, cash and credit, 703
Pricing, in shopkeeping, window, 509
Prickling irons, saddlery, 4784
Priesthood, in Buddhism, 417; Egyptian, 419; origin of, 6774; Roman Catholic, 6604
Priestley, discovery of gases, 60, 840
Primary rocks, 2067; palæozoic, 2253
Primates, characters, 1493, 1763, 1871
Prime, arithmetical term, 338, 1715
— costing, in bookkeeping, 2419, 2420
— movers, dictionary of, 6297: *see also* Power, Engines, *etc.*
— vertical, in navigation, 6665
Primer, of guncotton, 6274
Priming, painters', 5834
Primitive air breathers, 3361
Primitive Methodist ministry, 6606
— plants, in classification, 165
Primrose, *349*; pollination, 908; thumb-eyed and pin-eyed, *plate facing* 728
Printing, books on, 6076; branches of, 5026; dictionary of, 5253; invention of, 3604; jobbing, 5871; lithographic, *6635*; machines, modern

types, 5026, *5556*, 5745, 5867; margins, 5458; newspaper work, 5871; office "style" and new spelling, 5460; paper process *5556*; press, Caxton's, 3605; presses, hand, 5744, *5867*; sizes of paper, 5457; stereo-printing, 5556, 5559; women's training and prospects, 323
Printing drum, in carpet manufacture, 3359
— floorcloth and linoleum, 5125
— inks, 1037, 5367
— photographic, 6679, 6681
— phototype, *2793*
— pottery, 5383
— textile, 4499, *4500*, *4501*, 4502
Prints (clothes), coloured, washing, 2688
Prior, Matthew, poet, 993
Prism, *2734*; achromatic, *2951*; combination of three, *3369*, 3370
— in drawing, 1747, *1749*, 2005, *2007*, 2008; sheet metal, 4524
— powder, manufacture, 6759
Prismatic compass: *see* Compass
Prison commission, appointments, 3301
Private, army, 3840, 4030; R.A.M.C., 4031
— coaching, fees, 6479
— ledger, definition and function, 778
— schools, conditions and masters, 6477
Privet hawk-moth, *3513*
Privet, garden hedge, 6318
Probate valuation 5151
Proboscidea, mammals, 1494, 1762
Proboscis, butterfly, *3514*; moth, *3515*
Process blocks, 6481; in printing, 5872
Producer gas, 6818, 6829; use in furnaces, 2863
Product, in algebra, 1818, 1994; in arithmetic, 90
Production, cost of, on balance sheet, 2756; factory work, 6642
Products, natural, 5379, 6880–6891
Profession, choice of, 161–164; commercial, examinations, 148; medical, 5422: *see also* Clerkship
Profile cutting, processes, *3402*
Profile, dam, formulæ, 4334, *4335*
— in sculpture, measuring from, 1510
Profit, falsification, 2421; gross and net, 2271; calculation, 2420; relation to dividend, 2421; relation of stock, 2418; sharing, 6644
— and loss, arithmetic rules, 999; in partnership concerns, 2978
— — accounts, bank bookkeeping, 4440, 4441; classification, 2755; company balance sheet, 3189; debentures, 3331; relation to trial balance, 2201, 2502
Prognathous races, 1786
Prognosis, defined, 5540
Progress and evolution, 650; and natural selection, 5386; promoting, 5390; sociological law, 5386, 5388
Progression, in harmony, 364
— of mammals, 1869–1871
— in mathematics, 3913
Projectiles, nickel steel, 4747: *see also* Ammunition
Projection, in drawing, 1747, *1749*
— in geography: *see* Maps
— in geometry, 5473; envelopes, *4523*; sheet metal, 4522
Projector, in drawing, 1747, *1749*
Promiscuity, in history of marriage, 4536
Promoters, company, defined, 1262
Pronouns, English, 116; classification and personal, 447; demonstrative, interrogative, relative, 605; indefinite, 607; formation of adverbs, 1185
— Esperanto, 5516; personal, 4655; possessive, reflexive, 4943, 5949
— French, demonstrative, 2194, 5800; indefinite, 2348, 5802; personal, 2046, 5653, 5800; possessive, 2195; relative and interrogative, 2633, 5801
— German, demonstrative, 2350; indefinite, 2776; interrogative, 2488; personal, 745, 1056; possessive 1342, 1678; reflective, 2049; relative, 2776
Pronouns, Italian, demonstrative, 4503; indefinite, 4504; interrogative, 4648; personal, 3642, 3784, 4070, 4215; possessive, 4504; relative, 4647
— Latin, 242, 601; interrogative, 444; relative, 443
— Spanish, 2917; demonstrative, 3056; indefinite, 3207; personal, 2917; possessive, 3056
Pronunciation, in singing, *6383*, 6388
Proof, printed, correction, 4190, *4193*, 5159
— reader, duties, qualifications, 5459
— spirit, 3314; production, 2879
Propellers, aluminium bronze, 5992; screw, 835, 5258; steamer, number, 5402
Property, estate agency business, 5285; interest, 5152; investment in, 3225; auction, 5986; valuation, 5151
Proportion, in algebra, 3695
— in architecture, principles of, 2135
— in arithmetic, rules, 996
— in design, principles, 5977
— in drawing, 468
— in geometry, 5337; problems, 5473
— in modelling, 1351
Proportional parts, rules, 998
Proportionals, in geometry, 472, *473*
Propositions, in geometry: *see* Geometry
— of syllogism, 6098
Props, in mining, use, *3560*, *3565*
Propyl alcohol, preparation, 2877
Prose, and poetry, 304, 2309; general characteristics, 1607
Prosody, defined, 1766
Prospector, mining, equipment of, 2380
Prospectus, of limited company, 1262, 3186, 6801; debentures, 3330
Prostyle, temple, in architecture, 2859
Protasis, Latin syntax, 1183
Protection, methods of mammals, 2155
Proteids, animal food, 4133; composition, classification, 3110; excess in human body, 867; digestion of, 673; in meat, 866; physiological chemistry, 438; relation to protoplasm, 135; source, 3111
Protein, 4133; groups of, 4133
Protestantism, English, during reign of Elizabeth, 3997; Marian persecution, 3834; massacre of St. Bartholomew, 4102
Prothallus, club moss, 1310; ferns, *1116*
Proto, in chemistry, 4136
Protohippus, fossil horse, 1177
Protoplasm, 134; amœba, 278; cell formation, 29; in chara and spirogyra, 1370; in human body, 199; effect of hydrocyanic acid on, 3537; in living cell, 1370; nutriment of, 167; peculiar to living things, 275; in plant reproduction, 348; in plant roots, *167*; poisons, list of, 3017; reproduction, *381*
Protozoa, 4087, *4089*; characters of, 1493; life phenomena, 276
Protozoan, in biology, defined, 380
Protractor, 284; kinds, *4703*, 4706; in plotting surveys, 369
Proving, in breadmaking, 3283, 3392
Provision merchants, business of, 4713: *see also* Grocers
Provisional protection of patent, 1610
Provisions, economical purchase and use, 5581; in season, table, 1531
Prunes, 6889; drying, dipping, softening, 4845; nutritive value, 3590
Prussia, history (1511 to 1786), 6302; Napoleon's victories over, 5238; war with France (1870), 5240, 6445; war with Austria, 6445
Prussian blue, 871, 3536, 5145
Prussiate of potash: *see* Potassium ferrocyanide
Prussic acid: *see* Hydrocyanic acid
Pseudo-aconitine, powerful poison, 4012
Pseudo-astatic governors, 2020
Pseudopodium, 276; of amœba, *4088*
Psychical activity, definition, 6259
— energy, unrelated to physical, 6466
— research, 3287; ghostly phenomena, 3625; telepathy, etc., 3661
Psychics, distinct from the physics, 4450; value, 5532
Psycho-physics, theory, 2014, 2694
Psychology, 3287, 3382, 365, 3661; comparative, value of, 4123; dictionary of, 2015; differentiation from physics, 1563; in evolution theory, 1588, 1705; relation to biology, 137; relation to physiology, 97; subconscious mental activity, 3183
Psycho-physical interaction, and parallelism, 6536
Pteranodon, skeleton, *plate facing 2065*
Pteridophytes, characteristics, 165
Pteropod, muscular fins, *3113*
Ptolemy Philadelphus, strife with Cleopatra, 1514
Ptolemaic system, in astronomy, 6118
Ptolemy's theorem, in geometry, 5636
Ptomaines, discussion of term, 3826: *see* Alkaloids, animal
Ptyalin, 577; action on food, 674, 3706
Public, analyst: *see* Analyst, public
Public health and hygiene, 2663; local government duties, 316; London, 319; officials, salaries, 82, 697; women's work, 700
Public Health Act (1875) provisions, 1978, 2422, 6213
Public Health Acts, urban district powers, 316; Ireland, 317
— houses, free and tied, 3734
— libraries: *see* Libraries, public
— schoolmaster, qualifications, 6476
— schools, boarding-houses, 6477; masterships, 6476, 6477
— speaking, voice production, 2538
Publicans, business of, 3735, 3737
Pudding-stone, structure, 897, 1072, *1073*
Puddings, 1485; recipes for, 2001
Puddle wall, of earthen dam, 4333
Puddled bar, in iron working, 232
Puddlers' mine, in iron refining, 232
Puddling iron, 232, 1044, 4635; furnace, *232*, *4636*
Puering leather, 3010
Pug-mill, brick, 643, 1281, 1823
Pugging, in floor construction, 4446
Pullets, care of, 5093; feeding, 5433
Pulley, diameter of, and speed of belt, 3269; with belting, 962; blocks, 684, 834; cone, *5212*; high speed, governors, 2021; key-grooving, 3404; metal, in belt driving, 3532; practical applications, 687, 834; systems of, 685; in theory of machines, 684; of shaft belts, 5353; types and speeds, *3423*, 3424; in wire rope driving, 5355; use of gearing chain, 4000
Pulling, in flax preparation, 1385
Pulling-over, in bootmaking, 4541
Pulmonary artery, anatomy, *953*, *955*
— circulation, account, 1192, 1195
— veins, *955*, *956*, 957
Pulp cavity, of human teeth, 576, *578*
— papermaking, treatment, *6393*, 6398
— papers, for walls, 5827
— yarn, manufacture, 6400; uses, *6400*
Pulper, in agriculture, *1847*, *1849*
Pulse, human, 1194; beats, 1192
— plants, 874; kinds and cultivation, 4962
— in tonic sol-fa, 807
Pulsometer pump, *1824*, *5932*
Pumice, classification, texture, 1008
—stone, structure, *1006*, 1037, 6573
Pump, air: *see* Air-pump
—centrifugal, principles, 1686, *1687*, 1808, *6060*
—dredging, 5336
—engine, *4427*, 4428
—force: *see* Force-pump
— handle, carriage, 2820, *3124*
— hydraulic, 5677, 5678, 5679
— oil-extracting, 3191
— rotary, construction, 1686, *1687*
Pumping, appliances, 1824, *1825*, *1826*; dock construction, 6496; engines, 6034; windmill power, 6061
Pumps, principles, varieties, and working of, 1080, 1141, *5931*, *6060*; books on, 5596

Punch, use, 3108, 3388; mechanical action, 4584, *4585*; temper, 4746
— cartridge manufacture, *6615*, 6617,
— centre, form and use, *4585*, 4586
— in dressmaking, 185
— mason's, *2837*, 2839
— props, in mining, 3457
— shoemaker's, 3876
Puncheon, quarrying tool, *532*
Punching, *2987*, 2990, 3095, *3097*; in bootmaking, 4437; hydraulic machinery, 1222; machine, *3105*
— in telegraphy, *4386*
Punctuation, book on, 6352; in business letters, 6351; compositor's marks, 5158; English, 1471; French, 449; German, rules, 4363; Greek, 5375; laws of, 1338; in printing-offices, 5460; Spanish, 2041; in typewriting, 1696
Punic wars, 1204, 1381, 2946
Punishment, determinism, theory 2996
Punjaub, province, India, 2820; products, 5380
Puntato, violin bowing, *2742*, 2743
Pupil, of eye, anatomy, *2400*, 2952
Pupil teachers, in elementary schools, 6474; under L.C.C., 1679
Purbeck marble, 533, 535
Purchase department, factory, 6639
— record book, 6522
"Purchases," of ropes, 6408
Purfling, violin, *2121*; tool, 6705
Purkinje's figures, in optics, 3181
Purl, in sewing, 153
Purlins, of king post truss, *4249*, *4251*; roof, 5792, *5793*; trussed, *4253*
Purple dyes, 5905, 5907
Purple madder, pigment, 871
Purpose, in grammar, English rules, 756; Latin, 1183
Purser, mercantile marine, 6365, 6806
Pus, corpuscles, in, 953
Pusher, of lace loom, 4881
Puss-moth, *3513*, *3515*
Putrefaction, bacteria of, 3536; causes of, 2851, 2878; of food, 5403
Putty, fire-resisting, 1036; glazier's, composition and use, 5838, 5839
— lime, in gauged work, 1953
— in plastering, manufacture, 649
— powder, composition and use, 1036
Pygmies, African, 3278, 3279
Pylon, Egyptian architecture, *2521*
Pylorus, *576*, 578; in digestive process, 674
Pyramid, in drawing, 1747, *1749*; geometrical problems, 2006; perpendicular and slant, 4522
— in sheet-metal, drawing, *4522–4526*
Pyramidal cell, cause of knee-jerk, *2994*
— figures, apex inaccessible, *4525*, 4526
Pyramids, Egyptian, 419, *2520*; approximate date, 2519; brick of, 1278; mortar in, 1458
Pyrene oil, production, 1032
Pyrenees, France, 1682, 2232
Pyrethrums, culture, 6320, 6491
Pyrites, burners, construction, 4626
Pyrites, copper, 768, 4127
Pyrites, iron: *see* Iron pyrites
Pyrogallol, 3822, 5366; uses, 5467
Pyrography, in cabinet making, 6584
Pyroligneous acid, preparation, 3021, 5464
Pyrolusite, 6742; chlorine, 4776
Pyrometer, in galvanising, 6169; use and construction, 4468, 6129
Pyrope (stone), 5833, 5855, 6742
Pyrosoda, use and cost, 6680
Pyroxylin, manufacture, 3140, 5470
Pyrrhotite, nickel ore, 5981, 6742
Pythagoras, on shape of earth, 34; sound ratios, 2311; theorem, 5043
Pythons, limbs, crushing power, 2678

QUAD, in telegraphy, defined, 4668
Quaderno, in bookkeeping, 1467
Quadrant, in astronomy, 6244
— in mathematics, explained, 13
Quadratic equations: *see* Equations
Quadrilateral, 4330; propositions on, 4723
— figures, geometry of, 496
Quadruped, characteristics, 30, 136
Quadruplex circuit, telegraph, 4668, *4669*
Quail, 2212; carving, 5934
Quantitative chemistry, origin of, 60
Quantity surveying, nature of, 6505
Quantity surveyor, 1911, 6505
Quarantine certificate, ship's, 6806
Quarries, legislation, 1978; stone, 528, *532*; working, 2375, 2847, *2955–2960*; ventilation, 3768
Quartering, timber, *52*, 3544
Quartermaster, Army, 4030; marine, 6804
Quartz, 6742; in building stones, 529, 530; crystals, *plate facing* 1345; disintegration, 1813; fundamental form, 767; gold deposits in, 360; precious stone, varieties, 5853, 5855; refractoriness, 3941; sand in firebricks, 1285
— glass manufacture, 4931
Quartzite, 1075; road material, 2182
Quaternary rocks, order, 2067
Quay, walls for dock, 6494
Quebec, bridge, dimensions, *2739*, 2740
— province, agriculture, 3205; geography, 4068
Queen bee, *5957*, 5959, 5960
— cells, of beehive, *5958*, 5960
Queen post, roof truss, 2446, *2447*, 2497, *2499*, *4251*, 4252
Queensland, economic conditions, 5660; export trade, 3237; farming, 3237; geography, 3700, *3701*
Quercia, Jacopo della, sculptor, 3676
Quercus and varieties: *see* Oak
Quick bead, in jointing *3845*, 3848
Quicklime, 60, 844; in brickwork, 647; in farming, 257; slaking, 1457
Quicksilver: *see* Mercury
Quill feathers, sources, treatment, uses, 6609
— lace, making, *5620*
Quillaia, source and uses, 5781, 6068
Quillwort, structure, habitat, *148*
Quince, oil, source, 5469
Quinine, 4012, 4286, 6067; source, 354, 4012, 4286: *see also* Cinchona
Quinsy, symptoms and treatment, 6133
Quittor, in horses, 2621, 2622
Quoins, use in building walls, 3033, *3035*; binding of, *2177*
— compositors', 5457, *5459*
Quotation marks, in letters, 6352
Quotient, in arithmetic, explained, 91
Quotition, division process, 220, 230

R in shorthand, 586, 837
Rabbi, diploma, preparation for, 6602
Rabbit, 2155; Australian pest, 3698, 3702; carving, 5934, *5935*; choosing, 1228; dietetic value, 3311; digging claws, 1871; fur and skin, 6428; teeth, skull, 1762
— down, upholsterers', 6715
Rabelais, François, author, 2962
Rabies, Pasteur's treatment, 3274
Raccoon, 1764; skins, 6428, 6430
Race-development, bacteriological, 6782; evolution, 1705
Racehorses, 2073; breeding, 827
Races, African, *3279*; S. African, 3586; Asiatic, *2716*; bacteriological evolution, 6782; ethnology of, 627
Rack, 3921, *3922*; in railway construction, *3814*, 3815, *3816*
— bench, circular saw, *6143*
— railway, construction, *2275*, *3814*; in United Kingdom, 2276
— strub railway, 3816, *3817*
— tail, of clock, *5883*, 5884
Racking back, in wall building, 2385
— square, use in brewing, 6057
Radial winding of dynamo, *1322*
Radian, in trigonometry, defined, 6085
Radiation, 4090, 4093; animal heat, 1900; in design, 5819; human, 440; laws of, 2060, 4094
— pressure and gravitation, 939; of light, 938; of moving body, 3619: *see also* Light, pressure of
Radiators, electric, construction, *3031*
— water-heating system, *6017*, 6022
Radicle, of barley, in malting, 874
— plant, *347*, 350; wheat, 913, *916*
Radio-activity, and ablogenisis, 2554; earth's crust, 2061; human, 4440; of metals, 4104; universality, 2029, 2031
Radiobes, culture, 2031, 2032
Radiolarians, description, 4088, *4089*
Radiometer, 938, *939*, 1266
Radish, 352; culture, 6675
— wild, weed, 1378
Radium, 2027, 2395, 4104; action on living matter, 2030; alpha rays, 2028, 4104; analysis and synthesis, 4131; antiseptic, 2030; beta rays, 4104; compounds, 2030; Mme. Curie's experiments, 2028; discovery, 203, 1297; disintegration theory, 2029, 2393; duration, 1916; effect on physical dogmas, 313; electrons in atom, 2295; energy, 4105; emanation, 1916, 2392, 2553, 4105; evolution, 239, 1916; gamma rays, 2028, 4105; heat rays, 2028, 2393; and inertia, 424, 2063; instability of atom, 2295; and Röntgen rays, 2028; spectrum, 2027; in sun, 2553
Radius, of circle, definition, 4208
— human, 1708, *1709*; of rhinoceros, horse, tapir, *1179*
Raeburn, Sir Henry, painter, 4392, 4393
Rafters, construction and varieties, 4247, *4249*, *4253*, 5794
Rag boiler and cutter, paper, *6278*
— tearer machine, *2897*
Rags, in paper manufacture, *6225*, 6278; in textile industries, 2897
Rail mill, arrangement, 5019
— section, in plating-shop, *3096*
— welding, tramway, methods, 3752
Railing, in masonry, 3038; fixing, *5795*, 5797
Rails, of door frame, 5179, *5181*
— in railway construction, 3429, 3607; arrangement at small station, *3616*; construction and laying, 3252, *3254*; cross-over arrangement, *3609*; expansion and contraction, 1500; fractured, examination, 5103; function, 3436; guide, use, *3609*; joints, *3607*; "keying up," *4591*; laying, *3431*, 3432; length, 3437; nickel steel, use and wear, 5019; steel for, 4747; steel, 5019; stiffness, 3607; tests, 3607, 3962; wear of, *3437*; weight, 3611
— of tramway, setting, 3751, *3752*
— in vehicle construction, 2830
— of waggon, light, 2829, *2830*
— of window sash, *5183*, 5184
Railway beetle, emission of light, 3511
— carriages: *see* Railway rolling stock
— companies, administrative departments, 4227; clerical staff, 4230; election of directors, etc., 4227; engineers, 4231; general manager, duties, 4227
— construction, 157; books on, 3908; cost, 3052; embankment, 3253; coach, rails, 3429
— engineer's inspection, *4593*, 4594
— rolling stock, axle-boxes, 3265; axles, 3325; bogie frames, 3121; brakes, 960; construction, books on, 3908; design, 2555, 2727; double-decked cars, 2462; heating and lighting, 3025; makers, employment conditions, 2653; materials, 2827, 3906; passenger, 2462; springs, 2726; ventilation problem, 3024; wheels, 3126
— stock, 3483, 3484
— stations, *3616*; paving, 2181; roofs, 2448
— waggon makers, employment, 2653
Railways, block system, 4685; branch line enterprise, 2276; British mileage, receipts, etc., 2274; cartage departments and staff, *5070*; catering, 4810; Colonial appointments, 3548; earthworks, 3171; economics, 3051; engineering books, 5595; laboratories, 5102; maintenance cost and receipts, 2276, 3054; merchandise traffic, *5068–5073*; mileage total, 4517; relaying precautions, 4592;

Railways—*continued*
servants, occupations, 4380; shops, carpentry, 4646; speed, 2274; staff divisions and conditions of employment, 4379; suburban, tramway competition, 2274; surveying, 159, 801; traffic apparatus, regulation, *4692*; as transport means, 2154; waggons, and carriage of goods, 5068; water supply and tanks, 3615; waterways, 3613; working expenses, 3053
— electric, 2085, 2090; books on, 4298; continuous-current system, 2088; first invented, 128; modern forms, 2085; intra-urban, *2085*; multiple unit control, 2090; single-phase system, 2088, *2089*; speed, 2274; third-rail and overhead wire compared, 2276, *2277*; three-phase system, 2089, 2090; Zossen experiment, 131
— mountain, *2276*; adhesion and rack systems, 3817; construction, *3813*; rack railways, *2275*, *3814*
— tube: *see* Tube railways
Rain, blood-coloured, 1500; effect on building stones, 2835; formation, impurities, 4155; as geological agent, 1501; health value, 3799; mechanical effect, 1503; influence of mountains on, 4495; meteorology, of, 294, *295*, 4021; relation to climate, 4494; and water supply, 4026
Rainbow, cause of, 2899, 2900
Raindrop, formation, 1900; internal reflection of light, *2900*
Rainfall, 294, 4026; affected by forests, 1814; available, defined, 4025; calculation, 781, 4024; cause, 294, *295*, *296*; distribution and fluctuation, *295*, 4494; drainage, 738; economic value, *5660*; effect on rivers, 5113
Rain-gauges, varieties, *4024*, 4994, 6131
Rain-water, 4155, 4158, 5760; drainage, 569, 738, 780
Raise, in mining, 3194; drills in, 3457
Raised beaches, cause, 1353
Raisin, 4844, 4876, 6890
Raising, in sheet-metal work, 4521
— gig, cloth making, *4109*
Rake, haymaking, *1630*
Raleigh, Walter, author, 2687, 2962
Ram, hydraulic, 1220, 1685, *1686*, *5932*; of force pump, 1081
Ramie, *720*, 5118; cultivation, 720; dyeing, 5639; fibres, 68; making silver, 1724; manufacture, 721, 1390, 2100; microscopic structure of fibres, *821*; substitutes, 817
Rammer, small bench, *2457*, 2458
Ramming, in founding, *2111*, 2360, 2540; soft, 2547
Ramsay, Sir W., discovers argon, 237, 1298; discovery of helium in radium, 1916; on practical training, 156; atom synthesis, 4131
Randing, in basket-making, 5489
Random work, masonry, 1452
Range, kitchen, management, 1226, 1227
Ranges, in building, setting, 2390
Ranging poles, in levelling, 374; in traversing, 368
— rods, in surveying, 262
Rangoon oil, defined, 5915
Rankine, Prof., on Boyle's law, 1805
Ransome's artificial stone, 1520
Rantering, stitch in tailoring, *1111*
Rape of the Sabines, *1057*, 1135
Rape, classification, 352; cultivation, 1198; as livestock food, 2704, 2905; micrographs, *3893*
— cake, as livestock food, 2704, 2908; as manure, 589, 590
— oil, source, 1032, 4831, 5118, 6148
— seed, 1032, 5118; oil extraction, 4830
Raper's tables of logarithms, 6659
Raphael, architect, 3676; painter, place in Italian art, 3796, 4299
Raphides, function, *1114*
Raritan river, swing bridge, *2887*, 2888
Rasp, bamboo, *5725*
— plumber's, 5029, *5030*
Raspberries, canning, 4846; culture, 6678, 6890; pulp, source, 4846
Rat, omentum, *437*; owls' food, 2498
Ratchet, in motor vehicles, 3128
— brace, in screw driving, 3844
Rate-collecting, bookkeeping, 3569
— collector, qualifications, duties, 1069
Rates, on balance-sheet, 2882
Ratio, in algebra, 3695; in arithmetic, 996; in geometry, 5337, 5635
Ratiocination, in logic, defined, 6098
Rationalism, in logic, 6097
Rattlesnakes, structure of rattle, 2679
Rave, of vans, 2828, *2829*
Raven-Hill, L., pen-drawing, *6103*
Rawhide belts, tannage, 3712
Ray, fish, 3065, *3067*, 3069
Rayleigh, Lord, scientific work, 36, 1206, 2315
Rayonnant style, in architecture, 3374
Razor shell, boring apparatus, 3285
Razors, manufacture, *5477*, 5478
Reaction turbines, principle, *1689*, 1691
Reactions, chemical, 4403, 4406
Readers, proof, duties, 4430, 5026, 5459
Reading, educational value, 103, 2937
— aloud, art of, 1474
Reagents, in chemical analysis, 4404
Real, in philosophy, unknowableness, 6465
Realism, in art, 18[illegible], Chaldean, 2657; prehistoric Egyptian, 2519; Greek, 2930, 2931; Roman, 2933
— in philosophy, crude, 6253
Reality, eternity of, 6539
Reamering, 3095, *3097*, *3317*, 3319
Reamers tools, types, use, *4264*
Reason, importance in theory and practice, 1946; non-rational side of life, 3288; psychological account, 2803; in relation to judgment, 2404
Réaumur scale, 6128
Rebate, use, 3385
Rebating masonry joints, *3035*, 3039
Recapitulation theory, stated in relation to mental growth, 3117
Receiver, telephonic, *5681*
Receiving order in bankruptcy, 3569
Receptacle, of flower, 346, *347*
Reciprocal diagram, machine design, 415; stress, girders, *2227*, 2228
Reciprocating machines, types, 3319
— tools, *3401*
Recitative, in singing, 6340
Recognition, methods, animal, 2157
Recreation, 2672; value, 2548
Rectangle, geometry of, 496, 1086, 1251, 1442, 1549, 4723
Rectangular measure, 6085
Rectilineal figures, 4330, 5472
Rectum, *576*, 579
Recurring decimals, 884
Red cedar, wood, *55*
Red Indians, distribution, *627*, 629
Red lead, 1160; manufacture, 358, 1036, 5144; uses, 5988
— pine, timber of, *54*
— poll cattle, *432*, 2236, 3666, *3667*
Red Sea, currents, 558
Redcaps, fowls, points, *4957*
Red-hot poker, 355; culture, 6529
Redoubts, construction, *6271*, 6272
Red-shortness, iron, 234, 1045
Reducer, photographic, 6682
Reduction book, in surveying, 368, 370
— of plans, 370, 371
— in sculpturing, 1676
Redwoods, kinds, as dyes, 5906
Reed, sewage plant, 4549
Reeds, in joinery, 5179, *5181*
Reed-fish, classification, 3066, *3071*
Reef, saddle, *2377*, 2379, *3304*
Reeling, silk, 2598
— textile, 2592, *2593*
Reflection, importance in education, 2136; in Locke's theory, 2013
— in light, *2599*, 2735
— sound, 2101
Reflex action, 2301, *2303*; mutual inhibition, 2258; psychological importance, *2117*; and instinct, 2694; and will, 2993
— arcs, scheme of process, *2117*
Reform Bill, history of, 5686
Reform, function of sociologists, 4276
Reformation, coincidence with Renaissance, 3520; history of, 3650
Refraction, in light, 2599, 2732, *6665*; double, 2432, 3849, 4554
Refractive index, definition, 2732
Refractory materials, properties, 3941
Refreshment stalls, railway, *4801*, 4810
Refrigeration, 4316; food, *5403*
Refrigerator, brewery, 6058, 6059; creamery, *4281*
Refuse, house, disposal, 5020
Refuse destructor, types, 5020, *5025*
Regelation, phenomenon of, 1740
Register stove, construction, 6015, *6017*
Registers, voice, 6182, 6193
Registry office, servants', 609
Regulator verge watch, *6081*
Reichert's gas regulator, 241
Reid, Dr. Archdall, on alcohol problem, 5672; on bathmic evolution, 652; on heredity, 1313; on mental evolution, 1589, 1705; reversion theory, 1180
Reinforced concrete, 1554; compressive stress, 1646; tensile resistance, 1646; uses, 1643
Reins, manufacture, 4886, *5057*
"Reisert" filter, *5765*
Relapsing fever, bacillus, 6260, 6541, *6512*
Relay, telegraphic, 4606, 5065, *5244*
— frame, telephonic, *6079*
Reliefs, ancient Egyptian, *2520*, 2523; Roman, 2933; in sculpture, 1345
Relief: *see* Poor Law
Relieving officer, duties and salary, 1927
Religion, influence on art, 2480; books on, 6773; in Assyria, 501; Babylonian, 17; Egyptian, 419; in Egyptian art, 2519; established, social force of, 5531; geographical distribution, *629*; Hindu, 418; history of, 6771–6774; influence on development, 1706; of the lower races, 1788; lowest forms, 6771; practical versus metaphysical, 6256; primitive, 6771, 6772; relation to morality, 6773; service of philosophy to, 6539; women, attitude to, 4825
Religious persecution, Buckle on, 5099; in history of religion, 6774
Rembrandt, painter, *724*, 3949, 4299
Remedies, of disease, 5541, 5699; psychic, 5699; synthetic, 5469
Remington typewriter, 1528, *1529*
Remittent fever, cause, remedy, 6260
Renaissance, 3519, 3650; effect on English language, 1769; painting, *3793*
Rendering, plastering, 649, 780, 5499
Rennet, 4491; action on milk, 4489
Renold chain, 4001, *4002*
Rent, on balance-sheet, 2882; dead, *3919*; ground, 5153; proportion to income, 3222
Repeat, in design, 5819, 5977, *6592*
Repeaters, telegraphic, *5535*
Repeating coil, of telephone, *5878*
Repertory, acting companies, 6865, 6868
Repetition, geometrical, 2321, *2321*
Reporter, 4190; salaries, 162, 4431
Reporting, newspaper, 4190
Repose, angle of: *see* Angle of friction
Repoussé, art metal-work, *5526*
Reproduction, *1315*; amœba, 278; by fission, *381*; of plants, 346
— fee, photographs, 6687
Reptiles, 29, 30, 2677, *2798*; extinct, skeletons, *plate facing* 2065
Re-saws, circular and band, 6145
Reserve account, bookkeeping, 2881
— Navy, service with, 4265
Reservoirs, water, 4025, 4333; reinforced concrete, *1554*, *1555*; service, 4334; sewerage, *4462*; stability of walls, *2573*: *see also* Dams
Resin, 810, 1034, 5147; as electrical insulator, 672; in varnishes, 5835
— fossil, 1034, 5147
Resins, varieties, uses, 6890
Resistance, electric, 670; heating effects, 3030
— box, electric, *790*
— sense of, in psychology, 2118

Resolution of forces, 411, 551, 1833
Resonance, electric, *3749*; in sound, 2104
Respiration, 1294; aid to blood circulation, 1194; control, 5841; day cycle in health, *4529*; physiology of, 441, 1299; of the skin, 1422: *see also* Breathing
Respiratory organs, 196; diseases, 6132
Rest, value and curative effect, 4389
— in physics, 553
Restaurants, catering and management, 5583;· tourist vocabulary, 1962
Restoration, the, 4762; drama, 1149
Rests, lathe, kinds, *4913*, 4919
— in music, 38, 921
Resultant force, defined, 411, 1833
Retail business, expansion, 5925; management, organisation, 6054
— shops, wholesalers', 6208
— trader, definition, 43
Retaining walls, hydrostatics of, 1077; stability of, *2571*, *2573*
Retardation, in mechanics, 423
Retina of eye, 2402, *2403*, 2953, 3226; mechanical function, 839, 1882, persistence of image, 2259; physics, 3226
Retort furnace, principle, use, 4126
Retroussage, in printing etching, 6112
Retting, of flax, 1168, *1385*; silk, 1246
Returns inwards, 1572, 2272
Return-tube boiler, *3098–3100*, 3105
Reveals, in building, *2173*, 2174, 2176
Revenue office, departments staff, 2765
Reverberatory furnaces, *232*, 3108, 4125, *4126*; construction and working, 2864; for galena, *357*, 358, *5986*
Revers, in tailoring, making, *2206*
Reversion, biology, 1180, 5389
Revetments, military engineering, 6271
Revolution, French, history, 5111
Revolvers, types, construction, *6415*
Reynolds, Sir Joshua, painter, *4393*
Rhamnus, dye, 5907; bark, 6068
Rhea: *see* Ramie
Rheostats, telegraphic, 4606, *5241*, *5242*
Rheumatic fever, 5540, 6038; cause and remedy, 3819, 5410
— gout, causes, symptoms, 6038
Rheumatism, remedies, 5469, 6068
— in pigs, 2626
Rhine, river, basin, *456*, 1838; course, 1835, in Roman history, 1830
Rhine Provinces, 1975; architecture of, 3233; industrial area, 5826
Rhinoceros, *1179*, *1490*, *1869*, 1870
Rhizome, of ferns, *1115*, 1116
Rhodes, island, 6447; sculpture, 2930
Rhodes scholarships, 482
Rhodesia, 3587; police, 3549
Rhododendrons, classification, 354; culture, *6316*; nectar-guides, *730*, 731; poisonous to cattle, 2624
Rhomboid, geometry of, 496
Rhombus, 496, 4723; geometry of, 1084
Rhone, river, course, 1682, 1838
Rhubarb, 6890; culture, 6675
Rhumb-line, defined, *6665*
Rhus vernicifera, lacquer from, 6576
Rhyme, first use in English comedy, 1149; function in poetry, 306
Rhythm, in poetry, 305
Rib, human, *1300*, *1604*; in singing, *6018*, 6052
— moulded, in building, brick for, *1949*
— vaulting, in masonry, 3145, 3146
Ribbands, in shipbuilding, 5617, 5740, *5742*; marking position, 5739
Ribbon, stiffening and cleaning, 6040
— typewriter, price and varieties, 1528
Ribera, painter, 3796, 4120
Rice, areas of cultivation, 4875; Chi- 'tivation, 2974, 2976, 5658 climatic conditions, 4493, 4873, cookery, 2335; dietetic value, 3312, 3599; digestibility, 3314 starch, 4556, 5364; uses, 6890
— meal, as live-stock food, 2704, 2909
Richard I., 2914
Richard II., reign, 3249
Richard III., life and reign, 3603
Richardson, Samuel, novelist, 3129,
Richelieu, Cardinal, career, 5110
Rickets, causes, remedies, 5409, 6037
Rickshaws, use, 2153
Riddles, drain-pipe, 5777
Riddling, in fishing, 5314
Ridge, of roof, 4253, 4870, *5185*, 5187
— plate, of roof, 4248, *4249*, *4250*
— tiles, roof, *4867*, *4869*, 4871, 4872
Riding, as means of locomotion, 2152
— harness, dimensions of, 4886
Riffle, metal chasing tool, 5526
Riffles, use in mining, 2959
Rifles, types and construction, *6415–6421*
Rifling, guns, *6419*, 6420
Rigging, ship's, working of details, 6409
Righi, detector and oscillator, *3895*
Righi railway, construction, 3814, *3815*
Right angle, degrees, 6085
Right-angled triangle, 494, 4330
Right and left-handed, discussed, 3535
Right ascension, in astronomy, 6245; in navigation, *6665*
Right of way, legislation, public, 1979
Righting arms, of ship, 5970, *5971*
Rigidity, of materials, 209; in mechanics, 86, 1375
Rigs, of sailing ships, types, *5398*
Rim, of pulleys, measurements, 3423
Rimer, use, 5723, *5725*
Ring, in building, 2386
— doubler, thread manufacture, *2707*
— jewellers' manufacture, 5859
— segmental, pattern, 2454, *2455*
— spinning frame, *2442*, *2593*
— wooden, building, 3540, 5296, *5299*
Ringbone, in horses, 2622
Ringed worms, description, 3956
Rings, tree, rate of formation, *168*
— of trachea, human, *2144*
Ringworm, of cattle, *2627*, 3672; in horses, treatment, 2622
Rio Janeiro, description, *4288*
Rip saw, use, 3385
Ripper, slater's, 4865, *4867*
Rippling, of flax, 1385
Risers, of stairs, mitring, 5300, *5301*; of stone staircase, 3241
River, 456; bank facing, *5579*; barriers to communication, 4496; bed, cross sections, *5115*; as communication routes, 4496, 4517; effect on civilisation, 4497; discharge, 5114; embankments, 1643; engineering works, 5333; excavation by, *1634*; fall rate and maximum floods, 5115; gauging methods, *5114*; hydraulic mean depth, 5115; hydraulic works, *5333*; industrial centres, 4497; irrigation, 4497, 5483; power source, 4495, 4497; sediment deposit, 1816; self purification, 4547; sewage pollution, 4547; slope, influence of, 4495; tidal divisions, 5113; tidal works, 5333, 5334; tide observations, 1017; velocity finding, *5116*; water characters, 4156, 4158; weirs, *5333*; width, measurement, by military engineer, 6265
— police, duties, 1407
Rivet, engineer's, types, 3003, *3007*, *5351*, 5352; in ironwork, *1453*; in sheet metal work, 5352; shipbuilding, types, *5922*
— holes in girder, 450; in metal plates, 3095; of ship plates, 5919, 5739
Riveter, pneumatic, *1803*, 1807; portable hydraulic, 5676, *5678*
Riveting, *5351*, 5352; by compressed air, 5356; hydraulic, 1220, 3100, *3105*, 3106; plating, *3095*; in shipbuilding, *5917*, *5922*, *6221*
Road, rule of, in driving, 4185
Roads, 157; construction and maintenance, 2179, *2182*, 2422; drainage, 572, 2323; gradients, 591; laws and regulations, 1977; military, 6270; steam rolling, 2325; watering, 2326
Roasting, in cookery, 1486, 1487, 3313
— in metallurgy, 231, 356, 3836
Robbia, Luca della, sculptor, 6676
Robe, layette, *3744*; princess, *2205*
Robespierre, revolutionist, 5112
Robey Smith, bevel gear cutter, 3631
Robey spring governor, *2019*, 2020
Roburite, ingredients, 6765
Rochelle salt, 3704, 4782
Rochester mechanical recorder, 6643
— dove, classification, 2211
— elm, timber, *56*
— garden, making, 6315, 6320, *6321*
— rose, classification, 352
— salt, 1074, *4718*, *5585*; source, 1600, 1817
Rocker piece, of light waggon, 2829
Rocket, smoke, drain testing, 783
Rocking, in mezzotint engraving, *6289*
Rocks, bearing power, 330; breaker, 3835; cutting and drilling machinery, *1826–1828*; in foundations, 331; definition, 624, 896; disintegration, 1500, 1502; geological systems, 896, 2067, *2253–2255*; kinds, 2377; relative age of, 2066; sedimentary formation, 1071, 1816, 1921; solidification of, 1816; stratified, mining, 2581; tilted strata, 1921, 1922; weathering, 1500, *1501*
Rocky mountains, 4062, 4069, 5662
Rococo, art period, 4118, 5521
Rod, unit of measurement, 226, 1147
— in door making, 5180, *5181*
— boring tools, mining, *2666–2669*
— forging, 207, 2984, *2987*
Rodentia, 1493, 1762; digging claws, 1871; flying, *2037*; swimming, *2038*; teeth, 577, *578*
Rodin, M., sculptor, 1675, 3729, 4395
Rods and cones, of retina, 2402, 3226
— of Corti, of ear, 2534, *2535*
— in slide valve gear, 6140, *6141*
Rogers, Samuel, poet, 1304
Roll, boiler making, bending, *3104*, 3106; construction, *3098*, 3108
Rolled joists, as stanchions, 2198, *2199*, 2200; stability of, *1987*, 1988
— sections, in braced structures, 544; in plating shop, *3096*
— steel piles, 2737; pulleys, 2022
Roller, in agriculture, *1847*, *1848*, 1850
— bearing, 964
— bolts, of brougham, *2830*; of splinter bar, open carriage, *3125*
— casting, 2338
— feed benches, saw mills, *6145*, *6146*
— felting machine, *1998*, 2000
— gin, *387*, 388
— Hyatt flexible, *4326*, 4328
Rolling bridges, structure, 2886, *2887*
— friction, 958, 964
— load, stress diagram, 2197, *2199*
— mill workers, employment, 2645
Rolling stock: *see* Railway rolling stock
Romainville, plaster quarry, *2850*
Roman architecture, 142; order, *2035*
— Catholic church, patronage of marriage, 5531; priesthood, 6603, 4660; religious orders, 6604
— cement, 648; manufacture, 1578
— law, in England, 146
— mosaic, in modern flooring, 646
Romance nations, ethnology survey, 1790
Romanesque architecture, history of, 3231
Rome, *2231*; touring, 948
— ancient, architecture, 2134; art of, 2931; basilicas, 3089; cause of fall, 3871; early Christian art, 3089; philosophic barrenness, 2012; roads, 1977
— Emperor of, German title, 4398
— history, to the tribunes, 1135; growth of the democracy, 1201; from last Punic war to death of Sulla, 1381; Julius Cæsar, 1513; to Augustus Cæsar, 1670; Augustan age, 1829; Claudius Nero, Galba, Otho, Vitellius, Vespasian, 1937; Titus to Constantine, 2068; early Papal power, 2945; in middle ages, 4320; sack, 4322; capture in 1527, 4396; ceded to Italian rule, 6303
Romney, George, painter, 4393
Romulus, and founding of Rome, 1135
Romeo duplicator, 1698, 1919
Röntgen rays, 3943, 4091; effect on cancer, 3617; tube apparatus, *4104*

Roof, carpentry in, 4247–*4254* ; concrete in, 332 ; copper sheeting, 5035 ; fire-resisting, 4758 ; iron and felt, construction, 4872 ; lead-covered, construction, 5032, *5033* ; quantity surveying, *6511* ; reinforced concrete, construction, 1647 ; removal of, in building, 309 ; slating, 4865, *4867* ; steel, 209 ; supported by posts, *4251*, 4253 ; temporary, 4872 ; tiling, *4869*, 4870 ; timber construction, *1453*, 1454, 4247, *4249* ; zinc work, *5033*, 5035, 6168
— in mining, definition, 2377
— principals, putting together, 5792
— tiles, 644, *645*
— trusses, 545 ; mechanics, 415 ; stresses in, 2446, *2447*
— of the world : *see* Pamirs
Roofing, felt, 1169 ; slate, 530 ; zinc, 359
Rook, 2210, 2495 ; nest, 2507
Roosevelt, Theodore, President, U.S.A., 5976
Root, in algebra, 1818, 2381 ; in arithmetic, 1264 : *see also* Powers
— of chord, in music, 363
— in grammar, explained, 117
— climbers, description, 504, *505*
— crops, 3891, 4959, 6673 ; cultivation, 1230, 6673 ; culture in Europe, 856 ; market garden returns, 6836
— hairs, explained, *168*
— rot, fungous pest, *4927*
— of plants, *167* ; of ferns, 1116 ; in mosses, 1312 ; mycorhiza, 503, *505* ; shallow and deep, 503 ; in xerophytes, 727
— words, Latin and Greek, derivation rules and derivatives, 6810
Roots, blower, description, 1686, *1687*
Rope, cotton, use, 5354
— for driving, powers, diameters, 3427
— fibres, 819, 1168
— manufacture of, 1027, 2145, 5290
— in mining, 3308, 3560
— testing of strength, 1699
— trail, balloon, use, 3979, 3982
— and twine operatives, 2652
— wire, 5173, 5355 ; on cranes, 545 ; in mining, 3766
Rope-feed, of saw bench, *6144*, 6145
Rope-socket, in rope boring, 2845, *2846*
Rope-walk, described, 1028, 5291
Rope-wheel, moulding, *2867*
Rosa Salvator, painter, 4299
Rosaniline, colours from, 3711
Rose, *349* ; classification, *349*, 353 ; climbing, 6322 ; culture, 6487, *6490* ; designs, *5978* ; grown in Bulgaria, 2167 ; perfume, 5469
Rosechafer, description, 3510, *plate facing* 3361
Rosemary, culture, 6576
Roses of Jericho, seed-dispersal, 910
Rosette, in botany, *171*, 173
— in millinery, lace, 5621 ; styles, *5505*
Rosin : *see* Resin
Rossetti, Dante Gabriel, poet, 1437 ; pre-Raphaelite painting, 4394
Rotary drilling, petroleum, 6011
— printing machines, *5869–5871*
— puddling furnace, 232
— pumps, types, 1686, *6060*
— tools, milling and grinding, *3401*
Rotation, of crops, cereals, 872, 1199
— in applied mechanics, 87
— motion of, in physics, 315
Rothamsted, agricultural experimental station, 1378
Rotifera (wheel animalcules), 1492, 3958
Rotor, induction motor, *1909*
Rouen, architecture, 3374 ; cathedral, 3374, *3517* ; Henry V. of England besieges, 3463
Rouge, use, 5528, 6573
— marbles, *plate facing 408*, 533
Rough cast, in plaster work, 648, 5502
— cutting, in building, 1951
Roughing, in flax manufacture, 1386
Roughness, coefficient of, in measuring stream velocity, 1576
Rouleau, in millinery, use, 4861, *5329*
Roumania, geography, 2165 ; economic conditions, 5709 ; trade, 5709
Round, tool, use, 3385
Round-nose chisel, *4151*, 4152
Rounding, in wood-carving, *6046*
Round seam, in glove sewing, *5481*, *5482*
Round-worms, description, 3956, 3958
Rousseau, Theodore, painter, 4301
Router, use, 3386, *5809*, 5810, 6045 ; in veneer work, *6581*, 6584, 6586
Roving frame, mechanism, 2290
Rowe, Nicholas, poet, 993 ; dramatist, 1150
Rowing, value as exercise, 4389
Royal Academy, studentships, 164
— Academy Schools of Art, 858
— Academy of Music, 163, 2024
— Army Medical Corps, service, 3810, 4031
— College of Art ; training, fees, 164

— Female School of Art, fees, 164
— fern, 1116 ; culture, 6493
— Institute of Public Health, curriculum, 697, 699
— Irish Constabulary, 788, 1406, 1409, 2575
— Marines, pay, service, 4266, 4269
— Military Academy, 4197
— Naval Reserve, 6366
— School of Art Needlework, fees, etc., 323
— Veterinary College, London, 163
Royalty, in bookkeeping, 3918
Rubbed and gauged work, in building, 1950 1953
Rubens, Peter Paul, painter, *3947*, 3948 ; landscape painting, 4299
Rubber : *see* India-rubber
Rubbing stone, in building, use, 1950
Rubble, use for breakwaters, 6335 ; in walling, 3034, *3035*
Rubies, artificial and reconstructed, 5853 ; distribution, 3772 ; properties, 5852 ; source, 5308, 5855
Ruchings, in millinery, 968, *5621*
Rudder, *6227* ; wooden and Dutch, *2129*, 2133
Ruff, feather frill of, 2505
Rugs, manufacture of, 2897
Ruhr coalfield, map, *1974*
Rule, measuring tool, use, 4701, 4702
Rules, plasterer's, 5496, *5497*
Ruling, in bookkeeping, 6522
Rum, 3315 ; colouring, 4165
Ruminants, 1761 ; climbing foot, 1870 ; stomachs of, 578 ; teeth, 577
Run, in scaffolding, 1171
Runners, insects, classification, 3363
— in joinery, for drawers, 5294, *5295*
— of strawberries, function, 346, *347*
Running, physiological account, 1800
— department, railway, *4593*, 4595
— stitch, *150*, 3336, *4565*
Rupture, modulus of, 1258 ; of beams, 1984 ; in building-stones, 1517 ; in materials, 1984 ; in metals, 1396 ; timber, 1260
Rural District Council, 316
Rush, in basket-making, 5488 ; farm weed, 1378 ; sewage plant, 4549
Ruskin, John, *2619* ; influence, importance, 2616 ; on learning to draw, 109 ; pre-Raphaelitism, 4394 ; value of human produce, 4828
Russia, climate, 2406 ; coalfields, 5302, 5304 ; coins, weights and measures, 410 ; craniology, 1786 ; economic conditions, 5707 ; ethnology, 1790 ; geography, *2406–2409* ; government, 630, 4369 ; ivory, 811 ; literature, 3780 ; oil-wells 6008 ; population, 628 ; timber, 54 ; touring directions, 1524 ; trade, 5659, 5707, 5825 ; waterways, 2406 ; woollen industry, 72, 221
— history, Mongol supremacy, 218 ; to 15th century, 2948 ; invasion by Napoleon, 5238 ; wars with Gustavus Adolphus and Charles XII, 5397 ; 1481 to Alexander I., 6200 ; Alexander I. to 1907, 6301 ; wars with Turkey, 6447 ; Crimean War, 6692
Russia in Asia, geography, *2716–2719*
Russian Turkestan, geography, 2718
Russo-Japanese War, 6302, 6694
Rust, fungi, life history, *1667*, 1669
— of iron, cause, 6571
Rust's vitrified marble, 534
Rutherford, magnetic detractor, 3898 ; radium in earth's crust, 2027
Rutter, water filtration, 4097
Ruysdael, painter, 4299
Ryder, forging machine, 2991
Rye, 874 ; climatic limitation, 4493 ; dietetic value, 3312 ; as cattle food, 2704, 2904, 2905, 3890 ; fungous pests, *1667*, 1669 ; uses, 4874
Rye-grass, 875, *879* ; as hay, 1629 ; micrograph, 5365 ; as livestock food, 2904, 2909 ; sewage crop, 4549
Rye House Plot (1683), 4762
Ryeland sheep, 2361

S, in shorthand, 427, 587
Sabicu, timber, *57*
Sabines, Roman wars, rape of, 1135 ; *plate facing* 1057
Sable hair, for brushes, 1020, 6106, 6109
Sables, furs and skins, 6427
Saccharin, 5470
Saccharometers, use, 6230
Saccharomyces : *see* Yeast plant
Saccharose, sources, properties, uses, 3652 ; *plate facing* 3649 ; change to dextrose, 3706
Saccopharynx, fish, description, 3076
Sacculina, parasite of crab, *3807*, 3809
Sacking, paper yarn, *6400*
Sacque, shapes, *3591*
Sacred bark : *see* Cascara sagrada
Sacrum, human, *1604*, *1605*, *1708*
Saddle, manufacture, 5339, *5342*
Saddle boiler, construction, *6017*, 6018
— of lathe, forms, *4913*, 4914, 4923
— of planing machine, operation, *4999*
— use in pottery manufacture, 5237
Saddle-cloths, material and use, 5342
Saddlebags, upholstering, 6718
Saddlers, business of, 47, 4890
Saddler's wax, recipes, 5646
Saddlery, manufacture, *5057*, *5151*, *5339* ; machines and tools, *4783*, *5057*
— makers, employment conditions, 2649
Safes, lead, making, *5629*, 5632
Safety, factor of, 86, 1258, 1395 ; in machinery, 206, 210
Safety-lamps, mine, *3768*, 3769
— valve : *see* Valve
Safflower, in dyeing, 5907
Saffron, source of colour, 5145
Sage, classification, 354 ; culture, 6675 ; glutinous fruit, 912
Saggers, pottery 5235, *5237*
Sago, dietetic value, 3312 ; digestibility of, 3314 ; starch extraction, 4556 ; starch, micrograph, *5365* ; palm, cultivation, uses, 4873
Sahara, description, 626, 1500, 3280
Sailing ships : *see* Ships
Sail-maker, mercantile marine, 6803
Sailor, apprenticeship, 6406 ; mercantile marine, 6803 ; Civil Service posts, 2575, 2809
Sails, of ships, 5256, *5259*, 5399, 6406 ; creosoting, 5464 : reducing and setting, 6409, 6410
Sainfoin, grass, *881* ; cultivation, *1197* ; as hay, 1629 ; as livestock food, 2704, 2904
St. Anne's marble, *plate facing* 480
St. Bartholomew's Day, massacre, 4102
" St. George," Donatello's statue, 3676

St. Gotthard, mountain and pass, 1838, *1839* ; rivers rising in, 4495
St. John, N.B., 4068
St. Lawrence, river, course, 4061, 4518 ; bridge over, *2739*, 2740
St. Mark, Church of, Venice, architecture, *3090*
" St. Matthew," Rembrandt's picture, *3949*
St. Paul, conception of society, 5246

St. Paul's Cathedral, London, 1275, 3146, 3946
St. Paul's Church, Rome, *3089*, 3147
St. Peter's, Rome, 948; cupola by Michael Angelo, *3674*, 3676
St. Petersburg, 2406, 2408; foundation, 6201; tourist description, 1524
Saint-Simon, influence on Comte, 3869
St. Sophia, Constantinople, 3090, *3092*
St. Thomas Aquinas: *see* Aquinas
St. Vitus's dance: *see* Chorea
Saintsbury, G. E. B., critic, life and work, 2687, 2787
Sal volatile, use, 4777
Salamander, description, 2800, *2801*
Sal-ammoniac: *see* Ammonium chloride
Salary, distinction from wages, 1090
— book, function, 778
Sale by auction, procedure, 4984
— of real estate, 4986, 4987
Sale of Food and Drugs Acts, 45; milk preservatives, 3820; need of revision, 3822
Sale of Goods Act, 1893, provisions of, 6751, 6752, 6753; acceptance and delivery of goods, 6844
— and purchase, law of, 6751
Sales account, in bookkeeping, *490*; hire-purchase accounts, 3917, *3918*
— clearance, shopkeeping, 175, 2224
— journal, use of, 777
— ledger, functions, 778
Salesmen, duplicate bill system, 3416; function and position, 659
Salicin, use, 3819, 4013, 6068
Salicylic acid, chemistry of, 3818; food preservative, 3819, 5408
Salisbury boot, of dress landau, 3122
Salisbury Cathedral, 1275, 3374, *3375*
Saliva, 577; digestive action, 674
Salmis of game, cooking, 1875
Salmon, classification, 3065; care of young, 3069; carving, *5935*, 5936; choosing, 3717; digestibility, 3314
Salt, in chemistry, definition, 59, 240, 844, 1045; in electrolysis, 3260; state in solution, 4407
— bay, manufacture, *4718*
— brine, manufacture, *4717*, 4719
— cake, production, 4633, *4770*
— common, chemistry of, 839, 1600; distribution, 3771; beds, 768; in dietetics, 3111, 3380; in human body, 438; mines in England, 988; as preservative, 5403; in sea water, 555, 1636; effect on seashore plants, *728*; sources, 5308: *see also* Sodium chloride
— licks, herbivorous animals and, 1600
— pan, construction, *4717*
— table, preparation, 4717, 4718
— tax, India, 1600
Saltato, violin bowing, *2744*
Salting, in butter-making, 4281
Saltpetre, 843; deposits, *5587*; occurrence, 6741, 6757: *see also* Potassium nitrate *and* Chili saltpetre
Salts, effervescing, preparation, 4774
— of lemon, uses, 4782
— of sorrel, uses, 3704, 4782
Salvage, pumping engine, 6060, *6062*
Sample and warranty, law of, 6753
San Vitale, Church of, 3090, *3091*
Sand, angle of repose, 2572; bearing power, 330; in brickmaking, 643, 1282; in concrete, 332; deposition, *1814*; dyeing, 6767; eroding action, 1501; formation, 1072, 1813; use in founding, 2110, *2111*, 2337, *2339*; in foundation, 332; in machine moulding, 2458, *2541*; use in mortar, 1459, 1952; pillar-and-stall working, 3191; in road-paving, specification, 2180; utilisation, 5767; varieties, 1704; in water filtration, 4096
— casting, art metal work, 5690
— dried, in moulding, 2110
— dune, formed by wind, *1449*
— rammers, pneumatic, 5456
— table, of paper machine, *6396*, 6398
— white, refractoriness, use, 3941
Sampling, in chemical analysis, 4416; gold ores, 5830
Samson turbine, mechanism, *1689*, 1692
Sandalwood, 6890; in dyeing, 5906; source, use, 4658
Sandarac, 6890; varnish, 1085, 5835
Sandbags, in revetting, *6267*, 6271
Sandbanks, formation, 1816, 5578
Sandby, Paul, aquatint, *6112*, 6114
Sandcrack, in horses, 2662
Sand-drier, locomotive, *4595*, 4599
Sand-flea, habits, 3722
Sandhills, formation, *1499*, 1500
Sand-hopper, structure, *3808*
Sanding, on railways, *6515*, 6517
Sand-joints, in plate moulding, *2541*
Sandpapering, in bootmaking, 4140, *4545*; machines, *6755*, 6756
Sand-piper, classification, 2212; nest, 2506; *plate following* 2496
Sand-reel, in rope-boring derrick, 2845
Sand-sedge, *351*; depth of root, 503
Sandstone, classification, varieties, 530, *896*, 897, *1072*; action of sea on, 1817; erosion, rate, 1814; jointing, 1925; in masonry, 1452; quarrying, *2956*; strength, 1517, 1518
— Old Red: *see* Old Red Sandstone
Sanitary authorities, 1980
— inspectors, 82, 699; in the colonies, 3741; women's training, 323
Sanitary Institute, examinations, 699
— papers, for walls, 5828
— science, books on, 2034; diplomas, 697: *see also* Public Health
Sanitation and death rate, 2662; domestic, dangers, 5054; law of nuisances, 5056; roads, 1980
Sans, obsolete in English, 1336
Sanscrit, classification, 1771
Sansovino, Andrea, sculptor, 3678
Santa Maria Novella, Florence, 3145, *3147*
Sap, elaborated, explained, 170, 172
Sap, in trees, 51; nature and supply, 168, 170, 173; rising, 1374
— flowers, insects, 731
— of siege works, construction, 6273
Sapocarbol, from creosote oil, 5463
Saponification, chemical process, 3485
Sappers, in Royal Engineers, 4031
Sapphires, artificial, 5853; distribution, 3772; physical properties, 5853; source, 5308, 5855
Saprophytes, 166, 1372, 6441
Saracens, art and architecture, 3092; influence on European architecture, 3373; the Crusades, 2674; invasions of, 2354, 2946
Sarcin, constituent of meat, 3705
Sarcolactic acid, description, 3534
Sarcolemma cells, *1710*
Sarcophagi, Roman, 2933
Sarcous elements, of muscular fibres, *1710*
Sardinia, 2230, 2232
Sargent, J. S., picture of Ellen Terry, *722*
Sarrusophone, musical instrument, *5129*; manufacture, 6624
Sarto, Andrea del, painter, 3796
Sash-bar, of window, *5183*, 5184
Sash tool, use in glazing, 5839; painters, *5829*, 5831
— tool brush, manufacture, 6109
Sashes, of windows, *5183*, 5186
Saskatchewan, agriculture and farming, 3206; geography, 4066
Sateen, in dressmaking, 186; mattress ticking, 6720; weaving, 5509
Satin papers, for walls, 5827
— glass, manufacture, 4931
— twill cloth,. design, 2941, *2942*, 3153
Saturation, of vapour, definition, 294
Saturation point, atmospheric, 1899
Saturn, 6121, 6250; formation, 6701; and nebular hypothesis, 620; position in solar sytem, *11*; rings, 2392, 2949, 3620
Satinwood, source, use, 6890
Sausages, making, process, 1430, *1431*
Savage, testing apparatus, *4824*
Savages, psychology, 3117
Savanas, 627; African, conditions, 3278
Save, river, 1838, 2164
Savings banks, practical value, 3822
Savouries, recipes, 2003
Savoy, 352; cultivation, 1197; market garden returns, 6836
Saw, band, re-saws, *6357*; brick cutting, 1950, *1951*; carpenters', varieties of, 3385, *3387*; carvers', *5809*, 5810; combination machines, 6360; concave, 6451; cross-cut, varieties, *6357*, *6358*; cylinder, 6451; dimension, 6359; drunken, *6449*, 6450; equalising, 6358; forms and action, *4481*, 4483; grooving, 6450; hand, 3907; heavy carpentry, used in, 4646; hollowground, 6450; log and timber sawing, *5899–5904*; patternmaking, 2453; in saw mills, kinds, 5668; setting, 3754, *3755*; sharpening, 3754, *4583*; in smith's work, 3107; straightening, 3756; swaged, 6450; teeth, varieties, *6449*; tempering, 4746; varieties, 3773–*3755*, *5899*
— benches, feeds, varieties, *6144*, *6145*, *6146*, *6358*, 6359
— circular, 3908, *6143*, *6449*; shaft bearings, 962
— cross-cut, masons', *2837*, 2838
— frame, masons', 2838, *2839*
— hand, use, *532*, 3753, *3755*
— machine, types, uses, 5209
— stool, use, 3386, 3388
— tin, use, 1950, *1951*
Sawdust conveyors, use, 5997
Saw-fly, 3722, *3723*, 4926, *4927*
Saw-frame, construction, 5994, *5996*
Sawing, in carpentry, 3753, *3755*; with inverted saw, *6581*, 6585
— smiths' work, of rolled sections, 3108
— tools, *4481*, 4483
Sawmill, Gainsborough, *5666*, 5669; lay-out, 5667; Midland Railway Works, *5666*, 5669; position, 5667; riverside, 5668, *5669*; side elevation and plan, *5569*, 5668; typical, *5666*, *5668*, *5669*; for waterborne logs, *5668*; work of, 5667
— operatives, employment, 2652
Saw-tooth roof, construction, *4253*
Saxhorn, musical instrument, 5130–*5139*
Saxon architecture, ceilings, 3233
Saxons, Charlemagne wars with, 2915; conquest of England, 146; invasion of Britain, 1769, 2241; origin, 2355; take possession of Isle of Wight, 2611; wool industry, 69
Saxony, imperial electorate, 2947; industrial area, *1974*, 5825
Saxony wool, 72, 221, 1120
Saxophone, musical instrument, *5265*, *5730*; manufacture, 6624
Scabbing, in casting, 208, 2112, 3962
Scabbling hammer, *532*, *2837*
Scaffold, in shaft sinking, 3458
Scaffolding, in building, 145, 1170, 1454
Scala media, tympani and vestibuli of ear, 2534, *2535*
Scalds, treatment, 6472
Scale force, waterfall, *619*
— in music, 271
— in ordnance maps, survey, 1145
— in sound, ratio of notes, 2103
Scale-insects, products, *3363*, 3365
Scalene, triangle, definition, 4330
Scales, architects', drawing, *5419*, 5420
— of butterfly's wing, *3512*, 3513
— climbing, in tails of animals, 1871
— of fishes, etc., 30, 3065
— in geometry, 492, *493*, *2788*, *2789*
— measuring tool, use, 4701,
— in music, constituent elements, 39, 271; art of playing, 3528: *see also separate instruments*
— platform, cost, 4848
Scaling, of boilers, 3107
Scallop, foot and shell, *3285*, 3286
Scalloping irons, saddlery, 4783, 4889
Scandinavia, economic conditions and trade, 5708; geography, 1560, *1561*; history of, till Sweden becomes a kingdom, 2948; literature, 3782; rainfall, 854; *see further* Denmark, Norway, *and* Sweden
— languages, influence on English, 1769; internal affinities, 1426
Scantlings, in construction, 416
— of ship, specification, 5612, 6221

Scantlings, in timber felling, 52
Scapula, human, *1654*, *1709*
Scarab, description, 3510, *3511*
Scarf joint, described, *2987*
Scarf weld, *233*, 236, *2987*
Scarlet fever, immunity from, 6543; symptoms and treatment, 6260
Scarlet runner, 535; climbing, 504; cross-pollination, 732
Scents: *see* Perfume
Scepticism, in logic, 6097; philosophic use of term, 6257
Scheele, isolation of glycerin, 4967; oxygen discovery, 840; phlogiston theory, 61
Scherzer rolling lift bridge, 2886, *2887*
Schist, 530, 535, 898, 1075; cause of stratification, 2066
Schistose structure, 1075
Schleswig-Holstein, history of, captured by Prussia and Austria, 6445
Schneider kiln, in cement burning, 1729
Scholarships, county, university, 481; pupil teachers, 6474
Scholastic professions, 6474; future prospects, 6480
School Board, London, work, 319
— children, meals for, a social problem, 4124; women inspectors, 4974
— masters, training and salaries, 164
— room, analysis of air, 3801
Schools, boys' secondary, 1777; girls' secondary, 3505; hygienic construction, 4862; law affecting disease, 5056; for pauper children, 1930; public: *see* Education, Elementary, Voluntary, Board, *etc.*; technical, boys', 1782; ventilation by perflation, 6020
Schooner, type of rig, use, *5398*, *5399*
Schumann, musician, study of, 2023
Schwann, cell theory, 199; nerve fibres, 1942
Sciatic nerve, *1941*; affections, 1944
Science, agnostic, dogmatic and materialistic views, 6257; American authors, 3781; and commercial enterprise, 3228; comparative method, value of, 4123; conflict with religion, 5531; difficulty of accurate observation, 3944; in early Chinese civilisation, 216; interrelation of, 4882; limitations, 6256; modern, beginnings of, 3605; in religion, 6773; service of philosophy to, 6539; Spencer's definition, 59; value of observation and experiment, 6002: *see also under separate sciences*
Scientific instrument dealers, business of, 4093
Scientific instruments, manufacture, *6122–6131*
— knowledge, England's want, 3711
— "law," 401
Scissors, manufacture, *5477*; mechanical action, 4584; milliner's, 4565; needlework, 3093; temper, 4746
Sclerotic coat, of eye, 2401, *2402*
Scoop, of railway water trough, *3614*
Score, in music, orchestral, 1060, 5891; reading in parts, *3955*
Scorifier, in assaying, *5849*, 5850
Scorpio, sign of Zodiac, 6251
Scorpion, 3361; anatomy, *3803*
Scotch fir, 54, 1163, 1166, 4604, 4678; cones, *505*; fertilisation, 729; pests, 4926, *4927*; "winged" seeds, *911*, 912
— Highlands, formation, 2253
— kiln, for brick-burning, *643*
Scotia, moulding, 5297, *5299*
Scotland, banking, 1466; cattle farming, 987; climate, 984, 985; coal-fields, *987*, 988, 5302; education, free scholarships and schools, 483, 1777; farm servants' wages, 3001; flax cultivation, 716; forestry, 4603; geography of, 1064; highlands and lowlands, 983; islands, 1064; local government, 317; nasal index, 1786; police, 1408, 1409; sea-lochs, geology of, 1354; sea fishery regulations, 5318; sheep farming, 986, 987; silurian rocks, 2253; submergence to 600 ft., 982, *983*; wool yarn counts, 2895
Scotland, history, to death of Malcolm III., 2607; wars with Edward I. and II. of England, 3074, 3075; Richard II. invades, 3250; Henry IV. wars, 3251; rebellion against William III., 4843
Scott, Sir Walter, novelist, *3344*; Carlyle and Macaulay's judgment, 2615; as essayist, editor, etc., 2309; poems, 1307
Scott-Moncrieff, sewage testing, *1824*
Scour, cattle disease, treatment, 2624; in sheep, 2364
— formation in harbours, 6220
Scourer, in leather manufacture, 3218
Scouring, in clothmaking: *see* Braying
— paste, recipe, 1226
— in plastering, 5500
— stone, use, 3218, *3219*
— wool manufacture, *1121*, 1122
Scrape, plane surface testing, 3688
— turner's, 4259, *4261*, 6854
Scraper, cabinet-maker's, *6581*, 6583
— for cleaning drains, 784
— mezzotint engraving, *6289*
Scraping, wood and metal, 4259, 5667
— tools, definition, 4149
Scratch tools, plasterer's, 5496, *5497*
Screeds, in plastering, 5490, 5501
Screen, brickmaking, 1282
— in building, use, 309
— dispensing, chemist's, 1653, *1654*
— glazing with wood beads, *5839*
— half-tone, 6482, 6484, *6485*
— plasterer's, 5497
— wrought iron, *plate facing* 5521
Screw, of Archimedes, 35; theory of, 684; application, 687, 835
— bell, boring tool, *2666*, 2667
— block, in basket-making, *5489*
— of boring tools, use, 4479, *4481*
— conveyer, sugar, *4160*
— left-handed, cutting, *3029*
— jack, 835; in underpinning, 918
— machines, automatic types, 3628, 4914, *4921*, *4922*, 4924, 5209; cams for, *4323*, 4324
— piles, in bridge building, 2737, *2738*; in building, 335
— propeller: *see* Propeller
— threads, forms of, *3003–3005*; tools for, 4480: *see also* Screw machines
Screw-cutting, calculations, 3628; machines, *4914–4924*
Screwdriver, use, *3388*
Screwing, in turret practice, 3633
— tools, 4480, *4481*
Screw-plate, metal-worker's, *5521*
Screws, carpentry, kinds, 688, *3543*, 3546, 3843, *3845*, 4040; in furniture-making, *6581*, 6584
— tapered, lathe for, 4920
Scribbler card, of wool spinner, 1545
Scriber, use, 3319, *4703*, 4706
Scrieve board, for small vessel, *5616*
Scrim, of linoleum, 5123
— upholstery, 6716, 6718, 6719
Scroll, in design, *1413*, *2397*
— of viola, *2823*; violin, *2121*
— work, in vehicles, *2729*
Scrubber, in coal-tar distillation, 5462
Scrubbing brushes, manufacture, *6109*, 6110
Scuffler, in agriculture, use, 431, 1849
Scullery maid, duties, 1003
Sculpture, *184*, *1217*, *1509*; Assyrian reliefs, 2657, *2659*; early Christian, 3091; Egyptian, *2520*, 2522; French, 17th century, 4119; Gothic, characteristics, *3517*; Greek, 2857, *2929–2931*; 19th century, 4395; originality in, 1675; outfit, modelling, 1345; Persian relief, 2659; as profession, 164; Renaissance, 3676, *3677*, 3946; Roman, 2932
Sculpture d'applique, method, 6046
Scurvy, cure, 3704; prevention, 3312
Scutching, cotton, *1243*, 1244, 1385; felt, *1996*, 1998; flax, 1385
Scutellum, of wheat, 913, *915*
Scye, in tailoring, 2752; misfit, 3015
Scythe, ousted by machinery, 1630
Sea, depths, *12*, 457, 459; encroachment on land, 5577; erosion of bed, 5577; geological function, 1813; influence on atmosphere, 1159, 1298; influence on health, 5274; level, change of, *1352*, 1354; reason for salinity, 555, 1636; effect on temperature, 294; transport by, 4519
Sea-anemone, description, 4083; *plate facing* 4081
Sea-bottom, movement of, 6219
Sea-breeze, cause, 296
Sea-cucumbers, description, 4081, 4082
Sea-eagle, food, 2493
Sea-holly, storage of moisture, 728
— fishery, law, 5317: *see also* Fishery
— otter, skins and fur, 6428, 6430
— water, 5188; chemistry of, 555; geological result of salt in, 1600; isotherms and isohalines, 5188; in road watering, 2326
Sea-holly, *plate facing* 728; root, 503; protection against slugs, 1115
Sea-horse, form of body, *3067*, 3069
Sea-island cotton, 225, *383*, *384*
Sea-lilies, description, 4081, *4083*
Sea-mat, description, 3958, *3959*
Sea-mouse, description, 3956, *3957*
Sea-pie: *see* Oyster catcher
Seashore plants, description, 728
Sea-squirt, description, 31, 276, *3072*
Sea-urchins, 4081, 4082, *4083*; compared with ammonites, 1179
Sea-walls, construction, 3577–*5578*; reinforced concrete, *1557–1558*
Seakale, culture, *6674*, 6675; market garden returns, 6836
Seal, *2037*, 2039; skin and fur, 6428, 6430, *6431*; teeth of, 1765
Sealskin, furs, dressing, 6430; dyeing, 6433
— in drain pipe, 570, 572, *5052*
Seam, in dressmaking, 474; coat, pressing, 1842; French, 154; stitching, 527, *2207*; twisted, cause, 3015; in underclothing, 3336
— roller paperhangers', 5827, *5829*
Seaman, legal rights, 6364; Royal Navy, service, 4265
Seamanship, book on, 6410
Seams of boiler, riveting, *3099*, 3108
— in mining, 2377, 2666, 3307
— in sheet metal, jointing, *5351*, 5352
Seas, geology of, 1815; inland, communication, value, 4498
Seascape painting, evolution of, 4300
Season land, meaning of term, 257
Seasoning, wood, *52*, 3540, *3541*
Seasons, *15*, 6405; effect on body temperature, 440; Spanish names, 2041
Seat of brougham, 2829, *2831*; motorcars, 2557; railway carriages, 2556
Seatings, boiler fittings, *3097*, 3105
Seaweed, 1386; edible, 1369; as manure, 590, 5587
— weather guide, 6131
Sebaceous glands, function, 1423
Secant, in trigonometry, 6231
Secateur, use, *6315*
Sechwan, river, basin, 2976, 5658
Second, arithmetical term, 1715
— in trigonometry, 6085
— unit of time, 14, 226, 422
Secondary schools, 1778, 1783; girls', 3505; masters', 164, 6476
— rocks, 2067, 2254
"Seconds," in china dealing, 1894
Secretaries, private, clerical and political, 6480; women, 323
Secretary bird, snake eating, 2493
Secretory organs, 197; limits of control by will, 5841
Section, drawing in, 1747, 2006, *2007*, *2009*, *2790*
Sectional balancing, ledgers, 2980; in relation to trial balance, 2503
— elevation and plan, definition, 2006
Sections, for comb honey, *5960*, 5962
Sector, drawing instrument, 494
Securities, acceptance by bankers, 4293
Sedge, as farm weed, 1378; sewage plant, 4549; structure, *351*
Sedge warbler, nest, 2507; *plate preceding* 2497
Sediment, transport by rivers, 1635

Sedimentary rocks, 898, 1074, 1921
Seed-barrow, 1233, *872*, 1847
— beetle, description, 3512
— coats, defined, *347*, 348
— colour, Mendel's law, 1481
— drill, 432, 1847 ; for mangels, *1230*
— drilling, 432, *637*, 1231
— harrow, construction, use, 1849
— lac, production, 1035
— plants, 350 ; dispersal, 909
Seeding, in sugar manufacture, 3831
Seedless plants : *see* Cryptogams
Seedlings, tree, transplanting, *4677*
Seeds, 165, *635*, *638* ; bird food, 2494 ; catapult, sling, and flipping fruits, 910, *911* ; "dormant" life, 277 ; forage crops, 1197 ; in gardening, economy, 6833 ; germination, *347*, 350 ; grain and grasses, 872 ; preservation, winter, 728 ; production of, *347*, 348 ; root crops, 942 ; of trees, 4677 ; winged, *911*, 912 ; transported by wind, 1500
Seedsmen, business of, 4995
Seer of Gubr, of palm sugar juice, 4353
Segmental, pattern construction, 2454
Segregation, in metal, 4747
Seidlitz powder, Rochelle salt in, 4782
Seine, river, banks, 1643, *1645* ; basin, 1681
Seine net, description, use, 4990
Seismic wave, speed and direction, 1208
Seismology, volcanic action, *1208*, 1355
Selection, in agriculture, *637*, *638*
— germinal : *see* Germinal
— natural : *see* Natural selection
Selective absorption, astronomy, 6249
— agents, biology, defined, 826
Selenite, crystal of, *plate facing* 1345
Selenography : *see* Moon
Self, in Hindu philosophy, 418 ; warfare in society, 5247 ; in psychology : *see* Personality, *also* Ego
Self-acting incline, in mining, *3566*
Self-balancing ledgers, 2503
Self-colours, in dyeing, 6504
Self-control, and health, 2663
Self-consciousness, connection with internal sensation, 2374 ; in psychology, importance of, 2373
Self-education, contrasted with instruction, 2602
Self-heal, farm weed, 1378
Self-pollination, of plants, 348, 909
Selim I. and III., Sultans of Turkey, 6447
Seller's disc, 962
Selling price, explained, 999
Seltzer water, composition, 6393
Semicircle, definition, 4208
Semicircular arch, thrust from, *2761*
— canals, of ear, *2534*
Semicolon, use, 1338, 6351
Semi-deponent verbs, in Latin, 900
Semi-diameter, defined, 6665
Semi-girder engine, construction, 5911
Semi-lunar valves, anatomy, 957
Semites, ethnology, 1790 ; distribution, 627
Semitones, in music, 2721, *2311–2313*
Semolina, production, 3078, *3084*
Senna, source, uses, 6890
Senate, Roman, 1201 ; Gracchus' reforms, 1382 ; under Augustus, 1672
Sensation, elementary forms, 278 ; feeling-tone theory, 2517 ; inhibition phenomena, 2258 ; in Locke's philosophy, 2013 ; in lower organisms, 3117 ; organs of, 29 ; physiological, 1421 ; psychological account, 2116 ; in psychology, defects, 2012 ; relation to reason, 2803
— reflex, physiology of, 2302 ; in psychology, *2117*
Sensations, relativity ot, 1563 ; subjective symptoms of disease, 5539
Sense-organs, diseases, 6264
Senses, the five, criticism of division, 2118 ; psychic theory, 3288
Sensori-motor, 2117 ; function, 1943 ; of spinal cord, *2143*
— organs, structure, 1419
Sentence, in grammar, 115 ; analysis, 766 ; composition, 608, 4579
Sepal, of flower, 346, *347*
Separator, use in dairy farming, *4211*
— in milling wheat, 3079, *3080*
Sepia, pigment, 871, 3116 ; drawing with, 1534, *1792*
Septicæmia, cause, 6544
Sequences, in harmony, 366
Seraphine, musical instrument, 5569
Serfdom, Russian, 6200 ; ended, 6301
Sergeant, Army, 3840, 4030 ; police, qualifications and salary, 1407 ; in Royal Marines, 4266, 4269
Serging, stitch in tailoring, 1110, *1111*
Series distribution, electric, 2245
— parallel distribution, *2246*
Series-wound dynamo, 1322, *1324*
— — motor, electric, *1931* ; for electric traction, *2088*
Serpent leather, grain, *plate facing* 3217
Serpentine, mineral, 768, 6743
— rock, 529, 1009 ; formation, 1356
Serum, 954 ; disease treatment, 6781
Servant, domestic, 761, 814, 1091, 1094 ; law of position, 609, 6844
Servia, 5709 ; freed from Turks, 6447 ; geography, 2165, 2167
Sesame, 5118 ; uses, 2704, 4833, 5118
Set iron, in shipbuilding, 5738
Set-squares, architect's, 5420 ; drawing instrument, 284, 1748, *4644*
Sett hammer, 2983, *2985*
Setting machine, leather, *3219*, 3220
— in plastering, 649, 5500
— saws, 3754, *3755*
— in turnery, *3317*, 3319
— rule, compositor's, 5156, *5158*
Settling backs, in brickmaking, 1285
— machine, for felting hats, 6375, *6376*
Setts, chisels, *4151*, 4152
— granite, description and use, 3244
— paving, quarrying, 2955, 2956
— of smithy, described, 2983, *2985*
Seven bishops, trial of, 4841
Seven Years War, 5554, 6302
Severn, river, 1276, 2066 ; tide, 556, 5128
Severus, Roman emperor, career, 2071
Sewage, ammonia from, 4775 ; in buildings : *see* Drainage ; composition, 590 ; deodorisation, 3262
— disposal, 4547 ; bacterial treatment, *4742*, 6541 ; chemical precipitation, 4549 ; contact purification system, 4743, *4745* ; in country houses, 780 ; distribution, systems, 4549 ; distributors, automatic, *4821*, *4824* ; engineer's duties, 157 ; irrigation, 4548 ; outfalls, 4547 ; percolation beds, 4745 ; precipitants, 4550 ; pumping, 4462 ; purification, 4744, 4821 ; quality, 4548 ; into the sea, 159 ; upward filtration, 4742
— farming, chemistry of, 4548
Sewer, construction and varieties, *4458* ; level of, 784
— gas, dealing with, 781 ; diseases produced by, 5054 ; prevention, 570 ; removal, *4459*
Sewerage, of isolated buildings, 4457 laying out, 4457 ; *see also* Sewage disposal
Sewing, dressmaker's accessories, 185
— keys and press, bookbinding, *6776*
— machine, use of, 154 ; bootmaking, 3875, 4017, *4434* ; glover's, 5480, 5482 ; saddlemaking, 4784, *5342*
— machine dealers, business of, 4997
Sewing-maid, duties, 1092
Sex, elementary signs, *384* ; fundamental distinction, 4827 ; problems of variation, 651 ; reproduction in higher animals, 484
— in botany, 730
— equality, social conditions, 4825
— predisposing cause of ill-health, 5700
Sextant, 159, *1016* ; construction and use, 6658, 6664 ; in survey, 594
— box, in surveying, 158, 267, 1018
Seymour, Edward, Duke of Somerset, protectorship, execution, 3833
Shaddock, fruit, 6890
Shade, in colour, cause, 3730 ; in drawing, degree, 1534
Shades of electric lamps *2613*, *2614*
Shading, in drawing, 1533, *1535*, *1540* ; pencil, *2184* ; in carving, 6135
Shadow, in drawing, degree of, 1534, 1794 ; edge of, in physics, 3368, *3369* ; in perspective, 600
Shadows, umbra and penumbra, 2435
Shaft bar, of brougham, 2830
— bearings, 962
— engine, drawing, *4204*
— furnace : *see* Blast furnace
— in mining, 3306, *3193* ; excavating, 3457 ; exploratory, 2666, *2667* ; sinking processes, 3306, *3310*, 3347, 3457–3462 ; timbering, 3193, 3308, *3310*
— of portable electric drill, *5449*
— of vehicle, leather trimming, *3622*
Shaftesbury, Earl of, reforms, 6691
Shafting, forms, calculations and drawing, *3133*, *3137* ; nickel steel, 5984 ; power transmission by, 5353 ; of saw-mill, 5668, *5669*
Shag tobacco, manufacture, 4373
Shagreen, origin and use, 3065
Shake, in music, *271* ; clarionet, *4789* ; pianoforte, 1892 ; violin, 2508
Shakes, in timber balks, *52*, *3541*, 3545
Shakespeare, William, 679, *847* ; instance of psychical variation, 5387 ; as prose writer, 1641 ; relation to English literature generally, 848 ; use of Anglo-Saxon words, 1771 ; his women characters, 2451
Shale, 1073 ; in cement manufacture, 1579, 1853 ; source of paraffin, 4837 ; tar yield, 5461
— miners, employment conditions, 2642
Shale oil, 1164 ; retorts, 6149, *6150*
Shamoying, leather, 3165 ; *see also* Chamois
Shanghai, port, 2976, 5658
Shanks, of drills, 5007
Shannon, river, course 984, 1366
Shapers, 3401 ; portable, 3319, *5278–5282* ; tests, 3965
Shapes, millinery, 4860, *4861*, 5036
Share, ledger of limited company, *3186*
Shareholders, limited company, 3185
Shares, limited company, 3185, 6801
Sharks, classification, use, *3065*
Sharp, in music, *39*, 1212 ; in tonic sol-fa notation, 924
Shave, basketmaking, *5489*
— hook, plumber's, use, 5020, *5030*
Shaving, in leather, 3218
— knife, leather, 3218, *3219*
— in vehicle decoration, 3024
Shaw, George Bernard, 1152
Shawl, for layette, *3744*
Shea butter, source of oil, uses, 4832
Shear legs, boring, use of, *2668*
Shearing, action of tools, 4149, 4584
— machine, boiler shop, *3105* ; design, *4204* ; hydraulic, 1222
— sheep, 220, 2366
— stress, in beams, *1257*, 1260, 2197, *2199* ; rolled joists, 1987 ; wrought iron, *1392*, 1393
Shears, basketmaking, *5489*
— dental, 6027, *6028*
— metal work, *5522*, 5524
— paperhanger's, 5827, *5829*
Sheathing, of passenger coach, 2834
Sheave, of pulley, 684 ; in patternmaking, 2454, *2455*
— wheel, casting, 2337, *2339*
Sheep, *257*, *2360–2365* ; books on, 3471 ; diseases of, 2625 ; distribution and food, 72 ; fattening, 2360 ; feeding, 2904 ; gestation period, 2364 ; horns of, 811, 2155 ; insect parasites in, 2626, *2627* ; intestines, length of, 578 ; rations for, 2364, 2366 ; skins used for fur, 6428 ; teeth, 2366 ; urine, analysis of, 433 ; washing and shearing, 220, *224* ; weights, 2367
— farming, 2363 ; in early times, 68 ; in Great Britain, *2360–2365* ; N.S.W., 3701 ; N.Z., 3467 ; S. Australia, 3899 ; U.K., 987; Victoria, 3702
— hurdles, construction, 2364
— ked, and maggot fly, 2626, *2627*
— Merino, development, 5120

Sheep, scab, 2366, *2627*
— tick, destruction, 2626, *2627*
— wild, even-toed foot, 1870
Sheet gill, in textile industries, 1886
— glass, manufacture, 4531, *4534*, 5837
— lead, manufacture and uses, 5987
— metal bodies, elementary forms and combinations, 4521, *4523*
— printer's, sizes, 5457, 6775
— signatures, in printing, 5459, *6776*
Sheetings, in building, description, 330
Sheets, in books, sizes, folding, 6775
— patient's, arrangement, 6177
— washing, 2965
Shell, of boiler, *3097* ; furnace, 3102
— carving, processes, 6300
— of fire-box, construction, 3103
— in mining, boring tool, *2666*, 4480
Shellac, 810, 1035, 5147, 6890 ; in bronzing casts, 1673 ; in insulation, 672 ; in mortar, 1853 ; origin, 3365 ; varnish, 2456, 5835, 6591
Shell-expansion plan, of ship, *5917*
Shelley, Percy Bysshe, poet, 1308
Shellfish, choosing, 1228 ; classification, *3113–3116*, *3284* ; dietetic value, 3311 ; disease communicators, 5315
Shells, armour - piercing, 6619 ; cast steel, 6620 ; manufacturer, *6619*
— bivalve, 3284
— cameo, kinds, 6300
— of sea snails, *3113*
Shelves, fitting, *6581*, 6585
— bookcase, adjustment, *6589*, 6590
— glass, uses, *5838*
Shepherd, duties, wages, etc., 3000
Shepherd's purse, weed, *880*, 1378
Sherardising metals, process, 6170
Sheridan, Rd. Brinsley, plays, *1151*
Shetland Islands, geography, 1064
— pony, description, *2073*, 2074
Shield fern, culture, 6493
Shield, hydraulic, in tubular railway construction, 5677, *5679*
Shift key, typewriter, *1527*, 1528
Shifts, in guitar playing, 3761
Shim, in railway construction, 3437
Shin, human, 1708 ; ossification, *436*
Shingle, angle of repose, 2572 ; formation, 1072 ; and foreshore erosion, 5577
Shingles, roofing, 4870
Ship articles, 6806
— boy, mercantile marine, 6803
— British, defined, 6361
— cockroach, classification, 3363
— chandlers, business of, 5220
— cook, mercantile marine, 6807
— frames : *see* Frames
" Ship's husband," duties, 6362
— jack, 1222
— log, records, 6806
— management, 6361 ; dictionary of, 6413 ; merchant service, 6803
— money, levy by Charles I., 4552
— stores, management, 6363
— timbers, wood-working, 5996
— worm, boring through wood, *3285*
Shipbuilding, areas, calculation of, *5965* ; bending moment, 6223 ; buoyancy, distribution, *6222* ; centre of gravity, 5969, 5972, *6222* ; employment conditions, 2644 ; dead weight capacity, 5964 ; displacements, 5964, *5966*, *5967* ; fundamental requirements, 5964 ; history of the art, 5254 ; hogging moment, *6222*, 6223 ; inertia moments of sections, 6223, 6224 ; metacentre curve, *5972* ; models, experimental tanks, 6226 ; owner's requirements, 5964 ; practical training, 5402 ; righting arms, 5970, *5971* ; sagging moments, *6222* ; shell plating, *5917–5922* ; shipyard work, *5735–5743* ; stability conditions, *5968* ; straining tendencies, 6224 ; strength and speed, *6221–6227* ; structural material, distribution, 6222, 6224 ; Tyne and Tees industry, 1272 ; volumes, calculation of, *5966* ; water resistance, friction, 6225 ; wave-making, resistance, 6225, *6226*
Shipping, British supremacy, 6361
— clerk, duties, 6363
— owners, liabilities, 6365
Shippers (bricks), 1947
Shipyard, drawing-office, 5608 ; situation and arrangement, *5735*
Shipwrights, Navy qualifications, 4268,
Ships, auxiliary, 5398 ; builder's certificate, 6364 ; cellular construction, 5262 ; civilisation spreading function, 5254 ; clinker built, 5255; completion, 5924 ; composite, 5257, 5398 ; instruction, 5256, *5257* ; declaration of ownership, 6364 ; double bottom, 5262 ; early, 5254, *5255* ; forces acting on, 6222 ; horse-power, 6226 ; iron, construction, statistics, 5259 ; lacquer coating of hulls, 6577 ; modern, classes of, 5398, *5401*, 5402 ; official number, 6364 ; paint for bottoms, 6572 ; permanent magnetism of, 4246 ; propulsion, methods, 5256 ; registration, 6364 ; speed, 6224, 6227 ; steamers, 5258 ; steel, construction, statistics, 5260, 5261 ; steering, 6227 ; strength, 6221 ; wood, construction, 5259 ; statistics, *5261* : *see also* Steamers
— design : *5608–5614* ; area calculation, *5965* ; difficulties in, 6227 ; drawings for, *5608–5619* ; general conditions, 5964 ; laying-off lines, 5613 : midship section, 5609, *5611*, 5612 ; model, 5614 ; ordering materials, *5608* ; plans, 5608, *5609*, 5610 ; structural beauty, 5924 ; trial trip, 5924 ; tumble home, 5609 ; volume calculation, *5966* ; water-line, *5608* ; weight calculation, 5964
— sailing : appearance, 5398 ; American, *5257* : apprentices, 6804 ; construction, 5256, *5257*, 5400 ; construction plans, *5619* ; deck lines, 5616 ; deck plan, *5619* ; decrease of, 5398 ; direction at night, 6411 ; floor-plates, *5617* ; frames, *5618* ; full-rigged, type of rig, *5399*, 5400 ; general arrangement, *5400* ; keelson, 5617 ; landings, *5616* ; launching, 5923 ; materials, 5398 ; as means of transit, 2278 ; model, working, 5615, *5616* ; ordering material, 5617 ; ribands, 5617 ; sails, 5399 ; screwing and interpolation, 5616 ; speed, 6224 ; steel (construction), 5400 ; stern, *5618*, 5619 ; tea clippers, 5257 ; transom plate, 5618 ; types, 5398 ; world's tonnage, *5259*
Shire horse, *23*, 2073, *2075*
Shirring, milliner's, 152, *4565*, 4566
Shirt-blouse, material for, 186
Shirt and collar making, *6796–6799*
Shirts, book on, 6798 ; boy-baby's, *4195*, *4196*, 4355 ; calico, dress, flannel day, football, fronted, morning, night, *6797–6799* ; sac, *6796*, 6798 ; starching, ironing, and folding, *2911*, 2966, 6797 ; yoked and fronted, *6798*, 6799
Shoals, formation, 5578
Shoddy, dyeing, 6502 ; manufacture, 71 ; utilisation. 2897
Shoe, evolution of, 3873 ; dressing, recipe, 5646
Shoe, cast-iron, in carpentry, *3543*, 3547, *5793*
— of door frame, *5181*, 5182
— retailing : *see* Boot and shoe
— rubber, manufacture, 5201 ; utilisation of waste, 5309
— steel driving (boring tool), *2666*
Shoemaker's wax, recipe, 5646
Shoemaking : *see* Bootmaking
Shoes, children's, *4864* ; *see also* Boots
Shoot, in cement manufacture, *1855*
— mine, 2378, 3194, 3304, *3305*
Shooting-board, uses, 3386, 4611
Shooting-stars : *see* Meteorites
Shooting-stick, compositor's, *5457*
Shop, definition of, 43 ; bookkeeping : *see* Bookkeeping, *and special headings* ; branch shops, accounts, 3417
Shop, assistant, fines, law concerning, 6846 ; living-in system, 6846 ; women's training and prospects, 323
— fitting, 178, 395
— window, use and arrangement, 395
Shop Hours Acts, provisions, 45 ; inspector's under, 788
Shopkeeper, small, competition, 5926
Shopkeeping, principles of, 43, 175, 702 ; law of, 45 ; retail business, 6054 ; wholesale trade, 6207
Shopping, guide to household, 1227 ; tourist vocabulary, 1964
Shops, engineering : *see* Engineering
Shore, Crown ownership, 6220
Shores, in building, 331, *916*, *920*
Shoring, in building, *916*, *920*, *1453*
Short circuit, in electricity, 461
— coating set, infant's, *3856*
— cross-straps, of harness, 4886
— division, explained, 91
— sightedness : *see* Myopia
Shortening infant's clothes, 4683
Shorthand, 48 ; importance in L.C.C. exams., 1215 ; in business correspondence, 6354 ; knowledge by insurance clerk, 4725 ; use in reporting, 3975, 4191
— typist, salary, 1918
— writer, charges for, 1920
Shorthorn cattle, 986, 2235, *2237* ; dairy, 3666, *3667*
Shorts, livestock food, 2369, 2704
Shot, manufacturing, 1162, 5988 ; velocity test, 6613
— case, ironmonger's, 3573, *3575*
— effects, in dyeing, 6502
— metal, composition, 3941, 5988
Shoulder, human, leverage, 1708
Shovel, gardener's, *6315*
— in mining, 2583, 2847
— in railway work, *3172*
Show-room, 659 ; books used, 776
Shrapnel shell, uses, type, *6618*, 6619
Shrew, description, 1763
Shrimp, 3806 ; fishing, 4991
" Shrimp Girl," Hogarth's picture, *4392*
Shrinkage in clothmaking, 4107, *4110*
— of metals in casting, 2342 ; steel, 2698 ; in " sweeping-up " moulding, 2461
— of timber, *52*
Shropshire sheep, *2361*
Shrubs, flowering, culture, 6530 ; for general planting, 6206, 6316
Shunt-wound dynamo, *1324*
— motor, contrasted with series, 1931
Shunter, railway, 4804, *5070*, 5074
Shunting, of railway goods, *5070*, 5074 ; on temporary line, *3254*
Shutter, fire-resisting, 4760
— window, construction, *5185*, 5187
Shuttle, of Northrop loom, 3635, *3636*
— weaving forms, 3685
Siam, ethnology, 1789 ; geography, 2972, *2973*
Siberia, geography, 2716, 2717 ; railway, *2717*, 5707
Sibilants, in grammar, 121 ; in shorthand, 427
Sicilian marble, *plate facing* 480
Sicily, architecture, 3232 ; calls help from Pyrrhus against Carthage, 1203 ; geography, 2230, 2232 ; Greek remains, 2859 ; history after division of Italy into states, 2945, 2946 ; touring, 948
Sick-berth attendants, Navy, 4265, 4269
— leave, Government offices, 2159, 2576
— room, choice and care, 6173, 6176
Side-arm roller, paperhanger's, 5827, *5829*
— bar keel, formation, *5736*
— chain, catalysis theory (Ehrlich), 4135
— chisel, woodworking, 6854, *6855*
— drum, construction, use, 5566, 5733
— spring, vehicle, 2725, 3328
— stick, compositor's, 5457
— stitching, in tailoring, 1110, *1111*
— tip waggons, 3176, *3252*
— widths, of railway line, 802
Sidebone, in horses, treatment, 2622
Siderite, mineral, 768, 4466, 6743
Sidings, railway, *3616*, 5074
Siege, in glass-making, 4532

Siege works, military engineering, 6273
Siemens gas, production, use, 6818, 6827
— furnace, 4126, 5013, *5015*, 5016
— processes, in steel and iron, 234
Siena, cathedral, 2230, 3376; modern painting, 3518
Sienna, colour, manufacture, 5144
Sifter and scalper, in milling, 3081, *3083*
Sighing, physical explanation, 1303
Sight, discrimination inferior to that of hearing, 2317; effect of civilisation on, 3179; organs of, 197, 2146, *2400–2403*; variation in, 3944; without eyes, 3285
— reading, music, 2024, 4179
— testing, practice, 4141, 4143
Sigmoid flexure, *576*, 579
Signal-box, railway, 4686, *4687*; control of points, 3610
— lamps, railway, 4686, 4691
— repeaters, railway electrical, 4688
Signalmen, Navy, 4266, 4268; railway, 4690; railway fog, 4692
Signals, railway, *4685–4692*; observation, 4600; power, *4687–4689*; school of, 4690, *4691*
— department, organisation, 4231
— ship's, varieties and uses, 6411
— wireless, *3895*, 3897
Signature, in music, 272
Signs, law of, in algebra, 1993, 2151
Sikkur bridge, river Indus, *2736*, 2740
Silence, caused by interference, 3230
Silesia, Austrian, geography, 2162, 2165
— German, ceded to Prussia, 6302 geography, *1974*–1976, 5825
Silica, 1160; in cement manufacture, 1857, 1858; concretions, 1074; effect on lime, 1456; in firebricks, 1285; formation, 1356; in glass manufacture, 813; in mineralogy, 767; as plant food, 168; from rocks, 1455; refractoriness, 3941; test for, 4411, 4415
Silicates, in geology, 768
Silicon, chemistry of, 1160; compared with carbon, 239; in earth's crust, 239, 624; in iron, 232, 1044, 4907; in steel, 4747, 5019
— bronze, 3940, 6309
Silk, carpet manufacture, 3360; cleaning, *2595*, 6042; in cloth, dissolving, 3015; as clothing material, 4256; design, fitness, 5980; fibres, 68, *69*; fabrics, designs for woven, *6597*, 6598; gum in, 810; impurities, 5640; loom, 3912; microscopic structure, 820, *822*; printing, 4499, 4502; "scroop," 5640; sliver of waste silk, 1724; source, 5120, 5640; spinning, 2444, 2596; stocking yarn, 4619; test of thread, 5598; throwing, *2595*; trade and industry, 581; for trimming, 5774, *5775*; tussore, source, 5120; used for underwear, 3094; washing and ironing, 2911; waste, drawing process, 2100; waste, treatment, 1245; watered, imitation, 4345; waterproofing, 808; width, 186; winding, *2595*; and wool mixture, 1125; yarn counts, 2896, 2897
— artificial, 5120; dyeing, 5639; forest industry, 4928; viscose, 6562
— dyeing, 5640, 5905, 6199; action of dyes, 5637; dyebaths, 5954; hand, 6367
— sewing, quality, 185
— twist, for buttonholes, 153
— glands, of spider, 3804
— hatters, employment, 2651
— mercers, business of, 5221
— moth, cocoon, 3515
— reeler, primitive Chinese, *584*
Silks, trading in, 1096
— workers, employment, 2650
Silkworm, cocoon, 3515; cultivation and rearing, 582, *584*, 5120; Pasteur's cure of diseased, 3274
Sill, in geology, definition, 2065, 2066
— of light waggon, 2829, *2030*
— window, *5183*, 5186; bricks for, 1949, *1950*; lead apron of, *5033*; of room partition, 4448; stone, 3241 3248; terra cotta, *2781* 2784; timber used in tunnelling, 331
Silo, in agriculture, 1970
— plant in cement manufacture, *1853*
Silt, deposit by rivers, 5483, 5484
Silurian system in geology, 2067, *2253*
Silver, 361, 4303, 5847; alloys, 361, 5857; analysis, 4413; in art work, *5521*, 5523; in atomic evolution, 1917; books on, 5860; casting, 5858; chemistry of, 1447; colouring, 5858; distribution, 3772, 5847; in copper refining, 5754; electrical conductor, 672; electrolytic refining, 5848; electrochemical equivalent, 3262; electroplating, 3421; extraction from galena, 358; extraction processes, 4303, *5755*, 5847; in gold alloy, 5856; hallmarks, 5860; lead recovery, 4304, 5848, 5987; melting, 5858; micro-structure, 3934, *plate preceding* 3937; occurrence, 3772, 5847; ores, 4303, 5847; "parting" process, 5848, 5849; physical properties, 1396, 3837, 3838, 3839, 4303; refining process, 5848; solder for, 5523; soldering, 6460; standard alloy, 5523; standard rates, 5857; uses, world's production, 5307
— chloride, chemistry of, 1597; "clotted" precipitate, 4404, *4405*
— cyanide, formation, 3261, 3537
— dealers, business of, 5223
— fir, timber, 55; culture, 4679
— fish, classification, *3363*
— German: *see* German silver
— leaf, burnishing, 6277
— moth, disease in sugar beet, 4048
— nitrate, double decomposition, 1597
— plate, dealing in old, 893
— plating, process, 3421
— point, drawing with, 1534
Silvering mirrors: *see* Mirrors
Silversmithing, 5521, 5687, *5690*
Similar motion, in harmony, 365
Simiruba bark, source and use, 6068
Simmering, temperature for foods, 1485
Simple time, in music, 40
Simplicity, value in art work, 5522
Simplon, pass and tunnel, 1839
Simpson's area formulæ, shipbuilding, *5965*
Sincerity, factor in journalism, 3812
Sind, province, India, 2820, 5381
Sine, in trigonometry, 6231; sum and difference, formulæ, 6499
Sines, law of, in light, 2732
Singeing, in cloth manufacture, *4344*
— in dyeing, *6197*
Singer, debut of, 6340
Singing, 6047, 6182, 6336; bad production, 6185; breathing, 6051, 6185; care of the voice, 2538; faults, list, 6185; mannerisms, 6190; notation, the staff, 37; phrasing and articulation, *6336*; styles, 6340; vocal organs, *6047*; voice production, 6047
Single account bookkeeping, 3332
Single entry, in bookkeeping, 3916
Single-needle instrument, telegraph, *4385*
Single-phase motor, for traction, *2088*
Singling, in yarn manufacture, 2100
Sink, kitchen, care of, 1003; lead-lined, 5632; scullery, drainage, 572; slate, 3248; slop, 5053, *5055*, 5633; waste water, 569
— in mining, definition, 3457
Sinker-bar, in rope boring, 2845, *2846*
Sinking, in ashlar walls, *3035*
Sinking fund, 2884, 3331
Siphon, of bivalve, *3113*, 3284, *3285*
Siphon-worms, 3957, *plate facing* 4081
Siren, principle of, 2103; power 5128
Sirenia, order, 1494, 1762, *2039*
Sirius, double star, 6696, 6698, 6699
Sirpula, sea worm, 3956, *3957*
Sisal, *818*, 4176, 5118, 6891; dressing, 1389; non-dyeable, 5639
Site, in building, 308; plan, 5542, *5543*; selection, 144
Settmakers, in mining, *2955*, 2956
Size, manufacture of, 1036; leather recipes, 5646; vellum, 6275; whitewashing, 5835
— kettle, paperhanger's, 5827, *5829*
— stick, bootmaker's, *3875*, 4015
Sizing, paper-making, 1167, 6278, *6396*
— textile manufacture, 3489, *3490*
Skate, 3066, *3067*; value of fishery, 4989
Skein-making, in basket work, *5489*
Skeins, dyeing, 6367
Skeleton, human, bones, *1348*, 1349, 1603; comparative anatomy, 1603, *1604*; vertebrata, *98*
Skeps, bees', use, 5958
Sketches, detail, duplicating, 4329
Skewback, in brick arches, 2386, *2387*; of stone arch, 3143, *3147*
Skewers, use in casting, 2338
Skilled workman, definition, 307
Skimmer, in salt manufacture, *4717*
Skimming ladles, form and use, 2867
Skin, of animals, structure, 2852
— human, *1419–1423*; changes accompanying psychic phenomena, 2694; conduction, radiation, evaporation, 440; impurities, 4255
Skins, animal, taxidermy, 6328
— bootmaking, scientific cutting, 4242
— couch covering, 6719
— bookbinding, 6778
— leather, varieties and structures, 2852; *see also* Leather
Skip, in mining, 3305, *3307*
Skippers, certificates, 5317
Skirt board, dressmaker's, 185
Skirting, moulding lines, 2129; fire-resisting, *4757*, 4759; raking mouldings, 5297, *5299*
Skirts, 523, *525*, 654, *861*; corselet, *2205*, 2207; divided, *3473*, *4473*; evening, with pleats, 657; flounced, *655*; girl's, *2468*, 4473; linings for, 186; silk slip, for layette, *3744*, 3854; unlined, 970
Skiving, boot, *4017*, *4238*, 4434
Skull, human, anatomy, 1603, 1604, *1605*; importance in anthropology, 1785, *1787*; joints of bones, 1709; in modelling, proportion, *1348*, 1349
Skunk, skins and fur, 6428, 6430
Sky, cause of blueness, 3728
— lights, *5185*, 5187; glazing, *5839*, 5840; lead protection, 5034
Slabbing machine, soap, *4961*, 4965
Slag, basic, for manure, 5587
— blast furnace, 4469; action on iron flux, 4467; use in brickmaking, 1282; in cement, 1579, 1860; as manure, 590; in smelting, *232*; of steel, 5013–5018; utilisation, 4125, 5767; in wrought iron, 4465, 4635
— cement, varieties, 4469
— wool, manufacture, 813, 4469
Slaked lime, 617, 814
Slant height, in drawing, 4522
Slate, 6891; in cement manufacturing, 1579; cleavage plane, *1355*, 1356, 1925; as electrical insulator, 672; formation, 530, *531*; geological classification, 1073; in masonry, 3248; quarrying, 2379, *2960*
— clubs, cautions as to, 3225
— lithographic, 6635, 6636
— refuse, use, 1282, 5767
Slater, work of, tools, 4865, *4867*
Slaters, employment conditions, 2643
Slates, roof, varieties and fixing, 4865, *4867*; for concrete roofs, 4758; glass, 4868; stone, *4867*, 4870
Slath, in basket-making, 5489, *5490*, 5563
Slating, dictionary of, 2843
Slave labour, use in transport, 4516
— trade, abolition by Spain, 6304; African, 3278; beginning, 5844
Slavery, abolition of Colonial, 5686; abolition by Holland (1862), 6304; "fugitive slave law," 5975
Slavonic languages, list, 1771
— races, ethnological survey, 1790
Sleekers, tool used in moulding, *2457*
Sleeking, leather, 3218, 3220

Sleep, drugs producing, 5469; auto-suggestion, experiments, 2549; sufficiency of, conditions, 4390
Sleeper, of engine frames, load, 4206
— railway, varieties, laying, etc., 3429–3434, 3607; Bethell's process for, 52; care of, 3257; use in gate construction, 3615; on mountain railway, 3816; trestle bridge, 6266
Sleeping sickness, cause, 4089
Sleeplessness, treatment, 4530, 6262
Sleeve, term in drainage, 736
— in dressmaking, *187*, 191, *477*; for little boy, 1280, 1460; of boy's overcoat, 1755; for blouses, *522*; of girl's French frock, 4476; for girl's sacque jacket, *2471*; man's lounge jacket, *2753*, 2875; man's vest, *1873*; princess robe, 2206; woman's coat, 2056
— board, in tailoring, *1110*
Slewing, in basket-making, 5489, *5490*
Slide-bar, in grinding, *3403*, 3406
— rest, of lathe, 4914, 4915
— valves, link motions, 6139, *6140*; Zeuner's diagrams, 6140, *6141*
Sliding friction, defined, 958
— ways, in launching ships, *5923*
Sling-fruits, seed dispersal, 910, *911*
Slinking, in cattle, treatment, 2623
Slip, in carpentry, 3388
— in induction motors, 1909
— in yarn counts 2895, 2896
— band of crystal, 3937
— coaches, railway, working, *4802*, 4805
— galley, compositor's, 5158
Slipper, gully in drainage, 781
Slipways, dock, 6497
Sliver, dyeing, *6367*, 6368; forming, 1724, 1885; thinning threads, 2097; in woollen manufacture, 70
Slocomb machine, leather, 3164
Sloe, spines, function, *1114*
Slogging, in cupola furnace, *2862*
Slot-drilling, shafts, *3403*, 3405; machine, use in key grooving, 5448
Sloths, 1763, 1871; skeleton, *plate facing* 2065
Slotters, machine, *3317*, *3319*, *5003*; compared with milling cutters, *3401*; keyway cutting, 3404; portable, *5276*, *5279*; test, 3965
Slubbing, cotton, 2098, *2290*
Sludge, sewage, treatment, 4550
Slug, 3113, *3115*; food of birds, 2494; how plants protect themselves, 1115
— sea, 3114, *3115*, 3161
Sluices, dock gates, construction, 6496
Sluicing, ground, in mining, 2959
Slur, in music, 271; tonic sol-fa, 922
Slurry, 1579; cement, 1855, 1856; analysis, 4416; drying, 1728
Smacks, fishing, *4989*
Small pox, 5410; immunity from, 6543; races exterminated by, 6782; red light treatment, 3372
Smalts, glass, 4930, 5985
Smell, organ of, 197, *2146*, 2536, *2537*
Smelting, in metallurgy, 231, 356, 3835, 4125
Smith, Adam, economist, 2055
— Sydney, works, 2309
Smith-Premier typewriter, 1529
Smith's clinker cooler, *1731*, 1732; flurry wash-mills, *1580*
— solution, 737; pitch compound, 646
— work, dictionary of, 3107
Smithy, engineering, 2108, *2893*
Smock, overall, boy-baby's, *4195*
Smog, term for fog, 1900
Smoke-box, of boilers, 3105
— of locomotive, 6514, *6515*; cleaning, *4597*, 4599, 4601
— test, for drainage, 783
— tubes, boiler, *3099*, *3101*, 3104
Smoking, tobacco, effects, 4010
Smoothing brush, paperhangers', 5827
— plane, 3385, *3387*, 3756, *3757*
Smut, fungous disease, *1667*, 1669
Snail, of eight-day clock, 5716
— land, characteristics, *3113–3115*
Snakes, 2677, *2681*; blood temperature, 439; food of secretary bird, 2493
— bite, cure for, 2681
Snap, use, *4585*, 4586
— flask, for moulding, 2688, *2700*
— in riveting, described, *3096*, 3108
Snap-dragon, 354; pollination, 732; pollen protection, 1114
Snapshots, in photography, 6680, *6684*
"Snifting," aerated water, 6392
Snipe, 2212; carving, 5934
Snow, geological effect, 1504
Snowdon, *1276*; railway, 2276
Snowdrop, *351*, 355; culture, 6490; growth in woods, 504; pollen protection, *1114*
Snow-line, variation of, 1636
Snuff, manufacture, 4373, *4375*
Soak-pit, in leather manufacture, *2853*
Soakers, of gutters, use, *5031*, 5034
Soap, *4963*, *4966*; books on, 4834; dyeing, 5781, 5954, 6770; formation, 3485, 4829; in laundry work, 2477; oils used in, 1032, 4963; in sizing paper, 6395; in washing the skin, 4255
— bubble, balloon experiments, 3977; surface tension and colours, 3367
— washing powders, 4966
Soaping machine, in dyeing, *6371*
Social heredity, explanation of term, 5386; influence on government, 4370; instances of, 5387, 5388
Societies, animal and human, 4123
Society, dissimilarity of units and progress, 5387; dynamic condition, 5533; liberal and conservative forces, 5530; growth inevitable, 5246; industrial stage, 5096; at the level of the ant-heap, 5248; military stage, 5096; military-industrial stage of, 5097; an organism, 5245; relation to the individual, 4369, 5245; science of, 3870; spiritual type 5097, 5245; compared with chemical compound, 4278; unity of organism, 5100; without the "self," 5247
Society of Architects, 1912
Society of Arts, examination, 149
Sociologist, aims of, 5533; moral and intellectual training, 4121, 4122
Sociology, 3869; alcohol problem, 5812; books on, 5816; former conception, 4275; an academic subject, 4123; comparative, 4123, 5248; descriptive, 3986, 5817; moral ideas and social problems, 4124; natural selection in, 5386; practical interest, 5670; relation to biology, 137; relation to ethics, 4275; relation to geography, 3989; relation to psychology, 2012; relation to other sciences, 5670; scope, 4123, 4275; Spencer's work and life, 4121, 5816
Socket chisel, 4150, *4151*
Socrates, 774, 975; "argument," from analogy, 3230; condemnation, 2506
Soda, 842; use in laundry-work, 2477: *see also* Sodium, Sodium carbonate, Soda crystals *and* Caustic soda
— ash, manufacture, 4773, 5780
— crystals, formula, adulteration, 4773
— fountains, in chemists' shop, *1655*
— water, constituents, 3379; manufacture, strength, 6391, 6393
Sodium, chemistry of, 840, 841, 5756; distribution, 3771; in earth's crust, 230, 624; electro-positive atoms, 2297; emission of positive ions, 4700; spectroscopic examination, 3370; in sun, 3371
— bicarbonate, 4774; mfr., 4772
— bisulphate, in dyeing, 5781; preparation, 4627
— -carbonate, 842; commerical, 4774; in dyeing, 5780, 5954; manufacture, 2714, 4770, 5759
— chlorate, preparation, 4778, 5760
— chloride, 359, 3261; decomposition, 1598, 4634; in dyeing, 5780, 5954; electrolysis, *5757*, 5759; in human body, 438: *see also* Salt, common
— hypochlorite, mfr., 5759, 5760
— nitrate, in gunpowder, 6758; as manure, 589, 590, 4048; product of Chile, 4289, 5308, 5587
Sodium peroxide, in bleaching, 6199
— phosphate, in dyeing, 5780, 5781
— salicylate, source, use, 3818, 3819
— sulphate, in "caliche," 5587; in dyeing, 5780
— sulphide, in dyeing, 5781; in softening hides, 2853, 2854
— sulphite, as food preservative, 5408
— tartrate, composition, 4774
Softener machine, textile, 1026, 1385, *1386*, *1388*, 1390, 2595, *2596*
Soil, effect of rain on, 1503; enriched by plants, 504; fertile and unfertile, 4497; formation, 1071, *1502*, 1815; geographical importance, 4497; plant food, *167*
— in agriculture, constitution, cultivation, 255, 430; intensive culture, 21; manuring, 589; rotation of crops according to, 1200
— in building, 330; bearing power, 329, 331; in foundations, 142
— garden, improvement, 6203, 6204
— in hygiene, 5273. 5274, 5409
Soil-drain, 569, 780
Soil-pipe, in drainage, 736; manufacture, 646; for ventilating, 782
Solar plexus, *1944*
— system, *11*, 6250; Copernican, *6121*; cosmic future, 6702; nebular hypothesis, 620, 6701; radiation pressure and consequences, 939
Solder, composition and kinds, 360, 1160, 3941, 5523, 5830, 5987, 6453; dental, 6028; hard, 6458, 6459; jewellery, 5857, 5858; plumber's, 3941, 5987; soft, 6457, 6458
— pot, plumber's, 5029, *5030*
Soldered joints, in building, 5032
Soldering, 3839, 5352; in art metal work, *5523*, 5525; autogenous, 360, 6454; fat, composition, 6458; fluxes, 6454, 6458; hard, 6453, 6458; in jewellery, 5858; pastes, composition, 6458, 6460; plumber's, 5029, *5030*, 5627; soft, 6457
— iron, 5029, 6457
Soldier: *see* Army
Sole, 3069; carving, 5936; choosing, 3717; digestibility, 3314; eyes, 2403; frying, 1873
Sole, of boot, 3873; cutting, 4137, 4540, *4541*; manufacturing processes, 4138, 4240, *4242*, 4542
Soleplate, marine engine, *6295*
Solicitors, 6748; articled clerks, 6750; examinations, 6748; municipal appointments, 1410, 6571; official positions, 6751; railway, duties, 4227, 4228, 5107; training, fees, etc., 163, 6749
Solid, in geometry, 1747, 2605, *2607*, 4207
— physical, definition, 3836; expansion under heat, 1738; sound transmitting medium, 2101
Solidification, of liquids, 1268
— of matter, molecular motion, 1269
Soling, in bootmaking, 4138
Solipsism, in philosophy, 6469
Solstice, *6248*, 6250; causes, 6405; summer, 3698
Solution, dissociation theory, 4406, 4698; electrolytic and non-electrolytic, 4563; laws and problems of, 4562; properties of, 4698; volume inversely proportional to pressure, 4562, 4563
Solvay process: *see* Ammonia-soda process
"Somatic," in biology, 485, 1587
Somnambulism, mental state, 3288
Sonata, in music, 634
Song, 6340; "word picturing," 6336
Song-birds, description, 2209
Sonnet, introduction in English, 328; Shakespeare, 683; Wordsworth, 1303
Soot, danger of, 1226; as manure, 589
Soporifics, kinds, 5469
Soprano, clef in musical notation, 1059
— part, in harmony, 334
— voice, *6050*, 6182; exercises, *6103*, *6187*
Sordino, horn music, 5732
Sore throat, in pigs, 2626

Sorghum, as cattle food, 2905; source of sugar, 3652, *plate facing* 3849, *4354*, *4875*
Sorrel, farm weed, 1378; salts of, 3704
Sorters, in Post Office, 2809
Soudan: *see* Sudan
Soul, relation to spirit and body, 4527
Sound, 2064, 2101; brain perception, 2315, 2535; direction judging, 2315; feeling vibrations of, 2318; interference phenomena, 3229; physiological account, 2534; pitch, 2102; refraction, 2102; waves, compared with light waves, 2102, 2433, 3229
— of fishes: *see* Swimming-bladder
Sound-board, aluminium, 5991; organ function, 3857; pianoforte, 1210
Sounder, telegraph, 4382, 4608, 5065, *5178*; Morse, *5065*; quadruplex, *5243*
Sound post, violin, 2122, 2123
Soundings, in marine surveying, 1017
Soups, recipes for cooking, 1735
Source, of river, definition, 456
South Africa, commercial opportunities, 6212; constabulary, 3549; ethnology, 1789; geography, 3584–3587; medical profession, 5428; teachers in, 3741
South America, coalfields, 5305; fauna, 628; forest trees, 626, 627; geography, 460, 4282, *4289*
South Australia, climate, 3236; cotton production, 385; farming, 3236; geography, 3899; rainfall and stock, 5660; wool industry, 3237
Southdown sheep, 23, 2361
Southampton, harbour regulations and revenues, 6220; shipping, 6005
South Kensington School of Art, 868
South pole, 293; position, 13
South Wales, geography, 1277
Southwark bridge, construction, 2498
Southern hemisphere, explained, 13
Southey, Robert, poet, 1307, 2309
Sow thistle, farm weed, 1378
"Sower," Millet's picture, *342*
Sowerby Bridge, wool counts, 2895
Sowing, in agriculture, 431, *635–637*; cereals, 872, 1229; clovers, 940; forage crops, 1197; grasses, 872, 3256; root crops, 942, 1233
Soxhlet fat-determining apparatus, 4722
Space, ether, 935; Kant's doctrine, 2013; psychology, 2119
— in design, 5820, 5977
Spade, gardener's, *6315*
— tools, carver's, *5809*, 5810
Spadix, of arum, *351*, 355
Spain, African possessions, 3278, 3587; architecture, Gothic, 3376; art, 4119; coalfields, 5302, 5304; coins, weights and measures, 410; economic divisions and conditions, 5823; geography, 2232, *2233*; iron ore, output, 5307; literature, 2962, 3782; medical profession, 5429; touring, 1132
— history, at opening of Middle Ages, 2241; in Middle Ages, 2354; to Ferdinand II., 2946; colonisation of America, 3606; mediæval, 4396; from 1588 to reign of Charles IV., 5397; from 1817 to 1902, 6304
Spalling hammer, 532, 2839
Span, of beam, definition, 1984
— of roof, carpentry, 4250, 4252
Spanish Armada, 4397
— chestnut, timber, 56
— fly, cantharides from, 3512
— fowls, 4956, *4957*, *5622*
— language, alphabet, 2040; commercial phraseology, 5086; commercial correspondence, 6091, 6235; correspondence, general, 5803; dates, 3792; days, 3792; dialogues, 5514; English importations, 1770; euphonic changes, 3792, 4078, 4509; idiomatic phrases, 6236; Latin and Greek root words, 6810; suffixes, diminutive, 2628; tourist vocabulary, 1957; translation charges, 1920
— mahogany, *56*, 1260; use, 2827
Spanish Succession, War of, 4951, 5397
Sparging, in brewing, *6057*, 6229
Spark apparatus, Faraday's, *951*
— coil, invention, 130
Sparkless commutation, dynamo, 1323
Sparrow-hawk, jeweller's, *5857*
Spars, rectangular, strength, 6266
— of ships, kinds, 5398
Sparta, cause of decay, 4664; instance of militarism, 4371, 5095; history, 668, 772, 1203
Spathic iron ore, 231, 1044, 4466, 5306
Spavin, in horses, treatment, 2622
Spear heads, cave-dweller's, 2478
Special service, Navy, 4265, 4266
— subject teachers, pay for, 6479
Specialisation of function, importance in biology, 278; sex evolution, 382
Specialities, in shopkeeping, 6208
Species, in biology, defined, 135, 380; in counterpoint, 632
Specific characters, of animals, 279
— gravity, 797, 1078; Archimedes' discovery, 35; bricks, 1520; building stones, 1518; metals and alloys, 1396, 3837; minerals, 766, 6731; precious stones, 5853; timbers, 1259
— gravity bottle, 1078
— heat, 1564, 1739
Specification, architect's, 1910; in building, definition and use, 307
Spectacle Makers' Company, 4141
Spectacles, lens grinding, *6128*; pebble and glass compared, 3372
"Spectator, The" (Steele and Addison), 1903, 2963
Spectra, stellar, *plate facing* 6097
Spectroscope, 3369; in analysis, 4406; in astronomy, 6248, 6698; star motions measured by, 3371, 6698
Spectrum, 3369, 5193; complementary colours, 3729; heat rays, 2060, 2433, 3617; invisible rays, 3371; confirmation of electron theory, 3618; series lines, 3618
— analysis, 3370, 4135, 6248; of groups of elements, 2298
Speculum metal, 1160, 3940
Speech, physiology of, 2301, 2536, *2538*
— freedom of, aid to truth, 5390
Speed, arithmetical problems of, 1549; testing, 3964, 3966
— angular calculation, 1592
— in physics: *see* Velocity
— in shipbuilding, theory of, 1144
— indicator, of locomotive, 5104
Speedwell, description, *351*, 354; insect-pollination, structure, *730*, 908
Speiss, in metallurgy, 3836, 5983
Spelling, English, defects, 122; in business letters, 6352; compositor's, 5158; printing office, 5460
Spelter, composition and use, 3884, 5325, 5523, 6169, 6453, 6458
Spencer, Herbert, on conservation of matter, 1915; definition of science, 59; child and animal psychology, 3117; on meaning of evolution, 486; on filial responsibility, 4666; genius inherited by society, 5388; on highest being, 6539; on history, 3985, 3987; individualism versus genesis, 4827; on indivisibility of nerve cells, 3118; inductive and deductive methods in logic, 6097; on instinct, 1588, 2694; justice the end of the state, 5534; on legislation and character-making, 4371; on marriage, 4536; persistence of force, theory, 313, 2063; on physical courage, 5098; on pleasure and pain, 2518; "Principles of Sociology," 4539; psychological theory, 2014; reflex action, theory, 2118; the social organism, 5246; "The Study of Sociology," 4121; study and works of, 4122, 5816; on truth, 5530; on war and militarism, 5095; on women, 4825
Spenser, Edmund, 537; 1641
Spenserian stanza, criticism, 537
Sperm, development of embryo, 1315; *see also* Reproduction, *etc.*
Sperm oil, source, properties, 4833
Sperm organs, in chara, 1870, *1373*; of ferns, *1116*
— sacs, of hydra, *381*
— whale, 4333
Spermaceti, source, properties, 1033, 4834
Spermaphytes, defined, 165; subdivisions of seed-plants, 350, 353
Spermatozoa, of hydra, discharge, *381*
Sperms, of mosses, *1312*
Sphere, in geometry, 1747, *1749*; geometrical problems, *2006*, *2010*
Spheres, hollow metal, making, *3888*
Spheroid, oblate, diameters, 621, *623*
Spherometers, Ross type, 6122, *6123*
Sphinx, *183*; as artistic creation, 2519, *2523*; wind erosion, *1500*
Spices, dietetic value, 3312; properties, use, 4717, 4722
Spider, 3361, 3803, *3804*; eyeless, 2403
Spiegel-eisen, 234, 4464; use, 5013
Spigot, in drain pipe, 569, 570
Spikelet, 875; of wheat, *915*
Spiller's resin, formation, 5312
Spilling, in mining, 3565
Spills, of manufactured iron, 4638
Spinach, culture, 6675, 6836
Spinal cord, *197*, 1605; functions of, *2143*, *2301*
— curvature, 4387; in children, 4862
— diseases, nature, 6261
— nerves, 1941; course of, *2143*, 2302
— plexus, *1944*
Spindle, in machines, 5205, *5207*; eccentric, for hole grinding, *5212*; lathe, 4324, *4325*; planet, *3404*, 3407; testing, *3963*, 3965, 3966
— gill-box, mechanism, 2291, *2293*
— tree, 353; garden hedge, 6318
Spine, in botany, function, *1114*
— human, 29, *99*, *1604*, 1709, 1799; vertebræ, formation, 436
— in zoology, as weapons, 2156, *2157*
Spinel, 5853, 5855; artificial, 5853
Spinifex, distribution, 626, 3698, 3899
Spinneret, silkworm, 584; spider, *3804*
Spinning, art metal-work, 5526, *5528*
Spinning, textile, process and machinery, *2441–2445*; cotton, 223, 2289, 2291; flax, 2292; hemp, 2292; jute, 2293; rope, *2445*; silk, 2596
— lathe, in brass spinning, 6314
— wheel, 223, 1025, *1027*
Spinous process, of vertebræ, *1605*
Spinoza, services to psychology, 2013
Spinthariscope, description, 1915
Spiracle, 2801; in shark, *3065*
Spirals, geometrical, *1413*, 1414
— of screw wheel, drawing, 3923, *3924*
Spirilla, bacteria, 6437, *6439*
Spirit, relation to soul and body, 4527
— level: *see* Level
— of salt: *see* Hydrochloric acid
Spirits, varieties and constituents, 2879, 3314; consumption of, 3315; dietetic value, 3377
Spiritualism, Myers's theory, 3384; suggestion, phenomena, 3289
Spirogyra, description 1370, *1373*
Splash-stick, in soldering, 5628, *5629*
Splay, in joinery, 5296, 5297, *5299*
Splayed bricks, form, *1948*, 1949
Spleen, 1194; corpuscles, 953
Spleenworts, culture, 6493
Splice, in vehicle construction, 2832
Splicing, sailor's, *6407*, 6408
Splint, in horses, treatment, 2622
Splinter bar, of brougham, 2830, *2831*; of carriage, *3123*, *3124*; of van, 2828, *2829*
Split infinitive, defined, 756
Splitters, mason's, *2837*, 2839
Splitting, in leather manufacture, 3165, *3219*, 3220; saddlery, *4783*
Spoke, of bicycle, 3775, 3776
— of wheel, 2830, 3126; decoration, *3481*; timber used for, 2827
Spokeshave, description, *3387*, *4151*, 4152, 5298, 5301
Spondee, defined, 305, 1766
Sponges, 1493, 4086, 5121, 6891
Spongy layer, of plants, 170, *171*
Spontaneous generation theory, 28, 96
— variations, in germ-plasm, 651, 823
Spool, of loom, structure, 3635, *3636*

Spooling, in thread manufacture, 2708
Spore, of animalcules, 4089 ; of ferns, 1116, *1117* ; of mushrooms, 166
Spore-generation, biological importance, 1311 ; of mosses, *1312*
Spore-leaves of water-ferns, 1118
Sporting goods dealers, business, 5343
Sports, officials, 6869
Sprag, in motor vehicles, 3128
Sprains, treatment, 6472
Sprays, in mining, 3560
Spreadboard, flax carder, 1726, *1727*
Spreader machine, textile, 1541, 1885
Spring, cause, *15* ; oscillation energy, *3747*, 3748
— blocks, of brougham, 2830, 2831
— governor, *2019*, 2020
— steel, 234
Spring-tail, insect, *3363*
— tides, cause of, *556*, *6565*
Spring, of water, 456, 458, *1504*, 4025
Springs, coiled and spiral, temper, 4746 ; testing, 1704
— dentistry, dental, *6034*, 6035
— of vehicles, types and function, 2725, *2727*, 3328 ; of bogie frames, 3121 ; of coaches, 2465 ; of carriage, *3123*, *3124* ; of two-wheeled vehicles, 3126 ; of van, *2829* ; of wheel, 2830
Spruce, 4604, *4678*, 4679 ; insect pests, 4926, *4927* ; wood fibre, *6281*
— black : *see* Black spruce
— fir, 55 ; strength, 5, 1260, 1393
— Norway : *see* Norway spruce
Spueing, in leather manufacture, 3219
Spun silk, improving and gassing, *2597*
Spur gears, in gear cutting, 3630, *3631* ; drawing, *4202*
— wheel, casting, 2337, *2339*, 2543, *2544*
Spurry, farm weed, 1378, *3893*
Squabbing, vehicle, 3623, *3624*
Square, in building, axed work, 1950, *1951*, 3386, *3387*
— in carpentry, *3757*, 3759
— in geometry, 496, 1084 ; area problem, 1253 ; projection, *4523*, 4524
— mason's, description, *2857*
— in mathematics, 1264, 1442, 4723
— measure, table of, 226
— measuring tool, 4701, *4703*
— plasterer's, *5497*
Square root, 1264, 1439, 1440 ; of a multinomial, 3411, 3412
Squared paper, textile, 2939, *2940*
Squeezer, in iron manufacture, 4637 ; in shipbuilding, *5738*
Squid, description, *3114*
Squinting, causes, 6264
Squirrel, 1762 ; balancing tail, 1871 ; flying, 1871 ; parachuting, *2037* ; skins and fur, 6428, 6430
Stability, in chemistry, 693 ; in mechanics : *see* Equilibrium
— curves of ship, 5970, *5971*
— of structures, books on, 2764 : *see also specific structures—e.g.*, Arches
Stable, cleaning, 1001 ; construction, 2998 ; drainage, 736
Stable equilibrium, defined, 661
Stable-hands, duties of, 1001
Stablemen, in farming, 3000
Staccato, in music, 271 ; in singing, *6336* ; violin bowing, *2742* ; violoncello bowing, *2825*, *2969*, 2970
Stack, of blast furnace, 4469
Stacking, in agriculture, *1664*
Stacks, for hay, thatching, 1630
Staff, of business office, 659
— in music, *37*
— of van, 2828, *2829*
— apparatus, electric train, *4692*
Staffordshire bricks, 1280, 1520, 1947
Stag beetle, description, 3510
Stag's horn club moss, *1119*, 1310
Stage as a profession, 164, 6865
Staggers in sheep, treatment, 2625
Staging, for bridge erection, 1174
— in building, 1172, *1453*, 1454
— in shipbuilding, *5736*
Stahl's theory of elements, 60
Stained glass windows, *4945–4949* ; *plate facing 4945* ; books, 4949
Staining, cabinet-making, 6591
— in leather manufacture, 3456
— in vehicle painting, 3480
Stains, removal of, 2590
Stair carpets, laying, 6723
Staircases, types, 5298, *5301* ; architect's drawing, *5694*, 5698 ; casing, 3245 ; circular, curve of, 3241–3243 ; concrete in, 332 ; fire-resisting, 4752, *4753* ; plan, 5548 ; quantity surveying, 6510, 6513 ; sand courses for, 2513 ; stone, 3241–*3248*, *5795*, 5797
Staithes, construction and forms, 4644
Stake net, description, varieties, 4990
Stakes, in art metal-work, *5525*, 5520 ; in coppersmithing, *3888*, 3889 ; foundry, 2547
Staking, in leather manufacture, 3164
Stalactite, 844, 1074
Stalagmite, chemical account, 844, 1074
Stalk, of leaves, structure, *169*, 170
Steele, Sir Richard, author, *1903*, 1904
Stamen, of flower, 346, *347*, *351*, *730* ; production of nectar, 731 ; variable number, 350, 352
Stammering, cure of, 2539
Stamp Act, connection with American War of Independence, 5845
— battery, in mining, 3770
Stamping, process, *2989*, 2992
— in mining, 3770
— mill, *356*
— wood-carving, 6045, *6046*
Stamps, entry in postage book, 977 ; office-boy's duties, 194
— postage, dealing in, 4616
Stanchions, in carpentry, *3543*, 3547 ; cased with faience, *2781*, 2784 ; casing for fire resistance, *4753* ; cast iron in, *1453* ; fixing by builder, 5791, *5793* ; strength, 2198
Stand-pipes, in water supply, 4334
Standard, in scaffolding, 1170
— time, explained, *14*, 15
Standing, physiological account, 1798 ; psychology of equilibration, 2120
— ways, in launching ship, *5923*
Stanford's joint, in drain-laying, 736
Stanhope gig and phaeton, 2466
Stannous chloride, 5779
— hydrate, in dyeing vat, 5782
— nitrate, in dyeing, 5779
Stanstad-Engelberg rack railway, *2275*
Staphylococcus, bacterium, 6457, *6439*
Stapedius bone, of ear, *2533*, 2534
ar-coral, scarlet and gold, 4081
ar-flower group, classification, 354
ar shakes, of timber, *52*
ar-showers, occurrence, 6695, *6697*
ar-stones, 5855
arch, 5364 ; dextrose from, 3705 ; dietetic value, 673, 3109 ; conversion into glucose, 2878, 4556 ; digestion by hydrolysis, 3706 ; in dietetics, 3111 ; manufacture, 5364 ; photomicrographs, *5365* ; product of plants, *171*, 172 ; potato, granules of, 3706 ; in vegetable food, 635
— cells, of wheat, *915*
— grain, dietetic value, 673 ; of various flours, *3716*, 3717
Starching, in cloth manufacture, 4342
Starfish, description, 4081, *4083*
Stark, landscape painting, 4301
Stars, apparent motions, 6116 ; brightness, 6697 ; chemical composition, 6249 ; clusters, 6700 ; collision, 6699, colour, 6699 ; constellations, 6115–*6120* ; dissociation in, 4136 ; distance by parallax, 6697 ; distribution, 6700 ; double, 6698 ; declination, 6245 ; elements in, 839 ; fixed, 6115 ; Galileo's discoveries, 2949 ; Lockyer's classification, 4136 ; magnitudes, 6696 ; mass, 6697, measurements, *6244*, 6245, 6696, 6697 ; meridian passage, 6247 ; motions, 3371, 6697 ; naming, 6696 ; in navigation, 6662 ; parallax, 6696 ; physics of, 4561 ; right ascension, *6244*, 6245 ; spectra, 3371, *plate facing* 6097, 6248 ; temporary, 6699 ; triple, 6699 ; velocity, 6698 ; wandering, 6116
Starvation, death by, 866
Stassfurt, salt and potash mines, *5555*
States of the Church, 2945
States General, of France, 4101
Static electricity, 3579
— *friction*, 958
— stability, 553
Statics, definition and scope, 85, 411, 422, 553, 1833 ; books on, 2764
Station, in chain surveying, 262
— pointer, marine surveying, 159, 1018
— railway, platform and other structures, *3616* ; rails, arrangement, *3616* ; termini, 4807
Stationers, business of, 47, 5345
Stationmaster, railway, duties, wages, 4806 ; as goods agent, 4229
Stator, electric, 1358, *1909*
Statue, in art, Egyptian, *2519* ; electrotyping, 3422 ; founding, 6313, support of mass, 2286
Stature, in race classification, 1786 ; relation to longevity, 2063
Statute of Frauds, provisions, 6752
Statute measure, land, 1146
Stay bolts, in boiler work, *3099*, *3103*
— sail, sailing ship, adjustment, 5399
— tap, in fire-boxes, 3108
Stays, boiler, 3098, 3108 ; fire-box, *3101*, 3103
— telegraph lines, construction, 6324
Steak, cooking, 3313, 3314 ; food value, 3381
— and kidney pie and pudding, 1872
Steam, books on, 5595 ; as disinfectant, 5055 ; elastic force, 5414 ; energy, 290 ; expansion in cylinder, 5414, 6072 ; expansion curve, 5415, *5416* ; a heat vehicle, 5413 ; pressure curve, *5414* ; in propelling ships, 5256 ; in transport compared with electricity, 2274 ; as volcanic vapour, 1207 ; wrought iron tubes for, 5328
Steam chest, of engine cylinder, *5641*, 5642 ; flange, *3317*, 3324
— coal, geological classification, 1074
— domes, of boilers : *see* Domes
— engines : *see* Engine, steam
— hammer, 234, *2019*, 2022, 2984, 2986, 4203, *4204*, 4637
— heating, in buildings, 6023
— navvy, railway construction, *3173*, 5997
— ports, engine, drawing, *4423*, 4424
— roller, invention, capacity, 2325, *2326*
Steamers, 5258, 5398 ; advantage over sailing vessels, 4519 ; cargo, section, *5611* ; construction and arrangement, *5401*, 5402 ; date of first, 4519 ; direction at night, 6411 ; engines, 6296 ; machinery, 5402 ; plating, 5402 ; special fittings, 5924 ; speed, 6225 ; in trawling, *4989*, 4992 ; trial trip, 6227 ; world's tonnage, *5259*, yearly loss, *5258* ; *see also* Ships
Steaming, in cloth-making, 4106, 4109
— in cooking, 1486, 3314
Steapsin, action, 675, 3486
Stearin, 1032, 4835 ; in cod-liver oil, 3486 ; manufacture, 4833 ; in milk fat, 4035
Steel, 231, *233*, 5307 ; acid open-hearth process, 5014 ; is it an alloy ? 1722, alloys, 4747 ; aluminium in, 1043, *5991*, 5992 ; annealing, 5524 ; armour plate manufacture, 4750, in art work, 5523, 5688 ; barfling, 6577 ; basic open-hearth process, 5016 ; Bessemer : *see* Bessemer, blister manufacture, 4750 ; blueing, 6573 ; in boiler-work, 3098 ; in building, 2446, 2448, 2149 ; in buildings, fire-resisting, 4751 ; building, future use in, 519 ; carbon percentages, 3938, *plate facing* 3936 ; carburising, fusion method 4748 ; case hardening, 4750 ; casting, 5018 ; casting, shrinkage of, 2342, 2398 ; cementation process, 4750 ; cemented bars, manufacture, 4750 ; chemistry of, 1045 ; chromium alloys, 4748 constitution, 3938, 4465, 4746 ; conductivity, 1397 ; crucible furnace, *2862* ; drifting and punching,

Steel—*continued*
2990; electric furnace, production, 5757, *5758*; enamelling, 6575; friction data, 959, 3813; forging press, 1224; hardening process, 4746; "head" casting, 1404; heat statistics, 1396; for high-speed tools, 3633; hydraulic presses, 1223; iron compared, 2983, 2986, 4464; load stress, 2226; use in machinery, 206, 209; magnet, 559; manganese in, 362; manufacturing processes, 4748, 4907, 5013, 5307; medium carbon, 5015; melting for foundry use, *2862*, *2867*; musket, composition, 4748; open-hearth manufacture, 5013; painting, 6571; pig production, 4748; plating department, 3095; protective coating, 5149, 6571; puddled, 232; "punching bear," 1222; segregation, 4747; in shipbuilding, 5260, 6221; in smithy work, 2083; use of soaking pits, 5018; soldering, 6460; strength statistics, 1396; substitute for iron, 5018; tempering, 236, 4746, 4749; tools, turning and shaping, *4151*, 4153; vibration compared with iron, 2022; welding, 2990, 6453; wire, 1699; working, effect of, 4747; world's output, 5307
Steel buffer, *3219*
— cast, 231, 234; safe stresses, 3657, *3658*; shrinkage, 2342; strength, 1394–1396, 1397
— engraving, 6114
— facing, 3422, 6290
— mild, in building construction, 1454; defined, 4465; expansion, method of, and formulæ, 1555, *1556*, 1557; strength, 1393, 1395
— smelting, employment, 2644
Steelyard, 830; use, 1261
Steering gear, fitting to ship, 5924; hydraulic, 1224
Steljes type-printing telegraph, 5393
Stellar chemistry, 4135
— parallaxes, determination, 6697
Stem, of plants, *168–170*; in trees, 51, *53*
Stem-eelworm, description, *1667*, 1668
Stemming, in blasting, 2584
Stencil, in manifolding, 1698
— brush, 6728; painters', *5829*, 5831
Stencilling, 5836, 5977, *6726–6729*
Stenographer, hire of, 1920
Stenography: *see* Shorthand
Steno's duct, 577, *578*
Step, of brougham door, 2829, 2831
— of screw, 686
Step-ladder hinge, of vehicles, 3022
— setter, plumber's, description, 5029
— tread, of light waggon, 2829, *2830*
Stephanotis, culture, *6532*, 6533
Steppes, 626; economic conditions, products, 5707; plant life, 727; plant and seed-dispersal, 910; Russian, 2408; vegetation of, 626
Steps, of staircases, 5300, *5301*; stone, *3037*, 3040, 3241, *3243*
Stereo-chemistry, 2714
Stereo-printing, Dalziel process, 5560
Stereochromy, fresco painting, 4931
Stereoscope, 3182
Stereoscopic vision, of eye, 2400
Stereotype metal, 360, 5988
Stereotyper, printer's, 5026; employment conditions, 2655
Stereotyping, in printing, 5556
Stern, of vessel, forms, *5618*, 5619; making, *5742*
Sterne, Laurence, novelist, 3130, *3131*
Sternpost, of ship, *5742*
Sternum, human, 1300, *1604*, *1606*, 2144
Steward, marine, 6365, 6804; Metropolitan Asylums Board, 1930
Stewing, in railway construction, 3253
— in cooking, 1486, 3313
Stevenson, R. L., *2619*, 2550, 3442; poems, 1438; prose works, 2617
Stick insect, 3363, *plate facing* 3361
Stickleback, 3068, *3069*
Sticks, umbrella and walking, 5603
Sticky fruits, seed-dispersal, *911*, 912
Stigma, of flower, *347*
Stigmata, of air-breathers, 3361
Stile, of windows, *5183*, 5186
Still life, water-colour study, *1796*
Still-room maid, duties, 1005
Stilton cheese, composition, 4490; dietetic value, 3311; manufacture, *4574*
Stimulant, definition, 4009
Stimulation, of nerves, 1942
Stings, bee, 5958, 5963; treatment, 6473
Stipple engraving, 6114
Stipule, in classification of plants, 350
Stirrup, in carpentry, *3543*, 3546, *4251*
— in mining, 2669, *2670*; in rope boring, 2845, *2846*; in shaft-sinking, 3461
Stirling wool, yarn counts, 2895, 2896
Stitch pricker, shoe, 3877, 4784
Stitches, in glove-making, 5482
— milliner's, *4565*, 4566
— in tailoring, 2605, *2606*
— in underclothing, 3336, *3337*
Stitching, *150*; blind, in upholstery, *6717*; in bootmaking, 4139, 4542, *4543*; machine, 1328, *4543*
Stoating, in tailoring, *1111*, 1112
Stock: *see* Livestock
— book, use, 776
— classification on balance-sheet, 2758
— in cookery, 1188, 1530
— factory, defined, 6642
— finance, explained, 1262
— in hand, and profit and loss, 2418; in trading account, 2500
— jobber, definition, 1262
— metal-worker's, *5521*, 5524
— of plane, 4152
— rail, union with point, *3609*
— ramming, foreshore protection, *557*
— retail business, 177, 702; index systems, 6054
— in-trade, in bookkeeping, *490*; depreciation, 2758
— Virginian, culture, 6491
— of wheels, 2830, 3126; axles, 3326
Stockbroking as a profession, 164
Stockfeeder's medicines, 2626
Stocking frame, *4620*, *4621*
Stockings, washing, 2591
Stocks, bricks, 1947
— for hides, 3165, *3166*
Stocks and shares, 3483, 3484; mathematical rules, 1262
Stocktaking, bookkeeping, 2418–2421
Stokers, marine, 6807; Navy, 4265
Stoma, of leaves and stems, 170, *727*
Stomach, human, 198, *576–579*, 674; diseases, 5842; rest periods, 4391
— inflammation, in horses, 2620
— of ruminants, *1762*
Stomias, fish, description, 3070, *3071*
Stone, in arch construction, 3143; for building, 528–535, 3241; for footpaths, 2430; dyeing, 6766; glazing, *5839*; in masonry, 1452, 3033; quarrying, 2955; in sculpture, *1676*; strength, weight and safe working stress on, 1517; working, *3037*, 3040
— artificial, 1520; in construction, 1450; for paving, 2428, *2429*
Stone age, art of, *2479*, *2480*
Stonecutters, employment, 2642
Stonehenge, 1275, 2479, *2480*
Stones, building, characters and preparation, 2836, *2841*; strengths and weights, 1517, 1518
— precious: *see* Precious stones
— use in revetting, 6271
Stoneware, glazed, 569, 646; jointing to lead pipes, *5631*, 5634
Stonework, building-in, pinning-in, 2513; decay of, 3244; quantity surveying, 6509, 6510
Stoning machine, leather, 3218, *3219*
Stoolings, of jambs and mullions, 2837
Stop abutment, of arches, 2762
— trumpet, musical instrument, 5441
— valve, in service pipes, *5629*, 5633
Stopping, in mining, 3192, 3304, 3561
— in painting, *5829*, 5834
Stoping-up, in vehicle-painting, 3479
Stops: *see* Punctuation, Full-stop, *etc.*
— bricks, forms 1949
Stops, harmonium, 3951, 4180
— organ, 3859
Storage-tanks, for rain-water, 780
Storekeepers, Metropolitan Asylums Board, 1930; railway, 4228
Storey rod, description, *2515*, 5298
Storksbill, reproduction, *909*, 910
Storm, forecasts, 986; in navigation, 6412
— overflows of sewer, *4456*, *4458*
Story rods, in building, 309
Stoves, construction and use, 6016; heating system, 6015, 6028; material and setting, 2390
— cooking, management, 1226, 5193
— makers, employment, 2646
Stradivarius, violin making, 2510
Straight arch, 2760, *2761*
Straight-edge, 4701, *4703*; in carpentry, 3386, *3757*, 3759; plumber's 5029; steel, *5521*
Straight-winged insects, *3363*, *3367*
Strain, in building, 1256; in engineering work, 2107
Strainer, in drainage, 781
— painter's, *5829*, 5830
Straining beam, queen post truss, *4251*
— chain, in piling, 1174
— piece, in shoring, 918, 1174
Strains, calculation, 209, 416, *1256*
Strakes of ships, drawing, 5615; garboard, *5921*; plating, 5918, *5919*
Strand of rope, formation, 5290, 5292
Strangles, in horses, treatment, 2621
Strap, in boiler work, *3099*, 3100
— in building, in staging joints, 1176
— in carpentry, *3543*, 3546
— hinges, *5795*, 5797
— leather, making, 4783, *4886*, *5057*
— in structural ironwork, 5792, *5793*
Strapping, in dressmaking, 863, *2471*; in tailoring, *2208*
Strass, imitation stones, 5852
Strata, geological formation, *525*, *528*, 897, *898*, *1815*; geological record, 2066; influence on available rainfall, 4025; treatment in foundations, 332; varieties of, 1921, *1924*
Stratification in geology, 530, *531*, 897, *1815*; in metamorphic rocks, 1075; sedimentary rocks, 1071, *1923*; volcanic, 2066
Straw, dyeing, 6651, 6652; fibres, *6279*, 6280; for hat and bonnet shapes, 5217, *5218*; as live-stock food, 2704, 2909; palliasse filling, 6721; thatch, weight, 1704; trussing, pressing, 1848; varieties, 872
— plaits, in hat manufacture, *6160*
Strawberry, culture, 6678; canning, 4846; extra season crop, 6835; fruit formation, 348; for jam, 4847; reproduction, 346, *347*
Stream, velocity, measuring, 1576
Streaming, in quarrying, 2959
Street, derivation of word, 1760
Streets, asphalt carriageways, 2179; building line regulations, 6214; congestion, causes, 2153; general history of, 1977; laying out, *2423*, *2424*; naming, law of, 2424; construction, maintenance, 2422
Strength of man, definition, 2663
— of materials, 1256, 1260; books on, 2764; of materials in moving part of mechanisms, 209
Streptococcus (bacteria) 6437, *6439*
Stress, in mechanisms and structures, 86, 205, 209, 1391, 3964; calculation of, 416
— electric, 4023
Stretchers, in building, 2168, 2261
Strick, 1026, 1246; of flax, 1386
Strickle, in moulding, 2112, 2340, *2459*
Strike, in geology, 1924, 2378
Striking-boards, in "sweeping-up" moulding, *2459*, 2460
Striking-out machine, leather, 3217
String band, instruments, etc., 5885
— dressings in building, *2177*
String-hole, violin, *2122*
Stringed instruments, repairing, 6707
Stringer, in staging, joints for, 1176
Stringers, of ships, marking position, 5615, 5739; of ship's hold, *5743*
— of trestle bridge, 6266

Strings, harp, 3341; pianoforte, 1210; viola, 2823; violin, 2121
— of staircase, 5298, 5300, *5301*
— vibration of, in physics, 2103, *2105*
Striped muscle, human, *1710*
Stripper, in carding machine, 1543, *1546*, 1886
— in plate-punching, 3095, *3097*
Stripping, of boards, *3541*, 3546
— die, purpose, *2989*, 2091
— plate, in casting, 2340
Strozzi, Palazzo, Florence, 3675, *3676*
Strub rack railway, 3816. *3817*
Structure, in biology, basis of classification, 29, 276; homology, 379; of plants, fundamental, *167–173*
Struggle for existence, insects' success in, 3362; plants, 167, 503
Strut, in building construction, *1453*, 1454; of dams, *4643*, 4644; engineer's stagings, 1173; of girder, 540; in roof trusses, *4249*; use in shoring. 916; of trussed beams, 4639, *4641*; for timbering, 330
Strutting, in floor construction, 4446, *4447*; of gantries, 1176
Strychnine, chemistry of, 3825, 4011
Stuart, restoration, 4761, 4762
Stuart's granolithic, 534, 2427
Stub tenon, in roof work, 4248
Stucco, kinds, 648, 5499
Stud holes, templet drilling, *3317*, 3319
Studdles, in mining, 2666, *3193*
Student interpreter, appointment, 2252, 2695
Studs, cutting, 3628
Study, Hearn's advice on, 5592
"Study of Sociology," Spencer's, analysis and scope, 4121
Stuff-chests, in paper-making, *6396*
Stuffing, in leather manufacture, 3219
— in tapestry carpet manufacture, 3991
Stuffing-box, of engine cylinder, *5641*
— rods, in saddlery manufacture, 4784
Stull, in mining, 3194, *3304*
Stumping, in drawing, *1535–1540*
Sturdy, in sheep, 2625
Sturgeon's electro-magnet, 129, 562
Sturgeon, common, 3065, *3067*
Sturtevant brickmaking system, 1284
Stuttering, cure of, 2539
Stye, in eye, treatment, 6264
Style, of flower, *347*, 348, *349*
— literary, importance of, 1472; eighteenth century characteristics, 2139; in journalism, 4577; modern characteristics, 2309
Sub-clavian vein, *1195*, 1196
Subconscious, the, importance in mental development, 3183; in theory of association, 2805
Sub-editing, salary, 162
Sub-editor, newspaper, 4232, 4431
Subject, in counterpoint, 632
— grammar, 608; analysis, 760, 1618
Subjective genitive, in Latin, 901
— mind, Hudson's theory, 3288
Subjunctive mood, English, 608, 756; French rules, 3353, 5948; German, use, 3502; Italian, use, 6523; Latin syntax, 1183
Sub-lieutenant, navy, 4401, 4402
Sublimation, chemical, 4316, 4406; in metallurgy, 3836
Subliminal consciousness, 3183; nature and circumstances, 2305; Myers' theory, 3382; *see also* Hypnosis, Subconscious, *etc.*
Submarine navigation, 2280
Subscriber (telephone) apparatus, *5880*
Subsidence, in building, 331
— of coast-line, 625
— in geology, 1352
Subsoil, 1071; cultivation, 430; drainage, 781; formation, *1502*
Substance, law of, 313, 2063
Substitution, in chemical formulæ, 2714
Substitutions, in algebra, 1818
Subterranean rivers, formation, 458
Subtraction, in algebra, 1820; in arithmetic, 90, 93; compound, 229; of fractions, 548; recurring decimals, 885
Sucker, in lampreys and hags, 3070; liver fluke, 3959, *3960*; of octopus, 3115
Suction dredger, 1826, *1827*
— gas, manufacture, 6818, 6827
— pumps, kinds, 1080, *5931*; geography, 3278, 3450
— French, geography, 3278, 3454
Sudbury, Ont., nickel mines, 5981
Sudbury, river, pipe arch bridge, 2739
Suez Canal, description, 3452, 5486
Suffixes, in chemical notation, 1045
— in grammar, English, 117; Esperanto, 5805, 6093, 6237, 6381, 6524; Italian, 3209; Spanish, 2628
— in shorthand, 1102
Suffolk bricks, description, use, 1520, 1947
— punch (horse), 2073, *2075*
— sheep, 2361, *2365*
Sugar, analysis, 4554; boiling, 3830; crystallisation, 3830, 4452; curing, 3831; Demerara, 3831; dictionary of, 3655; duty, effect on prices, 4559; food, value, 3601, 3652, function in dietetics, 3111; lactic acid, source of, 4782; manufacturing processes, *4451–4455*; marks, 4559; moisture, test for, 4556; Muscovado, manufacture, 3831; oral digestion, 674; in plants, 636; refining, processes, *4451*; rendement, test for, 4556; sources, 3652, 4351; sweet making, 5494; varieties, 3652, 4351; weight delivery and payment, 4559
—, beet, bounty system, 4049; difference from cane, 3652; factory, 4161; manufacture, *4160*, *4166*; strontia, use of, 4164
— candy, 3652, 4165; source, 4353
—, cane, dextrose from, 3705; factory, 3831; inversion processes, 3705, 4166; manufacturing, *3827–3831*
— grape, 2878
— Indian, preparation, varieties, *4353*
— of lead: *see* Lead acetate
—, maize, production, 4354
— maple, manufacture, *4351*, 4352
— of milk: *see* Milk sugar
—, palm, sources of, 4352
— sorghum, cultivation, *4354*
— vanilla, manufacture, 3597
Sugar-beet, 4959; cultivation, *4047*, 4959
Sugar-cane, 355, *plate facing* 3649; cultivation, *3653*, 3654, 4962; uses, 4962; varieties, 3652, *3653*
Suggestion, psychic, connection with hypnotism, 3663; efficacy of magnetic belts, 4246; hysteria cured by, 6264; nature and problems, 3288; in sleep, 2549
Suint, of wool, removal, 5639, 6198
Suit, drafting and cutting, 1113, 1289, 1460, 1551, 2874, *4195*
— sleeping, child's, 4050, *4052*
Sukkur Bridge, structure, *2736*, *2739*
Sulina, river, *2165*
Sulphates, 1721; in earth's crust, 768; formation, 362
Sulphides, in earth's crust, 768; parallelism with oxides, 1718; reduction, in metallurgy, 356, 3836
Sulphonal, 4128, 5469
Sulphur, in Bessemer pig iron, 4907–4910; chemical properties, 1444; use as disinfectant, 5055; distribution, 3772; in earth's crust, 239; action on indiarubber, 808, 809; in living matter, Bastian's experiments, 1444; medicinal effect, 1718; native, 787, *plate facing* 1345; occurrence, refining, 6757; precipitate, *4405*; recovery processes, 4625, 4771; in steel, 4747; use and sources, 5308; in vulcanisation, 5312
— dioxide, preparation, 4626, 4627; uses, 1719, 5354, 5404
— dyes, kinds, use, 6194
— flowers of, 4625; use, 1675
— "showers," in pine woods, 729
— trioxide, chemistry, 1719, 4626, 4630
Sulphuretted hydrogen, properties, 362, 1718, 4404; in air, 3720
Sulphuric acid, in art metal-work, 5527; chemistry of, 362, 1444, 1720, 3261; in deliming hides, 2856; as disinfectant, 5055; manufacture and plant, 1720, *4626–4633*; Nordhausen, manufacture, 1037
Sulphuric ether, discussion of name, 3139
Sulphurous acid, 1444, 1720, 5359; in air, 3720; uses, 4627: *see also* Sulphur dioxide
Sultans, fowls, points, 4958, 5624, *5625*
Sumach, 3012; use in dyeing, 5780, 5905
— tanning process, 3163
Sumatra, coins, weights, and measures, 409; geography, 3161
Summarising, in journalism, 3975
Summer, cause, *15*
Sump, in drainage, 737, 780, 3457
Sun, age, 2027; altitude of, 1016, 6660; chromosphere, 6252; corona, 6252, corpuscle emission, 4700; course, equinox, 293; declination, in navigation, 6660; description, 6250; distance from earth, 6404; dissociation in, 4136; eclipses, 6564; energy of, in animals and plants, 4132; energy and shrinkage, 664, 6252; heat and energy, 6252; heat in power production, 5127; importance in vegetable world, 172; influence of gravitation on earth, 621; influence on tides, *533*, *536*, 1017, 6219; magnitude, 6697; motion of the, 549; nebular theory of, 6702; parallax, calculation, 6404, *6405*; photosphere, *6249*, 6251; prominences, *plate facing* 6241, 6252; power supply, 5011; purifying agent of air, 3799; radiation pressure on earth, 3620; rising and setting, 6115; rotation, 6250; shrinkage and solidification, 6252; the source of life, 11; spectrum of, 3371; spots, 2949, 4246, *6249*, 6251; a temporary star, 6699; terrestrial elements, 6252; and tides, *555*, *556*; worship of, 501, 502, 6772
Sun birds, description, 2209
Sunday closing, law of, 46
Sundews, 354; carnivorous properties, 277, 352, 508, *507*
Sunflower, culture, 6530, *6531*; florets *plate facing* 728, 731; self-pollination, 909; sewage plant, 4549
Sunlight, heat rays, 2060; hygienic value, 5193; painting of, 4299, 4302; Young's experiments, 3367
Sunn hemp, distribution, fibre, 719
Sun-plant, 173
Sunray skirt, making, *655*, 657, *861*
Sunrise and sunset, explanation, *11*
Sunset, cause of colours, 3728
Superannuation Act, pensions, 1852
— railway staff, 4381
Superelevation, railway construction, 3612
Superlative, in grammar, explained, 11
Superphosphate, manufacture, 5586
Supers, of bee-hive, 5960
Supine, in Latin, 244, 1334
Supervision, in business, 6518
Supply systems, electric, *2245*
Supraliminal self, Myers' theory, 3382
Surat cotton, description, 384, 1701
Surds, algebraic, 3521
Surf coasts, unfavourable to commerce, 4498
Surface, in geometry, 4207
— in mathematics, measurement, 1442
Surface-contact system, electric tramways, 1936, 2273
Surface-plate, testing tool, 3688, 4702
— tension, in physics, 1270
Surfacing table, in building, 1950, *1951*
Surgeons, navy, 4402
Surgery, antiseptic, 2878; books on, 5424; dental, 5449, *5551*, 5772
Surgical instrument dealers, business of, 5491
Survey, ordnance: *see* Ordnance survey
Surveying, 157, 158, 262; books on, 1017; instruments, 262; knowledge by estate agent, 5284; municipal, county, and district surveyors, 454; photogrammetry, 6634; plane table, 710; of streets, 2422, *2423*

Surveying, marine : *see* Hydrography
— quantity : *see* Quantity surveying
Surveyors, 161 ; Admiralty posts, 3196 ; of borough council, 320 ; in the colonies, 3741, 3743 : examinations, 160, 5285, 5286 ; insurance, 4850 ; quantity, 1911, 6343
Surveyor of taxes, 3333 ; appointments, 3765
Survival of the fittest : *see* Natural selection
Suspense account, bank, 4440 ; in bookkeeping, 2882
Suspension, of under-carriages, *3122* ; in vehicle construction, 2725
— bridges, 2498, *2499* ; stability of chain, *2763*, 2764
Suspensory ligament, of eye, 2954, 3178
Sussex cattle, 2235, *2237*
Sutlej, river, course, 2563, 2820
Suture, in anatomy, definition, 1604
Swage, use, 2983, *2985*, 3385, 4586
Swaging, in iron working, 235
Swallow, 2210 ; food, 2403 ; toe-bones, 436
Swan, 2213, 2494 ; courtship, 2505, *2506*
Swanley, training for gardening, 322
Swan-neck pipe, gutter, *5793*, 5796
Swarm of bees, described, 5957, 5959
Swathe-turner, and use, 1630, 1849
Sweat glands, excretion, *1419*, 1423
Swede, *942*–944 ; cultivation, 1231, 1232 ; harvesting, 1665 ; as live-stock food, 2704, 2906, 3891
Sweden, coins, weights, and measures, 410 ; craniology, 1786 ; economic conditions, 5708 ; fauna, 1424 ; geography, 1561 ; history, 2948 (1397–1718), 5396, 6201, 6246 ; iron ore output, 5306 ; language affinities, 1771 ; touring, 1421
Swedish language, translation fees, 1920
Sweep pieces of van, *2829*
— strokes, in wood carving, *6135*, *6136*
Sweeping, in moulding, *2459*
Sweet chestnut, 503, 504 ; husk, *1114*, 1116
— makers, list, with specialities, 5494
— pea, culture, 6488, 6489
— sellers, business of, 5493
Sweetbriar, garden hedge, 6318
Swift, Jonathan, author, 1901, *1902* ; importance in fiction, 2963
Swift, 2211 ; edible nest, 2507
Swim-bladder, of fish, 871, 1491, 3066
Swimmeret, of decapod, 3807, *3808*
Swinburne, Algernon Charles, poet, *1437*, 2687
Swine : *see* Pig
— fever, 2625 ; immunity of human beings, 6543
Swing bridges, structure, 1224, 2886
Switch, telegraphic, 5537, *5538*
— telephone, automatic, 5682, *5683*
Switch-box, of coal-cutter, *3564*
— plants, description, 503
Switches, railway, 3609, 4686 : *see also* Points
Switzerland, coins, weights, and measures, 410 ; economic conditions, 5825 ; geography, 1837 ; history, mediæval, 4399 ; labour saved by non-militarism, 5097 ; mountain railways, 2276 ; touring, directions, 946, 1809
Swivel bearing, line shafting, 3264, *3265*
Sword-fish, head, *3067*, 3069
Swords, temper, 4746, 5524
Sycamore, 353 ; "keys," *94*, 912 ; timber, *57*, 1260
Syllable, in grammar, 122 ; in French, division, 448
Sylviculture, training, 4679, 4929
Syllogism, in logic, 6098
Symbolism, in colour, art, 722–726
Symbols, actuarial, 4728
— in chemistry, list, 517, 693
— in logic, 6099
— mathematical, 89
— musical, 38
— shorthand, 48
Symmetry, in architecture, *2283*, 2284, *2286* ; in design, 5819–5820 ; in drawing, *2320*, 2321
Sympathetic nervous system, 674, 1941, *1944* ; and involuntary muscles, 1712
Symphony, in musical form, 634
Symptoms, of disease, 5539, 5540
Syncope, grammar, 1616
— disease, 2794
Synovia, definition, *1709*
Syntax, definition, 115
Synthesis, chemistry, 237, 4014, 4128, 4135
— in philosophy, 2016
— in psychology, explained, 2803
— of vital products, Meldola, 2710
Synthetic languages, 117
Syphon, 1140, *1141*, *1575* ; use in water supply, 1686
— of sewer, construction, *4459*
Syphons, aerated water, filling, *6392* : tops, 6392, *6393*, *6394*
Syphoning out, in drainage, 781
Syria, geography, 2719 ; annexed by Turkey, 6447
Syringe, principle of the, 1141
Syrup, in aerated waters, *6392* ; golden, 3831 ; maple, 4351 ; sorghum, production, 4354
System, business, 6518

T-SQUARE, architect's, 5420 ; in drawing, 284, 1748
Table, handbell, dimensions, 5575
— for ironing, *2476*
— of moulding machine, *2541*, 2542
— of planing machines, 5001
— textile printer's, 4499
Tables, varieties and construction, *5293–5295*, 6585, *6587–6589*
Tablet apparatus, railway, *4692*
Tabling, in masonry, *3035*, 3038
Tabular petty cash book, 2203
Tabular work, in typewriting, 1697 ; changes, 1920
Tabulator, 1697 ; use in factory, 6644
Tacheometer, in surveying, 159, 710
Tacheometry, in surveying, 711
Tacitus, historian, 1938, 2068 ; opinion on Christianity, 1830
Tacking, in dressmaking, 191 ; milliners', *4565* ; in needlework, *150*
— in ship navigation, 6410
Tackles, ship's, kinds and uses, *6408*
Tacks, boot-making, 4017
— in roofing, 4868, 4870, *5033*, 5035
Tadpole, evolution, 2801, *2802*
Tail, of decapods, *3806*, 3807
— prehensile, use by mammals, 1871
Tail, in slating, 4866, *4867*
— board and chain of van, 2828, *2829*
Tailing, in brickmaking, 1282
Tailor, business of, 471, 5597 ; employment conditions, 2651
Tailor-bird, nest, 2507
Tailoring, 1110 ; men's, 2872, *2604* ; women's, 1840
Tailpiece, of viola, *2823* ; violin, 2122
Tait, Prof., conservation of energy, 2062 ; on wave interference, 3229
Talc, mineral, 768, 812, 6744
Tallow, 1032, 4832 ; in hard soap, 4964
Tambour, in guitar playing, 3762
Tambourine, musical instrument, 5569
Tamping, in blasting, 2584 ; of mine charges, 6274
Tamworth pigs, *2365*, 2368
Tandem condensing engine, 6069, *6070*
Tandem cycle, construction, *3774*, 3779
Tang, of knives, *5474*, 5477
Tangent, in geometry, 792, 5198, 5337, 5783 ; of ellipse, 1411
— in trigonometry, 6231, 6499
— point, in railway curve, 801
Tangential motion, in physics, 550
Tangye lifting jack, 1220
Tank, domestic water heating, 6016
— makers, employment, 2646
— sewage disposal, *4549*, *4742*, *5764*
— slated, *3243*, 3248
— water, construction, 1404, 3615
Tannic acid, 3012, 3013, 3823 ; in English oak, 2827 ; in dyeing, 5779 ; gallic acid hydrolysis, 3822 ; preparation, use, in tea, 3378, 3822, 4008 ; in writing ink, 5366
Tannin, sources of, 1165, 3012, 5366 ; tea constituent, 6554 ; tea without, 3378 ; use, 6065
Tannins, industrial uses, 5779
Tanning, 1165, 3018, 3162, 3217 ; agents, 6065 ; early history, 2851 ; materials for, 1165, 3012
Tantalum, electric lamp, 2682 ; wire, use, 5171
Tap, forms, sections, 4480, *4481*
— temper, 4746
— plumbing pipes, *5629*, 5633
— wrenches, function, 4586
Tape, bootmaker's, use, 4015
Taper, casting, 2340 ; grinding, *3404*, 3408
— lighting, manufacture, 4840
Taper-turning, lathe, *4915*, 4920
Tapestry : *see* Carpets,
— carpet, design, 3358, *3359*, 6596
— curtains, 6722
Tape-worms, description, 3959, *3960*
Tapioca, 3312 ; digestibility, 3314 ; sources, 4959 ; starch, *5365*
Tapir, description, 1761 ; similarity to fossil horses, *1179* ; hand, modification, *1869*
Tar, distillation, 5465 ; books on, 6689 ; for footpaths, 2430 ; macadam roads, 2182 ; as rubber solvent, 5309 ; source, 4658 ; varieties, 1163
— coal : *see* Coal-tar
— extractors, gas manufacture, 6821
— oil, 5462 ; use, 52
Tarsus, human, *1348*, *1709*
Tartar emetic, 1162 ; in dyeing, 5781 ; preparation and misuse, 3704
Tartaric acid, in baking-powder, 4774 ; sources, 3112, 4782
Tartars, craniology, 1786 ; ethnology, 1789 ; invasion of China, 218 ; Russia freed from, 6200 ; wars with Russia, 2948
Tartrates, formation and uses, 3704
Tasmania, aborigines, 1785 1788 ; climate, 3468 ; economic conditions, 5661 ; farming, 3468 ; geography, 3900, *3901* ; land purchase, 3469 ; trade, 3469
Tassel-tail (insect), 3362, *3363*
Taste, organ of, 197, 2535, *2536*
Taurus, zodiac sign, 6251
Tawing, leather, 1166, 3163, 5119
Taxation, Augustus's Reforms, 1829 ; extortions of Henry VIII. ; Trajan's reforms, 2069
Taxidermy, practice of, *6326–6329*
Taximeter, use by London cabmen, 4188
Tay Bridge, 982, *2736*
Taylor, Jeremy, divine, 1335, 1640
Tea, *6553* ; adulteration, 3718 ; adulterants, 5581 ; analyses, 3378, 6554 ; chemical properties, 4007 ; China, 3823, 5658, 6553 ; cultivation, 4961, 6553 ; dietetic value, 3377 ; check to digestion, 577 ; extract, 3705 ; gallic and tannic acids, 3822 ; make, 3378 ; Russian preparation, 1525 ; stains, removal, 2590 ; voice effect, 2539
— shops, London, catering, 5583
Teachers, colonial, 3741 ; elementary, L.C.C., 1678 ; training, salaries, etc., 164 ; women's training, 323
Tea-gowns, making, 3590
Tea-jacket, infants', *3745*, 3855
Teak, *57*, 6891 ; strength, 1260, 1393 ; uses, 2827, 4658
Tear, in physiology, 2400
Teasing, silk waste, 1246 ; wool, 1124
Teasle, 354 ; protection against insects, *1114*, 1115 ; use, 4106, *4108*
Technical colleges, 1680, 1783
Technical education, domestic science, 321 ; English colleges, 483 ; engineering, deficient in England, 155 ; L.C.C. staff and salaries, 1679
— institutes, 6341 ; salaries of teaching staff, 6478
— schools, 1782
Technique, pianoforte, 1210, 1759
Tedder, in agriculture, *1628*, 1630
Tee, girder, 544
— grooves, milling, *3402*

Tee, section, in plating-shop, *3096*, 3108
Tees, brazing work, 3884, 3886, *3887*
Teeth, animal, 1761; evolution, 3065; of narwhal, 2156; as weapons, 2155
— artificial, making and fitting, *5861–5856*, 6029, *6033*
— children's, care of, 4864; cutting, 4684; regulation, 6035
— of cutters, 3630, *3656*
— of gear wheels, forms and design, *3638*, 3656, *3658*, *3921*, *3924*
— of horse, 2079
— human, *576*, *577*, *5551*; crowning, 6033; filling (stopping), 5552; function in singing, *6049*; influence on health, 5549
— of milling cutters, forms, 4260, *4261*
— mortise, *3921*
— of saws, kinds, 3753, *3755*, *4481*
— of wheels, moulding, 2543, *2544*
Teething, of children, 4684
Telefunken, wireless telegraph, 3898
Telegony, doctrine, refuted, 1587
Telegram, code, bank work, 4588; despatch, 4605; press rates, 4669
Telegraph Acts, provisions, 1978
— lineman, railway, 4691
— lines, erection, *6323–2325*
— service, women, 2807
— messages, forms, 4605
Telegraphist, training, 4382
Telegraphy, artificial circuit, 5241, *5243*; battery resistance, 5242; capacity faults and remedy, 5178; differential system, 5241; development, 4382; duplex working, 4668, *5243*; double-current duplex, *5178*, 5242, *5243*; duplex working, 4606, *5241*; history, 128; ink writer, *4383*: instrument-room, 4605; long circuit, 5242; manual *versus* automatic system, 5244; mileage in Great Britain and Germany, 130, 131; news distribution, 4668, *4670*; quadruplex working, 4668, *5243*; railway, training of signalman, 4690; in reporting, 4192; speed, 4605; switch, duplex and simplex, *5241*, 5242; systems and instruments, *5391–5395*; type-printing telegraphs, 5393, *5395*; traffic routes, 4605
Teleology, Myers' theories, 3384
Teleostei (fishes), 3065, *3071*
Telestonei (fishes), 3066, *3067*
Telepathy, and apparitions, 3626
Telepathy, importance in Myers' cosmic theory, 3384; inadequacy of term, 3661; instances, 3661
Telephone, calls, London analyses, 6180; apparatus, *5681*; calling, 5879; central energy system, *5878–5881*, 6179; circuits, 5682–*5684*; clear signal, 5879; cord circuit, *5878*; engaged test, *5681*, 5879; first commercial use, 128; connecting up subscribers, 6463; in Great Britain, capital value, 130; intermediate distributing frame, *6079*; invention, 5680; insulation test, continuous, 5880; keyboard, 5881; London Central Exchange, *6179*; main distributing frame, *6078*, 6079; metering the call, 5879; number and mileage in U.K., 5538; operating calls, 5683; operator's apparatus, 5879; pole and wire erection, *6323–6325*; switch, connecting up, 6080; switch section, *5879*, 5880; telegraph call-wire system, 6181; testing circuits, 6080; three-conductor plug, *5880*, 5881; through call, 5881; traffic, London analysis, 6180; underground cables, 6078, 6461, *6462*, *6463*; cable, colour code, underground codes, jointing, 6463
— call offices, rental by shopkeepers, 5599
— lines, erection, *6323–6325*
— message form, use, *194*
— operators, post-office, 2811
Telephotography, lens, 6128
Telescope, 2949; discovery, 2903, 6241; equatorial, *6246*, 6247, 6249; function, 6247; Galileo's improvements, 2949; kinds and construction, *6126*; photographic eyepiece, *6247*; applied to surveying, 265, 372, 710; transit, *6245*, 6246; varieties, 6247
Teleutospore, of wheat rust, *1667*, 1669
Tempera painting, methods, 1022, 1023
Temperament, types, 5701
Temperance beverages, dangers of, 3379
— reformers, early work, 5670, 5671
Temperate regions, classification according to economic conditions, 5660; physical conditions, 4494
— zone, 293; cultivated plants of, 628
Temperature, 1564; absolute, 1806; of animals and man, 439; atmospheric, *294*; balloon observations, 3982; body, normal, 96; normal, regulation, 439; conditions essential to life, 277; critical, of gases, 1741; effect of alcohol, 3377; in engineering (importance), 1806; oceanic distribution, *554*, 555
Tempering, in brickmaking, 1281
— in metal-work, 236, 4465, 5524
Tempers, for steels, 4749
Template, *3035*, 3039; lens, brass, 6123, *6124*; stone for girder, 3242, *3243*; of ship, 5619, *5740*, *5918*; in structural ironwork, 5791
Temple, Assyrian construction, 2658; Egyptian, 2520, *2522*; Greek, 2859
Templet, 3386; architects' drawings, 5698; in coppersmithing, *3885*, 3886; cylinder bore, *3317*, 3319; in floor construction, 4445; mason's, 2838; mitre, for mouldings, *5183*; roof, 4248; workshop, 3633
— board, in making engines, *3885–3889*
Temporal bone, *1348*, 1604, *1605*
— lobes, of cerebrum, *2144*, *2146*
Temporary way, railway, 3252, *3253*
Temptation, immunity from, 6784
Tenacity of matter, 1375; of metals, 3838
Tenancy, law concerning, 6846
Tendency, in heredity, 1587
Tender, locomotive, 4599
Tendon, of muscle, *1711*
Teniers, the younger, painter, *3948*
Tennessee, geography, 4172, 4174
Tennyson, Alfred, Lord, poet, 1434, *1135*; bibliography, 2787; dramatic works, 1152
Tenon, joint: *see* Mortise and tenon
— stub, in staging, 1176; in trestles, 1173
Tenoning machines, *6755*
Tenor clef, in music, 1059, 1060
— part, in harmony, 364
— voice, characteristics, *6050*, 6182
Tense, English verbs, 116, 757; French compound, 1476; German, use of, 3501; Italian, use, 6523; Latin rules of sequence, 1334
Tensile strength of materials, 210, 1256
Tension, in a belt drive, 3269; in backstay and pier, *2763*, 2764; of a stress, 1256, 1260
— bar, in engineering, 1643, *1645*
— boom, of girder, 450
Terebinth tree, exudations, 1034
Terminal, in electricity, 288, 463
Termite, white ants, description, *3364*
Terms, algebraic, 1818, 1819
— importance of definition, 484
— of syllogism, distribution, 6098
Terne-plates, manufacture, 6163
Terpenes, 3487, 4968
Terra-cotta, architectural, *5777*, 5778; in building, 644, 2780, *2782*; bonding with, *2177*; in damp course of walls, 2264; detail drawings for 308, 2780; for fire resistance, 4754; firing, 5778; in floor construction, 4756, 4758; glazing, *5839*; for internal partitions, 4759
Terre verte, pigment, 871, 5145
Terraces, mining in, *2849*, *2850*
Terrawode, for partitions, *4757*, 4759
Tertiary rocks, 2067, 2254
Tessellated pavement, in building, 646
Test Act, 4841
— box, telegraph, use, 4386, 5536, *5537*
— hydraulic, 3964; impact, application, 3962; steam pressure, 3964
— pump, 1082
— tube stand, use, *4404*
Testing of boilers, 3106
— in engineer's workshop, 2109, *3961–3968*
— of plane surfaces, 3688
— machines, 205, *1259*, 1261, 1392, *1395*, 1521, 1700, *1701*
— room of high-speed engines, *3967*
Testis, in the hydra, *381*, 382
Tetanus, cause, 5412, 6542, 6781
Tetragonal system, crystal, 766, 6730
Tetrahedron, in drawing, 1747, *1749*
Teutonic languages, 1771; relation of English and German, 248
— races, ethnological survey, 1790
Texas, cotton, 4172; petroleum deposits, 4172, 6007, 6011, 6014
Textiles, design, 2939, 2944, 3153; design and structure of cloths, 5507, *5508*, 5980, *6385–6390*.; books on, 6728; dictionary of, 73; examinations, 5511; yarn, count, 2895
— operatives, employment, 2640
Thackeray, William Makepeace, novelist, 3440, *3441*
Thallus, definition, 165, 1368
Thames, river, bridges over, 2497, 2498, *2499*; climate and rainfall of valley, 984; course, 456, 1274; estuary, *980*, *1275*; strata of bed, 528; tides, 556
Thatching, 1631, 1664
Thea assamica and *chinensis*, cultivation, 6553
Theatre, analysis of air, 3801; in Elizabethan age, 845
— band, instruments, 5889
Theatrical agents, 6865, 6868
Thebes, Macedonia under protection of, 774; subject to Philip II. of Macedon, 775
Theine, dietetic value, 3378, 6554; properties, use, 4007; in tea, 3378, 6554
Themistocles, his career, 773
Thenard's blue, composition, 5985
Theobromine, in cocoa, 3378, 4007, 6536; dietetic value, 3378
Theodolite, adjustments, 268; in building, 309; care of, 269; in marine surveying, 159, 1018; in railway surveying, 801; in surveying, 158, 265; in traversing, 367
— transit, 267, 269
Theology, English eighteenth century theologians, 2054, 2141; living theologians, 2786; *see also* Religion
Theorem, in geometry, 4208
Thermal conductivity, standard, 2061
Thermit, uses, 236, 5993, 6456
Thermodynamics, laws, 2061, 5413
Thermographs, construction, 6129
Thermometers, varieties, *1565*; manufacture, *6128*; scales of measurement, 1564, 6128
Thermopile, in electricity, 129
Thermopylæ, account of battle, 772; Greek victory (1823), 6448
Theseus, temple at Athens, *141*, 2839
Thimble, dressmaker's, 185, 3093
Third, arithmetical term, 1715
— estate, French, 5111
— rail system, railway, 2276
Thirst, physiological definition of, 365
Thirty Years War, 5110, 6445
Thistle, 354; bract, 1115
Thistledown, in fertilisation, 912
Thomson, Prof. E., electricity meter, 2813
— James, poet, 994, 995
— J. A., biological works, 1791
— Prof. J. J., corpuscular theory of matter, 2294; electrical nature of chemical forces, 2297; on gaseous ionisation, 4700; on kathode rays, 4090, 4103; periodic law and valency, 1915
Thoracic duct, anatomy, *1195*, *1196*; function, *676*, 677
Thorax, *30*, *197*, *1300*, *1348*; bones of, *1605*, *1606*

Thorax, of insects, 3362
Thorium, chemistry of, 1160 ; radio-activity, 2029 ; in Welsbach burners, 6026
Thorn-apple, 354 ; alkaloid, 4009
Thoroughpin, in horses, treatment, 2622
Thought, defined, 3661 ; laws of, in logic, 6100
— transference, 3661, 3662
Thread manufacture, 2707 ; cotton yarns, 224 ; silk, 2598
Thread, screw, 686, 3004, *3006*, 3922–*3925* ; cutting, 3628–3630
— in weaving, cutting device, 3636
— in woollen manufacture, 70
Three-colour printing, textile, 4501
Three-colour reproduction, 6483, 6486
Three-end twill, design, 2941
Three-part joints, casting, 2337, *2339*
Three-phase currents, *1905*, 1907 ; for traction, 2089
Three-ply carpet, invention, 3360
Three point problem, surveying, 1018
" Three Sisters," Vecchio's picture, *3797*
Three-wire system, electric lamps, *2240*
Threshing, in agriculture, *1664* ; machine, *1848*
Thresholds, construction, 3241, 3248
Throat, in building, definition, 2267
— complaints of, in pigs, 2626
— human : *see* Pharynx
Throat lash, of harness, 4886, 5057
Throat-plate, fire-box, *3101*, 3103
Throstle, spinning frame, *2441*, 2594
Throttle Brotherhood engine, *6072* ; equilibrium, double-faced, *5750*
Throttling, in steam engine, 5643
Throw, in geology, definition, 1925
Throw of the eccentric, 828
Thrush, 2210 ; nests, *plates between* 2497 *and* 2498, 2507
Thrush, disease, 4682, 6132
Thrust, of an arch, principle of, 2760, *2761* ; of vault and dome, 3145
Thunder, peals of, cause, 2102
Thunderstorm, effects on air, 3799
Thwaites cupola furnace, *2863*
Thwarts, in shipbuilding, 5736
Thyme, 354 ; culture, 6675
Thyroid body, human, *2144*
— cartilage, of larynx, 2537, *2539*
— gland, anatomy, 1195
Tibet, ethnology, 1789 ; geography, 2974, 2977
Tibia, human, anatomy, *1348*, 1708
Tibullus, in Augustan era, 1829
Ticket, railway, 4812, 4814
— collectors, wages, 4804
Ticking, mattress, varieties, 6720
Tickler, in knitting, 4621
Tickling, sense of, 1422
Ticks, habits, 3805
Tidal friction, and retardation of earth and moon, 620, 6565
— water, pollution, 4548
— wave, effect on coast, 6218 ; in rivers, 5333
Tide, cause, kinds, range, 5333, 6219, *6565* ; Prof. George Darwin's theory, 549 ; disturbing influences, 1017 ; effect on coast, 6218 ; erosion of coast, *1813*, *5577* ; lunar, solar, *555*, *6565* ; in navigation, 4498 ; observation and measurement, 373, 1017 ; ocean, 554 ; possible power production, 5011, 5128
— tables, Admiralty, 6658, 6662
Tie beams, roof, *4248–4253*, 5749
— of girder, 540
— pieces, coppersmithing, jointing, 3886
— rod, in braced structures, 544 ; in carpentry, 3546 ; of engine frames, calculation of load, 4206 ; forging, 2984, *2987* ; in mechanical construction, 416 ; for timber in staging, 1174 ; of trussed beam, 4639
Tierra, Andes, 4286 ; Mexico, 4175, 4176 ; Venezuela, 4287
Ties, in building walls, *2263*, 2266
— iron, in building, 5797
— in stencilling, 5977
Tiger, fur and skin, 6428 ; papillæ of tongue, 2535
— beetle, description, 3510, *3511*
Tiger flower, tigridia, culture, 6490
Tiger moth, scarlet, *plate facing* 3361
Tile, paving, 2516 ; encaustic, manufacture, 5776 ; marble, 3246 ; for tessellated pavements, *5776*
— roof, kinds, sizes and fixing, 644, *645*, *4869*, 4870 ; coloured glazed, 5384, *5385* ; for concrete roofs, 4758 ; glass, 4872 ; Venetian, 4872 ; weight, 2998
Tile-creasing, wall protecting, 2267
Tilers : *see* Slaters and tilers
Tillage, in agriculture, 430
Tiller, in shaft sinking, *2666*, 3461
Timber, in architecture, *140* ; in bridge building, 2497, *2499* ; as building material, 51, *53*, *453*, 1454 ; in building foundations, 335 ; building-in brickwork, 2513 ; circular sawing, *6143* ; commercial forms and qualities, 3544 ; creosoting, 5464 ; how indicated in drawing, *2792* ; fireproof, 4752, *4753* ; grain, 3539, *3541* ; growth, felling, 4680 ; heavy, tools and machinery for, 4644, 4646 ; ironwork, 5792, *5793* ; forms of joints, 4039, *4041* ; *4115* ; market quantities, 3544 ; preserving, 3433, 3545, 5641 ; for roofs, 4247, *4253* ; dimensions, 4252 ; safety factor, 210 ; sawing and planing, *3753* ; in scaffolding, 1170 ; in shaft supports, 3457 ; shrinkage, 3539, *3541* ; sources, 4602 ; storage, 3545 ; strength, testing, *1256–1261* ; strength variation, 211 ; uses, transport, 4657 ; *see also* Wood
Timbering, mine, *3193*, 3308, *3310*, 3565
Timbre, of note, 2104 ; of voice, 6184
Time, arithmetical problems, 1713 ; astronomical, 6120, 6665 ; English measurements, 226 ; civil, 6665 ; equation of, 6665 ; French expressions for, 1772 ; Greenwich, dissemination by chronopher, 5536 ; Greenwich mean, 13 ; Greenwich, determination at sea, 6660 ; Kant's doctrine, 2013 ; mean, 6665 ; mean solar, 6246 ; measurement, *14*, 15 ; philosophic aspect, 6 ; problems on (arithmetic), 1549 ; sidereal, 6120, 6665 ; in various parts of the world, 15
— code, in telegraphy, 4382, *4383*
— in music, 38, 40 ; double-bass, 3170 ; in pianoforte playing, 1891 ; signature, 41 ; in tonic sol-fa notation, 925 ; violin playing, 2125
Timekeepers, classification, 5787
Timekeeping system, card records, 6519
Time-tables, railway, 4803
Timothy grass, description, 875, *879* ; *plate facing* 728 ; fertilisation, 729
Tin, 356, *357*, 1160, 4307 ; alloys, 358, 3941, 6162 ; amalgam, use, 6163 ; analysis, 4414 ; casting shrinkage, 2342 ; conductivity, 1397 ; distribution, 3771 ; extraction, 4307, 6162 ; micro-structure, 3939 ; *plate preceding* 3937 ; occurrence, 6161 ; paint for, 6572 ; physical properties, 3837, 6161 ; recovering waste, 6165 ; refining, 4307, 6162 ; sources, 5308 ; strength, 1396 ; tooth-filling, 5553
Tin-foil, in electric condenser, *3580*
Tin-plate, 358, 1045, 6163 ; workers, employment, 2644, 4647
— salts, 1160 ; use in dyeing, 5779
— whistle, aid to flageolet playing, 4486
Tinder fungus, pest, 4928
Tinned food, 3312 ; Chicago, 3820
— iron, electrolytic skinning, 5754
— leadfoil, rolling, 5987
Tinning, purpose and process, *6164*
Tinsmithing, 4521, 4522
Tinstone, formula, occurrence, 356, 1160
Tintometer, colour grader, 5146
Tintoretto, painter, 3797
Tip : *see under* Hats
Tip waggon, *1823*
Tipping, 3175 ; in soft ground, 3259
Tissue, in botany, 168 ; cellular, 170
— of human body, 196, 435 ; action of alcohol and chemical substances on, 3017 ; cancellous, 435 ; muscular, *1710–1712*
Tits, 2210, *plate facing* 2209 ; food, 2493 ; nest, 2507
— of tools, use, 4479
Titian, painter, 3796 : " Assumption," 181 ; landscape painting, 4299
Titles of address : Italian, 6524 ; Spanish, 5803
Toad, 2800 ; care of young, 2802
Toadflax, *351*, 354 ; pollen, 1114
Toadstool, 166, 909, *1370*, 3726
— sponge, 1371
Tobacco, areas of cultivation, climatic conditions, 4960 ; exported from Cuba, 4178, 5380 ; fermentation, grading, cultures, 4274 ; manufacture, 4373 ; plants, *4270* ; seeds, 4270 ; effect on voice, 2539
— plant, 354 ; culture, 6493
Tobacconists, business of, 5600
Tobin's tubes, use, 4019, *6017*, 6021
Toe, in bird's foot, 2209 ; of fossil horses, 1177 ; human, bones, *1709* ; modifications in mammals, 1869
Toenails : *see* Nails
Toggle, of balloon hoop, 3978, 3980
— lever, in moulding machine, *2541*
Toledo, 1132 ; Spain recovers, 2946
Tolerance, value and dangers of, 2404
— limits, in machines, 3694
Toleration, factor of social progress, 5532 ; principle of, 5390
Tolu balsam, source, properties, 4960, 6891
Toluene, from coal-tar, 5463, 5953 ; saccharine from, 5470
Toluidene, production, 5468 ; use, 3710,
Tomatoes, 6675 ; market garden returns, 6836 ; pie, 2334 ; sauce, 2004 ; soup, 1735
Tombstones, quarrying blocks for, 2955
Tone, in colour, cause, 3730 ; in drawing, 1534, *1792*, *2184*
— in music, 1211, 1417, 1758 ; in singing, 6337
Tones, in musical scale, position, 272
Tongs, crucible, in analysis, *4407*, 4412
— use in smiths' work, 2984, *2985*, 3108
Tongue of honey bee, *3724*
— human, 2535, *2536* ; diseases, 6132
Tongue-shell, description, *3958*
Tonguing, cornet, *5444* ; piccolo, *4568*
— piece, of brougham, 2830, *2831*, 3124
Tonic, in music, 273
Tonic sol-fa notation, 805, 921 ; books on, 925 ; teaching, 806, 924
Toning and fixing bath, photo, 6681
Tonneau, motor-car, 2464, 2830
Tonsil, human, *577*, 579, 2144
Tonsilitis, symptoms, 6133
Tool-box, of planing machine, 4999, *5000* ; of shaping machine, 5004
— grinding machine, *5212*, *5214*
— rest, of lathe, evolution, 4912, 4914
— slides, lathe, 4923, *4924*
— steels, nickel, 5984
Tooling, in bookbinding, *6776*, 6779
— machine shop, processes, *3316*
Tools, cutting, 3385, *3401*, 4149 ; direct-driven, 5452 ; high-speed, steel alloys, 4748 ; non-cutting, 3386, *3387* ; prehistoric, 2255 ; scraping, 4259, *4261* ; screwing, 4480, *4481* ; sharpening, 3388 ; shearing, 4584, *4585* ; solid, angles of, *4151*, 4154 ; standards of measurement, 4701 ; steel and iron, early kinds, 5688 ; steel for, 4747, 4749
— dealers in, 2091
— machine, 4000, 4582, 4999, 5594 ; dictionary of, 3409 ; multiplication in single machine, 3322 ; testing, *3963*, 3965
— pneumatic, *1803* ; portable, *5452* ; reciprocating, 5456
— portable, 5275 ; machine, *5448–5453*
Tooth : *see* Teeth
Toothache, causes, 5551
Tooth-brush, manufacture, 6107, 6110
Toothing plane iron, *6581*, 6582
— in wall construction, 2268
Top lift, in mining, *2955*
— soil, in building, excavation, 329
— spinning, mechanics of, 426

Topaz, 5853, 5855, 6744; imitation, 5852
Topgallant mast, rigging, 6409
Topmast, sending down and up, 6409
Tops, of boots, making, 4239, 4432, 4541
— cabinet-making, 6586, *6587*
Toque, cockade rosettes, *5506*; fur, 5775, patterns, 4766, *4767*; straw brims, 5217, *5218*; velvet, 5331; wire shapes, 4860, *4861*
Torch lily, culture, 6529
Torpedo boat, high speed engine, 5749
— charging, air-pressure, 5356
— ventilator, in trains, 3024
— work, training of officers, 4401
Torque, in electric motors, 1592, 1909
Torre dei Schiavi, Rome, *141*
"Torrent" filter, action, 5765, *5766*
Torricellian vacuum, 1139, *1801*, 6120
Torrid zone, heat and light, 293
Torsion, of materials, 1258, 1342, *1393*
Tortoise, description, 2677, 2798, *2799*
— beetle, larvæ, 3512
Tortoiseshell, *2799*, 6891; imitation, 5470
— butterfly, chrysalis, 3516; egg, *3513*
Torris, form of moulding, 5297, *5299*
Tory, politics of original party, 4950; politics in Anne's reign, 4952
"Tots," arithmetic, explained, 2473
Toucan, description, 2210, 2494
Touch, in pianoforte playing, 1416
— sense of, *1421*-1423, 2118
Toughening, in metallurgy, 356
Toughness, of metals, 3838
Tourist vocabulary, 1956–1965
Tourmaline, properties, 1042, 5853, 5855, 6744; polariscope, 3850
Tous les mois starch, micrograph, *5365*
Tow, in flax industry, 1387, 1720
— carding, 1885
Tower, in architecture, evolution, 3231
— temporary timber, construction, 4639
Tower Bridge, London, *2736*, 2886, *2887*; bascules, 828
Tower of London, architecture, 3233
Town-clerk, 81, 989, 1213; of borough council, 320
Town Councils, development and powers (1882 Act), 80, 316
Towns, causes of sites, 4519; mortality and health, 4530; transit problems, 2153; ventilation, 3799
Townsend, F. H., line drawing, *6103*
Toxic acids, 3536, 3537, 3538
Toxin, in microbic diseases, 6781; effects and production, 6544
Toy merchants, business of, 927, 5602
Tracehook, of carriage, design, *2729*
Tracery, Gothic, 2321, 2567, *2568*
Traces, in brickmaking, 1284
— harness, dimensions, 4886
Trachea, of air-breathers, 3361
— human, *1259*, 1971, 2144
Trachyte, 1009; blasting, 3175
Tracing, technical drawing, 2792, 5542
Track, railway equipment, *3607–3616*
— brakes, tramcar, 1934
— cleaners, tramway, 4189
— inspection, of railway, 4593
Traction, electric, books on, 4298; *see also* Railways, Tramways, *etc.*
— engines, use, 3904; railway, 5079
— railway, mechanical principles, *3813*; steam and electric compared, 2274
Tractive force, 6516; calculation, 6517
Tractor, electric, for canal boats, *2275*
Trade, balance of, 3679; internal and international, 3972
— circulars, wholesalers', 6209
— expenses, in bookkeeping, *490*, 2202
— marks, ownership, registration, 6208
— returns (British), 6003, 6005
— vehicles, under-carriages, 3125: *see also* Vans, Handcarts, Milk van, *etc.*
— winds, Africa, 3276; causes, 296; effect on rainfall, 298
Trades unionism, in building trade, 139, 6346; in engineering, 6631
Trading account, 2270, 2500, 2756; departmental system, 3417
Traffic, London's problems, 2153; regulation, police, 1407
— inspectors, railway, 4806
Tragacanth, distribution, use, 810, 6885
Tragedy, 680, 768; *and see* Drama
Trailers, *2463*; for farm produce, 3904; rail motor, *4801*, 4812
Train, of eight-day clock, 5716, 5717
— railway passenger, 4806; heating, 3025, 4808; inspection, *4592*, 4594, 4807; lighting, 3025, 4807: *see also* Railways
Training, as factor in evolution, 1706
— colleges, elementary teachers, 6474, 6478
— ships, mercantile marine, 6804
Trajan, Emperor of Rome, reign, 2069
Trajan's Column, relief carving, 2033
Tramcar, axles, 3326; canopies, 3024; dimensions and shape, 2556, 2726; lighting, 3025; material used, 2827; mounting, 1934; ventilation, 3024
Trammel, masons', *2837*, *3388*
— net, use, 4990
Tramway, *3750*; drivers, 4189; employment conditions, 4189; gauge, 3751; principal officers and salaries, 573, 1498; origin, 2273; rolling-stock, 2462, *2463*; wood paving and granite setts, 3752
— cable, description, 2273
— electric, *1931–1936*, 2273; books on, 4298; car, *2463*; construction, 1934–*1936*; comparative statistics, 2154, 2273; motor, gear and construction, *1932–1934*; rail laying, *3750*, 3751, 4189; staff, 4189
— horse, description, 2273
Transaction in business, 1567; definition, bookkeeping, 488, 658, *777*
Transcaspian Railway, route, 2718, 2719
Transfer, business, full account, 1568
Transformer, electric, 949, *1657–1661*; Marconi's, 3898; three phase, 1907, *1908*
Transit, probable developments, 2276; *see also* Vehicles, *and separate headings*
— trade (British), 6005
Transition, in sol-fa notation, 922
Transitive verb, 608
— verbs (German), passive voice, 3355; syntax, 2489: *see also* Verbs
Translation, in applied mechanics, 87
— charges, 1919
Translucence, in light, 2436, 2599
Transmission, of acquired character, 825, 1586; Lamarckian theory, 653
Transmitter, telephone, 5081, 5682, *5879*
— Wheatstone, *5391*, *5392*
Transom, 2830, *2831*; of bogie frame, 3122; in elliptic spring vehicles, 3124; of ship, *5618*, *5742*
— in building, terra-cotta, 2783, 2784
Transparency, in light, 2436
Transpiration, 508, 727; connection with dew, 1900; of leaf, 172; of pores of skin, 1423
Transport, varieties and methods, 4517–4519; geological action of sea, 1814
Transporter bridges, structure, *2889*
Transposing keyboards, musical, 1059
Transposition, in music, 1057, 2024; cornet, 5443; trumpet, *5439*
Transvaal, climate, 3586; economic conditions, 5560; geography, 3587; history, 6693; mineral wealth, 2376
Transverse process, of vertebræ, *1605*
— strength of stones, 1597
— stress, building materials, *1257*, 1260
Trap, of house drains, 570, 733 *4462*, *5052*, *5629*, 5634
— door, of roof, lead protection, 5034
— — spider, underground dwelling, 3805
— hairs, of arum: *plate facing* 728
— rocks, 528
Trapeze, acrobat work, 6866
Trapezium, in geometry, **496**, **1254**, 4723; area, 4906
Trapezoidal areas, rule, *5965*
Travel, best seasons for in various countries, 394; atmosphere of a country, guides, climatic conditions, 391; modes of travel, 512; national importance of, 64; organisation, 1809; personal value, 212; value to journalist, 3976; tourists, vocabulary, 1956
Travellers' phrases, 1956–1965
Traveller, in mechanical engineering, 415, 832; testing, 3966
Travellers' letters of credit, 4294
Traversing, in surveying, 367
— bridges, construction, 2888
Travertine, classification, 1074, 6744
Trawl-fishing, territorial restrictions, 5318; vessels employed, 4989; regulations for trawlers, 5316
Tray, elliptical, drawing, 5164, *5165*; rectangular, *5165*, 5166; truncated, drawing, *4523*
Treacle, 3653; manufacture, 4455
Tread, in railway construction, 3612
— of staircases, 5300; stone, 3241
Treading plan, in textiles, 3909
Treasurer, municipal, 1067–1069
Tree-creeper, climbing, 2495, 2507
Tree ferns, 51, *1116*
Treeing, in boot-making, *4546*
Trees, *51–57*, 4676; age computation, 51, 504; classed as hard and soft, 3542; as check to soil denudation by water, 456; greatest dimensions, 503; distribution, 625; felling, 964, 5899; forest, high, 4680; forest pests, 4925, *4927*; in coal seams, 1921; planting, 6316; species, 4678; in town gardens, 6316; transplantation, *4677*, 6317
Trefoil: *see* Clover, yellow
Trellis girder, loads, *2227*, *2229*
Trembles, in sheep, 2625
Tremolando, violin bowing, *2743*
Tremolo, in music, *270*; banjo, 4312; concertina, 4488; double-bass, 5728; guitar, 3762; harmonium, 3951; singing, 6185; violin, *5727*
Trench, in drain-laying, 733, 781; excavation, 329, 332, 453, 1823, *1824*; military construction, *6267*, 6270
Trenching, in mining, 2665
Trench, Richard C., philologist, **1309**, 2616
Trent, river, course, 1273
Trepan, in mining, *3460*, 3461
Trepang, fishery, 4083, 5121
Trepanning, of brushes, 6107
Trestle, in building, 1173; in carpentry, 3386, 3754, *3755*, 4640, *4641*; in fitting, *3689*, 3691; railway, in military operations, 6266, *6267*
Treves Cathedral, 3233, 3374
Trial balance, bookkeeping, *490*, 2501, 3417; complex ledger, 2201, 2981
— holes, in building, 332
— pits, dock construction, 6196
— of the pyx, in coinage assay, 5851
Triangle, geometry of, 494; altitude, 4905; area, 370, 1251, 4906; classification, 4330; definition, kinds, 4330; equality of two, 4624; equality, 4330; equiangular, 5472; parallel, *4623*; proportional division of sides, 5338; quadrilaterals, 496; sides and angles, 6627; solution, 6628, 6789; squares on sides, 5636; value of angles, 4478
— musical instrument, use, *5567*, 5733
Triangle of forces, 412, 553, 685
Triangulation, in drawing, *4525*, 4526
— in surveying, 593
Triassic System, 2067; rocks, 2254
Tribulus, seeds, *911*, 912
Tribune, Roman, appointment and powers, 1138; before and after the Decemvirate, 1201
Tributary of river, definition, 457
Triceps, of arm, function, 1712
Trichina, habit, destructiveness, 3958
Trichinosis, treatment, 2625
Trichlorides, in chemistry, 1601
Tricuspid valve, structure, *955*, *956*
Tricycle, difference from bicycle, *3774*, *3779*
Tri-dimensional space, psychology, 2119
Trigonometrical rations, 6231
— survey: *see* Triangulation
Trigonometry, 6231, 6373, 6499, 6789; books on, 6790; logarithms, 6627; signs, use of, 6086; ratios, 6231
Trilobite, 3361, *3806*

Trimmer, tool, use, 3388, 3756
Trimming, in carpentry, plan, 4445, *4447*; in roof work, *4253*, 4254
— millinery, *5774*; lace, 5620; underwear, 3094; velvet, *5331*
— of vehicles, 3621, *3624*
— weavers, employment, 2651
Trindle, bookbinding, *6776*, 6777
Trinidad, 4178; petroleum, 1164, 6007
Trinity House Corporation, 1497
Trinomial, in algebra, definition, 1818
Trional, hypnotic, 4129, 5469
Trip, train, use, 4689, *4691*
Triple effet apparatus, sugar, *3829*
Triple expansion engines, 5418
Tripoli powder, formation, *1814*, 6573
"Triumph of Death," painting, *3519*
"Triumph of Venice," Paolo Veronese, *plate facing* 3793
Triumvirate, the Roman, the first, 1514; second, 1671
Trochee, definition, 328, 1760, 3051
Trochoid, in geometry, 1414
Trolley, electric tram, standard, *1936*
Trollope, Anthony, novelist, *3441*
Trombone, bass and tenor instruments, *5267*, 5271, *5732*; manufacture, 6624; orchestra, 5888
Tropics, 203; natural products and commerce, 5379; physical conditions, 4493; rainfall, 298
Trough, railway water, *3614*, 3615
— stratified rocks, 1923
Trouserings, warp, *5510*
Trousers, boys', 1754, 4356; men's, *2604*
Trout, classification, 3066, *3068*
Trowel, *4585*, 4586; gardener's, *6315*; plasterer's, *1951*, *5497*
Troy weight, table and use, 226
Truck, hand, construction, 2558
— railway, 2555, *5068*, *5069*; modern patterns, *2463*, 2467
— tramway, load distribution, 1923, *1935*
Truck Acts, provisions of, 6845
True discount, explained, 1319
— north, finding, 265, 709
Truffle, description, 1371
Trumpet, musical instrument, *5437*, *5440*; manufacture, 6624; use in full orchestra, 5888
Trunk telephone system, 5394, *6174*
Trunnions, for foundry ladles, *2865*
Truss, in bridge building, 2497, *2499*, 4640, *4641*
— roof, 415, 545, *4251*, 4523; king post, *4249*; queen post, *4251*
Trussed beam, construction, *5793*, 5794; stresses, 416, 2228, *2229*
— girders, in derrick stagings, 1176
Trustee, bankruptcy, 3571
— securities, defined, 3483
Truth, Bacon's inductive methods of finding, 6000; empirical value of, 6255; logical test, 6101; method of growth, 5388; philosophical, contrasted with other forms, 6256; pragmatic philosophy, 6535; search for, value of, 6255; supremacy of, 5530; toleration of religious, 5532; tests, old and new, 6470; ultimate triumph of, 5390
Truyere, river, garabit bridge, *2739*
Trying plane, use, 3385, *3387*, 3756
Trypsin, action, 675, 3819, 4135
Tschermak, Austrian biologist, 1481
Tsetse fly, *plate facing* 3361, 3721; distribution, danger to man, 628
Tuataras, classification, *2677*, 2678
Tuba, musical instrument, 5732, *5733*; *see also* Saxhorn
Tubbing, in mining, 3458, 3766
Tube, of boiler furnaces, *3097*, 3102, *5349*, 5351, 6514; *see also* Smoke tubes
— borehole casing, 2846, *2847*
— expander, use of, *3103*, 3104, 3108
— of fire-box, 3103
— metal, varieties and manufacture, *5319*–5328
— in mining core, 2668, *2669*
— railways, London, rolling-stock, 2556; statistics in London (1905), 130
— rubber, manufacture, 5201
— spinning frame, mechanism, 2441
Tube-feet, of starfish, 4081, *4083*
Tube-plate, locomotive, *3101*, 3103
Tube-worm, description, 3956, *3957*
Tuber, in botany, explained, 346, *347*
Tubercle bacillus, 6541, *6542*, 6781
Tuberculin test, applied to cows, 3554
Tuberculosis, 6781; communicated from milk, 3554; evolution of immunity against, 1030; heredity problem, 1587: *see also* Phthisis
— in cattle, treatment and symptoms, 2622
Tubing, of bicycle frame, *3774*, 3775
— flexible metallic, uses, manufacture, *5327*: *see also* Tubes
Tubular bridges, Britannia, 2498, *2499*
Tuck, in dressmaking, 3338
— textile, weaving, 3155
Tucking, in sewing, 154, 3339
Tuff, volcanic, 1074, 1921, 2066
Tulip, 355; culture, 6489
Tulle, joining, *5621*; for millinery rosettes, 5505, *5506*
Tumble home, of vessel, 5609
— of eight-day clock, 5717
Tumbler for tanning, *3162*
Tumbling, in building, 2268
Tumours, caused by aneurism, 6036; effect of radium on, 2030
Tuners, pianoforte, duties, 6444
Tungsten, in steel, 234, 4748
Tunic, boy-baby's, making, *4195*
Tuning, double-bass, 3168; harp, 3342; piano, 3880, 6442, 6709; viola, 2824; violin, 2128
— fork, 2104; in sol-fa notation, 806
Tunis, geography, 3280, 5822
Tunnel, Blackwall, driving, 3462
Tunnelling, 159, 1824, *1825*
— in building, 329, 331
Tup, in die forging, use of, 2992; of mechanical hammers, 960, 2022
Turbine steamships, 2278
Turbines, steam, varieties, principles and construction, *6645–6648*; books on, 5595; classification, 5679; electric installation, *1691*, 1693; horse-power, calculation, 1695; mechanical efficiency, 1688; principle of, 1143; in ship propulsion, 5258; utilisation of power, 5011
— water, *1691*, *1695*
"Turbinia" turbine, 6645
Turbo-alternator, 1906, *1907*
Turbot, boiling, 1874; carving, *5935*, 5936; choosing, 3717; form of body, 3069; value of fishery, 4989
Turkey, 5703, *5705*; carving, 5934, *5935*; choosing, 3747; courtship, *2505*; digestibility, 3314; manure, 5874, 5875; roast, cooking, 1874
Turkestan, geography, 2974, 2977; Mongol supremacy, 218
— Russian, geography, 2718
Turkey, coins, weights and measures, 410; geography, 2165, *2166*; history, beginning of Ottoman Empire to 1821, 6447; Crimean war, 6692; trade, 5822
Turkey in Asia, geography, 2719
Turkish Provinces, geography, 2167
Turks, craniology, *1786*; ethnology, 1789
Turmeric, in dyeing, 5145, 5907
Turn, in music, 271; violin, 2508, 2510
Turner, J. M. W., etching and mezzotint, 6290; landscape painting, 4302; "Dido building Carthage," *4301*; "Liber Studiorum," 724; Ruskinon, 2616
Turner's yellow, manufacture, 5144
Turner's templets, *6855*, 6856
Turnery, mechanical, *3316*
Turning, art metal-work, 5527, *5528*; metal, tools, *4151*, 4153; wood, *6853–6856*
— chisel, 4150, *4151*
Turnip, *942*; cultivation, 1231; disease, 1669; insect pests, 1668; as live-stock food, 2704, 2904; market garden returns, 6836; uses, *942*, 944
— flea-beetle, 1668, 3512
Turnpin, plumber's, 5029, *5030*
Turn-under, coachbuilding, 2558, 2730
Turpentine, 3487, 4657, 5147; distillation, 5147; properties and uses, 5832; purification, 5466; varieties, 1054
— oil and spirit of, 1034, 1035
— Venetian, as painting medium, 871
Turquoise, 5852, 5853, 5856, 6745
— blue, basic dye, 5955
Turret, of lathe, 3632, *3633*, 4914, *4920*, 4923
Turret lathes, 3322, 3631; contrasted with grinding machines, 3408
Turtle, 2677, 2798, *2800*, 6891
Tuscan order of architecture, *2035*
Tuscany, province, 2230; as Duchy, 2945; under the Medici, 4322
Tusk shells, classification, 3113, *3284*
Tusks, as weapons, 2155
Tussih moth, cultivation, 583
Tutors, dismissal, law of, 6845
Tutti, flute music, 5729
Tuyeres, in cupola furnace, 4469
Tweed, river, 984; valley, 1066
Tweezers, compositor's, 5156, 5157
Twill, use of treading plan, 3909
Twilled cloth, design, *2941*, 3153
Twine, manufacture, 1027, *5288*
— cable, machinery for, 5289
Twiners, twining plants, 504, *505*
Twist, use, 185; silk, 153
Twist-bit, use, 3386, *3387*
Twisting, textile process, *2593*, 2707
Two-string mill, in warping, 3489
Two-wheel vehicles, suspension, 3126
Two-wire system of electric lamps, 2245
Twyer: *see* Tuyere
Tycho Brahé, observations, 6241
Tying, in bootmaking, 4546
— in scaffolding, 1170
— in, in surveying, 264
Tympan, of printing press, 5744
Tympanum, of ear, 2316, *2533*
Tyndall, Prof., on life, 29; on scientific spirit, 2806; vowel flame, 2318
Tyne ports, tonnage (1904), 6005
Tynecastle canvas, for walls, 5828, 5830
Type, printer's, 5026; cases, *5156*, *5157*; in advertisements, 6859; "bill," average, 6074; arrangement in chase, 5457; composition, 5026; evolution, *5027*; founding, 6073–*6075*; making even, 5159; measurement systems, *5028*; moulding in linotype, 5250; sizes, 4236, *5028*; spacing, 5158; storage, 5252; wood, 6075
Type-casting machine, automatic, 6075
Typefounding, 6073, *6075*; employment conditions, 2645
Type metal, 360, 1162, 3941, 8988
Type bar, in typewriter, 1527, *1529*
Typewriter, hire-purchase system, 1918; mechanism, *1527–1529*
Typewriting, 1696; as a business, 1918; charges, 1920; the use and care of a machine, 1527
— ink, 5367
— paper, manufacture, 6401
Typist, charges for hire, 1920; wages, 1918; women in Government departments, 3303; women in L.C.C., 1215
Typhoid bacillus, *6540*, 6542
Typhoid fever, communication by shellfish, 5315; conveyed by water, 5410; immunisation during, 6544; immunity of animals, 6543; microbe, 6440; symptoms and treatment, 6260
Typhus fever, 5410; rarity, 6260
Topography, books on, 6076
Tyranny, Russian government, 4369
Tyre, bicycle pneumatic, 3775, 5201
— motor, 2154, 2273, 5201
— railway, intersection with rails, 3612
— wheel, brougham, 2830, 3127

UDDER, of cows, complaints, 2623
Uganda, geography, 3452
Ulcer, rodent, Röntgen ray, cure, 4093
Ulcers, tongue and mouth, 6132
Ulmaceæ, rubber plants, 5046
Ulna, human, *1348*, 1708, *1709*; of tapir and rhinoceros, *1179*

Ultramarine, pigment, 871, 6745; composition and manufacture, 5144; in sugar refining, 4453; in textile printing, 4501
Umber, raw and burnt, pigment, 871; preparation, 5144
Umbellales and umbellifera, classification, 353
Umbels, botany, defined, 353
Umbra, in light, 2435; eclipse, *11*
Umbrella makers, employment, 2651
— merchant, business of, 5603
— skirt, cutting, 524, *525*
Umbrellas, old and modern forms, 5603
Umbrian school, of painting, 3794
Unconformity, in geology, 1354, 1355
Under carriage, construction, *3121*, *3126*
Under cliff, of English coast, 1505
Underclothing, cutting out and drafting, 928, *3472*, *3475*; making, 3093, 3094; stitches used, 3336–3340
Under frames, railway rolling stock, 2556
Underglaze, of pottery, 5383
Underground working, in mining, *3190*
Underlays, in printing, 5867
Underlie, in mining, 2378
Underpinning, building, 335, 918, *2514*
Undershot wheel, principle, 1690
Under-spring, carriage suspension, 3122, 3123
Undertakers, business of, 5785
Underwriting, principles, 4853
Undistributed middle, in logic, 6098, 6100
Ungulata, characters of, 1494; evolution, 1761; swimming, 2038
Unhairing, leather, 2854, *2854*, 2856, *3219*
Unicellular organisms, 276, 278
Unicorn, origin of emblem, 2156
Uniformitarianism, geological, 1205
Union of Calmar, 2948
Union of England and Scotland (1707) provisions. 4952
Union, in plumbing, *5629*, 5633
Unipolar nerve cell, in anatomy, 1942
Unit in mathematics, 89
Unitary method, rules, 998
Unitarian colleges, examination, 6607
United Kingdom: *see* Great Britain and Ireland

— driver, railway goods, *5070*, 5071
— electric lorry, *5078*, *5079*
Vanadium, in art work, 5523; in steel, 4748
Vandyke brown, 871; varieties, manufacture, 5144
Vane, of waterwheels, 1691
Vanilla, source, uses, 4971, 6891
Vanillin, preparation, 5469; use, 4971
Vanishing point, in perspective, 595
Vapourer moth, egg, *3513*, 3514; wingless female, 3516
Vapours, saturated and unsaturated, law of, 1741
Variation, in algebra, principles, 3696
Variation, in biology, 484; books on, 1791; in botany, 167; causes, 650; Darwinian and Lamarckian theories, 824; of individuals, relation to social progress, 5387; natural selection and reversion 1180; retrogressive, counteracted by conservatism, 5389; the sex problem, 651; transmission to offspring, 5386
— of materials, 211
Varicose veins, cause, symptoms, 6036
Varnish, constituents, classes, 1035; oil, 5147, 5148; preparation, 5835, spirit, 5148
— brushes, painter's, *5829*, 5831
Varus, Roman frontier wars, 1829, 1830
Vascular, bundles, leaf, 170, *171*; stem, *169*, 170
— cryptogams: *see* Cryptogams
— system, blood vessels, *952-957*; function of the heart, 1192, 1193
— tissue, in trees, 57
Vase, china, making, 5606, *5607*
Vaseline, 1164, 6148; uses, 6151
Vat, brewer's, 6058
— dyeing, 5782, 6367
— glue manufacture, 5358
— paper-making, *6395*, *6396*
— wine-making, 6355
Vatican Museum, sculpture, 2929, 2930
Vanbrugh, Sir John, dramatist, 1150
Vaults, centres for, 2386, *2387*; Gothic period, *3373*; invention of, 2658; kinds and construction, 3144–*3147*; Romanesque, 3231; shoring, 916
Vaulting, in architecture, 3144, 3374
Veal, braising and stuffing, 1736; carving loin, *5935*, 5936; choosing, 1228, 3717; cooking, 1872; digestibility, 3314
Vecchio, Palma, painter, 3796, *3797*
Vecchio, Palazzo, architect, 3376
Veddas, the, 417; religion, 6771; skull measurement, 1785; stature, 1788
Vee (parting), tool, 4150, *4151*
Vee weld, *233*, 236, *2987*, 2988
Vees, of lathe, use and form, 4914, 4915
Vega Lyræ, star, 315, 625, 6117
Vegetable down, 817, 6716

Vegetable ivory, 812, 6299; dyeing, 6768
— kingdom, contrasted with animal, 275; Dair's diagram, *277*
— life, definition, *95*
— marrow, stuffed, recipe, 2127; market garden returns, 6836
Vegetables, choosing, 1228; culture, 6673; dietetic value, 3110; new varieties, 6835; packing for market, 6675; recipes, 2126, 2335
Vegetarianism, comparative value of, 3381, 3601; dietetic value, 3111
Vegetation, fossil, 1817; semi-tropical, formerly in British Isles, 1817; zones, 625, 2407, 2715, 3276
Vehicle, body-making, *2827–2834*; carving, 3024; classification and description, 2152, 2154, 2462; construction, drawings, *2725–2731*; construction, technical instruction, 3908; design, 2555; dictionary of, 2559; dimensions, weight, etc., 2726; fittings, 3022, *3024*; land-propelled, construction, 2558; heating and lighting, 3025; metalwork, *3325*; painting, *3479*; road trade, 2558; trimmings, 3621; under-carriages, *3121*; ventilation, 3024; wheels, 3126
— motor: *see* Motor vehicle
— of paints, definition, kinds, 5831
Veil, bridal, 5774; confirmation, 5774; hat, 5621; widow's, *5774*
Vein, in geology, *2375*, 2378; wide, mining, 3304, *3306*; proving, 2665; stoping, 3304, *3305*
— human, circulation in, 952, 1194; diseases, 6036; structure, valves, *953*, *954*, 955
Vein-rock character of, 2378, 2581
Velasquez, painter, *723*; "Alessandro del Borro," *182*; characteristics and style, 102, 4120
Vellum, preparation, illumination, 6275
Velocity, in physics, 423, 551; coefficient of, in hydraulics, 1573
Velvet, cutting and making up, 864; cotton-back, use and price, 5331
— of deer's antlers, 2156
— design, fitness, 5980
— millinery, *5331*, 5332; for hats, 5036; renovation, 6040; for trimmings, 186; washing, 6040
— textile, weaving and design, 3156
— upholsterer's varieties, 6716, 6722
Velvet-pile carpets, design, 3358, 3359
Velveteen, cutting and making up, 864; millinery, washing, 6040
— textile, weaving and design, 3156, 3157; finishing processes, 4342, *4344*; loom, 3685, *3686*
Veneer, 6583; of staircase, 5300, *5301*
Veneering, 6580, *6581*, 6582

Vibrato, in banjo music, 4312; guitar playing, 3762, 3765; in violin playing, 2510
Vibrators, of harmonium. 3951
Vice, carpenter's, 3385; planing with wood in, 3756, *3757*; in sawing boards, 3754, *3755*
— metalworker's, *3689*, 3690
Vickers' field guns, *6610*, *6613*
— nickel-steel plate, tests, *5984*
Victor Emmanuel II., King of Italy, unification of Italy, 6303
Victoria, Australia, geography, *3701*, 3702, 5660, 5661; gold discovery, 6552; climate, 3240; farming, 3240; municipal surveyors, 3743; trade, 3240; wool industry, 3237
Victoria Bridge, Rhodesia, structure, dimensions, *2736*, *2739*, 2740
— carriage, described, 2466, *3024*
Victoria Falls, Zambesi, description, *1634*, 3583; bridge, 2740; water power, 5012
Victoria Nyanza, lake, 3450, 3452
— phæton, 2726
Victoria, Queen, reign, 6690; books on, 2787
— stone, composition, 534, 2428
Victorian age, poetry, 1434, 1438
Victory, printing machine, use, description and operation, 5869
Victualling bill, ship's, 6806
Vicuna, sheep, distribution, 72; fur and skin of, 6428; habitat, 220, 4290
Vignoles rail, 3252, *3254*, *3432*, 3436
Vienna, 2162, 2164; cathedral, 3374; sieges, 6447; tourist description, 1248
Vienna, Congress of, 5239
Vienna, Peace of (1864), settlement of Danish affairs, 6447
Vienna bread, recipe, *3393*, 3394

Viewing, in carpet manufacture, 4341 ; cloth manufacture, 4342
Vignetting, in photography, 6682
Vikings, ships, voyages, *5255*
Villages, as military defensive posts, 6273
Villi, anatomy, 579, *580* ; construction, and digestion of fat, *675*
Vinci, Da Leonardo, painter, 1021, 3675, 3795, *3797*
Vinculum, algebraic sign, 1818, 1993
Vine, classification, 353 ; cultivation, areas, climatic conditions, 4875 ; culture in Europe, 856 ; tendrils, 504, *505* ; woodcarving design, *6138*
Vinegar, adulteration, 3718 ; artificial preparation, 4720 ; colouring, 4165 ; malt, properties, 4719 ; natural preparation, 4719 ; effect on obesity, 3016 ; source, 4717 ; tests, 4720 ; white, 4720
Vines, culture in England, 6677
Vineyards, influence of slope, 4495
Viol, precursor of violin, 2121
Viola, description, construction, handling, *2823* ; classification, 5726, *5728* ; compass, *2745* ; manufacture, 6704, 6707
Violet, *349* ; classification, 352 ; culture, 6490 ; nectar, *730*, 731 ; seed carriers, ants as, 912
— colour, pottery glaze, 5384 ; symbolism, 725 ; vibration, rate, 3728
Violin, books on, 2746 ; characters, harmonics, and playing, 2121, 2311, 2410, 2508, 2741 ; care of, 2314 ; compass, 5726 ; *f* holes, *2121*, 2122 ; manufacture, 6704 ; skeleton or mute, 2314 ; solo, orchestral and combined playing, 2746 ; strings, *5726*
Violinist, mind training of, 2744
Violoncello, structure and playing, *2968* ; classification, 5720 ; compass, *2968* ; manufacture, 6704, 6707 ; orchestral and solo playing, 2971
Viper, fangs and poison gland, *2680*
Virgil : *see* Vergil
"Virgin Adoring," Perugino's, *3796*
Virgin cork, 1166
— oil, production of, 1032
— soil, definition, 330
Virginia, colonisation, 5844 ; petroleum fields, 6007, 6014 ; products, 4172, 4174 ; settlement by Raleigh, 3606
Virginia creeper, classification, 353 ; tendrils, 504, *505*
Virgo, zodiac sign (season), 6251
Virtual centre : *see* Instantaneous centre
Virtue, relation to habit, 2861
Viscera, abdominal, *576*
Visceral cleft, in diagram, 30
— layer, of pleura, structure, 1300
Viscometer, use, varieties, 6149
Viscose, coagulation, 6552 ; filaments, 6563 ; silk, 6563 ; fibres solvent, 6561 ; solidification, 6562 ; spinning, *6562*
Viscosity, variation in fluids, 1374
Viscous liquids, defined, 1076
Visigoths, in Portugal, 2946 ; capture, Rome, 2241 ; in Spain, 2946
Visintini system, in building, construction, 1554
Vision, binocular, 2119, 3181, *3182* ; contrasted with perception, 2803 ; centre, 2602, 3730 ; distinction from light, 3181 ; inversion of, 2601 ; limit to, 3227, 3229 ; optics of, 2952 ; phenomena of attention to one of two stimuli, 2258 ; physiological account, 2400 ; psychology of, 1882 ; retention of image, a kind of memory, 2259 ; *see also* Sight
Visions, instances of, in psychical research, 3625
Visual angle, 595
— purple, of retina, 2402
Vital activity, variation according to season, 5274
Vital activity, chemistry, 2712 ; systematic treatment, 4132–4135
— products, chemical synthesis, 237, 2711
Vitalism, relation to synthetic chemistry, 2710, 2713
Vitality, period of growth, 3048
Vitellius, of Rome, reign, 1939
Vitreous form, of minerals, 766
— humour, description, 2953
Vitrification of bricks, 1280
Vitriol, aplication and derivation of term, 1721 : *see* Sulphuric acid
Vitriol, blue : *see* Copper sulphate
Vitriol, green : *see* Ferrous sulphate
Vivisection, true method of abolishing, 5391
Vlieger, Simon de, painting, 4300
Vocal cords, human, construction, function, 2537, *2538* ; function, in singing, *6048* ; in respiration, 1299
Vocative case, in English, 246 ; German, 2927
Vœlker's electric furnace, 4532, *4533*
Vogt, Carl, on thought, 6259
Voice, in grammar, 116, 608
— human, causes of a good, 2106 ; diseases, 6264 ; nature and production of, 2106, 6864 ; physiological account, 2536
— in singing, "break," 6193 ; characteristics, 6050 ; classification, 6049 ; compass, 6050, 6193 ; cultivation, age for, 6191 ; fatigue, 6185 ; female, exercises for "break," 6193 ; forcing, 6185 ; health affected by, 6186 ; intensity, 6184 ; intonation, faulty, 6189 ; male, exercises for, 6193 ; production, 6193, 6864 ; registers, male and female, *6182* ; timbre, 6184 ; tone quality, 6184 ; volume, 6184
Voile, material, width, 186
Volatile alkali : *see* Ammonia
— oils : *see* Essential oils
Volcanic conglomerate, 1074
— dust, effect on sunsets, 3729
— glass, 766, *767*
— rocks, character and formation, 1006, 1074, 2066
— tuff, classification, 1074
Volcano, action, 459, *461*, 1206, *1205* ; books on, 2256 ; connection with local upheaval and subsidence, 1355 ; distribution, 1208 ; earthquakes, relation to volcanic action, 1209 ; East Asiatic system, 2564 ; in the moon, *1206*
Volga, river, basin, 2406, 2408
Volition : *see* Will
Volt, electrical unit, 129, 291, 670
Volta, Count Alessandro, 129, 462, 5752
Voltage, in accumulator, 3087, *3088* ; alternating, 1357 ; converter, in electric supply, 2248 ; curve, railway, *2085*–2087 ; drop in electric supply, 2246 ; difference of phase, 1362 ; relation to current, 1362, *1363*
Voltaic battery, invention, 129, 5752 ; *see* Battery, electric
Voltameter, 3260, *3261*
Voltmeter, 291
Volume, of gases, Boyle's law, 1804
— in geometry, 4207
— of solids, change of, at melting point, 1740 ; calculation, *5966*
Volumetric analysis, 4411 ; text-books on, 4416
Voluntaries, in church music, 3867 ; for harmonium, list of collections, 4184
Voluntary action, physiological account, 2302
— muscles, function, structure, *1710*
— in psychology, distinguished from "reflex," 2117
Voluntary schools (Acts of 1902–3), 1677
Volute, in Assyrian architecture, *2657*
— in centrifugal pump, *1687*, 1688
— violin, *2121*, 2122
Vomiting, causes, remedy, 5842
Von Patera process of silver recovery, 4304
Vortex theory, in physics, 936
— turbine, mechanism, *1689*, 1692
Vortigern, King of Wales, invites Saxon help, 2610 ; and Hengist and Horsa, 2241, 2355
Vosges, mountains, Germany, 1837, 1974
Voucher trading in shopkeeping, 703
Voussoir, arch, bricks for, 1949, *1950* ; definition, formation, 2386, *2389* ; graduated with keystone, *3039* ; stone arches, 3143 ; joints to, 3036, *3038* ; position of natural bed of stone, 2836 ; size, *3144* ; stability, 2760, *2761*
Vowels, in English, 121 ; French, 123 ; in German, 249, 748 ; Italian, 2043 ; in Spanish, 2040
— in shorthand, 259, 260
— in singing, 6338
— in sound, production of, 2318
— tones, Helmholtz on difference between, 2318
Vries, De, biologist, mutation theory, 1181
Vulcanisation processes, 809, 5045, 5202, *5203*
Vulcaniser, cable, 6793 ; use in dentistry, 6030, 6032, *6033* ; theory, 5312, 5313
Vulcanite, 809 ; for covering concrete roofs, 4758 ; use in dentistry, 809, 5310, 6029 ; invention, manufacture, 5310 ; as insulator in electricity, 672
Vulgar fractions : *see* Fractions
Vulture, description, 2212, 2213, 2493
Vyner window, Christ Church Cathedral, Oxford, *plate facing* 4945, 4949
Vyrnwy, river, dam, *2573*, 2574

WADDING, in vehicle trimming, 3624
Wafers, biscuits, manufacture, 3597
Wages, how shown on balance-sheet, 2882 ; law affecting payment (Truck Acts), 6845 ; relation to cost of production, 3418 ; reproductive, 2500 ; salary, distinguished from, 1090
Waggon, agricultural, 1846 ; axle-box, 209, *3265*
— motor : *see* Motor vehicles
— railway, *2463*, 2467, 5068 ; axle-box, 209 ; closed, use, 5069 ; load gauging, 5075 ; loading, 5072 ; marks of railway companies, 5069 ; merchandise, 5068 ; mineral, 5068, *5069* ; private railway, ownership, 5068 ; reversing on temporary line, 3255, *3256* ; runaway, arresting, *5072*, 5074 ; shunting operations, *5070*, 5074
— road, light, 2829, *2830*
Waggoner, duties, wages, etc., 2999
Waggonette, 2466
Wagtail, classification, 2210 ; food, 2493
Waikite geyser, N.Z., *1207*
Waist, danger of restraining, 1301 ; woman's, natural size, 4258
Waistband of boy's knickers, 1551 ; of skirt, 655
Waistcoat, making, 2872, *2873* ; *see also* Vest
Waiters, wages and tips, 5584
Waiting, butler's duties, 761
Waitresses, catering charges, wages, 5583
Wales, agricultural land, 986 ; Cambrian rocks, 2253 ; coal and iron fields, *987*, 988, 5303 ; educational facilities, 1777 ; farm servants, 3001 ; geography of, *1276*, 1277 ; Glendower's revolt, 3251 ; early history of, 2609 ; language, origin, 1768 ; lowlands, 984 ; sea-fishery regulations, 5318 ; slate quarries, 580, 1817 ; universities for women, 3508 ; wars with Edward I. of England, 3074 ; wool production, 72
— truce of, the first, 2610, 3075
Walking of children, age, 4684 ; value as exercise, 4389 ; physiological account, 1800 ; as means of transit, 2152
Walks, garden, 6316

Wall ashlar, backings to, *2177*, 3037; brick, construction, *1451*, 1454, *2261–2268*; concrete construction, 334, 1450, *1151*; openings in fire-resisting, 4760; fire-resisting construction, 4754; foundations, 332; interiors, preparation for papering, 5828, 5829; mediæval, 920; shoring, 916; stability, 2570, *2571*; stone, *1151*, 1454, 3033; terracotta, 2779; top, finishing, 2267
— of Antoninus, building of, 2607
— boring machine, *6755*
— coverings, kinds, and preparation, 5828, 5830; upholstery, 6722
— garden, making, 6322
— plate of lean-to roof, construction, 4247, *4249*
— post, of room partition, 4448
— plants, list, 6322
— sea, *1557*, *1558*; rubble, *5578*, 5580
— engines, construction and use, 5911
— in mining, *2375*, 2378, 3561
— retaining: *see* Retaining walls
— surfaces, quantity surveying, 6513
— upholstery, 6722
Wallaby, skins and furs, 6428, 6430
Wallace, Alfred Russel, 136, 1791, 2786; on the Papuans, 1788; on spiritualism, 3665
Wallachia, ceded to Hungary, 6147; after Crimean War, 6692
Wallflower, *349*; classification, 352; nectaries, 731
Walling, mining shaft, 3457
Wallpapers, air permeability, 6020; books on design, 6728; design, 5980, *6724*, 6725; hanging, 5829; manufacture, 5827; printing, 6725; pasting, 5830; trimming, 5827; varnishing, preparation for, 5835
Walnut, *57*, 355, 6891; use for carving, 5809; *in vehicle construction*, 2827
— oil, in varnishes, 1035
Walpole, Sir Robert, political career, 5554
Walsall pumping engine, 5417
Walter printing press, first use, 5869
Walton, Izaak, works, 1642
Waltzes, as musical studies, 1890, 2023
Waltzing, psychological effect of "reversing," 2119
"Wander-year," part of German's education, 65
War, beneficial effects of, 5098; Buckle on evils of, 5099; Carlyle on purport of war, 5098; effect on family life, 4664; Grotius's four kinds, 5245; Napoleonic, 5685; place in sociology, 5095
War Office, junior clerkships, 3195
Warbeck, Perkin, imposture, 3640
Warble fly, in live-stock, 2626, *2627*
Warbler, classification, 2210; nest, 2507
Ward, Dr. Lester, matriarchal theory, 4825; on man's treatment of woman, 4825
Warder, prison, appointments, 3301
Wardrobes, construction, *6589*. 6590
Warfare, military replaced by industrial, 5099
Warning-board, railway, *4592*
Warp, of bobbin-net loom, 4979; breaking, detection, 3636; of carpets, 3990; controlling, 3684; in design, 2939, 2944, 3153, *6595*, *6596*; of double cloth, 5509, *5510*; dyeing apparatus and process, 6369; dyeing, mixed effects, 6501; frames, 4763; healding, *3909*; lace loom, 4879, 4978; "planted" effects, *6595*, 6596; of tapestry carpet loom, 3996; treatment, 3488
Warping, of timber, 3539, *3541*
Warping mill, mechanism, varieties, *3488*, *3490*
Warrant officers in army, 3842, 4031; in navy, 4266, 4267
Warren girder, 541; stresses, 541, *2227*, 2228
Wars of the Roses, cause, character, battles, 3603
Warsaw, battle of, 5396
Warships, development, 5257
Wash, inlet, Lincs., 984, 1273
— water-colour, laying on, *1792*
— back, in brickmaking, 1281
— drawing, press illustration, 6102
Washer, of ball-thrust bearings, *4325*
— in carpentry, proportions, *1704*; use with bolts, *3543*, 3546
Washer-cutting machine, in harness manufacture, 4784
Washer-plate, casting, *2111*, 2113
Washing, in dyeing, 6372; in laundry work, 2590, 2688
— powders: *see* Soap powders
Washington, description, 4172; touring, description, 1649
Washington, George, 5844; presidency, U.S.A., 5846
Washleather, manufacture, 1166, 3165
Wash-wheel, use in soaking hides, 2853
Wasp, description, 3722, *3724*, *plate facing* 3361; social, and solitary nests, *3725*, *3726*
Waste book, bank bookkeeping, *4441*; products, utilisation, 5766; books on, 6689
— silk, 1245; drawing process, 2100; improving and gassing, 2598; making sliver, 1724
— wax, casting method, 5526
Watch, cylinder or horizontal, mechanism, *6084*; dissecting and mending, *6081*; lever, mechanism, 6084; manufacture, 6081; repairs, 6083; types, 6084; verge, cleaning, 6082; verge, dissecting and putting together, *6081*, 6082
— ship's crew, 6803
— telephone receiver, 5394
Watchmaker, business of, 47, 5788; employment conditions, 2617; tools and appliances, 6081; work, 6084
Water, animals and plants, necessity to, 4133; bacteria in, 6441; capillarity, *1374*; chemistry of, 692, 1597, 3261; compressibility, 1142; daily amount for man, 3110; density, 798; desert plants' economy, 727; diseases carried by, 5410; distribution, 1597; drinking, 3380, 4157; drops, formation of, 1270; effect on atmospheric temperature, 294; effect on the earth's crust, 302, 456, 1490; electrolysis, 288, *3260*, 6455; erosive action, 1633; evaporation, *554*, 555; expansion under heat, 1738; as fertilising agent of flowers, 729; filters, *5765*; in foundations, 331; as geological agent, 255, 618, *619*, 898, 1356, 1501; hard and soft, 844; hard, conversion to soft, 4095, 5761; the home of life, biological statement, 1311; in human body, 438; hydrostatics and mechanical engineering, 1402; impurities, 4095, 4158; influence on plant life, 22, 167, *506*, 508; in laundry work, 2477; and lead pipes, 359, 1160; mine shafting, interference with, 3458; pollution of river, 4156; power generation from, 5011; pumping in mines, 3308, 3310; radio-activity, 2029; rainfall and supply, 4024; refractive index, 5852; soft, preparation, 5761; softened, use in railway engine boilers, 5103, *5104*; specific heat of, 1739; standard of specific gravity, 797, 1078; standard unit of mass in physics, 423; storage, 4027, 4029; subsoil, 5273; underground, 1504; in volcanic action, 1207; weight per cubic foot, 1402; weirs, 1576, *1577*; *see also* Hydraulics
Water Board, Metropolitan, functions, 320
— bucket, in mining, 3308, *3310*
— butt, use and capacity, 5761
— carriage by; advantages, 2277, 4517
— cart, capacity, 2326
— closet, *5631*; soil, 569; supply service, 5633; traps, pans, 5634; quantity surveying, 6512
Water filter machine, mechanism, 1999
— garden, making, 6321
— gas, production, 4931, 5195, 6153, 6818, 6825, *6826*
— glass, properties, use, 359, 842, 1160
— inspectors, municipal, 1498
— meter, construction, *4336–4339*
— pipe, screws for, 3004, *3006*; preparation for use, 4158, 4159
— power, and electricity, 1694; use in engineers' factory, 5590; horse-power, how to calculate, 1695; hydrostatic and hydraulic machines, *1685–1695*; man's use, 4516; mathematical rules, 1573; power: *see also* Hydraulics
— softener, *57*, *61*, *5765*, *6196*
— steriliser, *5760*
— supply, arrangements and connections, 5632; in building operations, 308; engineers' duties, 157; friction in pipes, *1574*; in military operations, 6270; piezometer, *1574*; pipes, 1704, 4337, 5632, 6512; purification and filtration, *4095–4100*; quantity surveying, 6512; Roman aqueducts, 1686; syphon, use of, 1686; of towns, 4027, 4157; waste detection, 4337
— tank, pneumatic, in mining, 3310
— tube, boilers, 6878
— vapour, amount in air, 1899, 3719; law of pressure, 1741; measurement in air, 6131; volcanic, 1207
— wheel, classes, 5678, *5679*; horse-power, calculation, 1695; mechanism, 1690; *see also* Turbines
Water-beetles, description, 3510, *3511*
Water-bug, description, 3365
Water-colour, shading, medium, 1533; choice of colours, 1021, 1022
Watercress, classification, 352; sewage plant, 4549
Waterfall, formation of, 618, *619*, *1634*; power utilisation, 5679
Water-ferns, structure and varieties, *1118*
Water-flea, description, *3809*
Watering, of roads, method, 2326
Waterleaf, qualities, 6395; description, 6398
Water-lily, classification, 352; stomata, 170; typical illustration, *349*; for water garden, *6320*, 6321; white, *349*, 359
Water-line, of ships, 5608, *5609*, 5967, 5614
Waterloo, battle of (1815), 5239
Waterloo Bridge, London, 2497; sunk joints to voussoirs, *3038*
Water-lover, beetle, description, 3511
Watermark, papermaking, 6397
Water-meadow, description, 1379
Water-parting, physical geography, 456
Water-plantain, classification, 355
Waterproof, as clothing material, 3015, 4256; preparation of, 808, 5201
Water-rail, classification, 2212
Water-rat, swimming apparatus, 2038
Water-ring, in mining, 3458
Water-root, plant, distribution, use, 626
Water-scorpion, description, *3364*, 3365
Water-seal, in drainage, 570, 781; rotary pump, *6060*
Water-snail, prey of fluke embryo, 3059
Water-spider, nest, *3804*–3805
Water-test, in drainage, 782
Waterways, railway, construction of troughs, 3613, *3614*, 3615
Waterworks, municipal, 575; Parliamentary powers, 1237
Watkin heat recorder, 1285
Watson, William, poet, 1438
Watt, unit of electricity, 292, 1590
Watt, James, inventions, 5415, *5417*
Wattle trees, cultivation, barking, and use of bark, 3698, 6065, *6066*
Wattmeter, use and construction, 292, *2812*
Watts-Dunton, Theodore, author, 2687; sonnets, 1438; on Tennyson's poetry, 1434
Watteau, 4118; landscape painting, 4300
Wave earthquakes, direction and speed of travelling, 1208, *1209*

Wave, electric, 3894, *3895* ; effect on coherer, 3896, 3898
— motion, 2101 ; "interference" of, 2319
— sea, erosion by, cause of, *1813*, 5578 ; in harbours, etc., 6218
— form of sound, 2102 ; analysis by ear, 2318
— winding, of dynamo, 1321, *1323*
Waverley Novels, Scott's, 3344
Wax, defined, properties, kinds, 4834 ; book on, 4834 ; as electrical insulator, 672 ; as a modelling medium, 1675 ; mineral, 1165 ; *see also* Carnauba, Chinese, Japan, etc.
— waste, art metal-work process, 5526 : *see also* Cire Perdue
Weak verbs, 117 ; English conjugation, 1049 ; German, 1190
Weald, in Kent, 1275 ; ancient sea bed, 1345
Weaning, calves, 2238 ; infants, 4683
Weapons, primitive, 4515
"Wear and tear," allowance in balance-sheet, 2759, 2883
Weather, physics of, 1899, 4882
— board, of window sill, *5183*
— glass, 1139, 6131
— glasses in botany, description, 1368
— vane, construction, *5795*
Weathercock, use, 6131
Weathering, definition, 302 ; of rocks, 1500, *1501*
— of building stones, 2835, 3039
Weaver birds, 2209
Weaving, 3488 ; automatic, 3637 ; beam, *3909* ; contractions of face and back design, 5509 ; design, *2944* ; looms and their mechanism, 3492, 3635 ; textile ornament, 3153
— basket, processes, *5490*, 5564
Web, spider's, spinning, *3804*
Webbing, in dressmaking, to put on, 655
— in upholstery, *6716* ; couch, 6719
Wedge, 684 ; practical application, 687, 834 ; in launching ship, 5923 ; use in mining, *2583*, *3564* ; in shoring, 917 ; of plane, loosening, *3757* ; tool, *532*, 533, 4149, *4151*
Wedging curb, in mining, 3458
— fox or foxtail, 4039–*4041*
Wedgwood jasper ware, *5382*
Weeds, in agriculture, *882*, *883* ; cows' food, 3890 ; eradication, *1377*, 1378 ; forest pest, 4925 ; garden, 6319 ; prevention, 1200
Weep-holes, agricultural pipes as, 647
Weeping pipes, in drainage, 570
— tree, described, *508*
Weevil, pine, pest, 4926, *4927* ; ravages of, 3512, *3513*
Weft, chenille, in Axminster carpet, 3994 ; continuous supply, 3635 ; control, 3636 ; definition, 3488 ; design, 2939, 2944, 3153, *6595–6598* ; of double cloth, 5509, *5510* ; fork, of Northrop loom, *3637* ; of lace loom, 4879 ; pricks of, use in carpets, 3993, 3994
Weighing machine, principle, 830
Weight, definition, 1797 ; and mass, 423 ; of matter, etc.. 312 ; as a standard in physics, 423 ; in machines, 684 ; variation, 289
Weights and measures, table of in chief countries, 409 ; public inspectors, full account, 787, 788
Weights and Measures Act (1904), provisions, 788
Weir, construction, calculation of water flow, 1576, *1577*, *5113*, *5333*
Weismann, Prof. A., chief biological work, 1791 ; evolution theory. 1180 ; germ plasm, theory, 5674 ; on sex and variation, 651
Weld, *233*, 236 ; of tramway rails, 3752
Welding, in iron working, 236, *2987*, *3096*, 3108, 6453 ; comparative advantages of iron and steel, 2984 ; electric, 6457 ; oxy-acetylene blowpipe, 6455 ; of wrought iron, 1044
Weldon chlorine process, 4777 · gas purifier, 6822
Well, 4156 ; artesian, *1504* ; brine and oil, 2847 ; cottage, types, *4095* ; country house, drainage, 781 ; foundations, in dock construction, 6496 ; hygiene of, 4156–4159 ; sinking, 4028, 4479–*4481*
— of steamer, position, 5401
Wellington, Duke of, defeats Napoleon, 5238, 5239 ; premier, 5686
Wellingtonia, classification, habitat and dimensions, 503
Wells, H. G., novelist, 2785, 3558
Wellsinker's boring tools, 4479–*4481*
Welsbach burner, construction, 6026
Welsh, the origin, 2354
— cattle, 432, 2236
— pony, description, 2074
— sheep, 2363, *2365*
Welt, in bootmaking, 4137, *4138*, 4541, *4543*
Weser, river, basin, *1975*
Wesleyan church, 162, 6605
Wessex, foundation, 2242
West Indies, geography, 4177 ; map, *4172* ; cotton industry, 222, 384 ; fibres, industry, 818 ; labour supply, 6629 ; petroleum deposits, 6007
West Saxons, Kingdom of, 2242, 2355
Western Australia, geography, 3899, 3900, 5560 ; farming, 3235 ; teachers' demand for, 3741 ; settlers, concessions to, 3235
Western Empire, Charlemagne's, 2947
Westinghouse brake, mechanism and working, 3127, *4696* ; tramcar, 1934
Westminster Abbey, architecture, 3374, *3375* ; buttress, 3145, *3147* ; stonework hardening, 3244
Westminster Hall, architecture, 3374
Weston clutch, 962
Weston standard cell, electric, 790
Westphalia, industrial area, 5826
Westphalia, Treaty of, 1648, 4399
"Westrumite," use, 6151
Wet doubling, *2707*, 2708
— manner, in painting, 1022
Wether, in farming, 2360
— wool, 1120
Weymouth pine, *54*, 1260
Whale, brain, weight of, 2144 ; classification, 380 ; description, 1763, *1764* ; ivory from, 811 ; swimming apparatus, 2039 ; source of sperm oil, 4833 ; uses, 5121 ; vestiges of hind limbs, 1491 ; whale oil from, 4833
— oil, source, composition, 4833
Whalebone, 1764, 6891 ; in dressmaking, 185
Wharton's duct, 577
Wheat, *872* ; from Argentine, 4288 ; botanical account, *913* ; cultivation in N.W.T. of Canada, 3206 ; cultivation of, 1229 ; cultivation in Europe, 855 ; dietetic value, 3311 ; experimental farming, 3204 ; flour, scales removed, *351* ; grain, *637* ; grinding, cleaning, milling, *3078–3083* ; harvesting, 1662 ; harvest in Canada, *3202* ; Hungarian, 5710 ; as livestock food, 2704, 2908 ; nutritive value, 3599 ; pedigree varieties, 914, *915* ; pests, fungous, 1669 ; relation to rainfall, 5660 ; sowing, 432 ; starch extraction, 5364 ; varieties, cultivation, climatic conditions, 4873 ; world's crop, 4874 ; yield, 26
— bran, as live-stock food, 2704
— milling, *3078–3083*
— polish, *872*
— rust, cause, 1372, *1373*, 1669
— straw, as cattle food, 2909 ; yield per acre, 872
Wheat-ear, classification, 2210
— — stitch, in underclothing, *3337*, *3339*, 3340
Wheatstone ABC system in telegraphy, 4384, 5067, 5177, *5178*
Wheatstone automatic system in telegraphy, *4386*, 4669, *5391*
Wheatstone bridge, in electricity, *791* ; use in cable testing, *6547*
Wheel animalcules, 3956, *3958*
Wheel and axle, 684 ; application in practice, 687, 832
— iron, in elliptic spring carriage, 3124
— meter, for measuring stream velocity, 1576
Wheel plate, of vehicles, 3122, *3125*
— press, 1222
Wheelhouse, of light waggon, 2829, *2830*
Wheels, bevel, drawing, 3922, *3923* ; cutters for, 3631, *3632*
— of bicycle, construction, 3775, 3776
— casting, 2337, *2339* ; moulding, 2543, *2544*, *2698* ; pattern making, 2464
— chain, teeth and links, 4002, *4003*
— change, in screw cutting, *3628*
— of clock, American, 5711, *5712*, 5713 ; of eight-day, 5716 ; for new clock, fitting, 5884 ; of pendulum clock, 5715
— emery, corundum, carborundum, 4583
— friction, use, action, 4002, *4004*
— gear, uses, materials, speeds, 3660 ; bevel, 5354
— gearing, raw hide, in technical drawing, 3921
— glass cutting, 4931, 4932
— grinding, 4583, *4585*
— of horse carriages, dimensions, **2558**
— key grooving, 3404, 5448
— screw, forms, drawing, 3922, *3925*
— spur, 3653, 3658, *3659*
— stud chain, 4001, *4002*
— trolley, 209
— vehicle, 3126 ; of light waggon, 2829 ; timber for, 2827 ; wear, 3437 ; verge watch, *6081*, 6084
— worm, form, 3924, *3925*
Whey, constituents, 4034, 4038 ; extraction from curd, 4490, 4572
Whig, during George III.'s reign, 5555 ; politics of original party, 4590 ; politics in Anne's reign, 4952
Whin-sill, in geology, 2066, 2377
Whinstone, 529, 535, 1517, 1518
Whip, in mining, in bell-pit working, 3190
Whipping, milliner's stitch, *4565*, 4566 ; in underclothing, *3337*
Whipple-Murphy truss, under load, 2228, *2229*
Whirligig beetles, description, 3510, 3511
Whirler, in drying block-plate, 6481, *6483*
Whisk, for brushes, 6106
Whisky, adulteration, 3718 ; alcohol in, 1035 ; dietetic value, 3315
Whistler, painter, influenced by Japanese art, 4302 ; "Battersea Bridge," *4302* ; medium used, 871 ; setting palette, 1020 ; pastel drawings, 1061 ; water-colour painting, *1022*
Whitbed stone, *533* ; quarry bed, 2836
White, pigment, oil-painting, 871 ; symbolism in art, 725 ; water-colour painting, 1021
— corpuscles, function, histology, *953*
— lead, formula, preparation, properties, substitutes, 1036, 1160, 5143, 5832, 5988
— lilac, perfume, recipe, 4972
— matter, of nervous system, *2143*
— oak, 56 ; strength, 1260
— precipitate, composition, 1721, 1722
— rose, perfume, recipe, 4972
— skit, in cattle, 2624
— spruce, timber, 55
— vein marble, *plate facing 480*
— walnut, timber of, 57
Whitebait fishing, 5314
Whitecoat, fur, 6428
Whitefriars rotary printing machine, construction and operation, 5870
Whitehouse tube-welding, process, *5321*
Whitening process, leather manufacture, 3220
Whitewash, preparation and use, 5835
Whitewashing, processes and materials, 5835, 5836
Whitewood, American, in cabinet-making, 6579, 6582 ; for carving, 5809 ; in vehicle construction, 2827
Whiting, cutlets, cooking, 1874 ; frying and grilling, 1873
— in glazing, 649 ; composition, use, 5143 ; use in whitewashing, 5835
Whits, tin ore extraction, 6162
Whitworth clasp-nut, 830, 831

Whitworth engineering scholarships, value, 482
— measuring machine, 688, 835
— screw threads, table of, *3005*
— standard bolts, proportions, 1703
Whizzer, use in clothmaking, 4106; in milling wheat, 3080
Wholesale trade, accounts, 6209; advertising, 6209; cash with order terms, 6207; bills of exchange, 1318; centres, 6207; conditions, 6207; development from retail business, 5926; opportunities, 6207; price maintenance, 6208; system in business, 6207
Whooping-cough, 5409, 5410, 5412; epidemics, severe, 6782; symptoms, 6261
Whorl, of flower, 346; various arrangements, 350
Wick, candle, manufacture, 4838
Wicker-work, varieties, 5488, *5563*
Wicket, of brick-kiln, 1284
— for foot passengers, *3613*, 3615
Widgeon, choosing, 1228; classification, 2213
Wight, Isle of, geography, 1275; history, 2611
Wild animals, trade in, 891
— cherry bark, source and use, 6068
— duck, choosing, 1228
Wilkie, David, painter, 4393
Will, in psychology, 2806, 2993; effect of alcohol on, 5813; control of physical functions, 5841; true method of cultivating, 2860; education of, 2549; relation to reason, 2805; in relation to reflex action, 2118; theory of, 2544, 2802, 2993
Will (and shall), in English grammar, 758
Willesden paper, preparation, 6561
William the Conqueror, acquires Channel Islands, 2611; life, reign, character, 2358, *plate facing* 2353
William I. of Prussia, reign, 6445
William II. of England, 2674
William II., Emperor of Germany, accession, 6446
William III. of England, reign, 4841
William IV. of England, reign, 5686
William, Prince of Orange, marriage, 4762
Willow, use in basket-making, 5488; classification, 355; flower, *plate facing* 728; in paper manufacture, *6278*, 6279; protection against insects, 1115; source of salicin, 3819, 6068; strength of timber, 1260; tufted seeds, *911*, 912
— bark, in tanning, 1166, 3013
— machine in cotton manufacture, *1241*, *1242*; woollen, 71, *1123*, *1124*
Willow-herb, *880*; classification, 353; pollen protection, 1114; tufted seeds, *911*, 912
Wills, legality of, 6851
Wilton carpet, design, 3357
Wind, calculation in designing structures, 416; cause, rainfall, *294*, 298; in climate, influence, 4494, 5274; coast, influence on, 6218; effect on earth's crust, 302; erosion, influence on, 5577; as fertilising agent of flowers, 729; influence on navigation and trade routes, 4498; measurement of direction and pressure, 6131; physical geography, 294; pressure on sails, *6225*; purifying agent of air, 3799; sailing vessels, effect on, *6225*; tidal influence, 1017, 6219, transporting life, agent in, 1500; transportation of matter, agent in, 1499; velocity and pressure, 6218, 6219; ventilation, means of, 4020,
— band, instrument, 5890
— chest, of organ, 3857
— cracks, in timber, *52*
— dispersal of seeds, *910–912*
Wind instruments, in music, pitch, 1058
Winders, of staircase, 3241, *3243*, 5298, 5300, *5301*
Winding of dynamo, 1321, *1323*
Winding in mining, 3308, 3766, *3767*
— silk, process, 2595, *2596*
— in textile, *2592*
— strip, in carpentry, 3386, *3757*, 3759
— up of partnership, process explained, 2980
Windlass, in building operation, 1172; Chinese, 834; in mining, 3190
Windmills, uses, horse-power, *5012*, 5012; pumping station, 6061, *6063*
Window, bay, bonding piers of, 2176, *2177*; elevation drawings, *5546*, 5548; dormer, *5185*, 5187; fixed, hinged, and sliding, 5184; grills, *5795*, 5796; of half-timbered gable, *5696*, 5698; hinged forms, *5183*, 5186; raking mouldings of pediments, 5297, *5299*; splayed work, 5296, *5298*; strutting openings, 918; two-light stone, detail drawing, *5695*, 5698
— shop, 396
— stained glass, *4946–4949*
— of vehicles, brougham, 2829; ventilation problem, 3024
— boxes, making, 6316
Window-casement frames, wrought iron and steel, *5795*, 5797
Window-dressing, in shopkeeping, 509; importance of, 45
Window-frames, cast-iron factory, *5795*, 5797; of light waggon, 2829
Window-partition, of light waggon, 2829
Window-sill, curved design, *2287*; lead upon, 5033
Wind-pressure, on buildings, 2448, *2449*; on telegraph and telephone wires, 6323
Wine, adulteration, 3718, 6356; bottling, 762; bouquet, 6355; composition, 6356; areas of cultivation, 4875, 4876; dietetic value, 3315; flavour, 6355; home-made, 3379; production, 2878, 6355; stains, removal of, 2590; unfermented, 6355
Wine, British, definition, 6356
— jelly, recipe, 2002
Wine and spirit merchants, business of, 5789
Wings, birds', attachment and use, *2495*, 2496; modification of fore-limbs, 2209; developed in mammals, 2037; differentiation in bird, reptile, and insect, 2038; originally parachuting organs, 1491; use in hat trimming, 5506
— of vehicles, freehand design, *2729*
Wingless insects (*aptera*), description, 3362, *3363*
Winter, cause, *15*; condition of plants during, *728*
Wintergreen, oil, composition and source, 3818, 5469
Winzes, in mining use, 3194, 3304, *3306*
Wire, aerial telegraph, capacity, 5242; in cutting bricks, 1281; use in casting, 2338; used for electric current, 463; fencing and barb, 5170; helicoidal, in quarrying, *2956*; iron and steel, breaking strains, 5167; pianoforte, manufacture, 5170; ribbon, use in millinery, 5504; in sculpture, in making an armature, 1675; silver-gilt, manufacture, 5170; steel, composition, 4747; as straining line in measurement, 3692; telegraph, material, 5169, 6324; telephone materials, and erection, *6324*, 6325; testing, 1700, *1702*; uses, 5167–5176
— cloth, manufacture, uses, *5176*
— coils, manufacture, *5173*
— drawing, process, *5524*, 5525, 5643
— entanglements, construction, in military operations, 6272
— feed, automatic, *4922*, 4924
— gauges, Imperial standard and Birmingham, 5169, 5170
— making, processes, 5167, *5168–5176*
— nail, use in carpentry, *3543*, 3546
— netting, manufacture, *5176*
— rope: *see* Rope
— stitch, milliner's, *4565*, 4566
Wire and tube drawers, employment conditions, 2644
Wired glass, 5837, 5838
Wireless telegraphy, 3894–*3897*; invention of, 128; books on, 4298
Wireworm, 1666, 3512; ravages, *1667*; destruction of, 589, 1668
Witch, in psychical research, explanation of power, 3625
Wöhler, synthesis of urea, 2711, 3703
Wolds, the Lincolnshire, 1273; Yorkshire, 1272
Wolf, skins and furs, 6428, 6430
Wolsey, Cardinal, life, 3650; fall and death, 3832
Women, air used in repose and at work, 3801; use of alcohol, 5673; effect of alcoholism, 5812; anabolic functions, 4827; athletics, effect on, 4828; brain, weight of, 2145; breathing, mode of, 1301; careers open, 321; church injustice towards, 4825; conservatism, 5531; standard diet, 3381; diseases of, 5424; effect of economic competition on, 4828; elementary school teaching, 6475; medical education and work, 4974; education, value of, 4973; over-education, under-education, 4973; effect of factory life on, 4667; function in society, 4825; government appointments, 2252; individuation versus genesis, 4827; journalistic career, 4675; legal injustices, 4975; librarians', public, salary, 1495; length of life, 4527; mortality, comparative statistics, 2794; physiological characters, sociology, 4828; post office service, 2807; private schools, teachers in, 6477; Qualification of Women Bill, 4975; claims on the race, 4828; railways, employment by, 4380; as sanitary inspectors, 700; Shop Hours, and other Acts, inspectors under, 788; subject condition in society, 4825; value in society, 4826; services lost to the state, 4975; strength compared with men, 2796; teaching, L.C.C. appointments, 1679, 6475; teachers' salaries, 6476, 6479; typewriting office, 1918; typists' salaries on L.C.C., 1215; universities, disabilities imposed by, 4975; writers, nineteenth century, 2618; work in mines and collieries prohibited, 6691
Wonder, factor in journalism, 3812; importance in training, 2137
Wood, compared with bast in stem of plant, *169*, 170, *171*; bending, 5296; bleaching for dyeing, 6652; in building, 51–57: *see also* Timber; in carpentry, properties, 3540, 5809; conductivity, thermal, 2061; composition, 5464; coniferous, distillation, 5466; creosoting, 5463; curved work, building up for, 5296, *5299*: design, treatment, 5980; destructive distillation, *5464*; books on, 6689; distillation products, 5467–5470; dyeing, 6652, 6653; fibres, magnified, 6280, *6281*; fuel for power production, 5127; curved work, 5296, *5299*; fixing to masonry, 5182; grain in wood-carving, 6045; manure, ashes as, 590; moisture, effect of, 3539; paper from, 1168; patterns, for casting, 2453; pulp, yield of, 6281; sawn, defects, 3545; seasoning, 3540, *3541*; tools for working, 4149–*4151*
— anemone, pollen protection, *1114*
Wood-ant, ant hill, 3727
— carving, designs, *5810*, *5978*, 6043, *6044*; finishing and ageing, 6138; flat, *6044*; fuming, 6138; German fifteenth century, 3947; incised, 6046; intaglio, 6137; relief, *6135*; tools for, *5809*, *5810*, *6043*
Woodcock, beak, 2494; carving, 5934; classification, 2212; roast, 1875
Wood-cutting, Dürer school, *6291*
— engraving, schools and methods, *6291*

Wood gas, manufacture, 6817, 6824
Wood-louse, habit, *3808*, 3809

END OF VOLUME VIII.

The Editor's Last Page

SOMETHING of the sadness of parting creeps into this final page of the SELF-EDUCATOR. The EDUCATOR is now complete. In saying this the thought comes that, after all, we live in a human world. We may aim high and plan long, we may mean well and do well, and yet our path, as we look back upon it, may be strewn with the wrecks of our desires and with shattered hopes. As we look back to the beginning from the end, we see that it could all have been better. We can all say that when the end of anything comes. There would be nothing worth having in experience if we could not.

I am not going to proclaim the faults of the SELF-EDUCATOR from the editor's desk. They are seen there, perhaps, as they can be seen from no other point of view. It is enough for an editor to say that he tried to be perfect and could not ; it is all that an editor can hope that his mistakes are not too many for human readers to forgive.

It is pleasant that with all the regrets which retrospect brings there comes a grateful sense of satisfaction. I have not lived long, but I have come to know that nothing in the world is so grateful to a man as success. I did not mean to write "success," but let us be honest and not be afraid of a word. Success is not everything. I would rather have experienced some failures, with all their bitterness and tragedy, than have reaped some of the successes that flaunt themselves blatantly before the world. But we need not be ashamed of success in well-doing, and there is too much false righteousness preached against those who urge young men to succeed. It is not the wise man who wants to fail, and if our life is set in the right path, if our hands are clean and our work is good, let us never for one moment feel that we ought to be ashamed to want success.

And the EDUCATOR has succeeded. There was room for such a book, and it must be better for us, better for our work, better for our lives, better for England, that there should be a vast thinking public with the EDUCATOR on its bookshelves.

It would take the whole of this number to say "Thank you!" to all to whom thanks are due. If, as this last page goes to the printers, I could remember all those with whom it has been a pleasure to come into touch, there would not be room, if I could find the words, to say all that I would say.

Such a publication reaches into a thousand fields. There comes to mind a letter from a lonely boy on the Canadian prairie, who had read of the SELF-EDUCATOR, and wondered how he could get it. There comes to mind, too, the Egyptian boy in Cairo whose two sets of the EDUCATOR have given us such trouble as can only be balanced, let us hope, by the pleasure they have given him. All over the world in the future travellers will come across this work.

There must also be thanked a vast number of correspondents who have been unwearying in their desire for the success of this work, the thousands of readers who have made its success possible, the schoolmasters who have commended it to their schools, those who have asked for an extra volume or suggested extension in other ways that were not possible without the approval of all readers. It is right, also, that it should be known how loyal and helpful the booksellers and newsagents have been. The contributors, the real makers of the EDUCATOR, can never be better rewarded than by the striking public appreciation of their work ; but it is due to them to say that, with one or two exceptions, they have proved themselves highly capable, interesting, and the soul of courtesy and forbearance.

One other note of thanks is due. Behind every great work is an army of unknown workers. The editor's name is blazed abroad, but a thousand names remain unknown of those without whose aid an editor's work would never be done. The production of the EDUCATOR has been exceptionally difficult as a result of the effort to keep the work up-to-date instead of allowing it to be produced, as most encyclopædias are, so that it is out of date on its completion. To authors, editors, artists, photographers, printers, newsagents, and a host of other workers the production has for this reason been unusually trying, and especially has it been a strain upon the immediate editorial staff. To my friend and colleague, Mr. J. A. Hammerton, whose short introduction to English literature is one of the essential values of the EDUCATOR, and to all those other members of the staff whose loyalty and hard work have helped to make a burden light, the indebtedness of the SELF-EDUCATOR should be acknowledged.

To them, and to all whom it may concern, I give now that deep and grateful feeling of which our language has but one expression—Thank you !

ARTHUR MEE

The next book in the Self-Educator series is the
HARMSWORTH HISTORY OF THE WORLD

THE WORLD'S GREAT MEN

A BIOGRAPHICAL COMPANION TO THE HARMSWORTH SELF-EDUCATOR

COMPRISING

Biographies of Men and Women, of All Countries and in All Times, who have Contributed to the Welfare of the World in Art, Science, Literature, Travel, Invention, Statecraft, or Other of the Varied Activities of Life

Edited by ERNEST A. BRYANT

THE WORLD'S GREAT MEN

Abbas I., the Great
b. 1557. d. 1628.

A man who, in spite of many crimes, was one of the greatest of Persia's sovereigns. Successfully rebelling against his father, he put to death one or more of his brothers, and ascended the throne in 1587. Suppressing lawless soldiery and a feudal nobility which menaced the throne, he embarked upon a brilliant career of conquest, and was assisted by a British fleet to wrest Omuz from the Portuguese. At his death the Persian Empire had been extended from the Tigris to the Indus. Terrible cruelties were practised at his behest, but his system of government was enlightened and praiseworthy.

Abel, Sir Frederick August
b. London, July 17, 1826. d. London, September 6, 1902.

War Office and chemical referee to the ent. He divested the preparation of guncotton of danger, and paved the way for smokeless powder, of which cordite—invented by himself and Sir J. Dewar—was adopted by the Government. His petroleum investigations determined the standard for flash-point; while in electricity and steel manufacture he won a special standing. He was President of the British Association in 1890.

Addison, Joseph
b. Milston, Wilts, May 1, 1672. d. Kensington, June 17, 1719.

"Whoever wishes to attain an English style, familiar but not coarse, and elegant but not ostentatious, must give his days and nights to the volumes of Addison." Dr. Johnson's estimate of our foremost light essayist still holds good. Obtaining through his patron, the Earl of Halifax, a pension of £300, he spent four years on the Continent, after which his poem, "The Campaign," celebrating the victory of Blenheim, secured him an Excise Commissionership. While secretary to the Lord-Lieutenant of Ireland he formed a close friendship with Swift. The "Tatler," started by his friend Steele, had Addison among its regular contributors; as had the "Spectator," founded two years later. A quarrel with Pope led to his being satirised by the latter as Atticus. Appointed a Commissioner for Trade and the Colonies, he was embroiled in disagreement with Steele. Three years before his death he married Charlotte Countess of Warwick. His fame rests not upon his poetic or dramatic writings, but upon the essays which caused him, while recognised as a contributor to the gaiety of the nation, to be hailed as "Guilt's chief foe."

Adrian IV. See Breakspear, Nicholas

Æschylus
b. Eleusis, Athens, 525 B.C. d. Gela, Sicily, 456 B.C.

The father of Greek drama was born of noble family, and before giving his mind wholly to poetry, shared with his brothers the perils of war against the Persians. His successful first appearance in the dramatic contest was in 484, when he won the prize with the trilogy of which the "Persians" formed part. Afterwards he enjoyed a series of thirteen victories, interrupted by the advent of Sophocles. This defeat, coupled with indignation at the doubts cast upon his piety, caused him to retire to Sicily, where, after other poetic triumphs, he died. Only seven of the sixty plays ascribed to him are extant, but these place him on a pinnacle of unapproachable height.

Æsop
b. Phrygia, Asia Minor, 620 B.C. d. 560 B.C.

For neither date can there be any pretence at accuracy. Very little is known of the immortal fabulist beyond that he was born a slave in Phrygia, and sold eventually to Jadmon the Samian, by whom he was freed. He visited the Court of Crœsus, by whom he was sent on various missions, which enabled him to travel in Greece and Asia Minor, inculcating morals by his fables. He is said to have met his death through being thrown over a precipice by the priests of Delphi.

Agassiz, Jean Louis Rodolphe
b. Motiers, Switzerland, May 28, 1807. d. Cambridge, England, Dec. 14, 1873.

An indefatigable naturalist, whose writings, when he was twenty-six, won the praise of Cuvier. His work on the glacial phenomena of the Alps, on fossil fishes in Europe and the American Continent, his lectures at various seats of learning, and his gifts of priceless collections, did much to advance the science to which he devoted his life.

b. 1740.

After Persia had been for many years torn by civil war, he acquired the sovereignty in 1794, and founded the existing dynasty. He promoted commerce and reforms, but was one of the cruellest monsters that ever wore a crown. Mutilated himself early in life, he treated his enemies with frightful barbarity. Once, after ordering a general massacre of women and children, he had 70,000 eyes of his subjects put out. He was assassinated in 1797.

Agricola, Cnæus Julius
b. Fréjus, France, 37 A.D. d. August 23, 93 A.D.

He thoroughly conquered Britain and a great part of Scotland; he gave the land wise laws, and induced the Britons to embrace Roman manners, and to have their children taught the Latin tongue. Also, he enriched the land with many noble buildings. He was the first to discover that Britain is an island. Recalled and humiliated by the jealous Domitian, he died at the age of fifty-five. Tacitus was his son-in-law.

Ahmed Shah
b. 1724. d. 1773.

The first sovereign of Afghanistan was in his youth in the service of Nadir Shah. Upon the assassination of the latter he retired to Kandahar, and persuaded the native tribes to assert their independence and make him king. He proved a talented military leader. The Koh-i-Nur was one of his many rich possessions.

Aird, Sir John, Bart., M.P.
b. London, December 3, 1833.

The son of a working man, Sir John Aird has raised himself by industry, integrity, and genius to the rank of one of the foremost contracting engineers in the world. His greatest work is the Assouan dam, the reservoir in connection with which holds 80,000,000,000 gallons of water.

Alaric I.
b. 376. d. Cosenza, Calabria, Italy, 410.

Chief, afterwards King, of the Visigoths, Alaric, though the leader of barbarians, was himself an Arian Christian. Although the great general Stilicho defeated him, he proved the foremost military commander of his age. He pillaged Athens; thrice besieged, and once, for six days, sacked Rome; deposed its Emperor, and set up another. Many barbarities were practised by his troops, in spite of his humane intentions; but he caused women to be spared and religious buildings to be preserved. At his death the river Busento was diverted from its course that he, with all his treasure, might be buried in its bed. The work completed, those who had carried it out were put to death, that the secret might be maintained inviolate.

Alcibiades

b. Athens, 450 B.C. d. Phrygia, Asia Minor, 404 B.C.

This famous general and statesman came early under the influence of Socrates, who saved his life in battle, to be himself rescued by Alcibiades at the battle of Delium. Brave and talented, Alcibiades lacked mental ballast. Mutilation of votive statuary in Athens caused him to flee into Lacedæmon, and thence to Persia, to be recalled in triumph to Athens. His military expeditions culminating finally in disaster, he passed into Phrygia, where, by Spartan orders, he was assassinated—his house being fired, and himself struck dead by darts as he emerged.

Alexander the Great

b. Pella, Macedonia, 356 B.C. d. Babylon, 323 B.C.

The son of Philip of Macedon, Alexander, educated by Aristotle, was regent of his father's kingdom at sixteen, at eighteen won his first battle, and two years later became king. Having subdued the Greeks and consolidated his power in Europe, he, in 334 B.C., with 30,000 foot and 5,000 horse, crossed into Asia, never to return. Defeating the Persians, he took Tyre, conquered Syria and Egypt, and founded Alexandria; defeated Darius, conquered Parthia, Media, and Bactria, invaded India, and over-ran Asia; then returned to Babylon, where he died from the effects of excessive drinking. Many appalling crimes tarnish his fame, but his influence for good was felt for centuries; for he caused to be diffused far and wide Greek art, science and philosophy, and gave an impetus to learning where barbarism in its worst forms had reigned. He left no successor, and at his death his vast empire was divided among his generals.

Alexander II. of Russia

b. April 29, 1818. d. St. Petersburg, March 13, 1881.

The son of Nicholas I., who upon his deathbed exhorted him to free the serfs, Alexander nobly carried out that mandate, and six years after his accession, emancipated 23,000,000 of his subjects. Russian territory was widely extended during his reign, which ended in a great tragedy. The Nihilists, who had thrice attempted his life, assassinated him on the very day upon which he was to have signed a Constitution for Russia. His eldest daughter married Queen Victoria's second son, the Duke of Edinburgh.

Alfieri, Vittorio

b. Asti, Italy, January 17, 1749. d. Florence, October 8, 1803.

The son of a noble house of Piedmont, Count Alfieri led for some years a life of indolence and luxury, but in middle age made himself master of Latin and Greek. He wrote many tragedies and comedies, some of which still keep the stage. Their effect was to popularise a purer Italian literature.

Alfonso X., the Wise

b. 1226. d. 1284.

Succeeding his father as King of Leon and Castile, he won victories over the Moors, and united Murcia to Castile. With him Castilian literature had its birth. He caused the first general history of Spain to be written, and the Old Testament to be for the first time translated into Castilian. His life was embittered by the rebellion of his sons, of whom Sancho eventually deposed him.

Alfred the Great

b. Wantage, Berkshire, 849. d. October 27, 901.

The wisest, best, and greatest King that ever reigned in England was the fifth and youngest son of Ethelwulf. His reign was one long struggle with the Danes, who, upon his accession, in 871, were masters of practically the whole of England north of the Thames. He waged war with varying fortune until finally he made himself King of all England. Such is the veneration in which his memory is held that it has been customary to ascribe to Alfred every privilege which Englishmen enjoy. What he did was to codify the best laws enacted by his predecessors, to found a Navy, encourage learning and industry, and, for the first time, to consolidate England into a united monarchy. His will, a notable document, is preserved, but it is not known where, or from what cause, he died.

Alleyn, Edward

b. London, September 1, 1566. d. London, November 1626.

An actor famous as a contemporary and neighbour in London of Shakespeare, in whose plays he frequently performed. Successful theatrical speculation, reinforced by money gained by marriage, enabled him to buy for £10,000 (worth now five times that sum) the 1,300 acres with which he endowed his College of God's Gift at Dulwich. The value of the property, which is constantly increasing, is now upwards of two millions sterling.

Amadeus VIII.

b. Chambery, France, 1383. d. Geneva, 1451

He caused Savoy to be erected into a duchy, then ruled Piedmont, but relinquished temporal cares for a hermitage, whence he emerged to be Pope, as Felix V. He filled the Papal chair for ten years, resigning in favour of Nicholas V.

Anaxagoras

b. Clazomenæ, Asia Minor, 500 B.C. d. Lampsacus, Asia Minor, 428 B.C

The philosopher who paved the way for the atomic theory, had the courage to trace eclipses to natural laws, to divest the sun of its halo of deity, and correctly to analyse the origin of meteoric stones. His views conflicting with the superstitions of the age, he was driven forth to die in exile.

Andersen, Hans Christian

b. Odense, Denmark, April 2, 1805. d. Copenhagen, August 4, 1875.

The divinity of the nurseries throughout the civilised world was the son of a poor shoemaker, and early in life had to work in a factory. The beauty of his voice induced him to attempt the stage, but for this he was declared too uncultured, and it was not until his early poems had attracted attention that he was enabled by sympathetic admirers to equip himself at a good school. His fairy stories are by this time classics.

Anderson, Alexander

b. Kirkconnel, Scotland, April 30, 1845.

Bred to the work of the colliery, Mr. Anderson managed, while working on the pit-brow, to master French, Italian, and German, and to read the great poets in their own languages. Now the pit knows him no more; he has been appointed chief librarian of Edinburgh University. Of his many charming poems there is one—"Cuddle Doon"—of which Sir George Douglas says, "Scotland has made this as much her own as she has made Burns's songs." The poem is, indeed, a gem of music, humour, and tenderness.

Angelico, Fra

b. Vecchio, Italy, 1387. d. Rome, March, 1455.

Fra Angelico is the name by which is best known Giovanni or Guidolino da Pietro, the great painter of religious subjects. He is specially famed for the spirituality and mystical charm of his saints and angels. Best examples of his work are at the Vatican, the Louvre, in the Uffizi, and at Orvieto.

Angelo, Michael. See Michaelangelo

Antony, Mark

b. 83 B.C. d. Alexandria, August, 30 B.C.

Related to Cæsar, and one of his closest adherents, Marcus Antonius induced the latter to make his (Antony's) expulsion from Rome the pretext for civil war, and himself led the left wing of Cæsar's army. At the death of Cæsar he played the rôle in which Shakespeare immortalised him. Forming, with Octavian and Lepidus, the second Triumvirate, he defeated Brutus and Cassius;

then summoned Cleopatra, Queen of Egypt, to meet him to settle an outstanding dispute. Captivated by her beauty and address, he followed her into Egypt. Called again to Rome, he was eventually defeated at Actium by Octavian, and fled to Egypt, where, deserted and alone, and deceived by a report of Cleopatra's death, he destroyed himself.

Apelles

b. Colophon, Asia Minor, 340 B.C. d. Cos, Asia Minor, 304 B.C.

Alexander the Great permitted only one man to make his statue, and only one man to paint his portrait. The painter was Apelles, the greatest artist of antiquity. He was most famed for his portraits, but his subject pictures were brilliant. He fell in love with Campaspe, a mistress of Alexander, who, it is told, surrendered her to the painter. From Campaspe Apelles drew his finest picture, "Venus rising from the Sea." Apelles had a varnish, the secret of which has been lost, whereby he added mellowness and beauty of tone to his work. He followed Alexander into Asia as far as Ephesus.

Aquila, Ponticus

b. Sinope, Asia Minor, 100 A.D.

Dates cannot with certainty be stated, but Aquila flourished about 130 A.D. He was skilled as a mathematician and architect, and was employed by his kinsman, the Emperor Hadrian, to assist in rebuilding Jerusalem. He gave the Greeks their first translation of the Old Testament, and was himself successively pagan, Christian, Jew.

Aquinas, Thomas

b. Calabria, Italy, 1225. d. Terracina, Italy, 1274.

Descended from the Counts of Aquino, Aquinas was born at his father's castle, Rocca-Secca, in which, upon his determining to enter the Dominican order against the parental wishes, he was imprisoned for two years. Escaping, he made his way to Albert Magnus, under whom he studied, until, long called "the dumb ox," he verified the saying of his master that "the voice of the ox shall one day fill the world." As a teacher he at once won fame. Having little Greek, and less Hebrew, he yet commanded the attention of the civilised world with his writings and with expositions of the Scriptures. Called now "the Angel of the Schools" and "the Eagle of Divines," he refused all Church preferments, remaining to the end simply the great theological scholar. At his death posthumous honours were heaped upon him. His "Summa Theologiæ" remains to-day substantially the standard authority of the Roman Catholic Church.

Archelaus

b. Athens, B.C., 480 (?).

The Ionic philosopher, scholar of Anaxagoras, who first demonstrated that the earth is round. This truth he deduced from observing that the sun rose and set at different times upon different parts of the earth. His fame was at its height in 450 B.C.

Archimedes

b. Syracuse, Sicily, 287 B.C. d. Syracuse, 212 B.C.

The "greatest mathematician and most inventive genius of antiquity"; first to establish the idea of specific gravity; perhaps, too, of the lever, in relation to which he uttered the well-known phrase, "Had I but a fulcrum whereon to rest, I could move the earth." The endless screw, the spiral pump for water, and innumerable engines of war which he was persuaded by his king to provide to withstand the assaults of the Romans—these, with great cranes, "burning mirrors," various hydraulic and compressed-air machines, were among his inventions. He preferred theory to practice, and despised his inventions. When the Romans at last broke through the defences of Syracuse, they found Archimedes bending over his diagrams drawn in the sand, and there killed him.

Ariosto, Ludovico

b. Reggio, Italy, September 8, 1474. d. Ferrara, Italy, June 6, 1533

Educated as lawyer, soldier, scholar, Ariosto had with distinction discharged military duties, subjected a rebellious province, ruled as governor for three years, and conducted diplomatic missions before he devoted himself to writing. His works, which have long become classics, consist of satires, comedies, sonnets, songs, and lesser poems. But his great achievement is the grand, heroic poem, "Orlando Furioso," the completion of which occupied him sixteen years. It takes up Boiardo's unfinished "Orlando Innamorato," and with art which seems artless improvisation thrills and enchants by almost every page.

Aristarchus

b. Samos, Asia Minor, 280 B.C. d. Samos, 264 B.C.

A Greek astronomer, who, by demonstrating that the earth moves round the sun, anticipated the discovery of Copernicus. He measured the distances of the sun and moon from the earth; but, while he was geometrically correct, his lack of adequate instruments rendered his results inaccurate.

Aristides, The Just

b. Athens (?). d. Athens, 468 B.C.

The man whom Athens surnamed The Just was one of the ten generals at the Battle of Marathon, and, by inducing the others to surrender supreme control to Miltiades, enabled that general to win the day. Great in battle, and of noble character, he made Athens the ruling state in a maritime confederacy, and enabled every citizen, no matter what his rank or riches, to be eligible for the archonship. He died in honest poverty, and was buried by the state, which awarded his descendants pensions.

Aristophanes

b. Athens, 444 B.C. d. 380 B.C.

The greatest of Greek comic poets. The licence of the Athenian stage enabled him to expose abuses and evils inimical to the commonweal. Eleven plays—only a fifth of the number he wrote—are extant. Some are gross and coarse, reflecting not so much the mind of the man as his age. His work is characterised by infinite wit and fancy, and here and there power and beauty. "The Acharnians," "The Knights," "The Clouds," "The Wasps"—these, the four best known, alone suffice to secure his standing with the immortals.

Aristotle

b. Stageira, Macedonia, 384 B.C. d. Chalcis, Greece, 322 B.C.

One of the greatest philosophers of antiquity, Aristotle became, at the age of seventeen, the pupil of Plato, and for three years had for his own pupil Alexander the Great, who quitted the side of his master to go forth upon his career of conquest. Aristotle then opened his famous school in Athens, which he called the Lyceum, from its proximity to the temple of Apollo Lyceius. Here he treated of every subject which came within the range of ancient thought, and was rightly viewed, even down to Dante's day, as "the master of those that know." His influence and teachings remained the barrier between later eras and barbarism. His piety being impugned, remembering the fate of Socrates, he fled to Chalcis, in Eubœa, where he died, saying, as he left Athens, "I do not wish to see the Athenians sin twice against philosophy."

Arkwright, Sir Richard

b. Preston, Lancs, Dec. 23, 1732. d. Cromford, Derbyshire, Aug. 3, 1792.

The youngest of thirteen children, Arkwright began life as a dealer in human hair, which he dyed and sold for wigs. His education was so meagre that not until he was fifty had he time to master grammar and orthography. His invention of the spinning-machine revolutionised the cotton industry. The machine was made when he was so poor as to be in rags. He was thirty-six when he set up his first machine in Nottingham, and had a hard battle to fight. A mob destroyed his factory at Chorley; masters and men were hostile to the new invention; protracted litigation greatly vexed him. In the end his triumph was pronounced. He originated factory labour; he created an industry representing untold wealth to his country. Not over-scrupulous in his dealings with other inventors, he was still a good master, and himself set an example of industry by working sixteen hours a day.

Armstrong, Lord

b. Newcastle-on-Tyne, Nov. 26, 1810. d. Rothbury, N'berland, Dec. 27, 1900.

The solicitor who revolutionised warfare was practising law while concerned with his first inventions. A colliery accident led to his investigating the generation of electricity from steam, and from this he worked on to the hydraulic crane, and all the hydraulic machinery for which his great works first became famous. At forty-nine he made his first big gun, and from that moment the history of heavy ordnance was changed. At first all his productions were for the British Government, but afterwards his business was extended to the Continent, and for field service and battleships his guns won world-wide reputation.

Arnold, Matthew

b. Laleham, Middlesex, December 24, 1822. d. Liverpool, April 15, 1888.

Poet, critic, educationist, author of the daintiest prose which conveyed hard-hitting truths, and of poetry which is pure music, Arnold has left a mark upon English literature and public life which will not soon be obliterated

Arnold, Thomas

b. East Cowes, Isle of Wight, June 13, 1795. d. Rugby, June 12, 1842.

Father of the foregoing. Dr. Arnold, though a scholarly writer with a record of noble works, is best remembered for having revolutionised public school education in England during the fourteen years he was headmaster of Rugby.

Arrol, Sir William, Kt.

b. Houston, Renfrewshire, 1839.

The son of poor parents, Sir William Arrol began life as a cotton-piecer, was apprenticed at fourteen to a blacksmith, and with a capital of £85 began business on his own account. His energy and initiative broke down all obstacles to success, and at thirty he was building the new Tay Bridge, at a cost of three-quarters of a million. The Forth Bridge, and later the Tower Bridge, followed, and innumerable other great schemes. For these enterprises he had to invent practically all his own tools, and by so doing created a new and remunerative industry.

Ashmole, Elias

b. Lichfield, Staffordshire, May, 1617. d. London, May 18, 1692.

A man who, though he hung spiders about his neck for ague, and dabbled in alchemy, will, as his epitaph says, be remembered as long as his museum endures. This he got for the most part from his friend John Tradescant. He gave all, with the residue of the library which he had been

still famous for its manuscripts.

Athanasius, St.

Alexandria, Egypt, 29 A.D. d. Alexandria, 373 A.D.

of the Greek Fathers, of whom

separated from the Catholic doctrine of the Trinity, to whose defence he consecrated every moment and every faculty of his being." He was the great champion of the Church against Paganism and Arian heresy, and spent twenty years of his life in exile—six in the desert, a hunted fugitive. Athanasius, who introduced monasticism into Western Europe, is not the author of the Athanasian Creed, of which nothing was heard until long after his time.

Attila

b. 406 A.D.

"The Scourge of God," descended from the ancient Huns who dwelt on the confines of China. Putting his brother Bleda to death, he became master of the then vast kingdoms of Germany and Scythia, his dominions extending from the Rhine to the frontiers of China. He invaded Rome, and compelled Theodosius to pay tribute. This Marcian, the latter's successor, refused to continue, and in a great battle Attila was defeated. He again invaded Italy, and fugitives, flying before him, founded what was to become the famous Venetian Republic. Attila, whose boast was that "grass never grows again where my horse has once trodden," left an empire which his sons, by civil wars, rapidly destroyed.

Augustine, St.

b. Tagaste, N. Africa, Nov. 13, 354 A.D. d. Hippo, N. Africa, Aug. 28, 430 A.D.

The father of Augustine was a Pagan until late in life, and Augustine himself lived a life of licentiousness upon first going to Carthage. Cicero and Plato called him to nobler aims, and it was from the study of philosophy that he turned to Christianity, being baptised when thirty-four. His immortal autobiographical "Confessions" were written when he was forty-four. To heresy he proved a redoubtable foe, and for centuries after his writings ruled the Christian Church. He died while the Vandals were besieging Hippo, of which he was at the time bishop.

Augustus, Cæsar

b. 63 B.C. d. Nola, Italy, 14 A.D.

The man who found Rome built of brick, and left it built of marble, was the grand-nephew of Julius Cæsar, to whose will, after a struggle with Mark Antony, he gave effect. He parted the Roman world with Antony and Lepidus, who took—the former Gaul, the latter Spain; while Augustus himself had Africa, Sardinia, and Sicily. By his victory at Actium over the forces of Cleopatra, after which she and Antony committed suicide, he became the enlightened and noble master of the Roman world. His name, really Caius Julius Cæsar Octavianus, was changed to Augustus, meaning sacred or venerable, and it exists to-day in the name of our month of August, which formerly was Sextilis, then the sixth month of the Roman year.

Austen, Jane

b. Steventon, Hampshire, Dec. 16, 1775. d. Winchester, July 18, 1817.

The heroine of an enthusiastic eulogy by Macaulay was a daughter of the rectory, studied French and Italian, and was conversant with Richardson, Johnson, Crabbe, Cowper, and, at a later period, with Scott. She introduced the novel of domestic life. Four of her best-known novels were published anonymously during her life; the others were not given to the world until the year following her death. "Sense and Sensibility" and "Pride and Prejudice" were written before she was twenty-two.

entirely self-taught. He never had instruction in instrumentation, nor in the theory of music. He created his own style. "Every room in which Bach is sung is transformed into a church," said Mendelssohn. Blindness fell upon him in his latter days, and the operation attempted for his relief brought about his death.

Bacon, Francis

b. London, January 22, 1561. d. London, April 9, 1626.

"The wisest, brightest, meanest of mankind," as Pope termed him, died Lord Verulam and Viscount St. Albans. He never was Lord Bacon, the name by which he is commonly called. His career as a public man was marred by servility and treachery. He fawned upon the powerful, to turn without mercy upon them—notably, in the case of the Earl of Exeter—when his ends had been served. Successively filling all the offices of State leading to the Lord Chancellorship, he fell from the latter office, convicted of the grossest corruption, was sentenced to imprisonment in the Tower, fined £40,000, and banished the Court and Parliament. The sentence was remitted, but he continued in retirement. His literary labours entitle him to be styled the "father of English learning." While he was ignorant of discoveries of his contemporaries, and cherished many superstitions, he gave an impetus to English learning such as no other man had done.

Bacon, Roger

b. Ilchester, Somerset, 1214. d. Oxford, 1294.

The "wonderful doctor," as he was called, became a monk of the Franciscan order, which prevented his publishing his writings. He dabbled in alchemy, but made notable discoveries, gunpowder and the magnifying-glass among them. He is famous as being the pioneer of modern scientific inquiry. Persecuted and hindered to an unparalleled degree, he yet contrived to leave a striking record of work accomplished.

Baker, Sir Samuel

b. London, June 8, 1821. d. Newton Abbot, Devon, December 30, 1893.

A daring traveller, who, with his wife, essayed the exploration of the Nile sources, and, in company with Speke and Grant, discovered the great lake to which he gave the name Albert Nyanza. He helped to suppress slavery in Egypt, explored Cyprus, extended his travels east and west, and wrote one or two valuable books.

Balfe, Michael William

b. Dublin, May 15, 1808. d. Rowley Abbey, Herts, October 20, 1870.

An Irish composer, whose memory is dear to multitudes who have been charmed with his melodious operas and other compositions.

Baliol, John de

b. Barnard Castle, Durham. d. 1269.

One of the wealthiest barons of his time, he founded Balliol College, Oxford. His third son, John de Baliol (1249-1315), became King of Scotland, but was taken prisoner by Edward. His son Edward recovered the crown after a bloody battle, in which the Regent Mar was slain, but died in 1367. With him the line of Baliol ended.

Balzac, Honoré de

b. Tours, France, May 20, 1799. d. Paris, August 18, 1850.

An indefatigable French author, who in twenty years wrote eighty-five novels, several of them masterpieces. His "Comédie Humaine," in which every phase of life and character was to be treated, proved too vast an undertaking, but in it is some of his finest work.

Baring, Sir Francis

b. Larkbear, Devonshire, 1740. d. Lee, Kent, 1810.

The son of an immigrant German, who, along with his brother John, founded the financial house of Baring Bros. Lord Cromer and Lord Northbrook descend from the same stock.

were equally notable. He was for thirty years regarded throughout Europe as the mirror of chivalry, and his name still serves as a synonym for noble, unselfish, and heroic deeds.

Becket, Thomas

b. London, 1118. d. Canterbury, December 29, 1170.

Of Norman parentage, Becket showed extraordinary ability as a young man, and, securing the patronage of the Archbishop of Canterbury, was employed to win the Papal recognition of the Plantagenet dynasty on the English throne. From 1155 Becket was Chancellor—ostentatious, unscrupulous, and worldly. Then, in 1162, the Archbishopric of Canterbury was forced upon him by Henry II. The office wrought a miracle in his life. The worldling gave place to the stern ascetic and great champion of the Church. He asserted her rights, and boldly denied the Royal prerogative, but was forced to fly to France, and remain in exile for six out of his eight years' primacy. The struggle ended in his assassination at the altar of Canterbury Cathedral by knights acting upon the exclamation of the King: "Of the cowards that eat my bread, will none rid me of this turbulent priest?"

Bede, The Venerable

b. Monkwearmouth, Durham, 673. d. Jarrow, Durham, 735.

The father of English history was educated at a monastery between Monkwearmouth and Jarrow. There he spent all his days diligently compiling his history, his scientific and theological treatises, and teaching and expounding with such distinction as to make Northumbria the literary centre of Western Europe.

Beethoven, Ludwig Von

b. Bonn, Germany, December 16, 1770. d. Vienna, March 26, 1827.

Beethoven, like Bach, was one of a musical family, and at fifteen was Court assistant-organist, having already appeared as a juvenile pianist. By the time he had attained his twenty-third year he was noted as the most brilliant extempore player of his day. He now went to Vienna to study, and there remained for the rest of his life. His compositions comprise all forms of music—vocal and instrumental - from the sonata to the symphony, from the simple song to the opera and oratorio. Upon his works the modern school of instrumental music has been founded.

Bell, Sir Charles

b. Edinburgh, November, 1774. d. Worcester, April 28, 1842.

He made the greatest discovery in physiology from the time of Harvey to his own day—the distinction between the sensory and motor nerves. He held many high positions in his profession, and took charge of the wounded after the battles of Corunna and Waterloo.

Bell, Alexander Graham

b. Edinburgh, March 3, 1847.

The inventor of the telephone is the son of a famous father, Alexander Melville Bell, author of the system of "Visible Speech." It was while teaching this system that Bell the younger invented the telephone. He deposited his drawing and specifications the same day on which Mr. Elisha Gray filed particulars of his telephone. Edison's differed somewhat from both. Mr. Bell has since then invented the photophone, which transmits sound by variations in a beam of light; the graphophone, and similar instruments.

Bell, Henry

b. Torphichen, Linlithgow, 1767. d. Helensburgh, Dumbarton, Nov. 14, 1830.

The father of European steam navigation was first a wheelwright, then a ship-modeller, and next worked under Rennie, the famous engineer. He

Belzoni, Giovanni Battista

b. Padua, Italy, 1778. d. Benin, W. Africa, December 3, 1823.

First a monk, he was driven, by the invasion of Rome by the French, to England, where he earned a livelihood in the streets as a "strong man." Starting his career proper, he explored Egypt, and invented a hydraulic machine for raising the waters of the Nile. He removed and sent to England the colossal statue of "Young Memnon," and was the first to enter the second great pyramid of Gizeh. He was the father of modern Egyptian research.

Bentham, Jeremy

b. London, February 15, 1748. d. London, June 6, 1832.

The son of an attorney, he devoted his life to ethics and jurisprudence, and, in the words of Mill, found the philosophy of law a chaos, and left it a science. He advocated universal suffrage, annual Parliaments, the ballot, and payment of members. To many of his ideals effect has already been given by Parliament. His skeleton, dressed in the clothes he wore, is preserved at University College, London.

Becquerel, Alexander Edmond

b. Paris, March 24, 1820. d. Paris, May 13, 1891.

The son of Antoine Cæsar Becquerel, who was noted as a physicist, he made important investigations in relation to light, and discovered the rays to which his name is given.

Bergmann, Torbern Olof

b. Sweden, 1735. d. Upsala, Sweden, 1784.

Although a victim of poor health, he showed extraordinary assiduity in problems in botany, geology, and mineralogy. His theory of elective or chemical affinities has had a great influence on the later developments of chemistry.

Berlioz, Hector

b. Isère, France, December 11, 1803. d. Paris, March 8, 1869.

A composer whose genius was often akin to madness, he had for long to depend for a livehood upon musical criticism instead of musical composition. In the end his triumph was complete, his "Faust," "Romeo and Juliet," "Beatrice and Benedict," "Messe des Morts," and "Te Deum" sufficing to make for him a reputation which time enhances.

Berthelot, Pierre Eugène Marcellin

b. Paris, October 29, 1827.

The father of synthetic chemistry, the chemistry which builds up new forms, fled from a priestly seminary to devote himself to science. Other scientists had analysed and broken up matter; he put together the fragments, invented explosives and chemical and commercial products innumerable. To-day the school which has grown up in his train enumerates and defines fifty thousand distinct compounds. He has been Minister for Education and for Foreign Affairs of France.

Bertillon, Alphonse

b. Paris, 1853.

A French police officer, who re-equipped the detective forces of the world by inventing a means of identifying criminals by measurements.

Bessemer, Sir Henry

b. Charlton, Hertfordshire, January 19, 1813. d. London, March 15, 1898.

Many inventions, some of which never yielded him any profit, stand to the credit of Bessemer, but his process for the cheapening of steel is his chief claim to fame. He discovered that by forcing a blast of air through the molten metal he could decarbonise it, and convert cast iron into steel. His discovery did not at first yield the desired results, and he was discredited. Years of disappointment followed, but he persevered until his invention was finally perfected, and, by producing steel from his own works at £20 a ton less than the trade generally, rehabilitated himself. He made a vast fortune, and revolutionised the steel industry of the entire world.

Bichat, Marie François Xavier

b. Thoirette, France, 1771. d. Paris, July 22, 1802.

A happy accident brought his abilities to the notice of Desault, who forthwith adopted him as his son. Profiting by the knowledge thus early placed at his disposal, Bichat became the greatest anatomist and physiologist of his age. He was the first to reduce the complex structure of the organs to their elements, and to simplify the whole science.

Bismarck, Prince Otto Edouard Leopold

b. Schönhausen, Germany, April 1, 1815. d. Friedrichsruh, July 30, 1898.

Destined to complete the work of Frederick the Great, Bismarck was first opposed to all popular reform, and, though he was afterwards to give universal suffrage, he voted against a constitution for Prussia. Experience as Prussian representative at the Frankfort Diet, and as Ambassador to Russia and France, modified his views, and it was a more liberal Bismarck who was called to the assistance of the despairing King of Prussia. He employed Austria to help in wresting Schleswig-Holstein from Denmark, then turned on Austria and crushed her, making Prussia supreme in Germany. France had next to be faced, and a four years' preparation culminated in Bismarck's falsifying a telegram to misrepresent a meeting between the King and French Ambassador. The Franco-Prussian War followed. Here, again, German arms were triumphant; and while the Second Empire was being crushed, Bismarck confederated the German States into the German Empire, with the King of Prussia as German Emperor. Loaded with honours and rewards, Bismarck retained office until 1890, when he was dismissed by William II.

Black, Adam

b. Edinburgh, February 20, 1784. d. Edinburgh, January 24, 1874.

A worthy publisher, who originated the "Encyclopædia Britannica," and became proprietor of the "Edinburgh Review" and of the copyright of Scott's novels.

Black, Joseph

b. Bordeaux, France, 1728. d. Edinburgh, November 26, 1799.

The founder of modern chemistry was the son of a wine-merchant. He exploded the theory that the causticity of lime and the alkalis is due to their absorption of the so-called phlogiston, and traced it to carbonic acid. His discovery as to latent heat was of still greater importance to subsequent investigators.

Blake, Robert, Admiral

b. Bridgwater, Somerset, August, 1598. d. Plymouth, August, 1657.

Was a member of the Long Parliament, and in the Civil War gave the turning-point to the issue. At sea he completed the discomfiture of the Royalists; then, turning his attention to the Dutch fleet, whose admirals in those days were giants, gave us the supremacy of the seas.

Blucher, Gebhard Lebrecht von

b. Rostock, Germany, 1742. d. Kirblowitz, Germany, September 12, 1819.

A soldier from boyhood, he considered himself neglected by Frederick the Great, and took to farming for fifteen prosperous years. Recalled by Frederick William II., he fought in innumerable battles, Jena, where he was a subordinate, among them. At Leipzig he had a great share in defeating the French, and at Waterloo appeared just in time to complete the overthrow of Napoleon, by whom he had only a few hours previously been defeated in the terrible battle of Ligny.

Boadicea

d. 62 A.D.

Queen of the Iceni, a British people living in Eastern England, Boadicea was robbed, at the death of her husband, King Prasutagus, of all her possessions, herself publicly whipped, and her daughters exposed to the brutalities of the Roman soldiers. She raised the Britons, captured Colchester, London, and St. Albans, and put to death, according to Tacitus, 70,000 Romans. The island would have been lost to Rome had not Suetonius Paulinus hastened from Anglesea with 10,000 disciplined soldiers. Boadicea's force of over 200,000 was powerless against the Roman legions, and suffered a terrible defeat. Thereupon Boadicea poisoned herself.

Boccaccio, Giovanni

b. Certaldo, Italy, 1313. d. Certaldo, December 21, 1375.

The "father of Italian prose" was the natural son of a merchant, and intended successively for commerce and canon law. The years which he devoted to these subjects were wasted, and much of his time in later life was taken up with diplomatic missions. The rise of Italian prose began with his writings, and his influence is to be traced throughout the subsequent literature of Europe—in our own not least. Poets and novelists alike, from Shakespeare to Tennyson and George Eliot, have turned to him for inspiration. Licentiousness characterises some of his works, but others comprehend the loftiest ideals expressed in the noblest language.

Bodley, Sir Thomas

b. Exeter, March 2, 1545. d. London, January 28, 1613.

After having acted as Ambassador for several years, he devoted his talents and resources to re-establishing the library which Humphrey, Duke of Gloucester, had bequeathed to Oxford. This he so enriched with MSS. and books from all parts of Europe as to make it one of the finest in the world. It is called the Bodleian, in his honour.

Boerhaave, Hermann

b. Voorhout, Holland, 1668. Leyden, Holland, September 23, 1738.

The greatest physician and chemist of his time taught practically the whole of Europe. Peter the Great sat at his feet, and letters came to him from China seeking his advice. His works were translated into every European language, and even into Arabic.

Bolivar, Simon

b. Caracas, Venezuela, July 24, 1783. d. San Pedro, Colombia, Dec. 17, 1830.

The liberator of South America from the yoke of Spain saw the close of the French Revolution, and carried the revolutionary spirit with him back to Venezuela. After a protracted struggle with the Spaniards, he finally drove them out, and formed Colombia, Venezuela, New Granada, and Ecuador into a great Republic. Over this he ruled, while he was dictator of Peru. Bolivia, which was formerly Upper Peru, still commemorates him. His great Republic proved more than he could control, and he surrendered his office a few months before he died. He was the greatest patriot South America has known.

poleon

b. East Dereham, Norfolk, July 5, 1803. d. Oulton, Suffolk, July 26, 1881.

Leading a wandering life as a child with his father, who was a captain of Militia and moved with his regiment, Borrow, who acquired tongues and dialects with extraordinary facility, early mastered Irish, Danish, Welsh, French, German, Greek, and even Romany, the language of the gipsies, whose life and manners he has so fascinatingly described. His subsequent wanderings are related in his delightful "Lavengro," and his experiences as a representative of the Bible Society in "The Bible in Spain." At thirty-seven he married a wealthy widow, but was a rambler till late in life. Among his fourteen works are those which will last as long as the language.

Boswell, James

b. Edinburgh, October 18, 1740. d. London, May 19, 1795.

The man who immortalised Samuel Johnson and himself at the same time was a Scottish lawyer, son of Lord Auchinleck, a judge of the Court of Session. In his youth he travelled, and met Rousseau, Voltaire, and Paoli, the Corsican patriot. Coming to London, he met Johnson, which crowned his happiness. His "Life of Johnson" appeared seven years after his hero's death, and was an instant success. It was acclaimed the greatest biography in the language, and such it remains. Boswell gave way to intemperance in his later years, and died miserably. His "Life" was the one meritorious performance of his career, and that was meritorious indeed.

Botticelli, Sandro

b. Florence, Italy, 1447. d. Rome, May, 17, 1510.

Alexander Filipeppi was the name of this great Florentine artist, who, however, adopted the title of the goldsmith to whom his father apprenticed him. His training here in goldwork and jewellery was valuable to him in his painting. He studied under Fra Lippo Lippi, whose work he excelled. Botticelli's paintings, both in classical and religious veins, are marked by infinite delicacy, beauty, and care. Glorious examples are to be seen in the National Gallery. He was among the first engravers. Although he made large sums of money, he died in poverty.

Bougainville, Louis Antoine de

b. Paris, November 11, 1729. d. Paris, August 31, 1814.

A man who might have gained reputation as mathematician or philosopher, Bougainville's fame rests upon his having been the first son of France to circumnavigate the world. This he accomplished, 1766-69, in a frigate, accompanied by a transport, and lost only seven men out of a crew of two hundred. In his closing days he was honoured by Napoleon.

Bouguer, Pierre

b. Croisic, France, February, 10, 1698. d. Paris, August 15, 1758.

Mathematician, hydrographer, and geometrician, he devoted ten years of his life to measuring a degree of meridian near the Equator. He made important discoveries concerning the expansion and contraction of metals, the refraction and density of the atmosphere, the reciprocation of the pendulum, and the mode of measuring the force of light. To Bouguer we owe the foundation of photometry and the invention of the heliometer.

Boulton, Matthew

b. Birmingham, September 14, 1728. d. Birmingham, August 17, 1809.

He was the son of a Birmingham silver stamper and piercer, and improved the manufacture of art work in metal, pottery, etc. He converted a barren heath at Soho, Birmingham, into a great industrial establishment, and induced Watt to join him. They produced the steam-engines for which they were famous. In addition, they enjoyed unique reputation for the manufacture of coins. Patient industry, as well as genius, conduced to their success. Their manufacture of steam-engines was profitless for the first eighteen years of their association.

Bourgelat, Claude

b. Lyons, France, 1712. d. Lyons, 1799.

The father of veterinary science was intended for the law, but, disgusted at having gained a verdict in which his client was, to his knowledge, in the wrong, he joined a cavalry regiment, made a study of horses, and opened the first veterinary school in Europe.

Bourne, Hugh

b. Fordhays, Staffs, April 3, 1772. d. Bemersley, Staffs, October 11, 1852.

Dismissed from the Wesleyan body, of which he was a member, he established a little community, which has since grown to importance, under the name of Primitive Methodists. He worked for the greater part of his life as a carpenter, but carried his message throughout the United Kingdom and to the United States.

Bowring, Sir John

b. Exeter, October 17, 1792. d. Exeter, November 23, 1872.

We owe to Bowring much of our knowledge of the folklore of other nations. He was one of the greatest linguists the world has seen; was master of forty languages, and declared that he knew two hundred, and could speak one half that number. While he was supreme naval and military head at Hong Kong, his action in ordering fire to be opened on the Canton forts caused the "Arrow" war with China.

Boyle, Robert

b. Lismore Castle, Ireland, January 25, 1627. d. London, December 30, 1691.

The true precursor of the modern chemist, one of the founders of the Royal Society, and one of the greatest natural philosophers of his age, was the seventh son of the great Earl of Cork. He made experiments with an air-pump, which he improved, and important discoveries as to the properties of air and the propagation of sound. A devout Christian, he caused the Bible to be translated into several foreign languages at his expense.

Bradley, James

b. Sherborne, Dorset, March, 1693. d. Chalford, Glos., July 13, 1762.

Though he took Orders, and was presented to two small sinecure livings, he did not give up his studies, his whole life being devoted to science. Six years after being appointed Savilian Professor of Astronomy, at Oxford, he made known his discovery of the aberration of light; following this by explaining the nutatio whose inclination towards t to show, is constant.

Brahe, Tycho

b. Knudstorp, Sweden, Dec. 14, 1546. d. Prague, Austria, Oct. 24, 1601.

Brahe studied astronomy when he should have been learning law, and made himself famous in a direction not desired by his parents. He did much to advance the science to which he was devoted, though his theory—a modification of the Ptolemaic, and rejection of the Copernican—was, of course, erroneous. Kepler was his pupil, and owed much to him.

Braidwood, Thomas

d. Edinburgh, 1715. d. London, October 24, 1806.

Braidwood was the first man in England to systematically teach the deaf and dumb. His school, opened in Edinburgh, was afterwards transferred to London, and its operations extended by his daughter-in-law, Isabella Braidwood, to Birmingham.

Braille, Louis

b. Coupvray, France, January, 1809. d. Paris, 1852.

Rendered blind by an accident when three years of age, Braille devoted his life to perfecting the beautiful system by which the sightless are enabled to read and write in relief.

Bramah, Joseph

b. Stainborough, Yorkshire, April 13, 1748. d. London, December 9, 1814.

Lame from an accident with which he met when sixteen years of age, he was compelled to quit work in the fields for cabinet-making, whence he passed to his true vocation—engineering. He invented many useful machines—among them the hydraulic pump, sanitary apparatus, printing machinery for banknotes, fire-engines, and a famous safety lock. His boilers for steam-engines enjoyed a high reputation, and he was one of the first to suggest the screw propeller for steamships.

Bramante, d'Urbino (Lazarus)

b. Urbino, Italy, July, 1444. d. Rome, 1514.

Bramante relinquished painting to devote himself wholly to architecture, in which he had Raphael as a student. He was commissioned by Pope Julius II. to undertake the first part of one of the greatest enterprises in history—the rebuilding of St. Peter's, Rome. He died before his work could be completed. Subsequently his designs were departed from by other architects; but expert opinion holds that had his plan been followed, the effect would have been more grand and impressive.

Brassey, Thomas

b. Barton, Cheshire, November 7, 1805. d. St. Leonards, December 8, 1870.

A man of scanty schooling, with no command of foreign languages, Brassey, who was the son of a small landowner, became head of the greatest industrial enterprises ever committed to the care of a single man. He built many railways, docks, and harbours in England; while, at the same time, his operations embraced the construction of railways in almost every country in Europe, India, Australia, Canada, and South America. He had an army of 75,000 workmen, whose wages represented from £15,000 to £20,000 every Saturday. He amassed enormous wealth, and made the fortunes of many of his subordinates. A man of simple, noble nature, he was in all his business relations scrupulously honest and just.

Breakspear, Nicholas (Pope Adrian IV.)

b. Abbot's Langley, Herts. 1100. d. Anagni, Italy, September 1, 1159.

The only Englishman to fill the Papal chair was the son of a poor clerk who turned monk, and left his son destitute. Nicholas used daily to attend the monastery at St. Albans; then, making his way to France, was received in a menial capacity into the house of the canons of St. Rufus, near Valence. Here he became prior and abbot;

it was who gave Ireland to Henry II., that he might civilise the Irish, and bring them into the Roman Church. His reign was one long struggle for the temporal supremacy of the Papacy over contemporary sovereigns.

Bridgewater, Francis Egerton, Duke of

b. May 21, 1736. d. London, March 8, 1803.

The "father of inland navigation in England" was so dull of intellect as a boy that his exclusion from the dukedom was seriously proposed. He built the first canal in this country dependent wholly upon an artificial waterway. It ran from Worsley to Manchester, and was forty-two miles in length. The canal uniting Manchester and Liverpool followed, and was so costly that at times its projector was glad to borrow a £5 note from his tenants. He spent in all nearly a quarter of a million on his canals, but before his death benefited from them to the extent of £80,000 a year.

Brindley, James

b. Chapel-en-le-Frith, Derbyshire, 1716. d. Turnhurst, Staffs, Sept. 30, 1772.

The unlettered son of a ne'er-do-well, built the Bridgewater and other canals, the first of their kind in England. He was a genius who worked for a guinea a week. The schemes for the canals he fashioned in his head; he could never draw or write. Troubled by a problem, he would retire to bed and think it over, when all would come right.

Broadwood, John

b. Cockburnspath, Scotland, 1732. d. London, 1812.

Having walked from Scotland to London to seek to make his fortune as a cabinet-maker, Broadwood took service with Burkhardt Tschudi, a Swiss harpsichord-maker. He married the daughter of the latter, and, becoming possessor of the business, won fame throughout Europe for his pianos.

Brontë, Charlotte

b. Thornton, Yorks, April 21, 1816. d. Haworth, Yorks, March 31, 1855.

Charlotte was the eldest of a family of four, of whom her brother, Patrick Branwell Brontë, a profligate, with some touch of the family genius, died of consumption. Her father was an eccentric, selfish clergyman. Her sisters—Anne and Emily Jane—like herself, were delicate, but shared her talent. They published jointly a little book of poems, but had to seek livelihood as governesses. This failing, Emily wrote her famous "Wuthering Heights," and Charlotte, having had the "Professor" rejected, commenced at once "Jane Eyre," which met with instant success. Anne produced "Agnes Grey." Charlotte's brother and two sisters died within a short time of each other, and she was left to attend to her father, and continue her literary work, uncheered. She married, in 1854, the Rev. A. B. Nicholls, who had been her father's curate, but died in the following year. The story of the three sisters is one of the saddest in literature. Genius was never nurtured in more dispiriting, uncongenial conditions.

Brown, John

b. Torrington, Connecticut, May 9, 1800. d. Charlestown, Virginia, Dec. 2, 1859.

The famous agitator for the abolition of slavery in America was of pilgrim stock, and lived as tanner, land-surveyor, and farmer until he devoted himself to anti-slavery propaganda. It was rough work, and bloody. Brown had five pro-slavery men shot, and, after organising an asylum in the mountains of Virginia for runaway slaves, attacked the Harper's Ferry armoury in Virginia. He was taken, tried, and hanged, but his life was not given in vain. His rough efforts aided enormously in the crusade against slavery, while his death was an even more powerful factor in the scale.

Browning, Robert

b. London, May 7, 1812. d. Venice, December 12, 1889.

Endowed with many gifts, with some talent for drawing, and a taste for musical composition, Browning could rhyme almost as soon as he could talk. He had written a little volume of poems before he was twelve, and finished his dramatic poem "Pauline" by the time he was nineteen. The best known of his shorter poems were written before he was five-and-thirty. After his marriage to Elizabeth Barratt—herself the most imaginative poetess that has yet appeared in England, perhaps in Europe—he settled in Florence, but returned, a widower, to London to publish his masterpiece, "The Ring and the Book." He died in Venice, but is buried in Poets' Corner, Westminster Abbey. Obscure and difficult as Browning often is, he stands high among the poets of all time. It has been well said that whereas Wordsworth would lead the soul through nature to rest, it is through the spiritual struggles of the soul itself that Browning reveals the divine touch that discloses the true end of living and thinking.

Bruce, James

b. Kinnaird, Stirlingshire, December 14, 1730. d. Kinnaird, April 27, 1794.

Intended first for the Church, next for the law, Bruce was for a time a wine-merchant before the fascination of the East, inspired by his knowledge of Arabic, led to his taking the Consulate at Algiers. Seeking the source of the Nile, he discovered that of the Blue Nile, a matter in which, however, he had been anticipated. His travels and adventures in Abyssinia and Egypt, extending over six years, were set forth, upon his return home, in five volumes. So remarkable were his stories that he was generally discredited, though subsequent travel has handsomely vindicated him. In stature a giant, and a man of fine courage and delightful nature, he has been described as the poet, and his work the epic, of African travel.

Brunel, Isambard Kingdom

b. Portsmouth, April 25, 1806. d. London, September 15, 1859.

The only son of Sir Marc Isambard Brunel, he inherited much of his father's genius, and heroically assisted in the building of the Thames Tunnel, a labour of almost unparalleled difficulty and trial. In business for himself, he built many notable bridges, and laid the Great Western railway-track. His was the first steamship—the Great Western—regularly engaged in traffic between Great Britain and America. Afterwards he built the Great Eastern, the leviathan of her time, which was useful in laying submarine cables. Like his father, he was a man of lovable character and an unselfish, unswerving friend.

Brunel, Sir Marc Isambard

b. Hacqueville, France, April 24, 1769. d. London, December 12, 1849.

One of the most versatile geniuses of any age, Brunel the elder spent seven years of his youth at sea, then was driven by the French Revolution to America, where he took up civil engineering, and became the chief engineer of New York. Coming to England, when thirty years of age, to offer an invention to the Admiralty, he married an English lady, and made his home here. His invention was a machine for making ships' blocks, which saved the Government £24,000 a year. Afterwards he executed important works at the arsenals and dockyards, built great sawmills, and invented machinery for boots, printing processes, writing and drawing-machines, a knitting-machine, and a marine engine. In spite of his genius and industry, he was for months a prisoner for debt. His crowning achievement was the building of the Thames Tunnel, for the purpose of which he invented his famous shield. Nearly twenty years elapsed before the work was completed, but he lived to see the triumphant end of his labours.

Bruno, St.

b. Cologne, 1030. d. Calabria, Italy, October 6, 1101.

As superintendent of all the schools of the Diocese of Rheims, he had many distinguished pupils, among them the future Pope Urban II. He is chiefly notable, however, as the founder of the famous Carthusian Order, which he established upon withdrawing to the desert of Chartreuse.

Brunton, William

b. Dalkeith, Scotland, May 26, 1777. d. Camborne, Cornwall, Oct. 30, 1851

The son of a watch and clockmaker, he worked first at Arkwright's mills, then under Boulton and Watt at Birmingham, where he became a foreman. When over sixty, he lost all his money through a disastrous speculation in business, but recouped himself. His inventions comprised many useful, and some fantastic, ones. Of the latter there was a walking-machine, called the steam-horse, which for a year carried loads up a steep gradient, but then exploded, killing thirteen people. His work in connection with steam navigation, however, was of primary importance. Some of the original engines used on the Humber and Mersey were of his design; while the Sir Francis Drake, the first steamer which ever towed a war vessel, was fitted out by himself.

Buddha

b. Kapilavastu, India, 480 B.C. d. Kusinagara, India, 400 B.C.

Only approximate dates can be given. His real name was Siddhartha, and he was the son of Siddhartha Gautama, raja of the Sakya clan, whose home was near Oudh. When nineteen he married his cousin, a princess, but renounced luxury and family joys to go for six years into the wilderness and study under learned Brahmans, practising severe penances the while. It dawned upon him one day that salvation was not to be sought in isolation, but in self-conquest and universal loving kindness. That instant he became consciously Buddha, which means "enlightened." He returned to his family, began his teaching at Benares, and travelled far and near, inculcating his doctrines. His converts were numerous, and to-day his religion is the faith of 500,000,000 people, half as many again as the whole of professing Christians.

Buffon, George Louis, Comte de

b. Montbard, France, September 7, 1707. d. Paris, April 15, 1788.

The son of a wealthy lawyer, Buffon devoted his whole life to the study of natural history, his great work upon which, though perhaps over-praised by his contemporaries, remains a wonderful achievement, considering the condition of scientific knowledge in the eighteenth century. He was a forerunner of Darwin, in that he takes a distinct place in the history of the doctrine of evolution.

Bunsen, Robert Wilhelm

b. Gottingen, Germany, March 31, 1811. d. Gottingen, August 16, 1899.

The co-originator, with Kirchhoff, of spectrum analysis, which opened a new world to chemists and astronomers, was one of the most painstaking men that ever lived. Although he destroyed the sight of one eye, and nearly poisoned himself by his experiments, he succeeded, by applying science to commerce, in effecting great reforms in the manufacture of iron, in inventing the burner which bears his name, the charcoal pile and the magnesium light, and many other valuable processes.

Bunyan, John

b. Elstow, Bedfordshire, November, 1628. d. London, August 31, 1688.

The son of a tinker, and himself trained to the same trade, Bunyan had but little schooling; and his experience as a soldier, when he was drafted into the Parliamentary Army, does not seem to have improved him. At the time of his marriage he was "the ungodliest fellow for swearing" his friends had ever heard. His wife brought him for dowry two pious books; and the study of these, assisted by her own influence, effected his ultimate reformation. He became a powerful preacher. Nonconformist ministers of the Gospel coming under the official ban, he was cast into prison. He remained for some twelve years in the Bedford County Gaol, where he wrote several works. His release at last secured, he resumed his preaching, but was cast again into gaol, remaining a prisoner for six months. It was during this second incarceration that he wrote the first part of his deathless "Pilgrim's Progress." This, with "Grace Abounding" and "The Holy War," will live as long as religion has a literature. It has been translated into practically every known language, and fault will not be found with the dictum of Macaulay: "There is no book in our language on which we would so readily stake the fame of the old, unpolluted English language; no book which shows so well how rich that language is in its own proper wealth, and how little it has been improved by all it has borrowed."

Burdett-Coutts, Angela Georgina, Baroness

b. London, April 21, 1814.

The daughter of Sir Francis Burdett, M.P., she succeeded, at twenty-one, to the vast fortune of her grandfather, Thomas Coutts, through his widow, who had been an actress, but died Duchess of St. Albans. Made a baroness in her own right, she devoted her life to noble works. She built churches, founded three Colonial bishoprics, instituted official inspection of schools, equipped topographical surveys of the Holy Land, helped to establish Rajah Brooke in Sarawak, assisted emigration and war funds, formed many charitable institutions, built Clare Market, and model lodging-houses. Her career of goodness is almost without parallel in the history of Englishwomen.

Burke, Edmund

b. Dublin, January 12, 1729. d. Beaconsfield, Bucks, July 8, 1797.

His father was a Protestant lawyer, his mother a Roman Catholic, and his first schoolmaster a Quaker—a combination of factors which early taught him the lesson of religious toleration. Entered at Trinity College, Dublin, he studied industriously, if without system, and settled in London to study law. This career he abandoned for literature and politics. He was successively secretary to "Single-speech Hamilton," at that time Secretary for Ireland, and to the Marquis of Rockingham, Prime Minister. He did not hold office until he was fifty-three, and then for a brief period was Paymaster of the Forces. His influence with pen and tongue had no relation to office. His knowledge of public affairs was inexhaustible, his sympathy with the oppressed unfailing. As an orator, he ranks among the greatest produced by this country, though his glowing imagination, his eloquent diction, and passionate delivery did not greatly appeal to the men of his day. His speech at the opening of the trial of Warren Hastings is regarded as perhaps the finest ever delivered in our language; while those attacking the action of the Ministry in regard to our American Colonists, and condemning the French Revolution were, like his writings upon the same subjects, scarcely less resplendent examples of argument and eloquence.

Burns, Robert

b. Alloway, Ayrshire, Jan. 25, 1759. d. Dumfries, July 21, 1796.

The eldest of the seven children of a small farmer, "the boast of Scotland," as Scott named him, received but the meagrest education. At thirteen he was threshing corn for his father, whose chief labourer he became two years later. Before he attained to manhood, he managed to improve his handwriting, and to master French. Latin was too much for him. His first poem was written before he was seventeen, being inspired by a girl with whom he worked in the fields. For a time he studied land-surveying under his uncle; but this, like a subsequent venture in flax-dressing, had no material result. At the death of his father he attempted, with a brother, the task of working an impossible farm. Meantime, he was writing verse. None was published until he had accepted the post of estate-overseer in Jamaica, at £30 per year. His first volume of poems, containing some of his most popular pieces, was issued to pay his passage. Happily, the work came into the hands of Blacklock, the blind poet, who, in a friendly letter, persuaded the friendless youth to abandon his plan of emigrating. The call for a second edition took him to Edinburgh, where he was introduced into the best society of the place. He carried himself with modesty and dignity, and was not spoilt by the admiration he inspired. Determining to "woo his muse at the plough-tail," he took a farm, and, married now to Jeane Armour, sought to make ends meet from this venture, coupled with an Excise Commissionership. The latter yielded him only a clear £40, and at best not more than £70. It had the effect of developing his affinity for evil company, and hard drinking and disregard of health ruined his constitution, and brought him to an untimely grave. His private life was not creditable. That his genius should have burned so brightly under conditions so debasing is greatly surprising. He wrote with remarkable facility. "Tam o' Shanter" was composed during a walk by the Nith; the "De'il's awa' wi' the Exciseman" during a wait by the seashore, and "Scots wha hae" while riding in a storm over the wilds of Kenmure. His works are for all time: "He left his land her sweetest song, And earth her saddest story."

Burton, Sir Richard Francis

b. Barham House, Herts., March 19, 1821. d. Trieste, Austria, Oct. 20, 1890.

This daring traveller and indefatigable writer went, disguised as a Mohammedan, to Mecca, and, seeking the sources of the Nile, discovered Lake Tanganyika. Speke, who accompanied him, was sent to explore another lake, and found in it the true source of the Nile—Lake Victoria. Burton, who was for many years in the Consular Service, was a roamer almost to his life's end, and was a pioneer in lands which have since become familiar to travellers.

Byron, George Noel Gordon, Lord

b. London, Jan. 22, 1788. d. Missolonghi, Greece, April 19, 1824.

Succeeding his grand-uncle in the title and estates, which latter included Newstead Abbey, he studied at Harrow and Cambridge, publishing, when nineteen, "Hours of Idleness." An adverse criticism of this in the "Edinburgh Review" called forth his "English Bards and Scotch Reviewers," published before he had completed his twenty-first year. After Continental travel he married, at twenty-seven, Anne Isabella Milbanke. Their daughter, who afterwards became Countess of Lovelace, was born the same year, and he and his wife parted, under mysterious circumstances, two months afterwards. Byron left England in 1816, and spent some years in Italy, where he took an active interest in the revolutionary movement of the Carbonari. In 1823 he threw in his lot with the Greek insurgents at Cephalonia, became in the following year Commander-in-Chief at Missolonghi, and there died of fever. He died when his intellectual powers were at their zenith. His best known works are "Childe Harold"; a series of dramatic poems, including "Manfred," "Cain," and "Marino Faliero"; also "Mazeppa," "Beppo," and "Don Juan." There remain indelible blots upon his fame as a man, but his nature had its grand and noble and heroic side. His works reflect himself. His poetry is a "dark but divine revelation," and from the dictum of Goethe, that here was a true poet, none now is found to differ.

Cabot, Sebastian

b. Bristol, 1474. d. London, 1557.

The second son of John Cabot, he, with his father, was the first European to see the mainland of North America, anticipating Columbus and

dred miles. Employed at the Spanish Court for some time in correcting maps and charts, he settled down in England as Grand Pilot. His name is also associated with heroic efforts for the discovery of other places not then clearly defined upon the map. He was the first to explain in England the variation of the magnetic needle.

Cadmus

It is difficult to separate legend from the history of the founder of Thebes, in Bœotia. As to his birth and death, dates cannot be given; nor can it be determined whether he was of Phœnician or purely Greek origin. He is credited with having introduced into Greece the Phœnician characters whence was derived the alphabet, the foundation of Western civilisation. Cadmus, the Milesian, the first Greek who wrote history in prose, is supposed to have flourished in the reign of Halyattes in Lydia.

r, Julius

b. Rome, July 12, 100 B.C. d. Rome, March 15, 44 B.C.

"The foremost man of all this world" was the son of a Roman prætor, or consul. He began his career at twenty, when he was fighting in Mytilene. He was captured by pirates two years later, but, gaining his liberty, rose rapidly to eminence, and, with Pompey and Crassus, formed the first triumvirate. He invaded Britain, then devoted ten years of his life to the complete subjugation of Gaul. So complete was his conquest, and so beneficent his rule, that France was proud of her conqueror. She remained Romanised, she Romanised Germany, and in time sent forth Charlemagne and William the Conqueror. Meanwhile, Cæsar had great battles to fight against the armies of Pompey and Vercingetorix, and, though not invariably successful, finally redeemed Rome from the clutches of an evil oligarchy, and subjected the Empire to his own personal rule. He reformed the calendar, re-cast the administration, and, by a multitude of measures, proved himself as great an administrator as he was a scholar, orator, and soldier. His three and a half years' rule was a period of marvellous achievement for the progress of the world. He was assassinated by conspirators whom he had befriended- jealous men who asserted that he desired to make himself hereditary ruler.

Calderon de la Barca, Pedro

b. Madrid, January 17, 1600. d. Madrid, May 25, 1681.

Spain's greatest dramatist was educated as a Jesuit, and was for ten years a soldier before receiving a Court appointment. Afterwards he rejoined the Army, then entered the priesthood; and was, after a further ten years, recalled to Court. He now wrote the plays which his warmest admirers aver entitle him to rank as the "fourth in a mighty quaternion, with Homer, Dante, and Shakespeare."

Calvin, John

b. Picardy, France, July 10, 1509. d. Geneva, May 27, 1564.

The most eminent of the Protestant reformers after Luther embraced the Reformation when nineteen years of age, was banished from Paris three years later; published his famous "Institutes" in 1536, and fled the same year to Geneva. Only two years' rest here was permitted him, for he was banished in 1538, returned three years afterwards, and initiated the Academy of Geneva in 1539. Calvin's services to the cause of Protestantism were inestimable, and his intolerance was not unacceptable in the age in which he so prominently figured. He was a great scholar, a social legislator, and a man distinguished throughout his career by his sincerity and purity of life.

Cano, Juan Sebastian Del

b. Guetaria, Spain, about 1460.

leader. He was the first man to sail round the world, completing his voyage on September 6th, 1522. He died at sea when on a further expedition.

Canova, Antonio

b. Possagno, Italy, November 1, 1757. d. Venice, October 13, 1822.

From his boyhood he showed his talent for modelling, and at seventeen made himself famous by his statue of Orpheus and Eurydice, which brought him notable commissions. His fame increased with his years. Noble examples of his works are to be seen in the galleries of the Continent. He visited England to pronounce upon the merit of the Elgin marbles.

Canton, John

b. Stroud, Gloucestershire, July 31, 1718. d. March 22, 1772.

Apprenticed to a broadcloth weaver, and afterwards engaged as a schoolmaster, Canton was acclaimed in his day "one of the most successful experimenters in this golden age of electricity." He was the first to show that air may receive electricity by communication, and that water is compressible; he also first manufactured powerful artificial magnets. Nobody in his era did more to advance public knowledge of electricity.

Caracci, Ludovico

b. Bologna, Italy, April 21, 1555. d. Bologna, November 13, 1619.

The son of a butcher, he established the famous Bologna school of painting, and left many fine works. The Caraccis, Agostino and Annibale were his cousins. The last-named, a tailor, eclipsed the works of Agostino, and even of his teacher.

Caravaggio, Michelangelo Amerighi da

b. Caravaggio, Italy, 1569. d. Porto Ercole, Italy, 1609.

A painter of the naturalistic school, two of whose most famous works—"Christ and the Disciples" and "The Entombment of Christ"—are respectively in the National Gallery and the Vatican, he was the son of a mason. The fact that he was guilty of murder may have invested his works with the wild and gloomy character for which they are noted.

Carey, William

b. Paulerspury, Northants, August 17, 1761. d. Calcutta, June 9, 1834.

One of the first two Baptist missionaries to India, he was by trade a shoemaker. He proved to have a remarkable faculty for languages, and under his superintendence the Scriptures were published in nearly two score Oriental tongues. He founded the famous Serampur Mission in 1799.

Carlyle, Thomas

b. Ecclefechan, Dumfriesshire, Dec. 4, 1795. d. Chelsea, Feb. 4, 1881.

This sturdy prophet, in the guise of a man of letters, was the son of a worthy stonemason, was educated at Annan Grammar School and Edinburgh University, and maintained himself, while studying law, by giving lessons in mathematics and by writing for encyclopædias. He married, when thirty-one, Jane Baillie Welsh, a woman noted for her wit and beauty. Genius and domestic bliss, unfortunately, are not invariably found beneath the same roof, and the married life of this gifted couple was not happy. Carlyle settled, in 1834, in Chelsea, and there resided to the time of his death, affectionately styled the Sage of Chelsea. There he wrote the works by which he will always be known—"Cromwell," the "French Revolution," "Sartor Resartus," his "Life of Schiller," and translations of that poet's works, and so forth. Chronic dyspepsia aggravated a naturally intolerant, irascible temperament; but while his faults were hidden from none, his virtues, his nobility of character, his hatred of deceit and meanness and dishonesty were acknowledged even by those at whose foibles he hit hardest. He accepted the Prussian Order of Merit upon the publication of his "Life of Frederick the Great," but refused the pension and decoration which Disraeli offered.

dmund

The inventor of the power-loom and of the wool-comber was a clergyman, who held one or two livings, and, further, was domestic chaplain to two Dukes of Bedford. His inventions, though

which existed in the minds of work-

Cary, Henry Francis

b. Gibraltar, December 6, 1772. d. London, August 14, 1844.

The one achievement which entitles Cary to

on gave

But he was always in pecuniary difficulties until within three years of his death, when a small pension was conferred upon him. When Cary was translating Dante, Napoleon said of the poet: "His fame is increasing, and will increase, because no one ever reads him." Cary has given Dante immortality in England because everybody does read him in Cary's meritorious translation.

er 17. 1796.

caused her husband, Peter III., to be deposed and assassinated, and usurped the throne. Next, Prince Ivan, upon whom the hopes of the nation were set, was assassinated. Her private life was scandalous, but her career as a sovereign was in many particulars exemplary. She introduced new laws, reformed the administration, encouraged learning, and left it truly to be said that no sovereign save Ivan the Terrible had so extended the Empire. She had given Russia for boundaries the Niemen, the Dniester, and the Black Sea.

Caxton, William

b. Kent, about 1422. d. Westminster, 1491.

The first English printer was a mercer, who served his apprenticeship in London, and then was for many years resident in Bruges, where he became the head of a company regulating the operations of English merchants in the Low Countries. In 1469 he translated into English the "Recuyell of the Historyes of Troye," and, the demand for the book being so great, he had recourse to printing, which art he had learnt in Bruges. The first book, however, of which we have definite knowledge as to its having been printed at the press which he established in Westminster is the "Dictes and Sayinges of the Philosophers." This made its appearance in 1477.

Cellini, Benvenuto

b. Florence, November 10, 1500. d. Florence, February 13, 1571.

Famous as sculptor, engraver and goldsmith, Cellini devoted the early part of his life to the work of a goldsmith. He was present in Rome during its siege and sack by the Constable de Bourbon. Cellini asserts that he fired the cannon which killed Bourbon and wounded the Prince of Orange. He experienced wonderful vicissitudes—committed murder, was imprisoned, escaped, to renew his fame in fresh directions, in sculpture and engraving. His autobiography is one of the most remarkable works of the character extant, and enjoys universal fame.

Cervantes-Saavedra, Miguel de

b. Alcalá de Henares, Spain, 1547. d. Madrid, April 23, 1616

The author of "Don Quixote" is supposed to have been educated at the University of Salamanca. He served, however, as a common soldier, and at the Battle of Lepanto, 1571, was so injured as permanently to lose the use of his left hand and arm. The galley in which he was returning to Spain was captured by pirates, and he was detained as a slave for five years in Algiers.

while actually in prison wrote the first part of his immortal work. Upon its publication it leapt

"Don Quixote" places him in the forefront of

Chalmers, Thomas

b. E. Austruther, Fifeshire, March 17, 1780. d. Edinburgh, May 31, 1847.

This celebrated Scottish author and divine was the father of the Scottish Free Church. He had

with 470 other ministers, quitted the parent church and established the new.

Chambers, William

b. Peebles, Scotland, April 16, 1800. d. Edinburgh, May 20, 1883.

The son of a cotton-manufacturer, he, with his brother Robert, founded the publishing-house bearing their name, from which works of the highest educational value to the nation have been issued. The brother, Robert Chambers, who was two years the junior of William, and died in 1871, was the author of many acceptable works. The

Chantrey, Sir Francis Legatt

b. Norton, Derby, April 7, 1781. d. London, November 25, 1841

Left fatherless when twelve years of age, this son of a carpenter worked in the shop of a Sheffield carver and gilder for five years, then was able to take lessons at the Royal Academy. Having carved a marble bust for a Sheffield church, and others for Greenwich Hospital, he rapidly made himself famous, and executed some of the finest statuary ever done by an English sculptor. He left a fortune of £150,000, from the interest of which our national treasures should be each year enriched, the sum being bequeathed to the Royal Academy.

Charlemagne

b. April 2, 742. d. Aachen, Germany, January 28, 814.

Charles the Great, King of the Franks, Roman Emperor, was the son of Pepin the Short, and succeeded jointly with his brother to the throne of the Frankish kingdom. Upon his brother's death he took the crown to himself. He was a great soldier, a scholar, a born administrator, and the most enlightened ruler of his time. His wars were long and many, but wherever he went the Christianising of his conquered subjects was a paramount consideration. He was crowned Emperor of the Romans in St. Peter's on Christmas Day, 800. His empire extended from the Ebro to the Raab, and from the Eider to the Garigliano, but after his death it was frittered away.

Charles I.

b. Dunfermline, Scotland, November 19, 1600. d. London, January 30, 1649.

This ill-fated monarch takes his place in the gallery of fame not as a great, good, or wise man, but as one whose acts and ends made him the most conspicuous sovereign in our annals. He succeeded his father, James I., on March 27, 1625, and three months later married Henrietta Maria, a Catholic Princess of the Royal House of France.

Persuaded of the divine right of kings, he essayed to govern without Parliament, meeting the expenses of government by forced loans, poundage and tonnage, ship money, and other unconstitutional sources of revenue. His attempts to anglicise the Church of Scotland brought about the Solemn League and Covenant, and led to a bloodless civil war. Parliament, which had not sat for years, was summoned, and the Long Parliament outlasted the King. The revolutionary war extended over four years, and ended in his being taken, impeached, and executed.

Châteaubriand, François René, Vicomte de
b. St. Malo, France, September 14, 1768. d. Paris, July 4, 1848

This celebrated French statesman and man of letters began his career in the army, and after visiting America fought with the Royalist forces at Thionville. Under Napoleon he accepted office, which he relinquished upon the murder of the Duc d'Enghien. Having previously spent some years in England, he now travelled extensively, afterwards supporting the Restoration Monarchy. He was made a peer, and ambassador to England, but revolted against the Royalists until the downfall of Charles X. His writings were many, various, and, for the most part, excellent. He has been called the "Father of the Romantic School."

Chatham, Earl of
b. Westminster, November 15, 1708. d. Hayes, Kent, May 11, 1778.

First a cornet in the Dragoons, William Pitt the elder entered Parliament in 1735, and allied himself with the Prince of Wales, who was then in opposition to the King. Upon the defeat of Walpole he filled minor offices, and in 1757 formed a coalition with the Duke of Newcastle, in which the latter was nominally Premier, while Pitt was so in actuality. His policy of conducting the war against France formed one of the most brilliant chapters in our history, the French being everywhere beaten—in India, in Canada, in Africa, in Europe on sea and land. He was compelled to resign when his Ministry would not support him in his determination to declare war against Spain. He was Premier again, this time as Viscount Pitt and Earl of Chatham; but his Ministry was helpless without the aid which his ill-health prevented his affording, and his power was gone. He vehemently condemned the policy pursued by this country towards the American Colonies, but was struck down by fatal illness in the House of Lords when declaring against the proposition to terminate the war by granting the Colonists unconditional freedom.

Chatterton, Thomas
b. Bristol, November 20, 1752. d. London, August 24, 1770.

The saddest soul in the history of letters had not completed his eighteenth year when he took his life in a miserable garret in London. Yet how many poets of a later day have his works inspired! He was the son of a sub-chanter at Bristol Cathedral, who left no provision for his boy. Chatterton was bound apprentice to an attorney, in whose house he lived the life of a menial. In his twelfth year he produced the first of the famous "Rowley" poems—his own creation, but which he represented as having been found by himself in the muniment-room of Bristol Cathedral. More followed, and upon his coming to London, and earning eleven guineas, fortune seemed within his grasp. He wrote poems, squibs, stories, essays, letters. "It was Ossian, or a Saxon monk, or Gray, or Smollet, or Junius; and if it failed in most what it affected to be a poet of the fifteenth century—it was because it could not imitate what had not existed." His patron, Lord Mayor Beckford, died, and, his application for a post as ship's surgeon failing, he was left penniless. He refused a meal offered to him in charity, and took poison.

Chaucer, Geoffrey
b. London (?), 1340. d. London, October 25, 1400.

Chronologically, Chaucer is the first of English poets, and is called the "Father of English Poetry." In point of merit he is among the first of all our poets. He bore arms for twenty-seven years, and was employed on many missions to the Continent. This enabled him to study the Italian poets, by whose example he was inspired. His best known work is "The Canterbury Tales." At later periods of his life he enjoyed considerable Court patronage, but his career was chequered, though not sufficiently to daunt his spirit or extinguish his genius. He was the son of a London vintner and innkeeper.

Cheops
b. 3095 B.C. d. 3032 B.C.

Authorities differ to the extent of two thousand years as to the age in which lived Khufu, the Egyptian King, commonly known as Cheops. He was neither a great man nor good, but he can never be forgotten so long as his vast pyramid at Gizeh, Egypt, exists. It was built for his sepulchre by the labour of hundreds of thousands of slaves, spread over a period of thirty years, and remains to-day the greatest stone building in the world, containing, it is estimated, six million tons of masonry. Cheops was impoverished by the cost of his tomb, and to raise money, it is said, sacrificed the honour of his daughter.

Chesney, Francis Rawdon
b. Annalong, Down, March 16, 1789. d. Mourne, Ireland, January 30, 1872.

A British general and engineer, he established an overland route to India, explored the valley of the Euphrates, and demonstrated the feasibility of a Suez Canal in a report which served De Lesseps as starting-point.

Chevreul, Michel Eugène
b. Angers, France, August 31, 1786. d. Paris, April 9, 1889.

He was for over sixty years chemist at the Gobelins factory, and professor at the French Museum of Natural History. From his labours vast industries have been brought into existence, among his most important discoveries being margarine, olein, and stearin.

Chopin, Frédéric François
b. near Warsaw, Poland, March 1, 1809. d. Paris, October 17, 1849.

Into the forty years of this famous composer and pianist's life was crowded a vast amount of composition—songs, dances, and greater works for the piano which will long keep his memory green. His association with the famous George Sand extended over eight years. He is the "Prince Karol" of her novel "Lucrezia Floriani," in which she represents him as a "high-flown, consumptive, exasperating nuisance."

Cicero. Marcus Tullius
b. Arpinum, Italy, January 3, 106 B.C. d. Formiæ, Italy, December 7, 43 B.C.

One of the greatest orators of his age, Cicero established his reputation as a speaker in his twenty-sixth year, and at thirty pronounced, in denunciation of the infamous Verres, the noble oration which has been preserved to us. As a statesman, Cicero was not robust of will; and, regarded as a trimmer and time-server, he was banished and his house sacked. He was recalled to Rome, but hovered between allegiance to Cæsar and Pompey, finally inclining to the former. He was assassinated in consequence of his indictment of Antony. Inconsiderable as politician and statesman, Cicero excelled as orator and man of letters, and his writings and speeches are dear to all scholars.

Cleopatra
b. Alexandria, 69 B.C. d. Alexandria, 30 B.C

The last Queen of Egypt was a woman of surpassing beauty and of highly-cultivated mind. She inherited the throne of Egypt jointly with her brother, Ptolemy Auletes, but his guardians denied her right. Cæsar, arriving at this time in

Egypt in pursuit of Pompey, was captivated by her beauty and address, and made successful war in her behalf. She accompanied him back to Rome, and there bore him a son, who was afterwards assassinated by Octavianus. In the tumult which followed the murder of Cæsar she returned to Egypt, to be summoned to meet Antony at Tarsus, in Cilicia. Antony was not proof against her beauty, and his devotion to her brought about his ruin. He spent the winter with her in Alexandria, then went to Rome to divorce his wife, the sister of Octavian, who thereupon declared war against Cleopatra. Antony joined her, and lost the Battle of Actium. Cleopatra fled, and he, to follow her, threw away half a world. Octavian appeared with his host before Alexandria; and Antony, hearing the false report that Cleopatra was dead, fell upon his sword, while she, to avoid being exhibited at Rome in the triumph of Octavian, took her own life.

Cobden, Richard

b. Heyshott, Sussex, June 3, 1804. d. London, April 2, 1865.

He began life in the warehouse of an uncle, whom he served as clerk and traveller; then, with two others, started a business of his own in London, with calico-printing works in Lancashire, which led eventually to his settling in Manchester. He visited the United States and the Levant, and began his campaign against the Corn Laws. The Anti-Corn Law League, born in Manchester, had Cobden at its head. He preached Free Trade in Parliament and out, and it was due mainly to him and his followers that the Corn Laws were abolished. His devotion to public affairs ruined his business, and, out of gratitude for his services, a national subscription of £80,000 was presented to him. He negotiated an important commercial treaty between France and England, and did useful work for the North in the American Civil War.

Coleridge, Samuel Taylor

b. Ottery St. Mary, Devon, October 21, 1772. d. London, July 25, 1834.

The son of a vicar, who was also a schoolmaster, Coleridge showed as a boy a wonderful avidity for learning, but he left Cambridge without a degree. He got into debt, enlisted, was bought out, acted as editor, lecturer, preacher, and wrote some poems. With Wordsworth, he wrote "Lyrical Ballads," contributing the immortal "Ancient Mariner." Meanwhile, he had married Southey's sister-in-law, and projected, with his two poet friends, a barren scheme for a settlement in the wilds of America. Accepting a pension from the Wedgwoods, he studied for some time in Germany, and upon coming back established himself at Keswick with Southey, and with Wordsworth for neighbour. Here his craving for opium asserted itself, and eventually mastered him. It ruined him mentally and morally. He went to London, where he lectured with varying success on Shakespeare and the fine arts. In London his declining days were passed. His conversational powers were remarkable, and he had many and true friends. As a poet he ranks high, and he was a notable critic. To English literature he rendered invaluable service by infusing into it the spirit of German learning.

Columbus, Christopher

b. Genoa, Italy, about 1435 or 1446. d. Valladolid, Spain, May 20, 1506.

This, one of the most fascinating of all life-stories, began in the humble cottage of a wool-carder. To the same trade as his parent the son was bred, but at a tender age took to the sea. He managed to acquire knowledge of subjects not commonly known at that time, and during all the adventures of his early days--his fights and hair-breadth escapes at sea—this was germinating in his brain, until, arriving at maturity, he resolved upon an attempt to reach India by sailing westward over the open sea. Years elapsed before he could gain the support necessary to equip his ships; but, after heart-breaking discouragements, he set sail, August 3rd, 1492, into the unknown. The wind was fair, and his crew inferred that it always blew in that direction, and, therefore, that they would never be able to return. The variation of the needle, with every other new phenomenon, terrified his crews, who were repeatedly on the point of mutiny. But he held bravely on, and on October 12th, 1492, reached the Bahamas, discovering during his three months' stay Hayti and Cuba. To the whole he gave the general name of the West Indies, so recording his belief that he had reached the Indian Sea. Returning with a greater fleet in the following year, he added little to his first discovery; but at the third attempt, in 1498, he first reached the American continent, near the mouth of the Orinoco. And now, at Hayti, he found the colony which he had established in confusion, and his enemies at home induced the King of Spain to have him brought home in chains. The revulsion of feeling upon his landing in this shameful plight was instantaneous, and he was restored to freedom and honour. Meanwhile, Da Gama had discovered India, in seeking which Columbus had found America. Columbus made another voyage, and explored more of the coast of America, and returned to die in poverty and obscurity. A quarter of a century later Cortez was in Mexico, and Pizarro was conquering Peru. The pilgrimage to the West had begun.

Comte, Auguste

b. Montpellier, France, January 19, 1798. d. Paris, September 5, 1857.

His full name is Isidore Marie Auguste François Xavier Comte. When twenty years of age, the founder of Positivism became the friend and disciple of Saint-Simon; but they took each his own way after four years, and Comte, unaided, founded the school of thought now known as the Positivists.

Confucius

b. Shantung, China, 551 B.C. d. Shantung, 478 B.C.

The name of the great Chinese philosopher was Kung, and we preserve the Latinised form of that name and the term which his disciples applied literally Kung the philosopher, or the Master Kung. He was the son of a soldier, whose widow was left to educate the child. The latter, when he grew up, was occupied as keeper of the public supply of grain and of the herds. Later he became a wonderfully successful governor, Minister of Works, and chief magistrate of his native place. The jealousy of a powerful neighbour caused his retirement, and from that time forward he wandered for years, attended by his followers, expounding his philosophy. Some of our best-known maxims were first uttered by Confucius. His memory is worshipped to-day in China by every class of the community from the Royal Family downwards, and each town and village must have its temple consecrated to his memory.

Constantine the Great

b. Naissus, Upper Mœsia, 272 A.D. d. Nicomedia, Asia Minor, May 22, 337.

Constantine was the son of Constantius Chlorus, who re-established Roman dominion in Britain and became Augustus. His son is commonly called the first Christian Emperor of Rome. As a fact, Constantine, while making Christianity the form of worship for his subjects, was not wholly a Christian until his end was approaching, when he was baptised. Throughout his life he paid official honour to heathen gods. A great soldier and far-seeing administrator, he made himself, after bloody conflict, master of the western portion of the empire, and, finally, emperor of the whole. Having defeated Licinius near Byzantium, he established his capital there, and in 330 inaugurated it under the name of

Constantinople. It was under his auspices that there assembled the great Church Council of Nicæa, at which was produced the Nicene Creed.

Cook, Captain James

b. Marton, Yorks, October 27, 1728. d. Hawaii, February 14, 1779.

The son of a farm-labourer, Cook ran away to sea, and by the time he was thirty-one had attained the rank of master in the Navy, and was given the task of charting the St. Lawrence and the shores of Newfoundland. His work here, as everywhere else, was marked by remarkable thoroughness. He circumnavigated New Zealand, and in the name of his country took possession of the east coast of Australia; circumnavigated the globe near the Antarctic Circle, and explored the Pacific Ocean. He was killed in a quarrel between members of his party and natives in Hawaii. An intrepid voyageur, Cook was a man of noble character, and so universally respected that orders were issued to all French ships by the French Government, during the war of 1779 between France and England, to treat Cook and his vessels as neutral allies.

Copernicus, Nicolas

b. Thorn, Prussia, February 19, 1473. d. Frauenburg, Prussia, May 24, 1543.

Like so many other illustrious men, the father of modern astronomy was the son of humble parents. It was his good fortune to be mentally equipped not only by diligent personal effort, but by a course of study at Cracow University, where he graduated as doctor of medicine. He taught mathematics, became a canon, busied himself with Church work and lay offices. But all his leisure was devoted to astronomy. The so-called Copernican system remained to be established by great men who followed; but he led the way with a new theory, and braved the terrors of the Church to state the case as it appeared to him.

Corneille, Pierre

b. Rouen, France, June 6, 1606. d. Paris, October 1, 1684.

The greatest tragic dramatist of France turned to writing when the attempt to win success at the Bar had failed He was for some time one of Cardinal Richelieu's "five poets," but was too independent to write at another man's dictation. Corneille ranks with Descartes as the first to free French thought and language from the restrictions due to Latin and Greek influences.

Antonio Allegri da

[illegible]

This great artist takes his name from Correggio, the town near Modena where he was born. Of his work it has been said: "In facility of handling, in absolute mastery of the difficulties of foreshortening, in the management of light and shade as distributed over vast spaces and affecting multitudes of figures, this great master has no rival." The National Gallery possesses some of his masterpieces.

Cortez, Hernando

b. Medellin, Spain, 1485. d. near Seville, Spain, December 2, 1547.

Cortez conquered Mexico for Spain against the orders of Velazquez, who, having given him the command of a small force, sought to depose him. The soldier hurried forward with fewer than six hundred trained warriors of his own nationality and a handful of friendly Indians, a dozen horses, and as many small guns. He founded Vera Cruz, made allies of the Tlascalans, and marched towards Mexico, the capital. Montezuma, the King, came to meet him. He was made prisoner, and siege laid to the capital. A force sent by Velazquez to recall Cortez now drawing near, Cortez took part of his force, defeated the Spaniards, and made the survivors part of his own army, then marched back to Mexico City, to find that those he had left there had been surrounded. Cortez had to battle against a risen nation, and his little force suffered terribly during the retreat from the city. At Otumba he was surrounded, but won a pitched battle against enormous odds, and, having recruited a large number of Indians, returned to the attack upon Mexico. The siege lasted seventy-five days, for the city did not capitulate until its destruction had been practically completed and its population decimated. Cortez had beaten a nation! Expeditions were sent in various directions, and new territories annexed, but Cortez's enemies at home were still powerful. He returned to Spain, and was honoured by his sovereign; but, though appointed captain-general of the New Spain, as it was called, he was not the civil governor. He lived in splendour for several years in Mexico, but, returning for the last time to Spain, died in neglect and obscurity.

Cowper, William

b. Berkhampstead, Herts, Nov. 15, 1731. d. E. Dereham, Norfolk, Ap. 25, 1800.

Genius and madness dominated the life of the author of "The Task." A morbid sensitiveness at school made his life hateful to himself. It made him shrink in terror from the duties which should have been his as Clerk of the Journals of the House of Lords. He repeatedly attempted suicide, and was confined as a lunatic. Afterwards began that intimacy with the Unwins which lasted for many years after the death of Mr. Unwin. Later there came into the life of the poet Lady Austen, who told him the story of John Gilpin, and inspired him to write "The Task." He translated Homer, but not with success, and recurrent dementia sadly marred his life. His poetical writings have had a great influence upon English literature, while his letters are a never-failing delight to the student.

Crompton, Samuel

b. Firwood, Lancs., December 3, 1753. d. near Bolton, Lancs., June 26, 1827.

The inventor of the spinning-mule was the son of a small farmer, and helped his widowed mother in farmwork and weaving. The desire to improve upon the old methods, which let the ends of the yarn so readily break, led to his inventing his famous machine. It gave other men vast fortunes, but he reaped little advantage from it, and died poor and in sorrow, defrauded of his just reward.

Cromwell, Oliver

b. Huntingdon, April 25, 1599. d. London, September 3, 16[illegible]

The Cromwells were of good stock—landed gentry, the backbone [illegible] days. Oliver was educated at Huntingdon Grammar School and Cambridge University, then went to London to study law. He became imbued with the tenets of Puritanism, which did not abate their influence when he went down to Huntingdonshire to live the life of an industrious country gentleman. He was returned to Parliament, and it was in the Long Parliament, when he had turned forty, that he first made himself known as above the level of his fellows. When the war with the King broke out, it was Cromwell who most distinguished himself as a soldier. He had had no previous experience, but he proved himself a born general—as great in his sphere as any the world has ever known. He raised the famous Ironsides, who were never defeated—neither in our own islands nor on the Continent—nor were his ships otherwise than victorious. He boasted that he would make the name of Englishman as respected as that of Roman had been, and he justified that saying. England under his rule became the sovereign power of Protestant Europe. Meanwhile, however, there was the terrible civil war raging throughout the length and breadth of the land. Cromwell suppressed this with an iron hand, and, plot upon plot originating with Charles I., he had him executed, and himself declared Lord Protector—or Regent, as we should now say. His followers wished him to be crowned king, and had he lived longer he would no doubt have yielded to their wishes. At the same time, however, he did not wish to wound the susceptibilities of the Republican party, and refused the title. He ruled as Protector for less than five years, and in that time proved himself the greatest and mightiest ruler this land has known. The downfall of the edifice which he had raised followed quickly upon his death, and England submitted to Charles II., with his Court of unexampled corruption, debauchery, and shame.

Crookes, Sir William

b. London, June 17, 1832.

From his earliest childhood he has been deeply interested in science, and when still a youth was appointed assistant to Dr. Hoffman at the Royal College of Chemistry. Before he was thirty, a chance observation, made during a spectroscopic examination, led him to the discovery of a new metal—thallium. His method in dealing with this was characteristic. He spent eight years in investigating its substance and properties and weight. One thing led to another. He found that it must be weighed in a vacuum, and this showed that the metal appeared heavier when cold than when hot. This in turn conducted him to his famous researches concerning the discharge of electricity through highly rarefied gases and his examination of radiant matter, all tending towards investigations concerning radium, with which his later years have been engaged. A practical scientist, he has done great things in promoting pure water supply and in the treatment and disposal of sewage.

Curie, Mme. Marie Sklodowska

b Warsaw, Poland, November 7, 1867.

The daughter of a Professor of Physics at Warsaw College, Madame Curie, from her earliest childhood, was accustomed to the work in her father's laboratory, and came in time to know as much of chemistry as himself. On going to Paris to complete her education, she met and married M. PIERRE CURIE (b. Paris, May 15th, 1859), and together they discovered radium, and revolutionised the whole world of modern scientific knowledge. The experiments attended by so vastly-important results were conducted when the young couple were very poor. Since then the whole scientific world has paid them honour.

Curwen, John

b. Heckmondwike, Eng., Nov. 14, 1816. d. Heaton Mersey, Lancs., May 26, '80.

As the man who, by the Tonic Sol-fa system, made it possible for the masses to learn music, Curwen is entitled to a place in the gallery of fame. An Independent minister, he was always interested in teaching, and this led to his being asked, at a conference of Sunday-school teachers, to recommend the best and simplest method of music-teaching. As the result, he gave to the world the system with which his name is associated. The principle of that system he seems first to have acquired from a Miss Glover, daughter of a Norwich clergyman. His later years were entirely devoted to the propagation of this system. He wrote many books upon it, and founded the Tonic Sol-fa College. Millions of people owe their knowledge of music to his efforts.

Cuvier, Georges

b. Montbeliard, France, August 23, 1769. d. Paris, May 13, 1832.

The full name of this most famous of comparative anatomists was Léopold Chrétien Fréderic Dagobert Cuvier—that given in the heading was his literary style. He filled many offices in the State, and was an indefatigable worker. The theory of evolution found in him a doughty foeman, but his work in comparative anatomy was of vast importance to the science.

Cyrus the Great

b. about 592 B.C. d. 529 B.C.

As to the birth and death of the founder of the Persian empire, fact is less traceable than legend. He was a great warrior, an enlightened administrator, and a humane conqueror. The scene of his conquests lies in the story of the Old Testament. It was he who, after conquering Babylon, permitted the Jews to return to Egypt to rebuild the temple. He not only permitted them to depart in peace, he restored to them the vessels of the temple which had been carried away by Nebuchadnezzar.

Daguerre, Louis Jacques Mandé

b. Cormeilles, Normandy, November 18, 1789. d. France, July 12, 1851.

Skilled as a painter, Daguerre followed up the discoveries of Nicéphore Niepce in obtaining permanent pictures by the action of sunlight, and with him produced the "Daguerrotype" process, the pioneer of modern photography.

Dalton, John

b. Eaglesfield, Cumberland, September 6, 1766. d. Manchester, July 27, 1844.

One of the greatest chemists of any age, Dalton was the son of poor parents, his father, a Quaker, being a weaver. It was his fortune to have within reach a cousin who kept a school, at which he was able to develop his love of science. During his life he held many appointments, enabling him to impart his knowledge to others. But he was himself a student all his days. There was so much for him to learn. It fell to him to demonstrate the atomic theory, and new facts innumerable in connection with gases, steam, acids, and so forth. He and his brother were colour-blind, and first drew attention to the existence of this physical disability, hence its early name—Daltonism.

Dante, Durante Alighieri

b. Florence, May, 1265. d. Ravenna, Italy, September 14, 1321.

Of honourable and ancient lineage, Dante was the son of a lawyer, and in his young manhood fought with bravery in the wars in which Florence was engaged. He attained to honourable office as a citizen, and successfully discharged civic functions seemingly incompatible with a temperament such as his. In the struggle of his native state to defeat the plan of the Pope to make Florence simply a dependency of the Papacy, Dante took an active part. He was afterwards sent on a mission to the Pope, and never permitted to return. The faction with which he was allied losing the day, a baseless charge of peculation was preferred against him, sentence of banishment passed, followed later by threat of execution; this latter twice repeated. For many years afterwards he was a wanderer, teacher, and student, acquiring that vast store of knowledge which made him the intellectual phenomenon of his age. Florence, which he so loved, he never saw again. His wanderings ended at Ravenna, and there he died. As to the production of his works, no chronological record exists; nor does that much matter. His "Divine Comedia" is known and loved wherever men have a written language. Dante gave Italy a language and a literature. It has been said, "God created Dante and Italian literature together." He began his great work in Latin, but abandoned the project, as Shelley has said, "to create a language, in itself music and persuasion, out of chaos and inharmonious barbarisms." The Beatrice of his dreams was Beatrice Portinari, whom he met when he was a child of nine, and she a few months younger. His passion for her was idyllic. She was married at the age of twenty, and died four years later; and some years afterwards Dante himself married a Florentine lady, by whom he had several children. She remained in Florence after his banishment; but when, later, sentence of death was passed upon her sons with their father, she joined the poet in exile.

Darwin, Charles Robert

b. Shrewsbury, February 12, 1809. d. Down, Kent, April 19, 1882.

Anticipated to a certain extent by his grandfather Erasmus Darwin, the founder of the

Darwinian theory of evolution, raised the crude hypotheses of others to a verifiable theory. Although he was destined for the Church, he was a "born" biologist, and the happy chance by which he was able to accompany the Beagle on her scientific survey gave him several years in which to collect data as to the flora and fauna of many lands. When afterwards he settled down to country life in England, he was able to turn this knowledge to profitable account in his famous "Origin of Species." He devoted years to the compilation of the work, and, as it was, had to be hastened by his friends into publication by the remarkable discovery that Dr. Alfred Russel Wallace was working along lines similar to his own, to the same goal of discovery. Wallace sent his paper on the subject to Darwin, and the latter was prevailed upon to read, with this, one of his own prepared a year earlier, before the Linnean Society. His theory provoked fierce controversy throughout Europe, but to-day is the scientific gospel of the biologist.

Davy, Sir Humphry

b. Penzance, December 17, 1778. d. Geneva, May 29, 1829.

Countless thousands—the perils of whose occupations have been lessened by the use of the safety-lamp in mines—think only of Sir Humphry Davy as the inventor of that mechanism. His contributions to science, however, were many and important. He discovered the use of nitrous oxide, and by previously unknown processes proved the existence of numerous metals—potassium, sodium, magnesium, calcium, strontium, and barium. His researches had highly important results upon agriculture, while his noble work was of inestimable value in far advancing the outposts of the scientific knowledge of the period. He was the son of a wood-carver, and began life as a surgeon's apprentice.

Defoe, Daniel

b. London, 1659 (?). d. London, April 26, 1731.

The father of Defoe was a butcher, and lived in the parish of St. Giles, Cripplegate. His son received a sound, middle-class education, which the industry of the youth vastly improved. In business Defoe failed as a hosier and as a potter. In politics he was not more to be applauded. Many of his writings were political; but that by which he will always be remembered is "Robinson Crusoe," a work suggested by the adventures of Alexander Selkirk, a marooned sailor. The story is, of course, the creation of Defoe's own brain, but it is a masterpiece of realism, and of simple yet elegant English.

Democritus

b. Abdera, Thrace, 460 B.C. d. about 357 or 370 B.C.

"The laughing philosopher," as he is called, was a man of noblest mind, stored with all the learning of his age. He travelled to wherever knowledge was to be gained. Fragments of his writings which remain show him to have been another Aristotle. His exposition of the atomic theory has been substantially confirmed in successive eras.

Demosthenes

b. Pæania, Greece, 384 B.C. d. Calauria, Greece, October 12, 322 B.C.

Statesman and patriot, Demosthenes was defrauded while a minor of the greater part of his estate. To recover his possessions, he studied law, and became a lawyer and the greatest orator of all time. His "Philippics" were speeches against the encroachment of Philip of Macedon upon Greece. Philip's attack upon the State of Olynthus called forth the "Olynthiacs" of Demosthenes. Perhaps the greatest triumph of his oratory was when he confronted the ambassadors of Philip, and in a great speech induced them to join with Athens against Philip. Very famous, too, is his speech delivered to clear himself of the charge of peculation. Success crowned the arms of Philip and his great son Alexander; but when the latter was dead, Demosthenes headed another revolt, and, being captured by his enemies, took poison.

Descartes, René

b. La Haye, France, March 31, 1596. d. Stockholm, Sweden, Feb. 11, 1650.

The father of modern philosophy was educated by Jesuits, but came to the conclusion that he must forget all he had learnt, and instruct himself from the book of knowledge—the world itself. He became a soldier, and fought in several battles; then travelled far, settling eventually in Holland, where for twenty years he studied and wrote. Finally he returned to Stockholm, where he died. He established philosophy upon a new and surer foundation, and presented an entirely new basis for the study of mathematics.

Dewar, Professor Sir James

b. Kincardine-on-Forth, September 20, 1842.

A chemist of world-wide repute, he is the co-inventor of cordite, and was the first to obtain liquid and solid hydrogen. He has been President of the British Association, and the recipient of innumerable degrees and diplomas.

Diaz, President Porfirio

b. Oaxaca, Mexico, September 15, 1830.

The man who has "made" Mexico was intended by his parents to enter the Church, but he chose the sword, and plied it with deadly effect during those stormy days which followed the withdrawal of the French troops. He has twice been taken prisoner when engaged in revolutionary fighting, and had the narrowest escapes of death. But, fighting his way to the Presidency, he has remained there term after term, to suppress the revolt, disorder, bloodshed, and dishonesty which he found, and substitute peace and order, good government, commercial prosperity, and security. He has made Mexico the model nation of South America.

Dickens, Charles

b. near Portsmouth, Feb. 7, 1812. d. Gadshill, near Rochester, June 9, 1870.

"Mr. Micawber" is Dickens's own father, which helps us to realise how the son regarded his parent. He was a thriftless, helpless man, first a clerk in the Navy pay-office at Portsmouth, and years afterwards a Parliamentary reporter. The novelist had but a meagre education, but read eagerly all the books upon which he could lay hands. When his father lost his situation at Portsmouth, the family lived in poverty in London, and Dickens was compelled to work in a blacking factory, where, for six shillings a week, he pasted labels on the pots of blacking. From this he passed to a further spell of schooling, then had some experience in a lawyer's office, and finally entered journalism as a reporter of Parliamentary proceedings. Collecting some articles which he had written, he published them in book-form as "Sketches by Boz." This attracted the attention of a writer, who was able to recommend him to Messrs. Chapman & Hall when the latter contemplated starting a serial story to run with the illustrations to be drawn by Seymour, the artist. "Pickwick Papers," which began to appear in 1836, when Dickens was twenty-four, was the result. Success was assured after the first few instalments had appeared. Now fairly launched, he wrote "Oliver Twist," "Nicholas Nickleby," "Master Humphrey's Clock," "The Old Curiosity Shop," and "Barnaby Rudge," in rapid succession. He was famous throughout the English-speaking world by the time he had reached the age of thirty. Thereafter his popularity suffered a temporary decline, and it was because he was in debt that he went to Genoa to finish "Chuzzlewit," and afterwards applied unsuccessfully for the position of stipendiary magistrate in London. Upon the "Daily News" being established, Dickens was appointed editor, but soon relinquished the post to start a paper of his own. The stage had always an attraction for him, and this, as well as the prospect of great pecuniary gain, had much to do with his undertaking his famous readings. These succeeded beyond his wildest hopes in this country and in America, which latter country he visited for the second time when over fifty. He made great sums by his platform work; but the excitement and strain were too heavy a tax upon his energies, and he died suddenly at Gadshill, the home with which he had fallen in love as a youth, and bought as a man. Dickens's married life was not happy, and he and his wife separated twelve years before his death. They had seven sons and three daughters.

Diderot, Denis

b. Langres, France, October 15, 1713. d. Paris, July 30, 1784.

Diderot's forefathers had for generations been working cutlers, and he, receiving a classical education, was the first to break away from the family habit. His father thereupon discarded him, and he set to work to maintain himself by his pen. He undertook, with D'Alembert, an encyclopædia, and for this gathered about him all the greatest writers of France. But the philosophy of the authors was too revolutionary for the official public taste, and again and again Diderot was in danger of imprisonment. The sale was more than once prohibited, and D'Alembert threw up the work in despair. Diderot continued bravely at his task, though it took him twenty years to complete it. He enriched French literature in many ways, and gave a great impulse to intellectual progress.

Diophantus

Lived about 275 A.D.

The writer of the earliest extant treatise on algebra. Diophantus is not clearly to be traced in any records giving data concerning his birth and death. He lived at Alexandria in the third or fourth century, and wrote three works—"Arithmetics" (six of the thirteen books being extant), "Polygonal Numbers," and "Porisms." Algebra was diligently studied in the great days of the Arabian school of learning, but it is believed that the principles of the science were not known before the day of Diophantus. Even if they were so, however, he vastly enriched it. The famous Hypatia wrote a commentary on his works, but this, unfortunately, is not now in existence.

Disraeli, Benjamin, Lord Beaconsfield

b. London, December 21, 1804. d. London, April 19, 1881.

The son of a Jew, Isaac Disraeli, the distinguished man of letters, Benjamin underwent as a child the peculiar rites which made him a member of the Jewish community, but at the age of twelve was baptised at St. Andrew's, Holborn. Having established a reputation with one or two political novels, he travelled, then returned, to stand for Wycombe as an advanced Radical, but was not elected until 1837, when Maidstone chose him. He was now a Tory, and assiduously courted the favour of Peel, but, not winning the recognition he had expected, turned upon and helped to defeat him. Hitherto regarded as a needy adventurer, he now rapidly rose to power—became Chancellor of the Exchequer, and twice Prime Minister. He carried a democratic Reform Bill, abolished Church patronage in Scotland, bestowed upon the Queen the title Empress of India, did a good stroke for his country in acquiring the Suez Canal shares, and embarked upon an Imperial policy as to the wisdom of which politicians differ. To those of his own party he appeared a man of inspiration, of lofty ambitions, and exalted instincts; to his opponents, an unscrupulous, untruthful man, greedy of power, and prepared by any means to gain it. Disliked and distrusted at first by Queen Victoria, he became in time her most trusted counsellor. She made his wife—a wealthy widow, whom he, when thirty-five, had married when she was fifty-six—a viscountess,' and in 1876 conferred upon him an earldom.

Dollond, John

b. London, June 10, 1706. d. London, November 30, 1761.

The inventor of the achromatic telescope was the son of silk weavers, who had fled to England on the revocation of the Edict of Nantes. He learned his parents' trade, and was compelled, by the early death of his father, to forgo any ordinary education. But he denied himself sleep that he might study, and acquired languages and scientific knowledge with extraordinary facility. It was not, however, until he had a grown-up son that he forsook silk-weaving to apply himself practically to optics and invent the telescope, by which he is rendered for ever famous. After his death a curious fact was established. Dollond's discovery had been anticipated by thirty years. Another student had produced an achromatic telescope. This was clearly established in evidence upon trial, but the court held that the Dollonds' rights had been invaded when the earlier instrument was now placed upon the market. Hall, the other inventor, had "confined the discovery to his closet, and the public were not acquainted with it, and Dollond was to be considered the inventor." The lesson from this decision, which still holds good in law, is obvious.

Dryden, John

b. Aldwinkle, Northants, August 9, 1631. d. London, May 1, 1700.

A son of the parsonage, Dryden was first sent to Westminster, then to Cambridge, and entered upon his career as a sturdy Parliamentarian. He became eventually a convert to the Royalist side, and was Poet Laureate and Historiographer Royal, and at fifty-five seceded to the Roman Catholic Church. The sincerity of this conversion, coming with the accession of James II., has been impugned; but it seems to have been one of conviction, for when the Revolution was effected Dryden declined to take the oath, though his refusal cost him all hope of official emolument. He wrote his many plays solely for profit. His critical work, his poems, and his satires, were dearer to his heart, and among the finest works in the language. His translations, too, were admirable. He was a great master of pure English—bold, vigorous, original, with a perfect ear for the melody of language—and wrought a revolution in prose and versification.

Dumas, Alexandre

b. Villiers-Cotterêts, France, July 24, 1803. d. Puys, France, Dec. 5, 1870.

His father, General Alexandro Davy de la Pailletrie Dumas, was a famous soldier, son of a marquis and a Haytian negress named Dumas. The novelist and playwright had for his mother the daughter of a tavern-keeper. He was first a clerk, but devoted some years to study, with a view to a literary career. Once launched upon the sea of letters, his output was little short of marvellous. "The Three Musketeers," "The Black Tulip," and "Monte Cristo," and other works by which he is rendered famous throughout the world, were only items in an unparalleled flood of books. He was a terrible plagiarist—put his name to other men's work, and is even said to have contemplated issuing as his own story a prose version of part of Homer. He had nearly five score men as collaborators at one time and another during his career. They supplied plots and descriptions, but Dumas put magic into the scenes, and breathed life into the figures.

Edison, Thomas Alva

b. Milan, Ohio, U.S.A., February 11, 1847.

One of the most striking examples of what can be achieved when genius is supported by courage and determination, Edison's career was for years a struggle against disadvantages. He had little education, and when twelve years of age was turned out to earn his living as a newspaper-seller on a railway. He managed to set up a small printing-press on board a train, and to edit and print, and sell his own paper. In his spare moments he studied chemistry, and persuaded a telegraph-operator to teach him telegraphy. This led to his first invention, the duplex telegraph, by means of which messages can be sent from one wire to another without the aid of the operator. The printing telegraph machine followed, and after that, patent upon patent, the carbon telephone-transmitter, the microtasimeter, the aërophone, the megaphone, the phonograph, the incandescent lamp, and electrical appliances innumerable. The incandescent arc lamp he invented to suit his own wants. He could not get sufficient light to carry out the work upon which he was engaged, and never rested until he had devised his new method of illumination.

Elgar, Sir Edward

b. Broadheath, Worcestershire, June 2, 1857.

The greatest living English composer is an entirely self-taught man. His father was an organist, but Sir Edward cannot remember ever having a music lesson. For twenty years he studied and composed without recognition, but since then he has gained the highest honours in England and on the Continent, and is regarded not merely as the greatest master of English music, but as the foremost composer of the age.

Eliot, George

b. near Nuneaton, Warks, Nov. 22, 1819. d. Chelsea, Dec. 22, 1880.

One of the greatest novelists produced by England, "George Eliot" was in private life Mary Ann Evans, youngest daughter of a carpenter, turned land-agent. She received a sound education, and when her school-days proper were ended had lessons in German, Italian, and music. Her first literary effort was a translation of Strauss's "Leben Jesu," and this brought her in touch with the editor of the "Westminster Review," whom, after she had visited the Continent, she joined as assistant editor. She lived with the Chapmans, and there met all the literary lions of the period. Among them was George Henry Lewes, to whom she was introduced by Herbert Spencer. Lewes was married, but separated from his wife. The friendship of the young people ripened into affection, and they agreed to set convention at defiance. They lived together as man and wife until Lewes died. Her first effort in fiction, undertaken at the suggestion of Lewes, appeared in a magazine, under the pseudonym which she afterwards retained. Its success encouraged her to write "Adam Bede," which won for her an immense triumph. "The Mill on the Floss," "Silas Marner," and "Romola" followed, each gaining for her new laurels, but each making her writing more than ever a matter of anxiety. Towards the close her work suffered from over-elaboration, and too great care. Nevertheless, "Middlemarch" is considered by some her best work, even though one authority declared "Adam Bede" the "finest thing since Shakespeare." She wrote some poems, but it is as a novelist that George Eliot will always be remembered. Two years after the death of Lewes she married his and her old friend, Mr. John Cross, who afterwards wrote her life. She died the same year. Mr. Swinburne has said of her: "In George Eliot it is the most vivid and vital impulse which lends to her large intelligence the utmost it ever has of the spiritual breath and living blood of genius, and never had anyone such gift more plainly and immediately as from the very heart of heaven."

Elizabeth, Queen

b. Greenwich Palace, Sept. 7, 1533. d. Richmond, March 24, 1603.

It was the happy fortune of Queen Elizabeth to be born in an age of great men, an era which knew Shakespeare, and Spenser, Sidney, Raleigh, Howard, Drake, Hawkins, and the illustrious Lord Burghley. With skilful counsellors about her, and valiant men to do her bidding, she, with her "King's heart, the heart of a King of England," as she said, was bound to rank high in the roll of British sovereigns. Her early days were spent in obscurity. The daughter of Henry VIII. by his second wife, she was declared illegitimate. When her half-sister Mary ascended the throne she was subjected to close confinement, being suspected of complicity in Protestant conspiracies. Called eventually to the throne, she took the most important step of her life when she declared for a Protestant England, and refused the hand of Philip of Spain. Mary Queen of Scots was the centre of innumerable plots, and Elizabeth had her imprisoned, and, in the end, executed. This act was made the pretext for invasion by Philip of Spain; and the destruction of "the invincible Armada" was the result. English influence was vastly extended in Europe by Elizabeth, who made her country a world power for the first time. Her reign was distinguished for the advancement of learning, for the extension of commerce and enterprise, and, most of all, of course, for the establishing on a firm basis of the Protestant religion. Personally, Elizabeth was not an ideal character. She was vain and coarse, fickle and revengeful. She was a king in petticoats, but with the weaknesses of a woman of feeble character. Although she was too masterful to admit any special powers in Parliament, she prided herself on basing her rule on the confidence and affection of the people. Deficient in many amiable and moral qualities, she yet proved herself one of the greatest of sovereigns.

Emerson, Ralph Waldo

b. Boston, Mass., May 25, 1803. d. Concord, Mass., April 27, 1882.

"The Buddha of the West," as a distinguished admirer has called him, was for a few years a Unitarian minister at Boston. The views of his congregation not according with his own, he quitted the pulpit, to be henceforth known as lecturer, essayist, and poet. His works, which are as widely read in the Old World as the New, are an unfailing inspiration to the thoughtful. He was an idealist, an invincible optimist, and in religion a rationalist. Twice he visited England, and on the second occasion delivered a notable series of lectures on "Representative Men." His friendship with Carlyle dates from his first arrival in England. Emerson was twice married.

Empedocles

b. Agrigentum, Sicily, 500 B.C. d. Sicily, about 430 B.C.

Sufficient is now known of the life of this famous Sicilian philosopher and physician to dispose of the story that he threw himself into the crater of Etna. His fame and liberality were such that the people wished to make him king. This offer he declined, and established instead a democracy. His philosophy embodied the belief that the world was evolved from fire, air, water, and earth, and that the reverse process of dissolution proceeded under the varying struggle between forces termed affinity and antipathy.

Encke, Johann Franz

b. Hamburg, Germany, Sept. 23, 1791. d. Spandau, Prussia, Aug. 26, 1865.

Famed for his investigations as to the comet now named after him, Encke, who was a soldier before turning to astronomy, solved the problem of the sun's distance. He studied at Göttingen, and was successively astronomer at Seeberg and director of the Berlin Observatory.

Ennius, Quintus

b. Rudiæ, Calabria, 239 B.C. d. Rome, 169 B.C.

He was the pioneer of literature representative of Rome. A soldier, he returned from the wars under the patronage of Cato the Elder, through whose influence Ennius, believed to be of Greek extraction, was made a Roman citizen. He taught

Erasmus, Desiderius

b. Rotterdam, Holland, Oct. 28, 1466. d. Basel, Switzerland, July 12, 1536.

The father of Erasmus was the hero of Charles Reade's "Cloister and the Hearth," and the philosopher's real name was Gerrit Gerritszoon. The two terms which he adopted—the first Greek, the second Latin—have the same meaning—"the de-

Cambrai, who

Thereafter he travelled throughout Europe, was released from his monastic vow, and for some years held a professorship at Cambridge University. He was forty-nine when his great work the first edition of the New Testament in Greek—was published. His original writings, wise and witty, came afterwards. Although he exposed the abuses of the Catholic Church, he would not take any share in the Reformation, and would have been made a cardinal had not death prevented it.

Ericcson, John

b. Vermland, Sweden, July 31, 1803. d. New York, March 8, 1889.

A born inventor, who before he was nine had constructed a working model of a water-power sawmill, Ericcson was compelled to waste several years of his life in the Swedish army. All his leisure was devoted to planning mechanical contrivances, and upon coming to England he built a steam-engine to compete against Stephenson's famous "Rocket." Ericcson's ideas were ahead of the times. His steam fire-engine was rendered a failure by popular prejudice and ignorance; while the story of his efforts to induce the Admiralty to test his screw propeller for steamships is historic. He designed the first vessel driven in this manner across the Atlantic, and himself took up his residence in America, where the reception of his schemes was scarcely more friendly than had been the case in England. In spite of all obstacles, he completely revolutionised marine navigation and the building of warships. From his schemes endless achievements have resulted, while the inventions which he carried to perfection serve still as finger-posts for others' guidance.

Euclid

b. Alexandria, about 300 B.C. d. Alexandria, date unknown.

Beyond the fact that he flourished in Alexandria under the first of the Ptolemies, about 300 B.C., dates as to the career of this famous mathematician are not available. It is believed that he founded the great mathematical school of Alexandria, so performing a service of prime importance to the cause of exact science. His chief work extant is the "Elements," which to this day continues the textbook for elementary geometry in the United Kingdom. He did not invent the system to which his name is given. He compiled, arranged, and permanently recorded known mathematical truths.

Euripides

b. Salamis, Greece, 480 B.C. d. Macedonia, 406 B.C.

The last of the Greek tragedians, and the model upon whose style the modern French and Italian drama is fashioned, was born when heroic history was being made by Greece. He did not catch the martial spirit of the age, but passed his youth in study, he became a poet, philosopher, and dramatist of infinite power and passion, and of inexhaustible love for the weak and suffering. Of his eighty plays, eighteen are preserved.

Eyck, Jan Van

b. Maaseyck, Prussia, about 1390. d. Bruges, Flanders, July 9, 1440.

system of mixing colours with oils for painting. The brothers painted together as a rule. Their greatest work—the altar-piece for the cathedral at Ghent—was one of their joint efforts. In the National Gallery, London, are fine examples of Jan's individual work.

Fahrenheit, Gabriel Daniel

b. Dantzic, Prussia, May 14, 1686. d. Holland, Sept. 16, 1736.

space between this point and that to which the mercury rose at the temperature of boiling water

Faraday, Michael

b. London, Sept. 22, 1791. d. Hampton Court, Aug. 25, 1867.

Newington Butts was the birthplace of Faraday; a blacksmith, his father. He received but a scanty schooling, and owed to an accident his chance of winning success in life. He was apprenticed to a bookbinder, one of whose customers, attracted by the intelligence of the apprentice, gave him four tickets for Sir Humphry Davy's lectures at the Royal Institution. Of this opening Faraday took such advantage that Davy, reading his notes on the lectures, appointed him his assistant and amanuensis, and took him for a tour on the Continent. Later, Faraday was appointed professor of chemistry at the Royal Institution, and for the rest of his days devoted himself to scientific research. His discoveries covered the whole field of magnetism, diamagnetism, electro-magnetism, and electricity proper. He elucidated the application of induced electricity to lighthouses, the firing of mines, telegraphy, and the magnetic currents of the earth. Within the space at command it is impossible even to indicate the number and scope of his discoveries of first importance. His lectures were famous, his writings models of lucidity and pure English. Few great men have received a more slender educational equipment, but none has eclipsed the importance and varied character of his investigations.

Fawcett, Henry

b. Salisbury, Aug. 26, 1833. d. Cambridge, Nov. 6, 1884.

Fawcett's life-story is another exemplification of the fact that will is greater than physical faculties. He was blinded when a youth by a shot from his father's rifle, but bravely bore his handicap, became a member of Parliament, and as Postmaster-General gave us the parcel post, postal orders, and the sixpenny telegram.

Ferguson, James

b. Keith, Banffshire, April 25, 1710. d. London, Nov. 17, 1776.

The man who, by his lectures and writings, and still more by his mechanical appliances, did much to popularise astronomy in England, was almost wholly self-taught. He learned to read from hearing his father teaching his brother. He gained his first idea of mechanics by seeing his father plying the lever. While working as a shepherd boy he made models of mills and other machines, and at night studied the stars, and planned the heavens with beads strung upon threads. For some years he was able to maintain his family by painting miniature portraits.

Fichte, Johann Gottlieb

b. Rammenau, Germany, May 19, 1762. d. Berlin, Jan. 27, 1814.

A son of poor parents, Fichte lacked the means to qualify for the Church, so took service as a tutor until he could afford to devote himself wholeheartedly to the teaching of Kant. He published an essay which was mistaken as being from the pen of that philosopher, and this proved the making of the younger man's reputation. He was appointed professor of philosophy at Jena, and there remained until he was falsely charged with Atheism. He removed to Berlin, where he lectured and wrote. Napoleon's great victories over the Germans called forth Fichte's famous Addresses to the German nation, in which he pointed out that the true way to national regeneration lay in a system of public education. After the war Fichte was invited by the king to draw up a constitution for a new university, and became its first rector. He died of fever, contracted through nursing his wife, who had herself taken it while tending the wounded German soldiers, of which the Berlin hospitals were full.

Fielding, Henry

b. Glastonbury, Somerset, April 22, 1707. d. Lisbon, Oct. 8, 1754.

"The father of the English novel" was the son of a general, and half-brother of Sir John Fielding, the famous blind magistrate of Bow Street. He became a theatre proprietor, but his bold attack upon the ministry of the day led to his being driven out of this venture. He was called to the Bar, but turned to literature, to write the novels which have made him immortal.

Finsen, Niels Ryberg

b. Faroe Islands, Denmark, 1861. d. Copenhagen, Sept. 24, 1904.

Crowned by the discovery of the application of light to the cure of disease, Finsen's career was one long battle against disease. Twenty years before the end came he knew that he was a doomed man, yet sought the physical salvation of others, though he knew that his own life was ebbing away. His famous light cure for lupus was first made popularly known in England through the wisdom and goodness of Queen Alexandra.

Flaxman, John

b. York, July 6, 1755. d. London, Dec. 7, 1826.

Destined to rank at the head of English sculptors for inventive power, controlled by unerring sense of beauty, Flaxman was the son of people in the poorest circumstances. He himself was seriously deformed. His genius discovered itself when he was engaged by the Wedgwoods to draw designs for their pottery. He taught himself Latin and Greek enough to enable him to read the poets, and spent seven years in Italy, where he executed numerous classical groups and drew illustrations for Homer. From his return to England to the end of his days he was engaged upon monumental sculpture, though he found time to discharge the duties of professor of sculpture to the Royal Academy.

Fo-Hi

flourished about 2400 B.C. d. Chin-Chao.

China gets her political and social system from Fo-Hi, who is supposed to have lived in the twenty-fourth century before the Christian era. Marriage, the division of time and of seasons, the calendar, the use of metals and minerals, of building, fishing, and hunting, are among the institutions said to have been originated by this representative of the founders of the oldest known civilisation

Fox, Charles James

b. London, Jan. 24, 1749. d. Chiswick, Middlesex, Sept. 13, 1806.

"The greatest debater the world ever saw" was Burke's description of Fox. He was the third son of the first Lord Holland. In Parliament he opposed the coercion of our American colonists and the war with France. Although George III. cordially disliked him, he was twice Foreign Secretary. He was engaged upon a bill for the abolition of slavery when laid low by death. Fox's private life was deplorable.

Fox, George

b. Fenny Drayton, Leicestershire, July 1624. d. London, Jan. 13, 1691.

The founder of the Society of Friends, or Quakers, was a worthy itinerary preacher who, the son of a weaver, served an apprenticeship to bootmaking. His outspoken denunciation of forms of worship of which he did not approve caused him to be the victim of repeated persecution and imprisonment. But he made converts wherever he appeared, and they suffered with him. During the latter part of his career he was accompanied by Penn, and visited, among other places, America and Holland.

Francis, St., of Assisi

b. Assisi, Italy, 1182. d. Assisi, Italy, Oct. 4, 1226.

His surname was Bernardone. A serious illness turned him from a life of profligacy to that of an ascetic, vowed to chastity and poverty. He gathered about him others who subscribed to the conditions, and founded the famous Franciscan brotherhood. After a visit to Egypt, where he preached before the Sultan, and obtained for his order the guardianship of the Holy Sepulchre, he retired to a hermit's cell, where tradition alleges he received upon his own person the wounds of the Saviour. He was canonised two years after death.

Franklin, Benjamin

b. Boston, Mass., Jan. 17, 1706. d. Philadelphia, April 17, 1790.

The man who, by a novel experiment, was to discover that lightning and electricity are identical, to establish the distinction between positive and negative electricity, and achieve other scientific triumphs, began his career as a "printer's devil" in the newspaper office of one of his brothers. His life was amazingly active. He set up a press of his own in Philadelphia after having worked for eighteen months in a London printing-office, published with unprecedented success "Poor Richard's Almanack," returned to England on a diplomatic mission, and was honoured by scientific bodies and both Universities. While carrying on his business as a newspaper proprietor he discharged more or less important offices under Government, and at the same time conducted scientific investigations as to tides, meteorology, and colours. Prior to the War of Independence he came again to England, in the hope of securing the rights of his fellow colonists. Failing, he returned, took an active part in preparing the Declaration of Independence, then proceeded to Paris, and negotiated a treaty whereby France recognised the new Republic and lent armed assistance. Eventually he opened a correspondence with England which paved the way to peace. Thereafter he was American Ambassador to France, and subsequently filled various offices at home. One of the most completely successful men of any age in all the branches of activity in which he engaged, Franklin left behind him writings which to this day continue to be read by every nation which has a written language.

Franklin, Sir John

b. Spilsby, Lincs., April 16, 1786. d. King William's Land, June 11, 1847.

He discovered the North-west Passage, but died, probably starved to death, in the scene of his triumph. After serving at the Battle of Copenhagen and at Trafalgar, and mapping parts of the coast of Australia, he twice commanded Arctic exploring expeditions, and received honourable reward for successes gained. For seven years he was governor of Van Diemen's Land (Tasmania). On May 18th, 1845, he sailed in command of the two

Government ships Erebus and Terror, and never returned. In the twelve years following his departure thirty-nine relief expeditions were sent out by England and America. The last—one of five despatched by his widow—discovered all that there was to be learned. The party had suffered frightful privations, and had all died. A memorandum was found giving the date of Sir John's death. Some of the victims had resorted to cannibalism in their agony of starvation.

Fraunhofer, Joseph von

b. Straubing, Bavaria, March 6, 1787. d. Munich, June 7, 1826.

A skilled optician, who did much to improve the telescope and other optical instruments, he is chiefly famous as the discoverer of the dark lines in the sun's spectrum, named, in his honour, "Fraunhofer's lines."

Frederick II., The Great

b. Berlin, Jan. 24, 1712. d. Sans Souci, Potsdam, Aug. 17, 1786.

When Frederick came to the throne of Prussia, Germany was loosely ruled by some three hundred men of different titles. There was no cohesion or national spirit, so when the Emperor Charles VI. of Germany died, and the validity of his daughter's succession was impugned, Frederick determined to take Silesia, part of which had anciently belonged to Prussia. The number of his people was inconsiderable—only half that of London—but he had a highly-organised army of eighty thousand men and a well-filled treasury. He was everywhere successful, and added Silesia to his own dominions. An alliance which he had concluded with France and Bavaria was now terminated, but he was afterwards forced to renew this and to enter upon a second war. His third and last war was the greatest and most terrible. Allied against him were France, Austria, and Russia, an unparalleled combination. England had been helping him with subsidies, but this source of revenue was stopped. What would have happened had not the Empress of Russia died, and the course of events been thus unexpectedly altered, it is difficult to imagine. He had fought with magnificent skill and courage, but the odds had become overwhelming. Still, he had not allowed his country to incur one penny of debt, though the land had been reduced almost to starvation. The latter part of his reign was spent in peace. He added a part of Polish Prussia to his dominions, and he retained Silesia. For the rest, he was happiest when promoting the educational and material interests of his people. He loved literature and the arts. He was a friend of Voltaire, and had him for some time at Berlin. Frederick deserved the appellation "The Great." Had not his time been so much occupied with wars, he would have proved a still greater man.

Froissart, Jean

b. Valenciennes, France, 1337. d. Chimay, Belgium, about 1410.

The chronicler of the knightly doings in Court and camp of the fourteenth century was the son of a Flemish painter of armorial pictures. Showing aptitude for poetry, he attained Court favour and a recommendation to the English Court, where he was patronised by the Queen of Edward III. Thus favoured, he made tours throughout this country, and afterwards in France, Germany, Italy, and Spain, and collected also details as to Hungary and the Balkan Peninsula. His influential introductions and his own pleasant bearing and address served to bring him tales of chivalry, and of more serious affairs wherever dames and knights or squires assembled. He gives us a delightful picture of the Europe he knew from the third decade to the end of the last of the fourteenth century. His poems and romances have merit, but the "Chronicles" are for all time.

Fuller, Thomas

b. Aldwinkle, Northants, June, 1608. d. London, Aug. 16, 1661.

This witty divine and historian was a son of the rectory, and as a youth imbibed principles which made him all his life a sturdy Royalist. He suffered for his loyalty, but made good his losses at the Restoration. Of his writings, the most famous is his "English Worthies," a posthumous publication, to which he had devoted twenty years' work. It is one of the great classics of the language. "A tithe of his beauties," says Coleridge, speaking of his style, "would be sold cheap for a whole library of our classical writers, from Addison to Johnson, and Junius inclusive."

Fulton, Robert

b. Little Britain, Pa., 1765. d. New York, Feb. 24, 1815.

Born of Irish parents, Fulton came to London to study portrait painting, but after some years devoted himself wholly to engineering, and was the first successfully to apply steam to navigation. He had many disappointments with other inventions, prejudice and ignorance being in alliance against him.

Gabelentz, Hans Conon von der

b. Altenburg, Germany, Oct. 13, 1807. d. Triptis, Germany, Sept. 3, 1874.

One of the most gifted of philologists, he was master of eighty languages. He wrote upon tongues of which previously little had been known. His son, who outlived him only nineteen years, was an accomplished Orientalist.

Gainsborough, Thomas

b. Sudbury, Suffolk, May, 1727. d. London, Aug. 2, 1788

In the estimation of Ruskin, Gainsborough was the greatest colourist since Rubens. The son of a wool manufacturer, he showed from the earliest age a gift for sketching, and when fourteen was sent to London to study. Four years later he returned to his native place, married a lady with means, and set up a studio as a portrait painter—first at Ipswich, then at Bath. There he remained for fourteen years, painting many fine portraits. Removing to London, he became one of the founders of the Royal Academy, from which he withdrew four years before his death, annoyed at the position awarded to his picture, "The King's Daughters." His works numbered upwards of three hundred, of which more than two-thirds were portraits. Gainsborough was a man of impetuous temperament, but on the whole singularly lovable, musical, sociable, generous, loyal.

Galen, or Claudius Galenus

b. Pergamos, Asia Minor, 131 A.D. d. Sicily (?), about 200 A.D.

This celebrated Greek physician and philosopher revived the old systematic study of medicine and surgery, and enriched it with independent research of inestimable value. He was the standard authority and fount of learning to whom students turned for the next twelve centuries. He travelled far in quest of knowledge, but was driven from Rome by the jealousy of the physicians there. Of his treatises, some four score remain to us—valueless now in the light of modern knowledge, but wonderful records of the industry and talent of a man vastly ahead of his time.

Galileo

b. Pisa, Italy, Feb. 15, 1564. d. Arcetri, Florence, Jan. 8, 1642.

Galileo Galilei, the father of physics, was descended from a noble but impoverished Florentine family, originally named Bonajuti. As a child he displayed versatile genius in music, in modelling, in painting, and in mechanics. While in his youth he invented the first instrument ever devised for accurately observing phenomena in a living organism—a pendulum for recording the speed of the pulse. After studying at Pisa University, he constructed a thermometer, improved the telescope, and turned it for the first time towards the heavens, with the result that he discovered the satellites of Jupiter, proved the existence of sun-spots, and became persuaded of the truth of the Copernican theory. He carried the subject much farther, and, the attention of the theologists thus drawn afresh to the matter, the works of Copernicus were placed on the "Index Expurgatorius," and Galileo compelled to vow that he would not defend their teaching. Some years later his own "Dialogues of the Two Systems" was published. Thereupon he was summoned to Rome, and compelled, under threat of death or torture, to sign a formal abjuration of the Copernican doctrine. He yielded, and did not suffer the torture commonly believed to have been his fate. But his activities were not checked. He worked on, even when sight failed him, preparing the way for Newton and the other giants who were to follow.

Gall, Franz Joseph

b. Tiefenbronn, Baden, March 9, 1758. d. near Paris, Aug. 22, 1828.

He is commonly called the founder of phrenology. He never used the latter word; his disciples, who are said to have resembled him only in his mistakes, coined it. Their master did not make conformation of the skull the foundation of his system. The functions of the brain itself were his study. He was the son of a physician, and was prohibited from lecturing in Vienna on his theories, on the ground that they were subversive of religion. He lectured through a great part of Europe, and became famous as a physician in Paris, where his closing years were passed.

Galton, Francis

b. Birmingham, 1822.

A grandson of Erasmus Darwin, and cousin of Charles Darwin, he has gained distinction as explorer and philosopher. His researches have done much to advance the knowledge as to heredity. Latterly he has rendered a public service by investigations of finger-prints. His calculations go to prove that the chances against the impressions made by two different fingers resembling each other are one to 64,000,000,000. He thus places at the disposal of the authorities a potent means for the detection of criminals.

Galvani, Luigi

b. Bologna, Italy, Sept. 9, 1737. d. Bologna, Dec. 4, 1798.

A noted physician and physicist at Bologna, he conducted experiments with metals placed in contact with the muscles of dead frogs, and came to the conclusion that electricity or magnetism was an animal product. He was wrong, of course; but he has an important place in the story of knowledge, inasmuch as it was his experiments which gave Volta a clue to the important solutions at which he was able to arrive. Galvanism takes its name from Galvani.

Gama, Vasco da

b. Sines, Portugal, about 1469. d. Cochin, India, Dec. 24, 1524.

Charged by his sovereign with the duty of finding a sea route by way of the Cape to India. Da Gama valiantly discharged his mission, established a Portuguese station at Calicut, Malabar, and returned. A succeeding mission was massacred, and Da Gama led a punitive expedition in consequence, and afterwards went out as Viceroy. His work was destined enormously to enrich Europe, and England in particular.

Garibaldi, Giuseppe

b. Nice, Italy, July 4, 1807. d. Caprera, Italy, June 2, 1882.

The son of a seafaring man, and educated for the Church, Garibaldi preferred the sea, became involved in the Young Italy movement, was sentenced to death, but escaped to South America, where he fought in more than one revolutionary war. His return to Italy was followed by another flight to America, where he followed the trade of a candle-maker. This occupation gave place to that of a farmer on the Island of Caprera, near Sardinia, which, by the generosity of English admirers, was, later in his life, made his own property. From this point, until the liberation of Italy was consummated, his days were given to fighting for the freedom of his native land. He was a born leader of guerilla troops, but not gifted in statesmanship, and his career included many mistakes, for which he paid dearly. But he was a sincere, unselfish patriot, and in England was treated as a hero.

Gay-Lussac, Joseph Louis

b. St. Leonard'le Noblat, Haute-Vienne, 1778. d. Paris, May 9, 1850.

Distinguished as physician and chemist, he is renowned for his researches on chemical combinations, the results of which were highly important to commerce. He made the discovery of the law of volumes, and was the first man to make a balloon ascent for scientific purposes.

Ged, William

b. Edinburgh, 1690. d. Leith (?), Oct. 19, 1749.

The man who first invented stereotyping, a highly important advance upon the original method of printing from the old movable types, had all his life to fight ignorance, prejudice, and jealousy. These won the day, and, in spite of the manifestly valuable character of his work, he died broken-hearted and in abject poverty.

Gibbon, Edward

b. Putney, April 27, 1737. d. London, Jan. 16, 1794.

"It was at Rome, on the 15th of October, 1764, as I sat musing among the ruins of the Capitol, while the barefooted friars were singing vespers in the temple of Jupiter, that the idea of writing the decline and fall of the city first started into my mind." So came the inspiration for our greatest work in history, "The Decline and Fall of the Roman Empire." A work of such magnitude and splendour could hardly have been expected of the man. He had had little regular scholastic training, owing to ill-health. His stay at Oxford resulted in his conversion to Roman Catholicism. This caused his father, a man of comfortable circumstances, to send him for five years to Lausanne, where the judicious handling of a Calvinistic tutor brought him back to his first faith. Here Gibbon read prodigiously, and remembered what he read, and stored up the knowledge which was to serve him for his great work. He had a love affair here, of which the heroine was to become the wife of M. Necker, and mother of the famous Madame de Staël. Upon the death of his father, he sat for some years in Parliament, but never addressed the House, and though he was granted a sinecure office it lasted but three years. The preparation of his first volume of the history occupied him many years. The others were written with striking rapidity, and the last was published six years before his death, which occurred following his return from Lausanne, where he had lived since 1783, and where nearly half his book was written. Except an autobiography, he wrote little worth mentioning beyond the history, but that amply sufficed to give him immortality.

Giotto, di Bondone

b. near Florence, 1276. d. Florence, Jan. 8, 1337.

His genius for art betrayed itself while he was a boy tending sheep. A generous patron, seeing him sketching upon a stone, had him properly instructed, and he became the head of a famous Florentine school of painting. Many fine specimens of his work remain. He designed the Campanile at Florence.

Gladstone, William Ewart

b. Liverpool, Dec. 29, 1809. d. Hawarden, May 19, 1898.

The fourth son of Sir John Gladstone, Bart., a Liverpool merchant of Scottish descent, he was educated at Eton and Oxford, and entered Parliament, representing Newark as "a rising hope of the stern, unbending Tories," as Macaulay said

He held minor offices under Peel in the Administrations of 1834 and 1841, and though he was out of Parliament when the Corn Laws were abolished, he had a great share in preparing the measure which Peel passed. From this time he gradually drifted away from Tory traditions; and after he had raised the questions as to the condition of Greece and of the Neapolitan prisons, a speech of his caused the rejection of Disraeli's Budget of 1852. This led to Gladstone's being made Chancellor of the Exchequer in the Coalition Government which followed. Now and later he showed that genius for finance which made him the greatest Chancellor of our own day. He abolished many vexatious taxes, among them that on paper. Over the Crimean War and the Civil War in America his attitude excited criticism, and he lost his seat at Oxford University, for which he had sat eighteen years. South Lancashire elected him, and, Palmerston dying, Gladstone became Leader of the House of Commons and Chancellor of the Exchequer. His Franchise Bill unexpectedly caused the overthrow of his party, which, however, at the next General Election, gained a great majority, and made him Prime Minister. To take his seat, he had to be elected for Greenwich, South Lancashire having rejected him. The Irish Church was disestablished, the Education Bill of 1870 passed, and the Ballot Bill made law. The elections of 1874 were adverse to Gladstone, and Disraeli became Premier, whereupon the Liberal leader retired temporarily into private life, to be recalled by the Bulgarian massacres and his complete disagreement with Disraeli's foreign and domestic policy. Midlothian returned him as its member in March, 1880, and for that division he sat until the end. He again took office as Premier, and five very troubled years followed. Crime in Ireland, the Bradlaugh incident, affairs in Egypt and the Soudan, and the whole foreign policy of the Government, tended to make the period one of the most exciting and exacting of the century. Again the verdict at the polls was in his favour, but his Government lasted only a brief time, Home Rule causing a serious cleavage, and sending the Liberal party into exile for the next six years. In 1892 the country for the last time gave Gladstone a majority, and he passed his Home Rule Bill through the Commons for the House of Lords to reject it. Then he retired, compelled by failing sight and hearing to withdraw from the scene in which for over three score years he had been a principal and splendid figure. He was a man of intense enthusiasms, lofty ideals, untiring industry, one of the greatest orators and debaters this country has produced, and a writer of the first rank upon poetry and classical and theological subjects.

Gluck, Christoph Willibald

b. Weidenwang, Bavaria, July 2, 1714. d. Vienna, Nov. 15, 1787.

He was the son of a forest keeper in a princely household, and from his cradle showed musical talent. After study and teaching at Prague, Vienna, and Milan, he came to London, as composer of operas for the Haymarket. Here he was enabled to study Handel, and this led to his reaching his highest work. Returning to Vienna, he became the music-master of Marie Antoinette, who materially assisted him in the production of the operas which have made him famous wherever music is sung or played.

Goethe, Johann Wolfgang

b. Frankfort-on-the-Main, Aug. 28, 1749. d. Weimar, March 22, 1832.

Another example of a career turning out differently from parents' designs, Goethe was intended by his father to follow the law, and did actually practise, but literature had always the stronger appeal. A love affair—one of many which are reflected in his poems—inspired the first production, a little pastoral drama. Once begun, there was no end to the flow. Poems, plays, scientific and philosophical writings, even novels, streamed from his fertile brain. In 1775 he was invited by the young Duke Karl August to make his home at Weimar, and there he lived to the end of his days, except when he accompanied his patron, who went forth to fight the French. Goethe was an able statesman, and performed service of note for Weimar. One of his many love affairs led to an association with a beautiful girl of humble birth, whom he eventually married.

Goldsmith, Oliver

b. Pallas, Ireland, Nov. 10, 1728. d. London, April 4, 1774.

Good results have seldom been won from more unpromising material than in Goldsmith's case. The son of an Irish curate, he spent his youth unworthily. With no sense of the value of money, he gambled away the little which should have carried him to America, ran away from college, was rejected on seeking to take Orders, continued his dissipation in Edinburgh and on the Continent, and reached London well-nigh penniless. Here he passed a wretched existence as chemist's assistant, as hack-writer and proof-reader, and as usher. Better times dawned with the production of his essay on the condition of learning in Europe—written to raise funds to enable him to leave the country. Thought of emigration abandoned, he wrote, sandwiched between hack-work, his delightful poems, his immortal novel "The Vicar of Wakefield," and his drama "She Stoops to Conquer." He was improvident to the last, and died owing two thousand pounds. A genius of a high order, he was erratic and unstable.

Gounod, Charles François

b. Paris, June 17, 1818. d. St. Cloud, Oct. 18, 1893.

Son of a painter of no little ability, his talent for music early asserted itself, enabling him to carry off the Grand Prix de Rome before he was twenty-one. His stay in Rome gave him an insight into sacred music, which was to serve him later in life. When he returned to Paris, he tried in vain to find a publisher for some songs which he had written, so accepted a post as church organist, and made up his mind to take Orders. Instead of carrying out this plan, he was persuaded to write an opera. "Sappho" was the result, satisfactory if not brilliant. No commanding success was won until he took Goethe's "Faust" for a subject. That proved the greatest success in French music of the latter half of the nineteenth century. "Romeo and Juliet," his next best work, appealed as strongly to him, but he felt older when he wrote this. The Franco-Prussian War drove him to London, where he wrote a composition for the opening of the Albert Hall, and some songs, of which "Maid of Athens" is best known. Upon his return to Paris he composed operas, and then turned to sacred music. "The Redemption," dedicated to Queen Victoria, is the effort in this direction most esteemed in this country. He was a man of tireless activity, with innumerable works to his credit, but he will be best remembered by those mentioned.

Gray, Elisha

b. Barnesville, Ohio, Aug. 2, 1835.

No history of the telephone is complete which fails to place the name of Gray in the forefront. He claims, indeed, to be the inventor of the instrument. His title to fame, however, does not rest on ground so well occupied, for he has taken out scores of patents in rel
pliances mainly concerned
telephony.

Gray, Thomas

b. London, Dec. 26, 1716. d. Cambridge, July 30, 1771.

Associated as a boy at Eton with Horace Walpole, he accompanied the latter on the "grand tour," but quarrelled and parted from him, and went to Cambridge, and there had his residence, except for holidays spent with his mother at Stoke Pogos. After refusing the Poet Laureateship, he became professor of modern history at Cambridge. His best-loved poem is the "Elegy Written in a Country Churchyard," one of the most perfect gems in the language; next, the "Ode on a Distant Prospect of Eton College." His most ambitious work is "Progress of Poesy," a noble composition. He lived a life of quiet days, was never married, and was one of the most painstaking poets of any time.

Green, John Richard

b. Oxford, Dec. 12, 1837. d. Mentone, March 7, 1883.

Readers of "Robert Elsmere" will recognise Green in the hero of that novel. He was educated at Oxford, and entered the Church of England, but—partly through ill-health, partly through failing sympathy with its doctrines—he relinquished his association with the Church, and devoted himself to literature. His "Short History of the English People" had an unprecedented success, and is the introduction of practically all students into the history of our country. This, like his larger schemes, was written while he suffered terribly from ill-health. He was greatly beloved by a wide circle of friends, and the story of his long battle against suffering and incurable disease is an object-lesson by which all may profit.

Gregory XIII.

b. Bologna, Italy, Feb. 7, 1502. d. Rome, April 10, 1585.

He was a professor of law for many years before distinguishing himself as one of the theologians at the Council of Trent. Elected Pope when seventy years of age, he made his pontificate memorable by imposing upon Catholic Europe the Gregorian calendar. No revision having been made since the days of Julius Cæsar, there had arisen a discrepancy of ten days. He caused ten days to be eliminated from the month of October, 1582, and modified the plan as to leap years. It took nearly two centuries to get the reform accepted in England, but in the end there was no alternative to the adoption of the Gregorian calendar. Gregory was an enlightened Pope, and spent an enormous sum of money in promoting education. The one blot upon his career was his ordering a "Te Deum" in Rome upon the occasion of the St. Bartholomew massacres. That, however, may have been the outcome of the massacres being represented to him as the suppression of a Huguenot plot and rising.

Gresham, Sir Thomas

b. London, about 1519. d. London, Nov. 21, 1579.

The son of a prosperous Norfolk merchant, Gresham made a fortune in financial operations, and displayed such unselfish patriotism as to effect a salutary influence for good upon the national credit. Towards the end of his life he founded the Royal Exchange, Gresham College, and a number of almshouses.

Grimm, Jacob Ludwig Karl

b. Hanau, Germany, Jan. 4, 1785. d. Berlin, Sept. 20, 1863.

It is as part-author, with his brother Wilhelm, of the delightful fairy stories for children that Jacob Grimm is famous throughout Christendom; but his reputation is based upon higher ground. He was one of the most accomplished philologists ever produced by Germany, and his great dictionary and German grammar are among the most notable of that class of work in existence. He is the father of comparative Germanic philology. Like his brother, he studied law at Marburg, and together they shared the duties of librarian to their patron, the King of Westphalia, and simultaneously filled professorial chairs at Göttingen.

Grote, George

b. Beckenham, Kent, Nov. 17, 1794. d. London, June 18, 1871.

The author of the monumental history of Greece spent thirty-two years of his life in the bank which his grandfather had founded, and of which he eventually became the head. He sat for some years in Parliament, and was an earnest advocate of electoral reform. In addition to the famous history, he wrote an exhaustive work on "Plato and the Other Companions of Socrates," and was engaged up to the time of his death upon a volume on "Aristotle."

Grotius, Hugo

b. Delft, Holland, April 10, 1583. d. Rostock, Germany, Aug. 28, 1645.

From his youth up a diligent student of law, Grotius was early initiated into diplomacy, and turned his attention to the study of International law, of which he may be said to have been the father. His works upon the subject were for long the standard authority. Theological conflict caused his expulsion from the Netherlands, and he found sanctuary in Paris, to which he was subsequently sent as Ambassador for Sweden. He died while on a return journey from Stockholm. Although law was his absorbing study, he was also a gifted poet, a sound historian, and a statesman of rare ability.

Grove, Sir George

b. Clapham, Aug. 13, 1820. d. Sydenham, May 28, 1900.

In early life an engineer, Grove erected the first two cast-iron lighthouses in the West Indies, and assisted in the construction of the Britannia tubular bridge. An extraordinarily versatile man, he became secretary of the Society of Arts, edited a famous magazine, edited and partly wrote the admirable Dictionary of Music and Musicians to which he gave his name, and acted as a director of the Royal Academy of Music.

Grove, Sir William Robert

b. Swansea, July 14, 1811. d. London, Aug. 1, 1896.

As distinguished for versatility as his namesake, he was famous first as a lawyer, then as a judge of the Court of Common Pleas, and, chiefly, as a great physicist. He invented the Grove voltaic battery, and greatly advanced the whole science of electricity and optics, as well by his lectures from the chair of Natural Science at the London Institution as by his books.

Guericke, Otto von

b. Magdeburg, Prussia, Nov. 20, 1602. d. Hamburg, May 11, 1686.

After a long course of study at the best Continental universities, and visiting France and England, he became engineer-in-chief in the Swedish army. Civic appointments allowed him to devote his attention to experiments, with the result that he invented the first air-pump, and fashioned the famous "Magdeburg hemispheres," which, being deprived of air, were not pulled asunder until the united strength of fifteen horses had been employed. He invented also the air-balance, and made important discoveries in electricity.

Guido d'Arezzo

b. near Paris, about 990. d. Arezzo (?), near Paris, about 1050.

It is not quite accurate to say that Guido d'Arezzo invented the notation of music, but it is indisputable that he first devised—or, at any rate, first systematically employed—the lines of the staff and the intervals between them. The importance of this advance from the chaotic conditions previously existing can hardly be overstated. He seems to have invented the F clef. Undoubtedly he gave their names to the first six notes of the scale—ut, re, mi, fa, sol, la—these being the first syllables of six lines of a hymn addressed to John the Baptist. It was Guido's boast that by his system a pupil could learn more music in five months than by previous methods he could learn in ten years. Pope John XIX. was one of his most notable and successful pupils. The reformer was a monk, and, like most other reformers, persecuted by his contemporaries.

Gurney, Sir Goldsworthy

b. Treator, Cornwall, Feb. 14, 1793. d. Reeds, Cornwall, Feb. 28, 1875.

Trevithick's experiments with the steam-engine inspired young Gurney to efforts in the same direction. The result was his steam-carriage, which, in July, 1829, ran from London to Bath and back again on the open road at the rate of fifteen miles an hour, the first vehicle driven by steam to accomplish such a journey. The success of the enterprise was immediately nullified by Parliament, which, carried away by stupidity and folly, passed laws imposing prohibitive tolls. Gurney's steam-jet, however, was very successful. It was employed by George Stephenson for his famous "Rocket," and raised its speed from twelve miles to twenty-nine miles per hour. It was succesfully applied, too, to steamboats and furnaces, and had a great influence in the manufacture of iron. The so-called "Drummond light" was Gurney's invention; so was the oxyhydrogen blowpipe. In his Royal Institution lectures, where he had Faraday among his listeners, he anticipated the principle of the telegraph. He lighted and ventilated the Houses of Parliament, invented a gaslight derivable from oil, and in many ways showed himself one of the great master minds of his age. His work in connection with lighthouses was specially important.

Gustavus Adolphus

b. Stockholm, Dec. 19, 1594. d. near Leipzig, Nov. 16, 1632.

Upon succeeding to the throne of Sweden, Gustavus found upon his hands wars with Denmark, Russia, and Poland. Girt about by enemies, torn by internal dissensions, with the kingdom weakened by the loss of territory. Sweden seemed in hopeless case. Gustavus was her saviour. He had been trained to statecraft; he showed now that he was a born warrior and leader of men. He healed the feuds by which his kingdom was rent; he fired his nobles with patriotism; he encouraged commerce and learning, and gave Sweden a new spirit. Peace was concluded with Denmark; Russia was compelled to relinquish to Sweden her Baltic provinces of Livonia, Esthonia, and Courland; Poland agreed upon a six years' truce. Then came work of wider character. Austria, crushing German Protestantism, was rapidly making herself supreme, and threatening both France and Sweden. Richelieu agreed to subsidise Gustavus, and with fifteen thousand men he took the field against this gigantic foe. It was expected that this little force would be laughed off the field of battle, but it proved an army the like of which Europe had not previously known. Every man felt himself a Protestant champion. Each day was begun with prayer: it ended with prayer. The army was perfectly disciplined. It was terrible in battle, humane in victory, considerate for the people in whose country its war was waged. With readier co-operation from the people whom he had come to help, Gustavus would have swept all before him, and probably have become Emperor of Germany, saving the land from the terrible evils which threw her back a century in the march of civilisation. As it was, he was everywhere successful, but tardy support prevented his conducting operations upon a greater scale, and so permitted the atrocities of Tilly and Wallenstein. It was in battle with the latter that he fell, and his troops avenged him by winning a great victory in one of the bloodiest battles ever fought. Gustavus was one of the greatest characters in history—a scholar, an enlightened ruler, with pure and lofty purpose, and a soldier of the very highest order.

Gutenberg, Johann

b. Mainz, about 1400. d. Mainz, Feb. 2, 1468.

His father's name was Gänsfleisch, but he took his mother's maiden name, and suffered with his family when the patricians, of whom he was one, were driven by the common people from Mainz. From the cradle he seems to have shown mechanical ingenuity, and had a project in his youth for polishing stones and making mirrors. This project not succeeding, he turned his attention to printing, and was, the Germans say, the first man to invent metal type and print a book. There is some doubt as to whether the idea actually originated with him. Pictures had been printed from engraved blocks. Gutenberg's departure, however, was the first attempt at making a book independently of the pen. A man named Dritzehn and the two brothers Heilmann were his partners in the enterprise; and there was Peter Schöffer, an expert metal-worker, who made the metal types. These names occur in the controversy; while there is the legend that the first types were stolen from their inventor, Laurens Janszoon Coster, and taken to Gutenberg. After examination of all the evidence, however, German scholars credit Gutenberg with the invention. The first book produced was a Latin Bible, which appeared in August, 1455, twenty-two years before the first book printed in England made its appearance. The invention spread rapidly to other German towns, but Gutenberg did not profit. A money-lender named John Fust, who had financed him, seized his types, and he was compelled to work with inferior metals. So poor was he that he was glad to take a Court appointment, which brought him each year one suit of raiment and an allowance of food. He died in poverty and misery, though he had given to the world an art which makes it for ever grateful to his memory. Gutenberg is finely celebrated by Victor Hugo in the following passage: "A Gutenberg discovering the method for sowing the seed of civilisation and the means for the ubiquity of thought will be followed by a Christopher Columbus discovering a new field. A Christopher Columbus discovering a world will be followed by a Luther discovering a liberty. After Luther, innovator in the dogma, will come Shakespeare, innovator in art. One genius completes the other."

Guthrie, Thomas

b. Brechin, Forfarshire, July 12, 1803. d. St. Leonards, Feb. 24, 1873.

An eminent orator and philanthropist, he helped to found the Scottish Free Church, for which he raised £116,000 in eleven months, and by his writings led to the building of the first Ragged School. He was also remarkable as an advocate of temperance and compulsory education.

Guy, Thomas

b. Southwark, about 1644. d. London, Dec. 27, 1724.

The son of a London lighterman, he was apprenticed to a bookseller, set up shop himself as another, printed Bibles and Prayer-books from type imported from Holland, made much money by buying sailors' pay-tickets at a huge discount, and still more from the dealing in South Sea stock. Of this he had invested £45,000 in £100 shares, which he sold in time to avoid the crash at prices varying between £300 and £600 per share. He is commonly reputed to have been mean and avaricious, but this legend does not bear examination. During his life he established almshouses at Tamworth, and built there a town-hall. He paid the debts of innumerable people confined in the prisons of the City, and set up many deserving young men in business. He added three new wards to St. Thomas's Hospital, and built the hospital which bears his name. His will, a remarkable document, liberated six hundred persons from the debtors' prisons, and made provision for a great number of relatives and persons not related to him, provided almshouses and pensions and many other benefits. He never married, lived simply, dressed simply, and thus, it is probable, got the reputation for avarice and miserliness.

Hadley, John

b. London, April, 16, 1682. d. London, Feb. 14, 1744.

By his improvement of the telescope, left imperfect by Newton and Gregory, he gave astronomers the first instrument of that kind which was of real value to them. He also made important improvements in the invention of the reflecting quadrant, which rapidly became indispensable at sea. Hadley's younger brother George, a scientific writer (1685-1786), had his share of the family talent, and was the first man clearly to formulate the correct theory as to the trade winds. The genius of the family was not transmitted beyond this generation, for John Hadley's son, inheriting an ample fortune in money and real estate, squandered it, and died in poverty and disgrace.

Hadrian, Publius Ælius Hadrianus
b. Rome, Jan. 24, 76 A.D. d. Baiæ, Italy, July 10, 138 A.D.

When forty-one years of age, Hadrian succeeded his guardian and cousin Trajan and at once inaugurated a new and beneficent policy. He realised that the era of conquest had passed, that Rome must now be wisely governed, and the Empire secured rather than indefinitely extended. Determined personally to know the needs of the Empire and its people, he undertook a journey throughout the entire dominions of Rome. Wherever he went architects and artisans accompanied him, organised like a legion, to build aqueducts, temples, fortifications, whatever he deemed necessary. The magnitude of his scheme may be estimated from the great wall bearing his name which he constructed, upon visiting Britain, from the Solway to the Tyne. Its purpose was to serve as a defence against the Picts and Scots. Seventy-three miles in length, it was in places more than twelve feet in height, and between six feet and nine and a half feet thick, and included, for the accommodation of troops, stations, castles and turrets, which communicated with one another by a military way. Although no more conquests were to be attempted, his army was maintained in the highest state of efficiency. That the soldiers should not complain of the rigorous discipline which he imposed, he himself shared their hardships. He lived on the food which they had, and walked his twenty miles a day bareheaded. His laws were merciful and wise, and Rome flourished greatly under his rule. Towards the end of his life his mind seems to have weakened and to have become overcast with jealousies and littlenesses. His character was stained with bloody crimes. The one great war of his reign was waged against the Jews, of whom it was said over half a million were slain, while the Roman losses also were appalling.

Hahnemann, Samuel Christian Friedrich
b. Meissen, Saxony, April 10, 1755. d. Paris, July 2, 1843.

After studying medicine at Leipzig and Vienna, and taking his degree at Erlangen, he became convinced that old methods were wrong. The result of his investigations led to his founding the homœopathic system of medicine. The new treatment was vigorously denounced, and he was boycotted by his profession, but he courageously adhered to his work, submitted to pecuniary loss for his faith, and, moreover, made many painful experiments upon his own person for the furthering of the system which he had founded.

Haeckel, Ernst Heinrich
b. Potsdam, Germany, Feb. 16. 1834.

This distinguished German biologist was entering upon his scientific course when Darwin's "Origin of Species" made its appearance. That book determined Haeckel's career. He read it, accepted its teaching, and by his enthusiastic advocacy made the doctrine known throughout Germany. Since then Haeckel has engaged in research work of the highest value, and contributed greatly to the common stock of knowledge upon biological mysteries. Latterly he has formulated theories which Christian students of science cannot accept.

Haggard, Henry Rider
b. Bradenham Hall, Norfolk, June 22, 1856.

One of a distinguished brotherhood, he went to Natal as secretary to Sir Henry Bulwer; passed on, as secretary to Sir Theophilus Shepstone, to the Transvaal, where he hoisted the British flag at Pretoria. Afterwards returning to England, he wrote a number of successful imaginative novels. Latterly he has been engaged in investigations concerning the conditions of rural England, and has carried out important inquiries on behalf of the Government in connection with emigration schemes to the Colonies.

Hakluyt, Richard
b. Herefordshire, about 1552. d. London, Nov. 23, 1616.

The author of what has been termed "the prose epic of the modern English nation" was a Westminster scholar, and graduated at Christ Church, Oxford. His absorbing study was the history of travel and discovery, whether in Greek, Latin, Italian, Spanish, Portuguese, French, or English. He lectured on his favourite subject, and had the gratification of introducing the globes into English schools. Then he wrote an account of the discovery of America, and so gained the patronage of Lord Howard of Effingham, who took him to Paris. There he pursued with all diligence his special study, and, piqued to find Englishmen regarded as of no account in the story of discovery and adventure, he consecrated his life to writing his immortal history of the voyages, adventures, and discoveries of our national heroes. For some years before his death he was Archdeacon of Westminster, and one of the chaplains of the Savoy.

Hales, Stephen
b. Bekesbourne, Kent, Sept. 7, 1677. d. Teddington, Middlesex, Jan. 4, 1761.

Although little is heard nowadays of his works, Hales was a man far in advance of his times. Upon his "Vegetable Statics" is founded our whole knowledge of vegetable physiology. He invented the artificial ventilator, and got it introduced into prisons, ships, and other buildings. He had a scheme for preserving water and meat on sea voyages, and for distilling drinkable water from the sea; and a method of registering sea depths which were by ordinary means unfathomable. Hales was a clergyman, and resided for many years in charge at Teddington. He provided a new water supply, and his entry concerning the new supply is characteristic of the minuteness with which his investigations were carried out. The outflow was such that it would fill a half-gallon vessel in "three swings of a pendulum, beating seconds, which pendulum was 39 2-10th inches long from the suspending nail to the middle of the plumbet or bob."

Halifax, Charles Montagu, Earl of
b. Horton, Northants, April 16, 1661. d. London, May 19, 1715.

Statesman, poet, munificent patron of literature, friend of Newton, Addison, Congreve, Prior, and Swift, Charles Montagu is best remembered for his achievements in the House of Commons. A million of money being needed for government, he established the National Debt. A further million and a quarter being necessary, he established the Bank of England—a plan originated, by the way, three years earlier by William Patterson. He made Newton Warden of the Mint, and with his help, and that of Somers, Locke, and Halley, reformed the currency. Exchequer bills, by which the Government gets its first credit from the House of Commons, also had their origin with Montagu. His vanity and arrogance made him unpopular, and he had to take a peerage and depart to the Upper House. Two attempts to impeach him for misconduct of public affairs came to nothing. He was a grandson of the Earl of Manchester, the Parliamentary general.

Hall, Sir James
b. Dunglass, Haddingtonshire, 1761. d. Edinburgh, June 23, 1832.

He was the father of three distinguished sons. John, the eldest, became a Fellow of the Royal Society; Basil, traveller and writer, made important discoveries in the Eastern seas; James was a talented artist and patron of art. Sir James's own claim to fame rests upon his having been the first geologist to embark upon experimental geology. Hutton protested that it was impossible to judge of the great operations of the mineral kingdom from having kindled a fire and looked into the bottom of a little crucible. But time justified the chemical tests of the baronet, and it was in his laboratory that experimental geology, from which we have learned so much, had its birth. He was the inventor of an instrument for registering high temperatures.

Hallam, Henry
b. Windsor, July 9, 1777. d. Penshurst, Kent, Jan. 21, 1859.

The son of a Canon of Windsor and Dean of Bristol, he took his degree at Oxford, and then held the post of Commissioner of Stamps. Upon inheriting his father's fortune, he devoted himself to literature, and by his "Europe During the Middle Ages," his "Constitutional History," and his "Introduction to the Literature of Europe," placed himself in the very front rank of historians. He is severe, but accurate; austere, but learned and judicious. Arthur Henry Hallam, of Tennyson's "In Memoriam," was one of his eleven children, of whom only four survived to cheer his old age.

Haller, Albrecht von
b. Bern, Switzerland, Oct. 16, 1708. d. Bern, Dec. 12, 1777.

Here the boy was truly father of the man. Before he was ten he had drawn up a Chaldee grammar and a Greek and Hebrew vocabulary, and compiled a great collection of biographies. He risked his life to rescue from fire his translations of the classics, and afterwards burned them. After a course of study at the best universities, he rapidly qualified to rank as one of the greatest anatomists and physiologists of his century. He filled the chair of medicine, anatomy, botany, and surgery in the new University of Göttingen, and attained a European reputation by his industry, his original researches, and his success as the leader of a new school of learning.

Halley, Edmund
b Haggerston, London, Nov. 8, 1656. d. Greenwich, Jan. 14, 1742.

The great astronomer was the son of a rich soap-boiler, who gave him an excellent education, and when sending him to Oxford presented him with a large telescope. Before he had reached manhood, Halley devised a new method of determining the elements of the planetary orbits; he then resolved to catalogue the stars in the Southern Hemisphere by way of complementing the efforts of Flamsteed and Hevelius in the Northern Hemisphere. During his stay at St. Helena, he observed a transit of Mercury across the sun's disc, and by so doing arrived at his method of ascertaining the solar distance. His successful charting of 360 stars and his other important discoveries led to his being termed the "Southern Tycho." Honours and more notable labours followed, and then his inquiries into gravity brought him into association with Newton, whose "Principia" he published at his own cost when, at Halley's earnest solicitation, Newton had written it. Halley's other work, undertaken with a view to solving problems as to the variation of the compass, the discovery of Southern lands, and his observations enabling him to predict the return of the comet named after him, was all-important and valuable as opening new horizons for the men who were to follow after.

Hamilcar, Barca
b. Carthage, North Africa, about 290 B.C. d. Spain, 228 B.C.

"Barca," his surname, is the Jewish term for "lightning," and refers to the character of the military operations of this great warrior and statesman. In his day, Carthage was the great rival of Rome, and had colonies in Sicily, Corsica, and Sardinia. Hamilcar died in the attempt to add Spain to the Carthaginian possessions and to make it a centre for an attack upon Rome. In the first Punic war he landed in Sicily with a small army, at first little better than savages, but afterwards moulded by his will into a magnificent fighting force. He maintained himself for three years on Mounte Erote against the Romans, who for the whole time were in possession of the rest of the island, save for two additional strongholds which he held but they blockaded. To raise the blockade, he moved to what is now Mount St. Giuliano, and there for two years withstood the onslaughts of the Romans. At length overwhelming numbers defeated him, and brought to an end the first Punic war. Returning with his army to Africa, he was unable to obtain the pay for his soldiers, and was called upon to subdue a formidable insurrection. This accomplished, he became commander of all the Carthaginian forces, and, having sworn his eldest son, Hannibal, to eternal hatred and enmity to Rome, he set out with a picked force for Spain. Some parts of the country he subdued by force of arms; other parts he won to allegiance by statesmanship. He died, however, before he could complete his plans, slain in a battle between the Tagus and the Douro. His son Hannibal carried on his task.

Hamilton, Sir William Rowan
b. Dublin, Aug. 4, 1805. d. Dunsink, near Dublin, Sept. 2, 1865.

He was a phenomonal boy, could speak thirteen languages by the time he was twelve, had mastered all the ordinary University course at fifteen, and entered upon original research. He distinguished himself in astronomy, acting as Irish Astronomer Royal, but is specially celebrated as the inventor of quaternions, a calculus of peculiar power and generality.

Hampden, John
b. London, 1594. d. Thame, Oxfordshire, June, 24, 1643.

A cousin of Oliver Cromwell, and a member of a distinguished old Buckinghamshire family, Hampden came into prominence in Parliament by his resistance of the loan which Charles I. attempted unconstitutionally to raise. He was conspicuous in the impeachment of Buckingham and Strafford. It was his resistance of the Royal demand for ship-money, however, which made him a national figure. He undertook the expense of fighting the case, and though seven of the twelve judges decided against him, the patriot had the sympathy and approval of all right-thinking men in the country. Hampden was one of the five members whom Charles I. sought to arrest in the House of Commons. That act brought on the Civil War. Here Hampden, who subscribed £2,000, and took an active part in the campaign of the Parliamentarians, showed courage and ability. He died from the effects of a bullet-wound sustained while attempting to counter a foray of Prince Rupert from Oxford. Hampden was a great patriot, and a noble Christian gentleman.

Handel, George Frederick
b. Halle, Germany, Feb. 23, 1685. d. London, April 14, 1759.

The son of a Halle surgeon, he was regarded, almost from infancy, as a musical prodigy, and was given the best musical education his father could afford. Before he was twenty he had written and produced his first opera. He played in a Hamburg orchestra, gave lessons, wrote minor pieces, and then made a triumphal progress through Italy. Returning to Hanover, he was made Chapelmaster to the Elector, our own George I. It was in 1710, when he was five-and-twenty, that he came to England, which from that time became his home. Ten years later the Royal Academy was founded, "to secure a constant supply of operas by Handel." That scheme did not long flourish. Handel wrote opera after opera, but quarrels with rivals and with his singers brought him eventually to bankruptcy, and for the time being unhinged his mind. It was upon his recovery that he began what was to be the work of his life—his oratorios. Fifteen of them he produced in a dozen years. His sight, long failing, now deserted him, but he still continued to compose and to give his magnificent organ recitals. Altogether, he wrote a score of oratorios, twice as many operas, hundreds of cantatas, psalms, songs, and instrumental pieces. His industry was inexhaustible, his fertility so phenomenal that some of his greatest works are said almost to have been improvised. He treated all styles, and he excelled in all. No man ever more richly dowered the world with sublime, inspiring melody.

Hannibal

b. Carthage, North Africa, 247 B.C. d. Bithynia, Asia Minor, about 183 B.C.

When nine years of age, Hannibal, eldest of the "lion brood" of Hamilcar, the great general, was compelled by his father to swear on the altar of sacrifice a vow of eternal enmity to Rome. He was then permitted to accompany his father from Carthage to Spain. At the death of Hamilcar, the command evolved upon his brother-in-law, but Hannibal became supreme, and proceeded to give effect to that part of Hamilcar's plan which death had caused to be left unfinished. He completed the conquest of Spain, all save one stronghold—Saguntum, which was in friendly relations with Rome. By attacking and reducing this he made all Spain a Carthaginian province, and brought on the second Punic war. With an army which finally dwindled down to 40,000 infantry, 6,000 cavalry, and fewer than two score elephants, he crossed first the Pyrenees and then the Alps, a daring, grandiose scheme, which only the greatest soldier of all time could have carried through. It was a war for the conquest of the world in which he was now engaged—a world ruled by Carthage or Rome. In battle after battle he inflicted appalling losses upon the Roman armies. He never knew defeat in all the sixteen years in which he overran Italy. Reinforcements which were being sent to him from Spain were cut off. He was recalled to defend Carthage from a Roman invasion, and at last Scipio won a decisive triumph over him. Hannibal's veterans, outnumbered, were cut to pieces; his raw levies fled. Carthage was already conquered before Hannibal appeared upon the scene; his small army could not avert the ruin. He now turned his genius to statesmanship, but his enemies caused him to flee, first to Antiochus of Syria, next to Bithynia, where, still pursued by the vindictive Romans, he took poison. Hannibal has been called at once the Burke, the Pitt, and the Wellington of his country. He was a great statesman, and the finest general in history. He only just failed to make Carthage mistress of the whole world.

Hansom, Joseph Aloysius

b. York, Oct. 26, 1803. d. London, June 29, 1882.

The inventor of the cab, which still retains his name, was apprenticed to his father, a carpenter, but showed great skill as a draughtsman. He attended a night school, improved his scanty education, and became a famous architect. His churches, mostly Roman Catholic, are to be seen in many parts of England, and even in Australia and South America. His church at Preston—St. Walburge's—has a spire 306ft. high, the loftiest built in England since the Reformation.

Hanway, Jonas

b. Portsmouth, Aug. 12, 1712. d. London, Sept. 5, 1786.

Left fatherless at an early age, he was apprenticed to a Lisbon merchant, and became a great traveller for commercial purposes. Inheriting a small competence, he devoted the remainder of his life to social and philanthropic work—to such schemes as the paving of London, the care of foundling children, of sweeps' boys, and outcast women, prison reform, and the establishment of Sunday-schools. He was the first Englishman to carry an umbrella, and after thirty years of derision saw his invention generally popular.

Hardy, Thomas

b. near Manchester, Dorsetshire, June 2, 1840.

The novelist and poet of Wessex scenes and life began his career as an architect. "Far From the Madding Crowd" and later novels—notably, "The Return of the Native" and "Tess of the D'Urbervilles"—have given him a unique place among English artists in fiction. He writes with great imaginative power, tinged with pessimism. Latterly he has forsaken fiction for historical drama.

Hare, Robert

b. Philadelphia, Jan. 17, 1781. d. Philadelphia, May 15, 1858.

He was a famous chemist of his day, and added notably to the science in which he was interested. His material gift to the world was the calorimeter, an instrument for measuring the specific heat of a body. He invented also an oxyhydrogen blowpipe, but in that he had been anticipated by the English inventor, Sir Goldsworthy Gurney.

Hargraves, Edmund Hammond

b. Gosport, Hants, Oct. 7, 1816. d. Sydney, N.S.W., Oct. 29, 1891.

The man who was destined to discover the Australian goldfields went to Australia in 1832, and after narrowly escaping death settled down to sheep-farming for fifteen years. He joined in the rush to the Californian goldfields. Arrived there, his knowledge of geology told him that the geological formation was similar to that of the quartz rocks of the Blue Mountains, New South Wales. He returned to Australia, put his theory to the test, and at once found gold. His discovery was unselfishly communicated to the Government, and a new era for the island continent opened.

Hargreaves, James

b. Blackburn (?), about 1745. d. Nottingham, April, 1778.

The inventor of the spinning jenny was an illiterate weaver, who began life as a carpenter. His mechanical skill being detected by the grandfather of Sir Robert Peel, he was set to work to improve the carding machine. An accident—the overturning of one of the old hand spinning-wheels—revealed to Hargreaves possibilities of a different system of construction, and he secretly made the spinning jenny, which would spin wool, cotton, or flax into a plurality of threads at the same time and by one operation. It was the first advance of the sort from the old plan of manual labour. When the invention became known, jealous workmen smashed the machine and demolished Hargreaves' house. Like Arkwright, he was driven to Nottingham. Here he entered into partnership with a man named James, and patented his machine. He seems to have made little out of it, Lancashire manufacturers pirating the invention, and leaving his family to poverty when he died.

Haroun-Al-Raschid

b. near Teheran, March 20, 763 (?). A.D. d. near Khorassan, Persia, 809 A.D.

The hero of so many stories in the "Arabian Nights" was the most famous of all Arabian califs, the most learned man of the then most learned people in the world. His dominions extended from Egypt to the Indus; his Court was the home of the most brilliant company of scholars, poets, grammarians, cadis, and scribes ever assembled round one calif. Ascending the throne when twenty-two years of age, he entrusted the Government to the famous Barmecide family, and saw to it that frontiers were strengthened, commerce developed, and learning encouraged. Five years before his own death, however, in an insane fit of jealousy, he had the Barmecides put to death. This was the one blot upon an otherwise noble character. As a warrior he overran Asia Minor at the head of a splendid army, and died while suppressing an insurrection at Khorassan. He several times made the pilgrimage to Mecca, and, despite the murder of the Barmecides, was renowned for humanity and chivalry. At the coronation of Charlemagne he sent, among other gifts, the keys of the Holy Sepulchre. Mediæval culture owed much to the intellectual splendours of the reign of "Aaron the Just," as he was called.

Harriot, Thomas

b. Oxford, 1560. d. Isleworth, Middlesex, July 2, 1621.

Having graduated at Oxford, he became mathematical tutor to Sir Walter Raleigh, through whose influence he was sent as surveyor with Sir Richard Grenville's expedition to Virginia. The result of his labours was the presentation of one of the earliest examples of a statistical survey on a large scale. Harriot was one of the famous scientists who bore Henry Earl of Northumberland company during his imprisonment in the Tower. With Walter Warner and Thomas Hughes he used to go there daily, and dream and solve problems. He was warned that if he did not make his discoveries public he would be anticipated, and he was. Viète, the French mathematician, anticipated his publication of the discovery upon which modern algebra is based. Still, Harriot carried the subject further than his contemporary, and it is claimed for him that but for his foundation Descartes' whole superstructure would have been impossible. The Earl of Northumberland gave him a pension and quarters at Sion House, and there he died.

Harrison, Frederic
b. London, Oct. 18, 1831.

After a distinguished career at King's College School, London, and at Oxford, he was called to the Bar, and practised conveyancing and equity. It has been as a publicist and man of letters, however, that he has taken a foremost place. He has striven unceasingly for popular rights, and as the intellectual leader in England of the Positivists has laboured without remission to win converts to the doctrines of Auguste Comte. He has been Professor of Jurisprudence and International Law at Lincoln's Inn Hall, and served upon Royal Commissions.

Harrison, John
b. Foulby, Yorks, March 24, 1693. d. London, March 24, 1776.

The inventor of the chronometer was the son of a carpenter who knew a little about clock-making, and set his boy to walk in like paths. But the boy was a genius, though he had to dispense with the education of one. He made a clock all of wood, then one with his famous "gridiron" pendulum, which was so constructed that changes of temperature did not affect the timekeeping. At this time navigation was very much a haphazard matter, so the Government offered three prizes—£10,000, £15,000, and £20,000 for the discovery of a method of determining the longitude at sea within sixty, forty, and thirty geographical degrees respectively. Harrison, with nothing but native genius to help him—no education and no models to suggest a plan—devoted the best years of his life to the task. He made four timepieces, each better than its predecessor, until, after voyages to and from Jamaica, and to and from Barbados, it was found that he had determined the longitude within ten miles, or twenty miles better than the distance required to qualify him for the first prize. He was submitted to scandalous indignities, his money withheld, and petty sums offered by way of solatium. He was friendless, but he had earned the prize, and he persisted with petition after petition until eventually, little by little, he got the sum due to him. But it cost nearly a lifetime to obtain the money. The prize was offered in 1713; he won it in 1762; he got his money in 1773, when he was within less than three years of the grave.

Harvard, John
b. London, 1607. d. Charlestown, Mass., Sept. 14, 1638

The principal founder of the famous Harvard University was the son of a Southwark butcher. His mother was thrice married, and, deriving property from each husband, left John the Queen's Head public-house, Southwark. He graduated at Cambridge University, married, and went to America, where he officiated as minister at Charlestown. In his will he left £700 and a library of 320 books to the college then about to be built. It was called Harvard in his honour.

Harvey, William
b. Folkestone, Kent, April 1, 1878. d. London, June 3, 1657.

The discoverer of the circulation of the blood came of good old Kentish yeoman stock, and was given the advantage of a first-class education, not only in England, but in Italy, where the schools of medicine were already famous, and where he was privileged to hear Galileo and Fabricius of Aquapendente. The latter had already made known his discovery of valves in the veins, tending to a flow of the blood in a special direction. Many minds were concentrating on the problem as to the blood, and controversy afterwards raged as to whether or not Harvey really discovered the truth. He did. Other inquirers had got some glimmering of the truth, but they had inverted the facts. To Harvey alone is due the credit for demonstrating that the perpetual motion of the blood in a circle is produced by the beat of the heart. The grand discovery was announced quite informally in discourses before the College of Physicians in their lecture-hall at Knightrider Street, near St. Paul's, and the MSS. of the lectures are still preserved at the British Museum. For some years after his return from the continent, Harvey acted as physician to St. Bartholomew's Hospital, where he had a salary of £33 6s. 8d. per year and no residence. He was in favour at Court, being successively physician to James I. and Charles I. He accompanied the latter as medical attendant during the Civil War until the surrender at Oxford.

Haussman, George Eugène
b. Paris, March 27, 1809. d. Paris, Jan. 11, 1891.

To all who love Paris, with its noble boulevards, its open spaces, its many fine bridges, and its beautiful parks, Haussman is indeed a great man. It was he whom Napoleon III. entrusted with the making of the modern Paris, when, having thrown up the Bar, he entered the Civil Service. He carried out the whole work for water supply and sanitation, in addition to the embellishment of the entire capital. The work left Paris with a debt of thirty-five million pounds, and caused his dismissal. Turning bank director, and then being elected a deputy, he was still dogged by evil fortune, and died in poverty.

Hauy, René Just Abbé
b. St. Just, France, Feb. 28, 1743. d. Paris, June 3, 1822.

His parents were so poor that it was only through the charity of friends that he was educated. He underwent his course at college amid almost incredible privations and misery. The accidental fall of a treasured specimen of calcareous spar led him, on examining the fragments, to discover the geometrical law of crystallisation. He devoted his life to mineralogy with important results. He was given an honorary canonry at Notre Dame, hence he is generally spoken of as the Abbé Haüy. His brother Valentin—like himself, poor all his days—consecrated his life to the education of the blind poor.

Havelock, Sir Henry
b. near Sunderland, April 5, 1795. d. Lucknow, India, Nov. 24, 1857.

This great Christian soldier was the son of a wealthy shipbuilder, and was to have been a lawyer, but, like his three brothers, entered the Army. He went to India, where he was converted and publicly baptised. He had an active part in all the fighting of his time, and his crowning work was, during the Mutiny, to relieve Lucknow. There he died two months later, killed by work and worry and responsibility. When the tidings of his great feat reached England, Parliament voted him a baronetcy and a pension of £1,000 a year. But they were voting the reward to a man who, though they did not know it, was already in his grave.

Hawke, Edward, Lord
b. London, 1705. d. Sunbury, Middlesex, Oct. 17, 1781.

The son of a barrister, he took early to sea, and when thirty-nine was dismissed the Service for a too great success. He was in command of the Wolf, and broke from the line of battle at Toulon to engage and defeat a French ship. For this breach of discipline he was dismissed, but was restored as an act of Royal favour, and lived to defeat the French fleet which, under Admiral

De Conflans, was to have covered an invasion of England. He was raised to the peerage, and given a pension of £2,000 per annum.

Hawthorne, Nathaniel
b. Salem, Mass., July 4, 1804. d. Plymouth, U.S.A., May 19, 1864.

A dreaming, solitude-loving boy, Hawthorne, son of a merchant captain, was left much to his own resources from an early age, his father dying when he was four. The love of isolation never left him. He lived, as a boy of fourteen, at a lonely farm in the woods of Maine, and as a man he became one of the Brook Farm community, where, with one or two other men, he tried the experiment of running a farm on idyllic semi-socialistic lines. He shut himself up for a dozen years in complete seclusion before he gave the world his first novel—"Fanshawe." America would have none of his works, but his writing found immediate acceptance in England, where to the end his reputation was higher than in his own land. England, indeed, set the Hawthorne vogue. For many years his circumstances were not easy, and he had to take employment as weigher and gauger in a customs house, while afterwards he held a consular appointment for four years at Liverpool. His income grew in time, and he was able to travel Europe, and finally to end his days rich in this world's goods—and rich, too, in honour. His writings are simple but melodious, full of fine feeling and insight. His reputation is still increasing and will increase.

Hay, John
b. Salem, Ind., U.S.A., Oct. 8, 1838. d. July, 1905.

Having been called to the Bar, he became assistant private secretary to President Lincoln, of whom, in conjunction with another writer, he produced an excellent biography. Famous as a statesman of wisdom and high ideals, he is best loved as the author of the delightful poems "Pike County Ballads," of which "Breeches" suffices to ensure his immortality.

Haydn, Joseph
b. Rohrau, Austria, March 31, 1732. d. Vienna, May 31, 1809.

He was wretchedly poor, only a wheelwright's son, and when his term as a soprano in the choir of a Vienna church ended he had a hard fight for bare existence. But genius burned, and a man of discrimination hearing a composition of Haydn's played by the composer himself in the street, commissioned him to write an opera. Haydn seized his chance. His opera was a success. It brought him introductions to influential people, and finally got him a lucrative appointment. He had to come to England, however, before he was truly appreciated. Here, in two visits, he produced his twelve great symphonies. Thereafter he composed his magnificent oratorios. The importance of Haydn to the world has been thus impressively expressed by the Right Hon. A. J. Balfour: "Without Haydn we should not have the Mozart we know; without Mozart we should not have the Beethoven we know; and without Beethoven the whole musical history of the nineteenth century would have been utterly different from what it is."

Hazlitt, William
b. Maidstone, Kent, April 10, 1778. d. London, Sept. 18, 1830.

"Well, I've had a happy life," he said with his last breath. The statement does not quite accord with fact. He was twice unhappily married, and had a stupid love affair with a woman intellectually his inferior. But there was something lovable in the man who could command the friendship of Lamb, Leigh Hunt, and Coleridge. He quarrelled, where it was possible, with all his friends, but Lamb was loyal and true to the last. Hazlitt tried his hand at painting without success. His contributions to literature are unequal. At his best he is very fine, and his reputation has been greatly enhanced of recent years. He was a master of epigram and of virile, nervous English. His father was a Unitarian minister, and Hazlitt himself studied for the Church. His early meeting with Coleridge dissuaded him from his original intention, and turned his thoughts first to art and then to literature.

Heathcote, John
b. Duffield, near Derby, Aug 7, 1783. d. Tiverton, Devon, Jan. 18, 1861.

He was the son of a Leicestershire farmer, and was apprenticed first to a hosiery manufacturer, then to a stocking-maker and framesmith. His indentures completed, he worked as a machine-builder, and bought out the man by whom he had been employed at Nottingham. Then he turned his attention to the construction of a machine which would do for lace what the loom had done for stockings by superseding the knitting-needle. For his purpose he took himself to Hathern, a little town near Loughborough, and carefully worked out his scheme—first on paper, then expressed in material form. The outcome was that at twenty-four years of age he had perfected what was described as the most complicated machine ever produced. The first square yard of net made by the machine sold for five sovereigns, 240 times the price which it would now command. Here, then, was the origin of the enormous lace industry which has meant so many millions sterling to Midland England. Heathcote was not long permitted the quiet enjoyment of his reward. The Luddites demolished the machines which he had erected in his Nottingham factory, and he was awarded £10,000 by the country, but never got the money. He moved to Tiverton, set up new machinery, constantly added improvements, invented a steam plough, sat in Parliament, built schools, and died wealthy and honoured.

Heathfield, George Augustus Eliot, Lord
b. Stobs, Roxburghshire, Dec. 25, 1717. d. Aix-la-Chapelle, July 6, 1790.

The gallant defender of Gibraltar was educated at Leyden University and the French military school of La Fère, as well as at Woolwich. He saw a great deal of fighting on the Continent before being sent to Gibraltar. He had some time in which to strengthen the defences of the fortress, but his defence for three years was one of the greatest achievements in the annals of war. Not only had he to withstand the combined assaults of fleet and army; the fortress was blockaded by sea and land, and the garrison was all but starved. While solicitous for the comfort of his men, he was himself of the simplest habits—a vegetarian, and total abstainer from alcohol. His peerage was granted in recognition of his valorous defence.

Heber, Reginald
b. Malpas, Cheshire, April 21, 1783. d. Trichinopoly, India, April 3, 1826.

After a distinguished career at Oxford, where his prize poem "Palestine" attained lasting fame, he accepted a country rectory in Shropshire, but was called to India as Bishop of Calcutta, and there died. His literary reputation rests upon his collection of hymns, of which "From Greenland's Icy Mountains," "The Son of God Goes Forth to War," and "Holy, Holy, Holy," are sung in every Christian land.

Hedley, William
b. Newburn, Newcastle, July 13, 1779. d. Lanchester, Durham, Jan. 9, 1843.

One of the pioneers of the age of steam, he has received less credit than he deserves. Working in a colliery, he perceived the need for better methods of hauling the coal from the pit-mouth to the Tyne, and, scorning the old toothed rails and cogged wheels with which locomotives were first invented, he devised and patented the smooth rail which we still use. He was among the first to use the steam blast for furnaces, and to apply steam for the purposes of barge propulsion.

Hegel, George Wilhelm Friedrich
b. Stuttgart, Germany, Aug. 27, 1770. d. Berlin, Nov. 14, 1831.

Destined by his parents for the Church, Hegel preferred the career first of tutor, and afterwards of professor. In the latter capacity he drew crowds of students to Heidelberg, and, later, to Berlin, and became the philosophical dictator of Germany. He established two different schools of thought. One of these interpreted his philosophy as true Christian theism; the other, as a pantheistic and eventually materialistic direction, denying both the personality of God and the immortality of the soul.

Heine, Heinrich
b. Dusseldorf, Prussia, Dec. 13, 1799. d. Paris, Feb. 17, 1856.

Poetry was to Heine a "holy plaything." His writings on religion, philosophy, and politics were often merely vehicles for his wit and cynicism. Yet their revolutionary character made his native Germany no place for him, and he spent the last twenty-five years of his life in Paris, drawn thither by the Revolution of 1831. By that time he had established his fame upon a firm foundation with his "Buch der Lieder" and "Reisebilder." These caused him to be hailed as the successor of Goethe. But born a Jew, and compelled to become a member of the Lutheran Church in order that he might practise law in accordance with the terms upon which he drew an allowance from a wealthy uncle, he became very unpopular with his compatriots. His best work was done before he was thirty. When he was in his fiftieth year he was laid low by spinal paralysis. He suffered tortures, and was confined to his bed for the remainder of his life. In that period, however, mastering pain and infirmity, he wrote much which will assist in maintaining his reputation as one of the greatest of modern poets.

Helena, St.
b. third century A.D. died about 328.

Supposed to have been the daughter of an innkeeper, she became the wife of Constantius Chlorus, who, upon being made emperor, was compelled to divorce Helena and take a wife of more exalted birth. Her only son was Constantine the Great. When he became Emperor of Rome, and a convert to Christianity, she, too, was converted, and, proceeding to Jerusalem, discovered the Holy Sepulchre and the Cross.

Heliodorus
b. Emesa, Syria, fourth century A.D. d. close of fourth century, A.D.

The earliest and best of the Greek romance writers was a member of a family of pagan priests, but himself became a Christian, and was Bishop of Tricca, in Thessaly. He is famous as the author of "Æthiopica," which became the model for all later Greek romance, and has inspired many modern writers. It has been translated into every written language.

Helmholtz, Hermann Ludwig Ferdinand von
b. Potsdam, Germany, Aug. 31, 1821. d. near Berlin, Sept 8, 1894.

One of the world's greatest mathematicians and physicists, he was so poor early in life that he had to begin his career as an army surgeon. His discoveries in physiology soon attracted attention, and brought him a professorship at Königsberg, followed by still higher appointments at Bonn, Heidelberg, and Charlottenburg. His investigations covered an immense field, and to whatever subject he turned it was to bring to light new data. He revolutionised the science of the ear; he opened a new world to the eye specialists; he threw new light upon the nervous system. In chemistry, mathematics, electricity, magnetism, meteorology and theoretical mechanics he was no less successful.

Helmont, Johann Baptist van
b Brussels, 1577. d. near Brussels, Dec 30, 1644.

After several years' devotion to mysticism he turned his attention to chemistry, and helped to reduce it to order out of the chaos to which it had been brought by the alchemists. He was the first to use the balance in chemistry, and gave science the word "gas." His discoveries marked a new departure for a future generation of scientists.

Hemans, Felicia Dorothea
b. Liverpool, Sept. 25, 1793. d. Dublin, May 16, 1835.

For many years this gifted woman was an invalid, and some of her most charming poems were produced during intervals of intense suffering. Her genius was not of the highest order, but lyrics like "The Treasures of the Deep," "The Better Land," "The Homes of England," "Casabianca," "The Palm Tree," "The Graves of a Household," and "The Wreck," may last as long as the language in which they are written. She was the daughter of a Liverpool merchant named Browne, whose reverse of fortune caused his removal to Wales, where she grew up in an atmosphere of romance and mysticism. She married in 1812 an Irish officer. They had five sons; then her husband left her, and they never afterwards met.

Henderson, Alexander
b. Creich, Fifeshire, about 1583. d. Edinburgh, Aug. 19, 1646.

The son of a Fifeshire tenant farmer, he was appointed by Archbishop Gladstanes to the living of Leuchars. The appointment was so unpopular, proceeding from a prelate, that Henderson, for his induction service, had to enter the church by way of a window. He soon identified himself with the popular cause, attained to fame, disputed with Charles I. on public and ecclesiastical affairs, and drafted the National Covenant and the famous Solemn League and Covenant. He was foremost in restoring to the Kirk of Scotland her ancient rights and liberties.

Henry IV. of France
b. Pau, France, Dec. 13, 1553. d. Paris, May 14, 1610.

The author of the Edict of Nantes, which gave perfect religious equality to France, was bred a Huguenot, and as one made himself famous at the head of the Huguenot army. He escaped the massacre of the Huguenots by submitting to Rome, but when at liberty repudiated his conversion, only to recant once more, saying, "Paris is well worth a Mass." By great skill as a general and diplomatist, he overcame all his enemies, and became King of France. He was a wise and humane ruler. To him France owes the inception of her industries; to his gifted Minister—Sully—the reorganisation of her finances. He planned a great scheme for the union of all the countries of Europe into a federal republic, but was assassinated by a Jesuit fanatic before the world could become acquainted with the details of his plan.

Henry I. of Germany
b. Saxony, 876. d. Saxony, July 2, 936.

Surnamed the Fowler, because of his love of the chase, Henry I. was the promoter of the unity and civilisation of Germany. He expelled the Hungarians, made Austria part of the German Empire, recovered Lorraine, gave the country fortified cities in place of squalid villages, and, great as a statesman and warrior, played a notable part in the upraising of his own country and of Europe generally. Henry II. "St. Henry"—another great soldier and administrator and a zealous Christian monarch, was the great-grandson of the Fowler.

Henry II. of England
b. Le Mans, France, March 5, 1133. d. Chinon, France, July 6, 1189.

Expediency rather than principle dominated the life and actions of this first Plantagenet king. His reign was important to posterity, because of his great legal reforms. He substituted the jury for trial by battle, established assizes and the High Court of Justice. One of the great blots upon his reign was the murder of Becket. From his eldest daughter—Maud—by her marriage to Henry V., Duke of Saxony, the present royal family of Great Britain is descended.

Henry VIII. of England
b. Greenwich, June 28, 1491. d. Westminster, Jan. 28, 1547

Of this King, son of Henry VII. and Elizabeth of York, it has been said that he approached as nearly as possible to the ideal standard of perfect wickedness as the infirmities of human nature would allow. Yet it is impossible to exclude him from the roll of men who have achieved great results. Not because he was more Protestant than his predecessors, but from quite other motives, he overthrew the supremacy of the Pope in England, made the sovereign of this land head and "defender" of the Church, and suppressed monasticism. He had six wives. The first and fourth he divorced; the second and fifth he beheaded; the third died, after giving birth to the future Edward VI.; the sixth was so fortunate as to survive him.

Hero
b. Alexandria.

The fame of Hero—or Heron—survives, but the exact dates of his birth and death—about 3rd century B.C.—it is impossible now to ascertain. He was a pupil of Ctesibius, the father of hydromechanics, and first applied science to industry. He knew the use of steam, and invented what was practically a primitive steam-turbine. He anticipated by two thousand years the modern hot-air engines, devised an instrument for surveying which was the forerunner of the theodolite, and left valuable writings on pneumatics and on other scientific subjects. His discoveries served no useful purpose in his own age, but they demonstrate wonderfully the genius and skill of the man and of the great Alexandrian school to which he belonged.

Herodotus
b. Halicarnassus, Asia Minor, 484 B.C. d. Thurii, Italy, 424 B.C.

Although a Greek, the great historian of antiquity was born a Persian subject, and helped, it is believed, in the overthrow of the Persian power and in making his native town part of the Athenian union. He travelled throughout Greece, familiarised himself with every part of the coast of Asia Minor, and with Egypt, and lived in Samos and Athens. Considerable as were his travels, he found time for extensive study, and was familiar with the whole range of Greek literature extant in his age. Wherever he travelled, he made himself master of all that there was to be learned of history and institutions, manners and customs. So he equipped himself for his great work, the writing of his History, whose charm to-day is as potent as ever, and whose authenticity is more and more firmly established by modern research. Herodotus was not only the father of history; he was, as De Quincey has called him, the general father of prose composition.

Herschel, Sir William
b. Hanover Nov. 15, 1738. d. Slough, Bucks, Aug. 25, 1822.

The son of a bandmaster, and himself a professional musician in his youth, he educated himself in mathematics and astronomy, and, too poor to buy a reflecting telescope, made one for himself. Famous among his discoveries was that of the planet Uranus. Herschel was the virtual founder of sidereal science. He was notably assisted in his labours by his brilliant sister—Caroline Herschel—who made important astronomical discoveries of her own.

Herschel, Sir John Frederick William
b. Slough, Bucks, March 7, 1792. d. Collingwood, Kent, May 11, 1871.

Herschel's father had but one rival as an explorer of the heavens, and that rival was his greater son. The latter carried on the work which his father had begun, and enormously increased our store of astronomical data. After re-examining his father's work, he published a catalogue of a vast number of stars and nebulæ, and, having exhausted the Northern Hemisphere, completed his work by exploring and cataloguing the stars of the southern one. He was a distinguished chemist, to whom photography owes much; while as a man of letters he made notable contributions to English literature, in the form of translations from the Greek and German.

Hertz Heinrich Rudolf
b. Hamburg, Feb. 22, 1857. d. Bonn, Germany, Jan. 1, 1894.

One of the most brilliantly successful of modern physicists, Hertz began his career as an engineer, but happily abandoned that vocation for the pursuit of physical science. Following up the work of Faraday and Clerk-Maxwell, he added greatly to the advancement of knowledge of electricity—in its relation to light. His most important discovery is commemorated by the name given to the Hertzian waves.

Hesiod
b. Bœotia, Greece, about ninth century B.C. d. Orchomenus.

The father of Greek didactic poetry exercised so great an influence over the minds of his countrymen that he is said, with Homer, to have created the religion of the ancient Greeks. He wrote not to please, but to instruct. Scholars are not agreed as to how many of the works attributed to him were really his, how many received his name which really belonged to the school of poetry which he founded. His career is enshrouded in obscurity, and dates cannot be given with any certainty.

Hill, Matthew Davenport
b. Birmingham, Aug. 6, 1792. d. near Bristol, June 7, 1872

Eldest brother of Sir Rowland Hill, he was as conspicuous for efforts on behalf of the reform of the criminal law as Sir Rowland was in connection with postal reform. He was successively Member of Parliament, Recorder for Birmingham, and Commissioner of Bankrupts, but his greatest efforts lay in the direction mentioned. He was one of the pioneers of the movement for reformatories for juvenile criminals, a work attended by great benefit to the community.

Hill, Sir Rowland
b. Kidderminster, Dec. 3, 1795. d. Hampstead Aug. 27, 1879.

When Hill was a young man it cost $1/4\frac{1}{2}$ to send a letter from London to Edinburgh, and absorbed a fifth of the wages of an Irishman labouring in England who wished to send home a letter. Hill repeatedly witnessed the fear of his mother that a letter should be delivered at her house for which she should be unable to pay. He saw that illicit methods were employed to get letters conveyed, and that the public revenue from the Post Office, instead of increasing with the growth of the national wealth, steadily decreased. His scheme of penny postage was the result of his own personal experiences. It was strongly opposed by the postal authorities, who predicted terrible consequences from its adoption; but by patience, skill, and courage he carried his scheme in the face of almost unprecedented opposition. Appointed finally Secretary of the Post Office, he saw the number of letters dealt with by the Post Office increased from 76 millions to 642 millions a year, and the revenue raised from $2\frac{1}{4}$ millions sterling to upwards of $3\frac{3}{4}$ millions. Few men of the nineteenth century accomplished a more notable work for the nation.

Hipparchus
b. Nicæa, Asia Minor, second century B.C. d. Nicæa, about 120 B.C.

The founder of scientific astronomy conducted his experiments with instruments falling short a hundredfold of the precision of those now in use, but his discoveries were of great importance. He catalogued a great number of stars, discovered the eccentricity of the solar orbit, some of the inequalities of the moon's motion, the precession of the equinoxes, and did much in the application of astronomy to geography. Hipparchus was a man of towering intellect, who, armed with the crudest implements, achieved results which, for centuries afterwards, were the basis of all scientific knowledge in the paths he had chosen.

Hippocrates
b. Island of Cos, about 460 B.C. d. Larissa, Greece, about 377 B.C.

The greatest physician of ancient times, a profound scholar and philosopher, Hippocrates was not only the founder of the art of medicine, but prepared the way for men like Aristotle and the great school of Alexandria. Nearly fourscore works bearing his name are in existence. Many of these are forgeries or wrongly attributed to him. A sufficient number of writings incontestably his remains for us to reconstruct the splendid learning of which he was the founder.

Hobbes, Thomas
b. Westport, Wilts, April 5, 1588. d. Hardwick Hall, Dec. 4, 1679.

Scholar and philosopher, associate of Bacon, Galileo, and other intellectual giants, Hobbes produced works of philosophical character, which, while affording a stimulus to thought, brought him into serious difficulty. He was accused of heterodoxy, and even atheism. But, though he submitted to the Commonwealth, he died a Royalist pensioner.

Hofman, August Wilhelm von
b. Giessen, Germany, April 8, 1818. d. Berlin, May 5, 1892.

One of the greatest chemists of the last century, as a young man he was appointed first director of the Royal College of Chemistry in London. He was brilliantly successful. All the future great chemists of his day came under Hofman's influence. It was by one of his pupils that the aniline dyes were discovered. In spite of all his success, his efforts met with no reward in England. Englishmen did not believe in science in commerce. He, therefore, returned to Germany, and gave his native country the secret of the great coal-tar industry, which has been productive of incalculable wealth to her.

Hogarth, William
b. London, Nov. 10, 1697. d. London, Oct. 25, 1764.

Our great satirist upon canvas was apprenticed to a silversmith, but learned drawing in the school of Sir James Thornhill, with whose daughter he eventually eloped. His work as an artist seriously began with illustrations of "Hudibras." Portraits followed, and then the series of cartoons pillorying the vices of his time. His power as a humorist was great; but he was still more a preacher on canvas. Many of Hogarth's drawings are coarse and unlovely, but so were the subjects he attacked.

Hogg, James
b. Ettrick, Selkirkshire, 1770. d. Eltrive Lake, Yarrow, Nov. 21, 1835.

Receiving less than a year's education, this delightful poet became, at seven years of age, a shepherd-boy, and lives in history as the Ettrick Shepherd. It was while working as a shepherd that he was granted access to books which enabled him further to educate himself. Then meeting "a half daft man," who recited some of Burns's poems to him, and said that they were by the sweetest poet that ever was born, Hogg determined that he would make an effort to fill the dead singer's place. His work attracted the attention of Scott and Byron, and both helped him, as did the Countess of Dalkeith. The latter left him a farm at a nominal rent, and he farmed and wrote poetry to the end of his days. Some of his work is exquisitely dainty, and it has been justly said that at his best he might have claimed over all his contemporaries the laurel for direct and immediate inspiration.

Holbein, Hans
b. Augsburg, Bavaria, 1497. d. London, 1543.

He was called Holbein the younger, to distinguish him from his father, who also was a skilful artist, and was his master in painting. Holbein's early manhood was spent partly on the continent, partly in England. Here he painted the portraits of Erasmus, Anne of Cleves, Sir Thomas More, and Henry VIII. He died of the plague upon a date unknown.

Holberg, Ludvig von
b. Bergen, Norway, Dec. 3, 1684. d. Copenhagen, Jan. 28, 1754.

The father of the Danish drama and the greatest figure in Danish literature, he was a man of versatile genius. In addition to his plays, he wrote satires, history, biography, as well as serious reflective works. He also held important academic rank at the Copenhagen University.

Holden, Sir Isaac
b. Hurlet, Renfrewshire, May 7, 1807. d. Keighley, Yorks, Aug. 13, 1897.

He was the son of a collier, who, though a poor man, did the best he could for his boy's education. The boy himself was studious, and though a great part of his early days was spent in the factory, he managed so well to equip himself with knowledge that he became a school teacher. While acting in this position he discovered the principle of the lucifer match, though—unknown to him—a Stockton chemist had been before him. His greatest triumph, however, was won in connection with the wool-combing machinery which he invented. This brought great wealth to him and to all associated with him in the business. He was made a baronet four years before his death.

Holinshead Raphael
b. Cophurst, Cheshire. d. Bramcote, Warks, 1580.

The author of the famous "Holinshead Chronicle," giving the history of England, Scotland, and Ireland down to his own era, had assistance in his great work, but he was responsible for the enterprise. The work is of great importance to historians, and additionally interesting to us all, from the fact that from this "Chronicle" Shakespeare drew the material for his early English plays.

Homer
Lived about 9th century B.C.

No fewer than seven towns in Greece claim to be the birthplace of Homer, the father of poetry, but no authentic record on the subject exists. Nothing is known of the poet himself; even the story that he was blind and a beggar is a legend. The two great epic poems which we call Homer—the "Iliad" and the "Odyssey"—form one of the most priceless bequests which have come down to us from ancient Greece. It is impossible to determine whether the whole work is by one hand. Both are noble poems, but the differences in general tone and style between the two lead the critics to believe that the "Odyssey" may have been by an unknown later poet, or by one poet welding into a harmonious whole the efforts of a school of poets. It is unlikely that we shall ever approach any nearer to a solution of the mystery. We have the works, and in them Homer, one man or twenty men, lives immortal—the great Greek of Greeks, as Ruskin says—the more notable because of his influence on Virgil, and, through him, on Dante, and all the after ages.

Hood, Samuel, Viscount
b. Butleigh, Somerset, Dec. 12, 1724. d. Bath Jan. 27, 1816.

The son of a clergyman, Samuel Hood entered the Navy as a captain's servant, served as an able seaman, and gradually worked his way up to the rank of admiral. He had a conspicuous place in the sea battles of his time, and, in the words of Nelson, who served under him, was 'the best officer, take him altogether, that England has to boast of." He was created a viscount, and made Governor of Greenwich Hospital.

Hood, Thomas
b. London, May 23, 1799. d. London, May 3, 1845.

"He sang the Song of the Shirt" is the epitaph on Hood's tombstone. If he had written nothing else, his days would have been justified. But in grave vein or gay he was always writing, though his health was of the worst, and his fortunes often dismal in the extreme. A business misfortune consumed all his possessions, but he was too honourable to declare himself bankrupt; he mortgaged his brain to work off his liability, and broke down while still at his task. Hood began his career in a merchant's office, and was afterwards apprenticed to an engraver, but was too delicate for the work of either position.

Hooke, Robert
b. Isle of Wight, July 18, 1635. d. London, March 3, 1703.

One of the greatest of experimental philosophers, Hooke anticipated the invention of the steam-engine and of the flying-machine, and made material contribution to mechanics in the direction of ingenious contrivances for clocks and watches. He carried further the scientific manufacture of optical instruments, and afforded Newton valuable assistance in his theory of gravitation. He was delicate and eccentric, but a good man, and very industrious; he earned his place in history as the most notable of philosophical mechanics.

Horace, Quintus Horatius Flaccus
Venusia, Italy, Dec. 8, 65 B.C. d. Rome Nov 27 8 B.C.

He was the son of one who, o

as a freeman attained to means, and was able to give him a sound education. He was a student in Rome at the time of the assassination of Cæsar. Horace took arms under Brutus, and fought as an officer at Philippi. Returning to his home, he found his property confiscated, and himself driven to write verses for a living. Thanks to the friendship of Virgil, he came to enjoy the patronage of Mæcenas, who presented him with a pretty property in the Sabine Hills. Here the greater part of his years were spent, and here were written the famous satires, epistles, odes, and lyrics by which he immortalised himself.

Howard, John
b. London, Sept. 2, 1726. d. Kherson, Russia, Jan. 20, 1790.

A personal experience made Howard a prison reformer. He was on a voyage to Lisbon when captured by a French privateer, and thrown into prison at Brest. The horrors of a fortnight's detention led him, upon his return to England, to inquire into the condition of English prisons. From that time his life and fortune were devoted to the cause of the reform of our gaols. He died while on a tour of inspection in Russia, killed by typhoid fever.

Huber, François
b. Geneva, July 2, 1750. d. Geneva, Dec. 31, 1831.

He worked with such assiduity in the pursuit of knowledge that by the age of fifteen he had begun to lose his sight, and eventually became totally blind. But the noble woman to whom he had become engaged married him in spite of his blindness, and was sight to him. Together they made the bee their life-study, and laid the foundation of all our scientific knowledge of the fascinating subject.

Hugo, Victor Marie
b. Besançon, France, Feb. 26, 1802. d. Paris, May 22, 1885.

His father was a general in the army of the Empire, and carried his family with him, as far as possible, to the various places in which he was quartered. Hugo was a phenomenon as a boy—there can never have been another such. Between his thirteenth and sixteenth years he had written every possible kind of verse—odes, satires, epistles, poems, tragedies, elegies, idylls, imitations of Ossian, translations from the classics, romances, fables, stories, epigrams, madrigals, logographs, acrostics, charades, enigmas, impromptus, and a comic opera. And yet this boy was destined by his father for a military career! The Academy withheld the prize which he had won for a poem, believing it impossible that the author was only fifteen years of age. His example, Mr. Swinburne has said, will stand for ever as the crowning disproof of the doubtless more plausible opinion that the most amazing precocity of power is a sign of ensuing impotence and premature decay. The boy, in this instance, was father of the man. His literary activity was unbounded. He took his share in the public life of France of his day, and helped to administer the affairs of the country. Napoleon fired his imagination, but the coup d'état of Napoleon III. filled him with indignation, and France and Belgium became successively impossible as places of residence. He retired to Guernsey, where his literary outpourings proceeded unchecked. The fall of the Second Empire recalled him to Paris, where he remained throughout the Commune, but, retiring again to Brussels, was again expelled the kingdom. Paris once more opened her arms to him, and made him a Senator. Almost to the end of his long life he continued to write, and though towards the close of his career he fell below the high standard of his earlier work, his record is almost without parallel for variety of themes and treatment, for nobility of aim and beauty of expression. He has been acclaimed the finest purely literary spirit

Humboldt, Friedrich Heinrich Alexander
b. Berlin, Sept. 14, 1769. d. Berlin, May

As a child he was called "The Little Apothecary," so keen was his devotion to scientific subjects. At twenty he had matured his powers, and resolved upon the career of scientist and explorer. All his studies were directed to that end. He travelled through Europe, spent some years as a mining engineer, resumed his European travels and studies, then made a productive exploring trip to Mexico and South America. For the next twenty years he resided mainly in Paris, engaged in scientific pursuits, then went to Berlin, whence, at the invitation of the Emperor of Russia, he departed on an expedition to Siberia and the Caspian Sea. The monumental results of his investigations were given to the world in thirty volumes of brilliant writings. He found time to discharge numerous important political missions, and was not less esteemed as a diplomatist than as a great master of learning, the Encyclopædia of Science, as Emerson has named him.

Hume, David
b. Edinburgh, April 26, 1711. d. Edinburgh, Aug. 25, 1776.

The famous historian and metaphysician "found himself," after expeditions in various directions in search of a vocation. He first tried the law, then commerce, was at various times companion to men of note, Under-Secretary for the Home Office, and Judge-Advocate. He had attained his forty-first year when he decided to write his "History of England," and completed it nine years later. His political and moral essays, though not invariably attracting great attention at the time of publication, have since had a decided effect upon the opinion of the country.

Hunt, William Henry
b. London, March 28, 1790. d. London, Feb. 10, 1864.

The father of English water-colour drawing was a puny cripple, son of a journeyman tinplate worker. His gift for drawing was inexplicable. It showed itself when he was quite young, and he was soon copying Gainsboroughs at eighteenpence apiece. A good-natured patron of art took him in hand, and gave him an introduction to the Earl of Essex, the interior of whose house formed the subject of Hunt's first picture at the Royal Academy. Ruskin places him among the greatest colourists of this country. He left a fortune of over twenty thousand pounds, all earned by his brush.

Hunt, William Holman
b. London, April 2, 1827.

With Dante Gabriel Rossetti, Millais, and other artists he founded the "Pre-Raphaelite" school of painting, which aims at telling the truth, the whole truth, and nothing but the truth in a painting. The most famous of all his many well-known pictures is "The Light of the World." The original is in the chapel of Keble College, Oxford; a replica has been sent by Mr. Charles Booth on exhibition throughout the British Empire.

Hunter, John
b. Long Calderwood, Lanarkshire, 1728. d. London, Oct. 16, 1793.

Destined to become the founder of modern scientific surgery, Hunter wasted his youth, and never quite made good the opportunities neglected. Spelling and grammar were always too much for him, yet he was the instructor of the great surgeons who were to follow him. He disregarded books, and studied instead men, animals, and plants. His discoveries were of the greatest importance to the science of which he became the chief exponent. All the money which he could spare he devoted to the collection of specimens which, when catalogued years later by Owen, formed a priceless possession to comparative anatomists. Hunter's wife was the author of

"My mother bids me bind my hair," and other popular poems. Among his pupils were Jenner, Astley Cooper, and Abernethy. William Hunter, another great surgeon, was his brother, and gave his more famous junior his first insight into surgery.

Hunyadi, Janos
b. Hunyad, Transylvania. 1387. d. Semlin, Croatia-Slavonia, 1456.

A great Christian general, he was Regent of Hungary during the minority of Ladislaus V. His whole career was one long campaign against the Turks, whom he defeated in many brilliant battles. His most famous achievement was the storming of Belgrade.

Huss, John
b. Prachatitz, Bohemia, July 6, 1369. d. Constance, Baden, July 6, 1415.

His preaching of Wyclif's tenets brought him under the ban of the Roman Catholic church. The Pope by bull condemned Wyclif's teachings, but Huss continued to expound them, was brought to trial, refused to recant, and was burnt at the stake. The Hussite war, which followed, was the outcome of the resistance of his followers offered to the whole forces of the Empire, and sustained for a generation at terrible cost in lives to both sides.

Hutton, James
b. Edinburgh, June 3, 1726. d. Edinburgh, March 26, 1797.

The son of well-to-do parents, he received an excellent education, and was then placed in the office of a lawyer. But his mind from the outset ran wholly on science, and when he should have been studying lawyers' laws, he was probing Nature's. His articles were cancelled, and he was sent to Paris and Leyden to study medicine. This, too, he abandoned, and determined to try scientific farming, which conducted him to mineralogy and geology, in which his interests really lay. His laborious researches led to his discovering the modern explanation of the phenomena of the earth's crust by means of changes still in progress. The "Huttonian Theory" was assailed by his contemporaries, and it was not until the luminous exposition of John Playfair made the ponderous tomes of the founder of geology popular that the significance of Hutton's discoveries was realised. He had no mathematical knowledge, and went astray in adopting the phlogiston theory; but, with every detraction considered, the value of his work remains very high.

Huxley, Thomas Henry
b. Ealing Middlesex, May 4, 1825 d. Eastbourne, June 29, 1895.

The seventh child of a seventh child, Huxley began his education under his father, who had the future Cardinal Newman among his students. For the son of a school teacher, his education was strangely desultory and irregular. "I had two years of a pandemonium of a school—between eight and ten--and after that neither help nor sympathy in any intellectual direction till I reached manhood." he recorded. His desire was to be a mechanical engineer, but the study of Hutton's works, of logic, and of German, and the fact that two of his sisters married doctors, fortunately led to his taking other paths. He was apprenticed to a London surgeon, and at his first post-mortem examination contracted an illness which left him with chronic dyspepsia. In his twentieth year he announced an important discovery in relation to the human hair. In the same year he graduated M.B., and won a gold medal for anatomy and physiology. Like Darwin, he was destined to find fame on the sea. He took voyages, in the capacity of assistant-surgeon, in two ships, and in both made important contributions to the science of biology. His fame was now growing, but he had no funds with which to publish the full results of his work. Ordered to rejoin his ship, he had to throw up his only certain income rather than leave unfinished the work of completing the description of his collection of specimens. Fortunately, the position of lecturer on natural history at the Royal School of Mines fell vacant at an opportune moment, and Huxley was appointed. He was now in a position in which he could make his influence felt. Despite lasting ill-health, he addressed himself with heroic energy to the popularising of science. In the great controversy on evolution he played a leading part in support of Darwin. His lectures to his students, to unscientific audiences, and especially to working men became famous. Honours crowded upon him, and no man of science of his era had greater influence. He was one of the first members of the London School Board, and accomplished much for the improvement of popular education. His writings and lectures on scientific and philosophical subjects are by this time for the most part classics. The nineteenth century produced few such splendid brains as Huxley's, few men so strong and courageous and lovable withal.

Huygens, Christian
b. The Hague, Holland, April 14, 1629. d. The Hague, July 8, 1695.

He was the son of a poet and diplomatist, whom James I. knighted, and studied physics, astronomy and mathematics at Leyden University. One of his greatest advantages was his adaptability. He could seize upon and improve a new idea. Thus he invented the pendulum clock, on the suggestion of Galileo; and, developing the same philosopher's theory of the acceleration of motion under the influence of gravity, prepared the way for Newton. Huygens, who first expounded the undulatory theory of light, discovered Saturn's ring and one of his satellites.

Hypatia
b. Alexandria, fourth century A.D. d. Alexandria, fifth century.

The daughter of an Alexandrian astronomer and mathematician named Theon, she learned all that her father could teach her, then went to Athens, where she became so proficient in philosophy that she returned to Alexandria to become noted herself as a teacher. She presided in the public schools, teaching philosophy and mathematics. Her beauty and talent made her very famous, and excited the hatred of a bigoted Christrian archbishop, one of whose creatures headed a riot in the course of which she was stripped of her clothing and torn to pieces in the public streets. Kingsley's novel is founded upon her career.

Ibsen, Henrik
b, Skien, Norway, March 20, 1828. d. Christiania, May 23, 1906.

The failure of his father's fortune coloured the early life of the future poet and dramatist. He was apprenticed to an apothecary, but studied literature in his leisure, and before he was twenty-one published his first work. It was a failure, as were several others—dramatic and poetic. He had tried his fortune in journalism and as manager of a theatre before he gained the approving attention of the world with the plays which made him famous. "Love's Comedy," written in his thirty-sixth year, linked his name with the social and satirical drama, and the future held no more difficulties for him, though his works were never received without prolonged and bitter controversy. Ibsenites see in him the stern moralist depicting conditions and life as they are; his critics find him morbid, and a painter of things which ought not to be painted.

Ivan III.
b, Moscow, 1440. d. Moscow, Oct. 27, 1505.

Ivan the Great, as he is commonly called, was born Grand Duke of Moscow. Finding the country divided into many petty states, and tributary to the Mongolian Tartars, he made Russia a whole, and became the first Tsar and founder of the Russian Empire. Ivan the Terrible (b. 1530; d. 1584) was an enlightened but cruel and barbarous prince, who slew his own son in a fit of passion. He extended the dominion of Russia—notably by the acquisition of Siberia. By him the first printing press was established in Russia, and the mission sent to England by which the first treaty between Russia and this country was signed.

Jacquard, Joseph Marie

b. Lyons, July 7, 1752. d. near Lyons, Aug. 7, 1834.

The inventor of the famous silk-weaving loom which bears his name was the son of poor parents, and while pursuing his experiments had to sacrifice everything he possessed to carry on his work. He was unsuccessful, and became a labourer, then a soldier. It was not until he had entered his fiftieth year that the fame of his invention became public. Even then he still had years to wait before it was perfected. The workpeople of Lyons fiercely resisted its introduction, but he lived to see it in universal use.

Jenner, Edward

b. Berkeley, Glos., May 17, 1749. d. Berkeley, Jan. 26, 1823.

The discoverer of vaccination for smallpox was He was twenty-six when he tions, but twenty years had elapsed before the medical faculty accepted his theory. His own hope was that by the universal application of vaccination smallpox would become extinct. He was rewarded by two Parliamentary grants, aggregating £30,000.

Joan of Arc

b. Domremy, France, Jan. 6, 1412. d. Rouen, May 30, 1431.

"The Maid of Orleans" was the daughter of peasants. She never learned to read or write, but was characterised by boundless mental and physical activity. At this time the English were masters of the whole of France north of the Loire, and Henry V. of England had been proclaimed King of France. A local saying that France was to be redeemed by a virgin out of the forest of Domremy seems to have impressed the mind of the girl. Although she was devoted to her parents, and received with reverence the spiritual instruction of her mother, she dwelt apart, as it were, and dreamed of the prophecy, until she fancied that she heard supernatural voices declaring that she was the maid appointed to the task. She eventually gained access to the Court of Charles VII., and persuaded him to give her the command of an army. At the head of this force she was brilliantly successful. She raised the siege of Orleans, drove the English from their principal position on the Loire, and had the king crowned at Rheims. Still continuing her campaign against the invaders, she was eventually captured by the English at Compiègne—sold, it is said, by traitors for 10,000 crowns. Arraigned before a spiritual tribunal at Rouen, she was condemned as a heretic, and, according to a version upon which later research casts doubt, burnt at the stake.

Johnson, Samuel

b. Lichfield, September 18, 1709. d. London, Dec. 13, 1784.

Johnson owes immortality to his disciple and biographer Boswell. The great literary dictator of his age would not be known to posterity as the man he was but for his faithful henchman, who mirrored his manners, ideas, and diction in a manner which Johnson in his own writings quite failed to do. He was the son of a second-hand bookseller, afflicted, in spite of great physical strength, with a disease for which he was "touched" by Queen Anne. In spite of his prodigious mental activity, he failed to obtain a degree at Oxford during his years of residence. He made two or three attempts as a schoolmaster, but without success, and came to London, accompanied by a pupil, David Garrick. He had already married a widow, whose small fortune a calamity soon absorbed. During many years his life in London was one long struggle with adversity. He was still very poor when he projected his famous dictionary. The publisher agreed to pay him £1,575 for the entire work. To complete it he had to employ six amanuenses, five of whom were Scotsmen, whom he affected so heartily to despise. The dictionary was dedicated to Lord Chesterfield, whose discourtesy and neglect were noted in a letter which has become famous. During the latter portion of his life, Johnson enjoyed a Government pension of £300 a year, and became the centre of that literary circle which Boswell has rendered famous. He had no taste for music or pictures; he had many prejudices, and was dogmatic, and apt to browbeat those who crossed him. But, withal, he was one of the greatest figures of his age—a noble-hearted, lovable man, whose wise and witty sayings are to this day in all men's mouths.

Jones, Inigo

b. London, July 15, 1573. d. London, June 21, 1652.

Like many another genius, this great architect began his career in unpromising circumstances. His father was so poor that he was compelled to pay a debt by instalments so small as ten shillings a month. The boy was apprenticed to a carpenter, but his aptitude for drawing attracted the attention of the third Earl of Pembroke, who sent him to Italy to study. He is said to have designed a palace during this trip for the King of Denmark. His first work of note in England was to design the scenery and machinery for the presentation of plays by Ben Jonson and other dramatists. Following this came his appointment as Surveyor-General, and the beginning of his architectural work. His banqueting-house in Whitehall was intended as part of an immense palace. His Lincoln's Inn Chapel, his residence for the Queen at Greenwich, and many other notable buildings in the capital and the country, caused it justly to be said that "what was truly meant by the art of design was scarcely known in this kingdom until he brought it into use and esteem amongst us here."

Jonson, Benjamin

b. London, 1573. d. London, Aug 16, 1637.

One of the most celebrated poets and dramatists, he was the posthumous son of a clergyman. His mother marrying a bricklayer as her second husband, the boy was taken from school, and put to work at his stepfather's trade. His spirit revolted against it and he fled, to join the Army as a private soldier, and serve bravely in a campaign in Holland. Returning to England, he got himself entered at St. John's College, Cambridge, but was forced back to London, to earn his bread as author and actor. A duel with a brother actor terminating fatally for his antagonist, Jonson was imprisoned, and narrowly escaped execution. At twenty-four he published his famous play, "Every Man in His Humour," and thereafter produced a play annually for several years, in addition to masques and smaller pieces for the Court. His share in a dramatic piece which Court favourites resented nearly cost him his nose and ears, which he was condemned to lose in the pillory. He soon regained the Royal favour, and was appointed Poet Laureate, and, following journeyings on the Continent, was the recipient of an honorary degree from Oxford University. But his health was now impaired, and he died of palsy, and was buried in Westminster Abbey, with the simple epitaph, "O, Rare Ben Jonson." His dramas exhibit pungent humour and profound philosophy. They are unequal, as are his poems; but while Shakespeare is accounted among the gods of English verse, Jonson is in the forefront of the giants. Some of his songs are for all time. In spite of his poverty and hard youth, he was among the most learned men of his age.

Josephus, Flavius

b. Jerusalem, 37 A.D. d. Rome, second century A.D.

The great Jewish historian was the son of a priestly house, and so early profited by educational advantages that he was frequently consulted as a youth by the high priests and prominent citizens upon points of Jewish law. After three years in the wilderness as the pupil of a hermit, he went to Rome. His visit impressed him with the power and resources of that empire, and upon his return he did all he could to dissuade his countrymen from their contemplated rising. His voice was not heeded. He himself was swept into the revolutionary movement, and held important military commands until defeated and taken prisoner by Vespasian. The latter befriended him, and upon becoming emperor gave him a residence in Rome. Here Josephus produced his immortal literary works.

Juvenal, Decimus Junius Juvenalis
b. Aquinium, Italy, first century A.D. d. about 140 A.D.

Little is known of the life of this celebrated Roman satirist. He was the son, either by birth or adoption, of a wealthy freedman, who gave him a liberal education. Half his career was spent at the Bar, where he acquired considerable reputation. Against his will he was sent to Egypt, and resided afterwards for some time at his native place. His immortal satires were directed against the social vices of the early Roman Empire, and underlying them all is a strong dislike of the imperial regime, and regret for the loss of the old Republican system. Dryden's translations of Juvenal are among his finest work.

Kant, Immanuel
b. Königsberg, Germany, April 22, 1724. d. Königsberg, Feb. 12, 1804.

The son of a poor saddler of Scottish stock, he studied at the local university, and never resided away from his native city. He was successively private tutor and university lecturer. He lectured on logic and the various branches of metaphysics, on anthropology, physical geography, and mathematics. His great work, the "Critique of Pure Reason," was twelve years in preparation. It was only during the last twenty years of his life that he was famous, though he had published several treatises, in one of which he predicted the existence of Uranus, which Herschel afterwards discovered. His fame spread throughout Europe as work after work followed his "Critique," and an enormous impulse was given by his labour to critical philosophy, of which he was the founder.

Kay, John
b. near Bury, Lancs., July 16, 1704 d. France, after 1764.

The inventor of the "fly shuttle" was twenty-nine when granted a patent for this extremely important invention—perhaps the most important improvement ever made in the loom. His patent was unblushingly infringed by the manufacturers of his day, and the costs of litigation almost beggared him. His brain teemed with schemes for further improvements in industrial machinery, but the mob broke in and destroyed everything he possessed. He fled to France, and there died in obscurity and poverty. British industry owes an enormous debt to this poor fugitive, who starved to death in a foreign land.

Keats, John
b. London, Oct. 31, 1795. d. Rome, Feb 23, 1821.

This rare and great genius was the son of an ostler, who had married the daughter of his employer, a livery-stable keeper in Moorfields, London. The poet was born in the house adjoining the stables, and went to school at Enfield, where, after two idle years, he applied himself with extraordinary enthusiasm to the study of literature, of which classical mythology was his favourite. He carried from school some Latin and French, but no knowledge of Greek in the original. Keats inherited a modest competence from his grandfather, a practical old man, who apprenticed him to an Edmonton surgeon. The work did not appeal to the poet; and though he studied for three years at the London hospitals, he withdrew at the earliest possible moment to devote himself to the muse, encouraged by the example, if not advice, of his literary friends, among whom were Shelley and Leigh Hunt. "Endymion," though not free from fault, contains so many beauties that it was hailed with acclamation by all but the terrible "Blackwood" and "Quarterly," which attacked it with characteristic ferocity. He bore the onslaughts bravely, but they left an ineradicable scar. The last volume contains some of his finest work, but his health was broken. His devotion to a sick brother, the fatigues of a walking tour in Scotland, and his passionate love for a woman who did not appreciate him, rendered his condition critical. He went to Rome, and died three months after arrival. He had many friends, one of whom—Severn the artist—accompanied him to Rome, and tenderly nursed him until he died.

Keble, John
b. Fairford, Glos., April 25, 1792. d. Bournemouth, March 29, 1866.

The "sweet singer of Israel" and true saint, as Mr. Gladstone called him, was an Oxford professor and a clergyman. With him originated the Tractarian Movement, culminating in the famous "Tract No. 90." His "Christian Year" is the most famous of his poetical writings. Keble College, Oxford, was erected to commemorate him. It is for students of limited means.

Kelvin, William Thompson, Lord
b. Belfast, June 26, 1824.

His father was Professor of Mathematics in the University of Glasgow, where, at the age of twenty-two, young Thompson was to begin a professorship of natural philosophy which was to last over half a century. Meanwhile, he much distinguished himself at Cambridge University. Not only was he a brilliant student, he was famous as an oarsman. At seventeen he attracted the attention of scientists by a brilliant paper on heat and electricity, which showed quite original method of investigation, and was destined to be of importance to subsequent investigations. Since then his writings on science have been beyond enumeration, and their effect upon the scientific learning of the age above comparison. His inventions are of equal importance. It is by those in the field of telegraphy, and those which form aids to navigation, that he is best known to the public. His share in the Atlantic cable brought him a knighthood; his inventions of the magnetic compass and of his famous sounding-machine, which enables the depth of water to be taken without a ship slackening speed, make his name a household word with sailors. His researches in electrostatics gave us those infinitely fine instruments which embody the perfection of mechanical and geometrical adjustment. He has received all the distinctions possible to a man of science, and his jubilee at Glasgow University drew together a notable gathering of British and European scientists.

Kempis, Thomas à
b. Kempen, Germany, about 1379. d. Zwolle, Holland, July 25, 1471.

His real name was Thomas Hamerken; that by which he is known comes from his birthplace. He was trained in an Augustine convent near his native town, and became eventually its superior. Of all his writings, the "Imitation of Christ," of which he is believed to be the author, is the most famous. No other book, after the Scriptures, has been so often reprinted; none other translated into so many languages. A copy of the work—not the first—in the handwriting of Thomas himself is to be seen in Brussels.

Kepler, Johann
b. Weil, Germany, Dec. 27, 1571 d. Ratisbon, Germany, Nov. 15, 1630.

He was the son of poor gentlefolk, and himself scarcely ever free from domestic worries. His first appointment was that of mathematical lecturer at Grätz, he not having as yet taken any interest in astronomy. Fortunately, he was brought into communication with Tycho Brahé, who directed his studies to the work with which he was to immortalise himself. After labouring for some time with Tycho, Kepler succeeded him as astronomer to the Emperor Rudolf, and at the death of the older man inherited his vast store of facts, as he had benefited by all that he had learned of him. The publication of his famous astronomical laws formed the basis of Newton's work, and the foundation of modern astronomy.

Kingsley, Charles
b. Dartmoor, June 12, 1819. d. Eversley, Hants, Jan. 23, 1875.

The son of a clergyman, Kingsley, after a successful course at Cambridge, took orders, though at one time he had such religious doubts that he declared his intention of quitting the University for the prairies. He first became curate, then rector of Eversley, interested himself in Christian Socialism, and became one of its most powerful exponents. His earlier novels, written with this purpose in mind, excited extraordinary interest. Under the pen-name of "Parson Lot" he wrote a great number of articles for the Press, further elaborating his doctrines. The latter he put into practice in his daily intercourse with his own flock. He held two professorships, and was made Canon of Westminster and chaplain to Queen Victoria. Miss Mary H. Kingsley was his niece. His second daughter, who in 1876 married the rector of Clovelly, but has since become a Roman Catholic, is the well-known novelist "Lucas Malet."

Inheriting talent from both sides of his family, he was sent home to Westward Ho for his education, then, returning to India, was put to work on a newspaper. The short tales which were later to make him famous were written for the paper with which he was associated, and accepted as additions to routine work not willingly, but as a favour to the author. These he eventually put into book form, issuing them one at a time in slim, paper-backed volumes. They made his name at once in India, and later in England. Since then he has travelled almost as far as his fame. He married an American lady, and nearly died in the land of her birth in 1899. The "Bard of Empire," as he is called, he is also the laureate of the barrack-room. His noblest composition—one which, whatever befall the rest, is sure of immortality—is his grand and splendid "Recessional," written for the Diamond Jubilee.

Kircher Athanasius
b. Geisa, Germany, May 2, 1602. d. Rome, Nov. 28, 1680.

Although he was a great scholar and mathematician, Kircher, who was professor first at Wurzburg of philosophy, mathematics, and Oriental languages, then of mathematics at Rome, is best remembered as the inventor of what is still popularly termed the magic-lantern.

Klopstock, Friedrich Gottlieb
b. Saxony, July 2, 1724. d. Hamburg, March 14, 1803.

The founder of modern poetry in Germany was educated at his native Quedlingburg, at Jena, and at Leipsic. Inspired by Milton, and, to a lesser extent, by Virgil, he published three cantos of his sacred epic, the "Messiah." This at once brought him favour and fortune. The completion of his epic occupied him nearly thirty years. It has been superseded by far nobler works, but its influence in creating a German poetic literature can never be overlooked.

Knox, John
b. Haddington, 1505. d. Edinburgh, Nov. 24, 1572.

The perfect symbol of Reformation in all countries and times, as Ruskin has called him, was first a lawyer in Glasgow, where he was educated at the university, then a priest of the Roman

was brought in touch with a Lutheran reformer, by whom his religious opinions were much influenced. This man, Wishart, was burned at the stake for

thither Knox, who was now formally admitted to the ministry. St. Andrews yielded to the French, and Knox was confined to the galleys for eighteen months. Upon his release he travelled and preached in England, was made one of the chaplains to Edward VI., and assisted in the reformation of the second Prayer Book. On the accession of Mary Tudor he fled to the Continent, and came under the influence of Calvin. His "Blasts of the Trumpet Against the Monstrous Regiment of Women" was first directed against Mary of Guise, then Regent of Scotland, against Mary of England and Catherine de Medici, but it complicated his relations with Mary Stuart. When the latter, as widow of the Dauphin, returned to Scotland, the battle between herself and him at once began, and led to the dramatic interviews which have become famous. In the end, thanks mainly to his efforts, Roman Catholicism was abolished in Scotland. The times in which he lived were violent, and the cause which he made his own was endangered by many terrible deeds by his disciples. He himself was rough and rude at times, but the verdict of history upon his life, his acts, and his writings is that no one in England or Scotland who values liberty—national, civil, or religious—can speak of John Knox without reverence and gratitude.

Koch, Robert
b. Klausthal, Germany, Dec. 11, 1843.

It was while practising as a physician that he began those researches in bacteriology which have made him famous. His investigations as to anthrax, Asiatic cholera, rinderpest, and bubonic plague have led to important results. Controversy still rages round the conclusions which he has reached on the subject of tuberculosis.

König, Friedrich
b. Eiselben, Germany, April 17, 1774. d. Jan 17, 1833.

Trained to the trade of a printer, he devoted his leisure to planning a steam press. This, with the assistance of Bensley, a London printer, he was able, in 1810, to patent. In the following year he obtained a patent for a cylinder press, which, in improved form, was adopted three years later for the printing of the "Times."

Lagrange, Joseph Louis de
b. Turin, Jan. 25, 1736. d. Paris, April 10, 1813.

Interested at first in literature rather than mathematics, he eventually devoted himself to his calculus of variations, which had highly important results for the higher branches of physical astronomy. He was for twenty years a professor at Berlin, on the invitation of Frederick the Great; but, turning to Paris, was received with honours and emoluments, to devote the rest of his days to the dissemination of knowledge in the French capital.

Lamarck, Jean Baptiste Pierre Monet de
b. Bazentin, France, Aug. 1, 1744. d. Paris, Dec. 18, 1829.

The founder of invertebrate zoology was for some years in the French Army, from which his retirement was necessitated by an injury. He became bank clerk, studied medicine, and then botany. Securing an appointment at what has since become the Jardin des Plantes, on the creation of the museum, he became responsible for the lowest order of animals, what Linnæus had called merely insects and worms. These he reclassified into ten classes, and, though his work has been superseded by subsequent labourers in the same field, its importance at the time was very great. His researches led him to the theory that altered conditions of life lead to variation of species. He was the forerunner in this matter of Darwin and his s

Lamb, Charles

wealthy Bencher of the Temple. He was entered at Christ's Hospital—the Blue Coat School—where Coleridge, his lifelong friend and first collaborator, was also a pupil. Lamb became a clerk in the South Sea House, and afterwards in the India House. When he was twenty-one his sister Mary, in a fit of madness, murdered their mother. Thereafter he became her constant guardian, devoting his life to her care. In her lucid intervals

he was forty-five, and appeared in "The London Magazine." The name under which he wrote was that of a former clerk in the India House. He enjoyed the friendship of all the literary men of his age, and was recognised as a critic and humorist of the highest order. When, after a generation spent in the service of the India House, he retired on a pension of £450 a year, he went with his sister to Edmonton. His term of rest was not more satisfactory to him than the condition of retirement which he describes in one of his essays. His sister Mary was all her life subject to fits of insanity, and these became more frequent and of longer duration as age increased. His last days were thus saddened by this grief, and also by the loss by death of many of his dearest friends. In life he was the same gentle, merry, tender-hearted, delightful man which his writings suggest, and his position in the affections of posterity can never be assailed.

Landseer, Sir Edwin Henry

b. London, March 7, 1802. d. London, Oct. 1, 1873.

The youngest of a talented brotherhood, Landseer was the son of an engraver, who early taught his son the art of drawing from life. When he was yet in his fourteenth year he exhibited a picture at the Royal Academy, while at sixteen he became famous with the picture "Fighting Dogs." From that time forward he was a regular exhibitor at the Academy, of which he became an associate, then a member, and finally declined the presidency. He attained the very highest rank among animal painters. Deer and dogs and horses were his favourite studies. His one fault was that he gave his animals too human an expression. The noble lions at the base of the Nelson monument in Trafalgar Square are of his execution. He received the commission in 1858, and the figures were finally placed in position in 1867.

Lâo-Tsze

b. 604 B.C., Honan, China. d. China, date unknown.

Although five-and-twenty centuries have elapsed since the birth and death of Lâo-Tsze, his birthplace and the temple erected in his honour are still pointed out. He was for some time one of the keepers of the king's archives, but retired to live a life of quiet and contemplation. He bequeathed to his country the religion which, with Buddhism and Confucianism, still holds sway today. It was the simple and quiet life which he preached. He deprecates learning and recourse to arms, and bids his followers requite injury with kindness. Confucius, who was much his junior, went to see him, and was reproved for troubling himself with the affairs of the world. The teaching of this philosopher is contained in his classical "Book of the Way."

, Pierre Simon Marquis de

rance, March 28, 1749. d. Paris, March 5, 1827.

The son of a farmer, he became a professor of mathematics, and renowned for his mastery of the whole science of mathematics and its application to practical astronomy. For six weeks he was Minister of the Interior under Napoleon. His contributions to science deal with the tides, with lunar motions, and the nebular theory.

Latimer, Hugh

b. Thurcaston, Leicester, about 1485. d. Oxford, Oct. 16, 1555.

The son of a yeoman farmer, he became Bishop of Worcester. He was one of the divines who found in favour of the divorce of Henry VIII. In his forty-fifth year he was, in his own words, "as obstinate a Papist as any in England." From that time, however, he turned strongly to the Protestant faith. Called upon, after the accession of Mary Tudor, to recant, he declined

as I trust shall never be put out!"

Lavoisier, Antoine Laurent

b. Paris, Aug. 26, 1743. d. Paris, May 8, 1794.

One of the crimes of the French Revolution was the execution of Lavoisier, the father of modern chemistry. A man of exceptional talent, he first exploded the phlogiston theory of combustion. Until this was dispelled, although Black and Cavendish and Priestley were doing brilliant work, substantial progress could not be made. Lavoisier showed that the true theory of combustion was a process of oxidation. This opened up the way to the correct study of life, by rendering the function of respiration and the production of animal heat for the first time intelligible. This was not his only discovery, but it was the most important, as establishing the basis upon which modern chemistry has been built. He accepted a position as tax-farmer in order that he might have funds with which to carry on his experiments; and, popular rage being excited against all concerned in tax-gathering, he was condemned and guillotined when in the prime of life.

Layard, Sir Austen Henry

b. Paris, March 5, 1817. d. London, July 5, 189[illegible].

He had two careers. One was as member of Parliament and

earlier, was the m

which his fame w

plored the remains of ancient Nineveh, and made important contributions to our knowledge of Babylon and of the inscriptions on Assyrian monuments by which the history of the Old World is revealed.

Leibnitz, Gottfried Wilhelm von

b. Leipsic, July 6, 1646. d. Hanover, Nov. 14, 1716.

Equally celebrated in philosophy and mathematics, Leibnitz is regarded as having possessed one of the finest minds of his own or any other time. He inherited a bent for philosophy from his father, and was free to pursue his education under the wisest thinkers. With the Elector of Mainz he was engaged in literary and political work. A similar appointment at the Court of Hanover led to his undertaking a history of the House of Brunswick, and the character of his labours entitles him to be regarded as one of the first of the critical school of historical research. He was the inventor of the calculus. It is claimed for Newton that he arrived at the same discovery by independent research. The point was the source of long and acrimonious debate between followers of the two men, but there seems little doubt now that the German was really the pioneer. He visited England, and met the members of the Royal Society, and endeavoured to institute similar bodies in all the capitals of Europe. His discoveries as to the laws of energy, his work in material directions for the better health and comfort of his fellows, his part in the theological discussions of the age, all show the universality of his genius.

Leo I

[illegible]

One of the greatest of the Roman fathers, he was of a good Tuscan family, and during his early manhood was employed in distant missions, which brought him in contact with St. Augustine. He was called to the Papal chair when absent on one of these errands. He entered with spirit into the duties of his high office, and established a precedent by preaching from his own pulpit. When Attila overran Italy, and had Rome at his mercy, it was Leo who interceded for the capital. He was less successful when the Vandal Genseric invaded Italy. Rome was sacked, but the Pope managed to induce the conqueror to forgo some measure of the conqueror's licence. The remainder of his days Leo devoted to repairing the ruin which the barbarians had wrought. The Roman Empire had fallen, to rise no more; but, thanks to his efforts, Rome now became the spiritual centre of the West.

Leonardo da Vinci

b. Vinci, Italy, 1452. d. Cloux, France, May 2, 1519.

One of the most richly-endowed of Nature's sons, he excelled in art, in sculpture, in all forms of engineering, in music, and in writing. His father was a Florentine notary, who gave him the advantage of study under the greatest masters of the age. But it was as engineer to the Sultan of Cairo that the artist first attracted attention. He resumed the old life years later, when he was appointed to drain the plains of Lombardy, as well as direct the Court pageants. Few of his paintings remain. One, however, "The Virgin of the Rocks," is in the National Gallery, London. His famous "Last Supper," still, after four hundred years and in spite of many restorations necessitated by damp, one of the greatest art treasures in the world, was painted on the refectory wall of the Santa Marie delle Grazie Convent. His most notable sculptural work was the equestrian figure of Duke Francesco of Milan, a colossal and noble statue, which the French destroyed in 1800. Apart from his great subject pictures, he painted many lovely easel pictures; but the student now must rely mainly upon his drawings, of which many authentic collections exist in England and on the Continent. His celebrated treatise on painting was published in 1651.

Le Sage, Alain René

b. Sarzeau, Brittany, May 8, 1668. d. Boulogne, Nov. 17, 1747.

Having failed at the Paris Bar, he turned to literature, and poured out plays, stories, and translations. Most of them were failures. His famous play "Turcaret" was at first rejected. His fame rests upon that and upon his greater work, the immortal novel "Gil Blas." The originality of the work is challenged; his enemies called it a mere conveyance from Spanish sources. But, though the scene and characters are Spanish, the treatment is essentially French, and the result and glory his. He was the first to see the possibilities of the picturesque novel, and later writers of romance owe him an immense debt.

Leslie, Sir John

b. Largo, Fifeshire, April 16, 1766. d. Coates, Fifeshire, Nov. 3, 1832.

The son of a carpenter, he was enabled, by the kindness of the eighth Earl of Kinnoull to study at the University of St. Andrews. Engaged by his friends the Wedgwoods to superintend their studies, he had time for experiment and research, which resulted in the production of a differential thermometer, a hygrometer, and a photometer. Afterwards he travelled much, and conducted inquiries into the nature and properties of heat, with the result that he was the first to announce important discoveries in relation to the radiation of heat. He also first announced the process of artificially freezing water—a discovery of considerable importance. He became mathematical professor at Edinburgh University, and made many notable contributions to the scientific literature of his age.

Lesseps, Ferdinand Viscomte de

b. Versailles, Nov. 19, 1805. d. Paris, Dec. 7, 1894.

Educated for a diplomatic career, he went, in the course of his profession, as French Consul-General to Alexandria. When he returned, years later, on a visit to Egypt, he unfolded to Said Pasha, the then Viceroy of Egypt, his scheme for the Suez Canal. The project met with fierce opposition, nowhere more severe than in England. In spite of all difficulties, however, the work was carried to a successful conclusion, and to-day England is paramount shareholder in the canal. Honours were heaped upon the engineer, but with his scheme for the Panama Canal came ruin. Enormous sums were involved in the work, and in 1892 he, with five directors, was condemned to imprisonment for breach of trust. He was too ill to undergo sentence, and died at his own house in the following year. De Lesseps was a cousin of the Empress Eugénie.

Leverrier, Urbain Jean Joseph

b. St. Lô, Normandy, March 11, 1811. d. Paris, Sept 23, 1877.

He at first intended to devote himself to chemistry, but a post as teacher of celestial physics was offered to him, and he became one of the greatest astronomers of his age. Certain planetary irregularities led him to investigate the cause. He predicted that the origin of the disturbance would be found in the existence of a then unknown planet. Unsuspected by Leverrier, Adams, the English astronomer, had at about the same time committed himself to a like prediction. Within a few days of the Frenchman's announcement, Galle, of Berlin, actually discovered the planet--Neptune. The two prophets shared the honours of the prediction. Leverrier had a share in shaping the political destinies of France, but it is in astronomy that his fame is established.

Liebig, Justus Baron von

b. Darmstadt, Germany, May 12, 1803. d. Munich, April 18, 1873.

One of the greatest chemists of all time, Liebig claims the gratitude of posterity not only for the immense amount of data which he himself added to the stores of knowledge, but for the enormous impulse to the study and development of chemistry which he gave through the hosts of brilliant students who during two generations sat at his feet. His father was a drysalter, and the boy was fired with a desire to become a chemist from reading old-time experiments. The result of his labours was the foundation of agricultural chemistry, in itself sufficient to make him for all time famous. In addition, he shared in the discovery of chloroform and chloral, and in the extension of the functions of organic and animal chemistry. He invented an extract of beef which has made his name known throughout the world. As professor of chemistry at Giessen and Munich, his lectures attracted students from all parts of the civilised world; and so great was he as a teacher that he trained his sons in science almost to equal him in his own day. His successors, of course, go far beyond the frontiers to which he had advanced, but as a pioneer his work was of incalculable value and merit.

Lincoln, Abraham

b. Kentucky, U.S.A., Feb. 12, 1809. d. Washington, April 15, 1865.

The sixteenth President of the United States of America was the son of a backwoodsman, and was born in the wilds of Hardin County, Kentucky. He received an education which could barely be said to comprise the three R's; but he did learn to read. During youth and early manhood he was successively farm labourer, boat-hand, splitter of rails for his father's log hut, salesman in a tiny store of his own which made him bankrupt. Then he began to study grammar and law, and qualified himself for the acceptance of a minor State office, and to contest a seat in the Legislature. He practised law at Springfield, fought in a war against Indians, then resumed his attempts to enter the Legislature. Successful at last, he attracted widespread attention as an unbending opponent of slavery. Finally, in 1858, he was elected, as a Republican, President of the United States. His election precipitated a crisis in the affairs of the nation. The slave-owning states, seeing that an end of temporising had come, seceded from the

Union, so that they might be free to retain their slaves. The North determined that the South should neither retain slaves nor secede from the Union. The result was the most terrible civil war in history. Lincoln, as President, issued a proclamation liberating all slaves. He behaved with courage, fixity of purpose, and diplomacy throughout the war, and had been re-elected for a second Presidential term before the conflict ended. It was while he was occupied with plans for the reconstruction of the devasted South that he was assassinated at a Washington theatre by an actor named Wilkes Booth. He was one of the greatest men America has produced. A sincere Christian, though not attached to any one church, he was truthful, honest, abstemious, a pattern of morality and probity. He was the saviour of his country and the emancipator of a race.

Linnæus, Carl

b. Råshult, Sweden. May 23, 1707. d. Upsala, Sweden, Jan. 10, 1778.

The founder of modern botany was the son of a poor clergyman, from whom he inherited his love of Nature. Declining to devote himself to a clerical life, the boy was apprenticed to a shoemaker, but managed to work his way to the Universities of Lund and Upsala, living on £8 a year, and making his own boots from the bark of trees. Luckily, he attracted the notice of a man whose interests were similar to his own, and for the future his path was smooth. When twenty-four, he was sent on an expedition to Lapland, whence he returned with a mass of new material on natural history. Befriended in Holland by Boerhaave, he was given charge of the gardens and collection of a wealthy Haarlem merchant. His career closed with an appointment to a professorship of physic and botany. He devised the system of classification of the animal and vegetable world called, after himself, the Linnæan system, and his grouping has been of inestimable value to succeeding generations of botanists.

Lister, Joseph, Lord

b. Upton, Essex, April 5, 1827.

The son of a scientist, he has held during his career professorships at Edinburgh, Glasgow, and King's College Hospital, London. He was house-surgeon to the great Syme, whose daughter he married. His original work has included observations on the coagulation of the blood, on inflammation, on the fibre of the involuntary muscles. But his greatest triumph—the greatest triumph in surgery of the age - has been the introduction of the antiseptic treatment. The effect of this is so great that it seems impossible to realise that the reform has come about within living memory. The use of anæsthetics took surgery at a bound far in advance of the methods of the past. The surgeon had no longer to depend simply upon nerve and speed for the successful performance of an operation. His patient feeling no pain during the operation, he was able to do his work carefully at his leisure, and to observe all the signs necessary to the proper treatment of the case. But to counterbalance this boon there were the deadliest after-effects. The wounds became corrupt, and the healthiest patients died of blood-poisoning. People were afraid to enter hospitals, so terrible was the mortality rate after operations. New wards, new hospitals, were built, in the belief that the fault lay with the old buildings, but the deaths in the new buildings were as numerous as in the old. Lord Lister, seizing upon the discoveries of Pasteur as to the prevention of putrefaction by atmospheric organisms, saw that he must render the wound insusceptible to the influence of these deadly foes. His purpose was effected by the use of carbolic acid. First methods were necessarily crude, but these led step by step to the ultimate goal. The highest honours have been bestowed upon this great benefactor of the human race, and his fame is world-wide. He is the first man ever called to the House of Lords in recognition of his supreme eminence as a medical man.

Liszt, Franz

b. Raiding, Hungary, Oct, 22, 1811. d. Baireuth, Germany, July 31, 1

The Paganini of the piano determined that he would attain to that degree of perfection after hearing the great violinist play. He was already master of the instrument, having played, when only nine years of age, at a great concert at which Beethoven was present. In recognition of his talent, six Hungarian nobles had defrayed the cost of his education. His career as a virtuoso began in his twenty-eighth year, when he won triumph upon triumph in the great cities of Europe. His earlier performances had won appreciation and wider knowledge for the work of Beethoven. He was now able to introduce the music of Wagner, Berlioz, and Chopin. Settling down for a time as director of the Court Theatre at Weimar, he produced Berlioz's "Benvenuto Cellini" and two of the operas of Wagner, to whom a daughter of his was married. In 1865 Liszt entered the Church, to be known thenceforward as the "Abbé Liszt." His compositions, which previously had been brilliant works for the pianoforte, now became mainly suited to the use of churches. Before his death he was ennobled and granted a handsome pension by his native country.

Livingstone, David

b. Blantyre, Lanarkshire, March 19, 1813. d. Ilala, Africa, May 1, 1873.

The son of quite a poor man, he had to begin work as a piecer in a cotton factory when ten years of age. With his first wages he bought a Latin grammar, and by its aid mastered Virgil and Horace. His evenings were devoted to study, although he had to be in his place at the factory by six o'clock in the morning. While at work he used to fix his book on the spinning-jenny, so that he might glance at it in passing. At nineteen he was earning enough money to admit of his attending classes for the study of medicine, Greek, and divinity. He had already made up his mind to be a missionary. It was to China that his heart turned, and he would have gone there had not the opium war prevented it. He went to Africa instead, and there found his vocation as missionary and explorer. His first work was among the Bechuana, whom he befriended as doctor and missionary. During these years he married a daughter of his friend and leader, Dr. Moffatt. The failure, through Boer dislike, of his proposal to plant native missionaries in the Transvaal, set him upon his travels. Without attempting to tell the whole story of his stirring career, of his voyages to and from England, his receptions and honours, it is possible briefly to summarise his achievements. He discovered Lake Ngami in 1849; explored the Zambesi and Kuanza basins to Loanda, 1851-4; recrossed the continent from Loanda to Quilimane, discovering the vast Victoria Falls, in 1855; led a Government expedition up the Zambesi and Shire rivers, and discovered Lakes Shirwa and Nyassa, 1858-9; explored the Rovuma Valley in 1866, the Chambezi in 1867, and Lakes Tanganyika, Moero, and Bangweolo, 1867-9; was at Ujiji in 1869; navigated Tanganyika, and was relieved when in precarious plight by Stanley, at Ujiji in 1871; parted from Stanley at Unyanyembe in 1872, and returned to Lake Bangweolo. During these years he had had many trials, mental as well as physical. He had been grieved by the prevalence and extension of the slave trade carried on by the Portuguese, and had battled strenuously against it. He had suffered severely from privation and fever and dysentery. He succumbed at last at Ilala. His faithful native servants found him dead in the morning. He had passed away as he knelt at prayer. They reverently embalmed his body and carried it to the coast, to be brought home and laid in Westminster Abbey. Livingstone was a great Christian hero, a bold and skilful explorer, whose services to humanity and to geography were of the highest order.

Livy, Titus Livius
b. Patavium, Italy, 59 B.C. d. Patavium, 17 A.D.

Of patrician birth, he became a favourite at the Court of Augustus, but never hid the fact that his sympathies were with a republican form of Government. His fearlessness and impartiality are reflected in his monumental work, his history of Rome. To this great undertaking he devoted forty years of his life. It was in 142 books, of which thirty-five are extant, and traced the story of Rome from her beginnings down to the first decade after the birth of Christ. This, the chief of his life's work, placed him in the forefront of prose writers of the Augustan age.

b. Wrington, Somerset, Aug. 29. 1632. d. Oates, Essex, Oct. 28, 1704.

His father, a country lawyer, had served under the Parliament in the wars of the Commonwealth. Locke's sympathies inclined the same way, which fact, coupled with his ill-health, made it desirable for him to reside abroad—mainly in Holland—until after the Revolution of 1688. His immortal essay on the "Human Understanding" was published in 1690, and remains to this day one of the most notable contributions to the philosophy of the human mind. His writings on toleration and government have had a great influence in diffusing free and generous sentiments through European and American systems of government. He at one time intended to be a doctor, and did practise a little. His skilful diagnosis of the complaint from which Lord Shaftesbury, his friend and patron, suffered was the beginning of their friendship. Newton also was among his friends, and they had long corresponded when mighty things were being accomplished by them in the world of abstract science.

Lodge, Sir Oliver Joseph
b. near Stoke, Staffs, June 12, 1851.

While acting first as Professor of Physics at Liverpool University, and as Principal of Birmingham University, he has found time to undertake original experiments of the highest importance. He is one of the pioneers of wireless telegraphy, and has in hand an invention for dispelling fog. Actively interested in religious and social questions, he has made striking contributions to the literature of both subjects. Psychical research also engages his sympathies and keen attention.

Longfellow, Henry Wadsworth
b. Portland, Maine Feb. 27, 1807. d. Cambridge, Mass., March 24, 1882.

At nineteen he was sent by the trustees of his college to Europe to study languages, and passed two profitable years on the Continent. This qualified him for the chair of Modern Languages and Literature at Harvard, which he occupied for seventeen years. He wrote his first poem as a boy, and to the last the muse seldom deserted him. He is the one American poet whose poems are universally known. His poems are songs of gladness and sweetness and purity. He is the poet of life, as Poe is the poet of death. Longfellow was twice married, and several times visited Europe.

Longman, Thomas
b. Bristol, 1699. d. London, June 18, 1755.

The son of a soap-boiler, he was apprenticed to a London bookseller, and founded the great publishing house of Longman & Co., by whom, during the last century and a half, some of the finest works in the English language have been issued to the world. He began business for himself by buying out the first publisher of "Robinson Crusoe," in premises whose site is still occupied by the firm.

[illegible]

d. London. April 16, 1886.

ence, indexes, and so forth. Many excellent philanthropies were assisted by his judicious and generous efforts.

Lowell, James Russell
b. Cambridge, Mass., Feb. 22, 1819. d. Cambridge, Mass., Aug. 12, 1891.

Essayist, poet, scholar, and diplomatist, he filled the chair at Harvard which Longfellow had formerly occupied. Although he was a successful Ambassador to Spain and England, he never better served the cause of his country and humanity than in his poems. "The Biglow Papers," were called forth by the efforts of the North to free the slaves. Of the latter he was an unswerving and warm-hearted friend.

Loyola, Ignatius de
b. Loyola, Spain, 1491. d. Rome, July 31, 1556.

Iñigo Lopez de Recalde was the real name of the founder of the Jesuits. In his youth he was the very prototype of Don Quixote; but a serious injury, which left him crippled for life, caused him to turn his attention to loftier ideals than those of chivalry. The Church of Rome was at that time reduced to the depths of degradation by corruption and the luxury of its dignitaries. After making a pilgrimage to the Holy Land, he established the Society of Jesus, whose members were to be missionaries, to go to the uttermost parts of the earth at the bidding of the Pope, to convert the heathen to Christianity. The future of this society was destined to be very different from that which he had planned; but the name of Loyola stands out in the Catholic Church as does that of Luther in the Protestant.

Lucian
b. Samosata, Syria, about 120 A.D. d. Egypt, about 200.

His father was a poor stonemason, and intended him to follow the same trade with himself; but Lucian managed to get an education, and to maintain himself as an orator and advocate. Thereafter he settled at Athens, where his literary works were composed. Of these many remain. They are brilliant satires, parodies, and mock narratives of travel, upon which tales such as "Gulliver's Travels" are modelled. He is alleged to have been torn to pieces by dogs, but that is probably an invention of the early Christians, the more likely version being that he died in peace in Egypt, whither he had gone to enjoy a lucrative office.

Lucretius, Titus Carus
b. Rome, about 99 B.C. d. Rome, about 55 B.C.

Little is known of the personal history of this celebrated Roman poet and philosopher. He was the intellectual link between Ennius and Virgil. He lived the life of a recluse. One version as to his death has it that he committed suicide in a fit of insanity; the other, with which Tennyson's poem has familiarised us, that he was poisoned by a love-philtre administered by his wife Lucilia.

Luther, Martin
b. Eisleben, Saxony, Nov. 10, 1483. d. Eisleben, Feb. 18, 1546.

His father was a working man, who gave him a university education, and greatly regretted his entering a monastery. It was here, however, that the reformer was enabled closely to apply himself to the study of the Scriptures, and to develop his powers as an orator. His first sign of disagreement with the Church of Rome was brought about by the shameless sale of indulgences. Luther nailed on to the church door of Wittenberg a denunciation of this traffic, and of the Pope's title to forgive sins. The Pope summoned him to Rome. Luther refused to obey the summons. His works were ordered to be burnt, and the Pope excommunicated him. Luther retaliated by burning the Papal Bull containing the sentence upon him. The reformer published his famous "Address to the Christian Nobles of Germany," spite of a powerful defence of his doctrines, he was proscribed. After this he was for some time in hiding, and turned the period to account by translating the New Testament into German. The Old Testament was afterwards similarly treated, and the hymns were written and published from time to time. His writings had immense influence. They created the modern German language. The effect of his stand against the Pope was far-reaching. Europe started like a giant from sleep at the blasts of his trumpet. Dauntless, inspired, invincible, he was rough and violent in his battles, but it was against unprecedented odds that he was matched. When he thought he saw the devil, he threw his ink-horn at the apparition. That was characteristic of his methods. He stands out a great, magnificent figure, initiator of an impulse which became a mighty struggle still in progress. After he had finally broken from Rome, he renounced his monastic habit and married.

Lyell, Sir Charles
b. Kinnordy, Forfarshire, Nov. 14, 1797. d. London, Feb. 22, 1875.

A good classical scholar, a man of many friends, Lyell must have distinguished himself in whatever pursuit he had followed. Geology was his absorbing passion. His "Principles of Geology" ranks next to the "Origin of Species" as among the books which influenced the scientific thought of the century. Darwin rated his work very highly, saying that no other geologist had ever done as much for science as Lyell. He was very near-sighted, a fact which may have accounted for his being not the keenest of field observers.

Lytton, Edward George Earle Bulwer, Lord
b. London, May 25, 1803, d. Torquay, Jan. 18, 1873.

His father was a general; his mother, Elizabeth Barbara Lytton, heiress of Knebworth. After a university education he married, against his mother's wishes, a beautiful woman, with whom his union proved very unhappy. Husband and wife parted after nine years. In that time, to maintain his house, he had produced novels, plays, essays, reviews. He continued an indefatigable workman to the end of his days. After he had inherited Knebworth, he entered Parliament, and became a successful Colonial Secretary.

Macadam, John Loudon
b. Ayr, Sept. 21, 1756. d. London, Nov. 26, 1836.

The man who, in modern England, first gave us good roads—the "macadam" roads, called after himself—was taken by his parents to America, but came back to England, and undertook victualling appointments for the Navy. His road-making experiments were begun at Bristol, and afterwards extended to London. His labour brought him to poverty, and he was voted £10,000 by Government.

Macaulay, Thomas Babington
b. Rothley Temple, Leicestershire, Oct. 25, 1800. d. London, Dec. 28, 1859.

With the story of his childhood every schoolboy is familiar. He was another Victor Hugo in his amazing precocity. His career at Cambridge did not realise all the expectations which his friends had formed; but, nevertheless, he got his coveted fellowship, and faced the world one of the completest scholars ever known. Not only was his scholarship wide and deep; his memory was abnormal. What he read he never forgot—prose or poetry. This was of immense help to him in his writings, essays, criticisms, and history. His early career was threatened by the failing fortunes of his father, and it stands to his credit that three years after he had entered public life he contemplated retirement rather than go with a weak-kneed Government which paltered with principles dear to him. Minor offices paved the way to his going to India as a member of the Supreme Indian Council at Calcutta. The result of his work became eventually the admirable Indian penal code. What he gained in knowledge of Indian life is reflected in his superb essays on Clive and Warren Hastings. Upon his return to England he twice represented Edinburgh in Parliament, but literature absorbed his interest. His history was the ambition of his life. He had brought it down to the reign of William III. when death stayed his hand. That, like his essays, is a masterpiece of writing—as a picture of historical pageants, as portraiture of men; but it does not bear the analysis of the impartial student of history. He was a partisan, and let his partisanship influence his judgment on affairs of which he had undertaken to narrate the true story. Still, there is in the history that which not even Gibbon could have equalled, and, for all his honest prejudices appearing again and again, it lives as one of the glories of English literature. Macaulay was famous as a conversationalist. He was a hard-hitting enemy in public, but a true, loyal, and generous friend, and one of the best-loved men of his age.

Machiavelli, Nicolò di Bernardo dei
b. Florence, May 3, 1469. d. Florence, June, 22, 1527.

Descended from a noble but impoverished family, he lived in an age when troubles were heavy upon Florence. He saw the Medici expelled, the Republic instituted and dissolved, and the Medici reinstated. In the meantime he had fulfilled many diplomatic missions, and taken a prominent part in public life. The restoration of the Medici led to his being put to the torture as a conspirator against the ruling family. Thereafter he retired, to devote himself, for the greater part of his remaining years, to literature. He presented a notable report to Leo X. on the reforms for Florence, and afterwards acted as ambassador. His name has been made the synonym for deceit and villainy. His aims and purpose were misunderstood by early commentators. Modern critics hold that Machiavelli was a man whose public conduct was upright and honourable, whose views of morality, where they differed from those of the persons around him, differed only for the better. His fault was that, having adopted some of the maxims then generally received, he arranged them more luminously, and expressed them more forcibly, than any other writer.

Macmillan, Daniel
b. Arran, Sept. 13, 1813. d. Cambridge, June 27, 1857.

The son of a small farmer, he came to London as a raw lad, worked for some years in the employ of a Cambridge bookseller, then with a man of the same trade in Fleet Street, and finally, with his brother Alexander, founded what has since developed into the famous publishing house of Macmillan & Co.

Maeterlinck, Maurice
b. Ghent, 1864.

Educated in a Jesuit college, he forsook the law for literature. Falling early under the influence of Villiers de l'Ile Adam, in Paris, he gave to the world a succession of powerful dramas which have made him world famous. Of a different type, and happier, is his "Life of the Bee," which, whatever be the ultimate verdict upon his other works, seems to assure him lasting fame.

Magellan, Ferdinand
b. Sabaroso, Portugal, about 1480. d. Philippine Isles, April 27, 1521.

Brought up at the Portuguese Court, he served for some years in the East Indies, after which, feeling himself slighted, he took service with Spain. He sailed upon an expedition from which he was fated not to return. On the way, he proved that America is not a great continent stretching away to the South Pole. He made his way, by the straits which bear his name, to the great ocean which he named the Pacific. Reaching the Philippine Islands, he was slain by natives. One of his ships continued on her way, and sailed round the globe, for the first time in the history of the world. The feat was not equalled until Drake was successful more than fifty years later.

Mahomet
b. Mecca, Arabia, 570 A.D. d. Medina, Arabia, June 8, 632. A.D.

There are half a dozen renderings of the name Mahomet, which means "praised," or "the praised one." His father was poor, but of exalted lineage, one of the dominant tribe of Mecca. The Prophet was early left an orphan, and was educated by relatives. He became a soldier, and after that a shepherd. His travels brought him in contact with Jews and Christians, in scenes where idolatry was generally practised. Married at twenty-five, he was fortunate to have for helpmeet a rich woman, who loved and revered him. He would often flee the society of men, and seek the solitude of a cave beyond their reach. Here he pondered over what he had learned of Jew and Christian and from Arabian fable. He was seized with fits of alternating exaltation and despair. At last he became convinced that he had been sent into the world as the prophet of the one true God. His wife believed in his mission, and a few other converts were made. It took three years to get a congregation of forty believers. When once news of the new faith was noised abroad, persecution sharp and protracted followed. He had to flee from Mecca to Medina. Hitherto he had been simply a spiritual teacher; but now he gathered warriors about him, and conflicts many and bloody resulted before he subjugated his enemies. Slowly the faith which he preached made its way. Towards the close of his life progress was rapid, and he was able to add a temporal character to his rule. Mecca remained a holy city, but idolatry was swept away. His teachings were embodied in the Koran, the holy book of the Mohammedans. He pretended—and, possibly, partly believed—that he received the laws which he interpreted direct from the angel Gabriel. Those laws, however, are largely drawn from the Old Testament and rabbinical sources. His followers to-day number one-sixth of the human race.

Manzoni, Alessandro
b. Milan, March 7, 1785. d. Milan, May 22, 1873.

The founder of the modern Italian school of romance was the grandson of a great scholar, and was introduced early in life into the best literary circles in Italy. Beginning with sacred lyrics and a defence of the religious basis of morality, he startled the world first with a romantic comedy, followed by "Il Conte di Carmagnola," a novel which at once made him famous throughout Europe. The death of Napoleon called from his pen one of the noblest odes in modern literature. His life was singularly beautiful, though his griefs, through the loss by death of all those dear to him, were many and heavy.

Marconi, Guglielmo
b. Bologna, Italy, April 25, 1874.

He studied first at Bologna, and then at Leghorn University, but began his experiments in wireless telegraphy at home. When only twenty-two years of age, he sent messages by his system across the Bristol Channel. His invention was adopted in 1900 by the Admiralty for a term of years; while the battleships of the Italian Navy, as well as those of this country, and many of the vessels of the ocean lines and mercantile marine, have since been fitted with his apparatus. Lloyds' stations at home and abroad and many of our lighthouses employ his system.

Marcus Aurelius
b. Rome, April 26, 121 A.D. d. Vienna, March 17, 180.

One of the noblest of the Roman emperors, his name originally was Marcus Annius Verus. He was adopted by Antonius Pius, Hadrian's successor, and eventually succeeded to the throne. He was more philosopher than warrior, and generously shared his dominions with his adoptive brother. His reign was marred by wars and pestilence. Though hating war, he became at the call of duty a great captain. Wherever he led

train. His immortal

most remarkable books in the Greek language, was really his diary. Its pages were never intended for any eye but his own. They represent the thoughts and feelings of a man of singularly pure heart and noble mind. He aimed at the highest standard of life of which he could conceive, and lived up to that standard.

Mariette, Auguste Edouard
b. Boulogne, Feb. 11, 1821. d. Cairo, Jan. 19, 1881.

His father was town clerk of Boulogne; but Mariette, after a liberal education, took a post at the grammar school, Stratford-on-Avon, after which he worked as a pattern-maker for a ribbon manufacturer at Coventry. Unable to settle, he returned home, and by chance was placed in possession of a mass of papers on matters relating to ancient Egypt. This changed the whole course of his life. He mastered the subject, and devoted the rest of his days to it. He excavated innumerable monuments and inscriptions in Egypt, working unweariedly in spite of ill-health. The world owes him gratitude for a vast store of knowledge of the ancient world. He lies buried in a sarcophagus in an Egyptian garden overlooking the great museum which is his noblest monument.

Marlborough, John Churchill, Duke of
b. Ashe, Devon, June 24, 1650. d. near Windsor, June 16, 1722.

The son of an impoverished Royalist, he was first page to the future James II., and a great favourite of Court ladies, one of whom—the Duchess of Cleveland—presented him with £5,000. Entering the Army, he saw a good deal of fighting; but promotion did not come his way until he married Sarah Jennings, who was to become in all but name Queen of England. He was now elevated to the peerage, but went over to William of Orange when the tide turned. His military exploits in Ireland and against the French did not establish his loyalty to the new dynasty, for he was imprisoned for complicity in Jacobite intrigues. Quickly restored to favour, he was promoted to the command of all the British forces, and in that capacity successfully fought one half of Europe, while at the same time keeping the other half in fighting order. He was a great general—brave and modest, fearless and determined, yet a merciful conqueror; but he was one of the most avaricious men that ever lived, and not among the most truthful. He has, however, to be judged by the standard of his time. Rewards were heaped upon him by his country. His wife, the famous Duchess of Marlborough, who long survived him, became for many years dictatress of the Court, and disposed of places and Government offices as she chose. Queen Anne finally revolted, and this singular woman lived for many years in complete retirement, possessor of enormous wealth.

Marlowe, Christopher
b. Canterbury, Feb. 1564.

A shoemaker's son, he managed to equip himself at Cambridge University. When he reached London, he found the stage encumbered with "a litter of rude, rhyming farces and tragedies." These his mighty talent swept away. Like many another genius, he led a wild, erratic life, which fact makes it the more striking that in the few years at his disposal he should have produced so much work of brilliant quality. He prepared the way for the tragedies of Shakespeare, on whose early work his influence is clearly traceable. Marlowe met his death in a street brawl at Deptford.

Marvell, Andrew
b. Winestead, Yorks, March 31, 1621. d. London, Aug. 18, 1678.

After graduating at Cambridge, and spending four years in travel on the Continent, he became, upon Milton's recommendation, tutor to Cromwell's ward. Subsequently he was appointed

Milton's assistant in the Latin secretaryship. He sat in Parliament, and undertook with success certain diplomatic missions. His claims to fame, however, rest upon his friendship with Milton, his brilliant satires, and his poems. He was practically the first to recognise and proclaim the magnificent genius of "Paradise Lost."

Mason, Sir Josiah
b. Kidderminster, Feb., 1795. d. near Birmingham, June 16, 1881.

Beginning life as a hawker, he was successively carpenter, blacksmith, house-painter, and carpet-weaver. He discovered a way to make split key-rings by machinery, and then set up in business as a penmaker. He made the pens which became famous as Perry's, the name of the London stationer who sold them. Mason engaged in other considerable enterprises, and retired with a great fortune, nearly the whole of which he devoted to philanthropies, whose benefits should long be enjoyed.

Maurice, John Frederick Denison
b. near Lowestoft, Aug. 29, 1805. d. London, April 1, 1872.

As a Dissenter, he quitted Cambridge without taking a degree; but under the influence of Coleridge he went to Oxford, and took orders. Becoming the leader of the Christian Socialist movement, he exercised great influence throughout the country. He was the founder of, and taught in, the Working Men's College and the Queen's College for Women. He held various livings and professorships.

Maximilian I.
b. March 22, 1459. d. Wels, Austria, Jan. 12, 1519.

The son of Frederick III., this great German Emperor was elected Emperor of the Holy Roman Empire, and greatly extended the area of his dominions. Wars occupied a considerable part of his reign, but his ideal was peace. In his day learning flourished, the administration of justice was improved, and he gave cordial encouragement to the pursuit of arts.

Maxwell, James Clerk.
b. Edinburgh, June 13, 1831. d. Cambridge, Nov. 5, 1879.

After a successful career at Cambridge University, he became first occupant of the Chair of Experimental Physics established there by the Duke of Devonshire. He held other professorships, and was one of the greatest and best-loved teachers of his age. Although he lived only forty-eight years, thirty-three of those years were precious to science. His first scientific paper was read before a learned society when he was only fifteen. The greatest work of his life, his "Elec-

Mazzini, Giuseppe
b. Genoa, June 22, 1805. d. Pisa, Italy, March 10, 1872.

He was one of the national heroes called to act with spirit and determination in the hour of Italy's greatest depression and degradation. Well educated and a fiery enthusiast, he first associated himself with secret societies, but, abandoning these, set on foot the Young Italy movement, whose watchword was "God and the People." He was banished from Italy, from France, and from Switzerland; but returned to his native land, to be appointed, with Saffi and Armellini, one of a triumvirate with dictatorial powers. Overpowered by the troops of Napoleon III., he had again to flee. After that, though his life was still eventful, he no longer played a really important part in Italian history. He had already earned the gratitude of his countrymen in firing them with hope and courage to strive for the unity which they were enabled to gain.

Mencius
b. Tsow, China, 372 B.C. d. China, 288 B.C.

The lineal descendants of this Chinese philosopher are said still to live in his native province. His teachings are studied by every scholar in China. When forty years of age, after a diligent study of Confucius, he went forth on a twenty years' pilgrimage, seeking a prince who would give effect to his system of social and political order. His system recognised the innate good of man, and desired a form of government which should do the greatest good to the greatest number. His quest was unsuccessful, and he retired with his disciples, never again to emerge into active life.

Mendelssohn-Bartholdy Felix
b. Hamburg, Feb. 3, 1809. d. Leipzig, Nov. 4, 1847.

The name of this composer was built up in three stages. His grandfather, Moses Mendelssohn, the philosopher, was born Mendel; his father added the Bartholdy to the already lengthened name. Mendelssohn was a wonderful boy, and before he was twenty had earned lasting fame. Hamburg and Berlin did not adequately honour him; London did. He loved England all his days, and produced here some of his finest work. His "Elijah" was first given at the Birmingham Festival. A Scottish tour inspired the "Hebrides" overture and the Scotch Symphony. "St. Paul" was given at Birmingham after having been produced at Düsseldorf, where for three years he held an appointment. His years, all too few, were singularly productive. At sixteen he gave the world that almost unequalled example of early musical talent, the overture to the "Midsummer Night's Dream." His last great work was the "Elijah." Two other oratorios which he had begun were left unfinished. Mendelssohn was a fine instrumentalist, a talented painter, and a charming correspondent.

Meredith, George
b. Hampshire, Feb. 12, 1828.

His early education was received in Germany, where, taken as a child, he remained until he was fifteen. Returning to England, he vainly endeavoured to interest himself in the law. Literature was his natural avocation. It was as a poet that he first courted attention. Afterwards he entered journalism, edited an Eastern Counties' paper, and acted as special correspondent for a London daily during the Austro-Italian War. For some little time he edited a review while Mr. John Morley, its regular editor, was absent in America; and for years he was the valued literary adviser to a publishing house. His introduction proper to the world of letters came with the "Shaving of Shagpat," followed, three years later, by the triumphant appearance of "The Ordeal of Richard Feverel." But it was his "Diana of the Crossways" which announced to the [illegible] come to the head of contemporary novelists. The list of his publications—fiction and verse—is too long for enumeration. His work leaves him one of the giants of nineteenth-century literature. In his old age he considerably altered some of the best of his early work. His place in the hierarchy of literary immortals is assured; but he will be judged on the earlier and better versions, which in his declining days he damaged in the attempt to improve.

Michelangelo
b. Caprese, Italy, March 6, 1475. d. Rome, Feb. 18, 1564.

It used to be considered beneath the dignity of a nobleman to learn to read and write. The father of Michelangelo—whose full name was Michelangelo Buonarroti—looked with disfavour on his son's taste for drawing, deeming art unworthy of a gentleman. But the boy, who was destined to wear the four crowns of sculpture, architecture, painting, and poetry, was permitted to follow his natural bent, and in due course was apprenticed to a painter. Soon came the opportunity to develop his love for sculpture. Michelangelo's proficiency in this art led to his rival, Torregiano, smashing his nose with a mallet. By the time he had reached his thirty-first year he was famous as sculptor and painter, and was summoned to Rome to undertake the vast tomb of the Pope, Julius II. He was destined never to finish it. For forty years, off and on, he returned to what he felt was the work of his life, but all was vexation. Conspiracy and other influences caused his energies to be diverted into different channels. One of these led to his producing that world-wonder, the fresco decoration of the Sistine Chapel, a stupendous work, done entirely by his own hand after over four years' labour. After the death of Julius he returned to Florence, where he produced some of his most famous statues. Again he was torn from his work—this time to organise the fortifications of Florence, in the defence of which, against the Medici princes, he took a foremost part. Again he went to Rome, where he designed the cupola of St. Peter's. He laboured to the last at his gigantic tasks. There never was a greater genius, there never was a more indefatigable man; and it was his boast to the end that he was ever a student. "I am still learning," he said shortly before he died. Had he never painted a picture, he would have been immortal as a sculptor; had he never seen marble, his fame as a painter would have endured as long as history; had he neither painted nor carved, he would live as a poet. His influence on the whole realm of art has been little, if at all, inferior to that produced on the realm of thought by Homer and Dante.

Mill, John Stuart

b, London, May 20, 1806. d. Avignon, France, May 8, 1873.

The childhood of the "Saint of Rationalism," as Gladstone called him, has no parallel. His father made him an intellectual machine. At three he was studying the Greek alphabet; at eight, mastering the classics in the original; at twelve, besides studying Euclid and algebra, he was acting as instructor to the younger members of the family. When only thirty years of age, he was given charge, in the India House, of all the Company's relations with native states; and it eventually fell to him to prepare the case against the transfer of the government of India to the Crown. The transfer having been effected, he retired, amply compensated, and had time to turn his attention to philosophical studies. He debated and wrote and collected data, with a view to writing a history of the French Revolution. Finding that Carlyle was engaged upon a similar task, he generously handed over to him all his materials. It was to Mill that Carlyle lent the manuscript of his first volume of the "History." A careless maid burnt it, to the infinite distress of poor Mill and the nobly-borne agony of Carlyle. Mill made amends, when the book did appear, by writing a brilliant review of it, at once focussing public interest upon it. After some years of quiet work, Mill produced the works on logic, government, and political economy, upon which his fame is based. He sat for some years in Parliament; but the life, though patiently endured, was not to his liking, and he accepted his ultimate defeat with perfect composure. His contributions to logic and political economy have greatly advanced and popularised those subjects, and widely influenced modern political thought.

Millais, Sir John Everett

b. Southampton, June 8, 1829. d. London, Aug. 13, 1896.

He began his career as a student at the Royal Academy when only eleven, and at seventeen first exhibited a picture. With Hunt and Rossetti he formed the Pre-Raphaelite Brotherhood, which aimed at painting Nature as she presents herself rather than as the artist may choose to idealise her. He was excellent in portraiture, landscapes, and general paintings. Engravings and other reproductions have made his pictures famous all over the world. Millais, who married the lady who was first the wife of Ruskin, was made a baronet, and was one of the most popular men of his time.

Miller, Hugh

b. Cromarty, Oct. 10, 1802. d. near Edinburgh, Dec. 23, 1856.

One of Nature's gentlemen, he was a working stonemason, who distinguished himself first as a poet, then as a capable writer on religious and political subjects. His work in geology made him still more famous. Overwork ruined his health, and he committed suicide.

Millet, Jean François

b. Gruchy, France. Oct. 4, 1814. d. Barbizon, France, Jan. 20, 1875.

He was the farm labourer who became a great painter. The friendship of a discerning patron enabled him to acquire an artistic education, and a portrait sent to the Salon gained him fame. He fought in the Revolution of 1848, then settled down among the peasants and painted their life. His famous picture, "The Angelus"—of which thousands of copies are to be seen—sold, not many years after his death, for over £23,000.

Milton, John

b. London, Dec. 9, 1608. d. London, Nov. 8, 1674.

The Miltons were of Oxfordshire yeoman stock, but the poet's father, having become a Protestant, was compelled to settle in London and earn his livelihood as a scrivener. Milton went to Cambridge as a pensioner, and at twenty-four settled down for six quiet years under his father's roof, determined to consecrate his life to poetry. Here he produced "L'Allegro," "Il Penseroso," and "Lycidas." A tour of sixteen months on the Continent followed. He was recalled by a sense of duty. His country was on the eve of the Civil War, and he felt that he could not rest away while such serious conditions ruled. He acted as pamphleteer, and afterwards as Secretary for Foreign Tongues to the Commonwealth. When the Protectorate fell, Milton's prosperity was at an end and his safety endangered. Blindness attacked him at forty-four, and to the end of his days he had to depend upon the help of others. "Paradise Lost" was published in 1667, and, all told, brought the poet what in our money would amount to £70. He sold the copyright for £5. "Paradise Regained" and "Samson Agonistes" came out simultaneously four years before his death. He was thrice married, and, though he never actually knew the pinch of poverty, he was very poor in this world's goods for one so great. Fame had come to him before he died, but it was after his death that the world realised the mighty genius of the man who ranks with Homer, Dante, and Shakespeare as the greatest poet this world has seen. A blessing in disguise was the law of Laud, which forbade Milton's entering the Church as once he wished. He might have become a great prelate, but England would have lost the one great singer before whom only Shakespeare stands.

Moffatt, Robert

b. Ormiston. Scotland, Dec. 21, 1795. d. near Tonbridge, Kent, Aug. 9, 1883.

It was while working as an under-gardener that he studied for the missionary field. He devoted himself mainly to Bechuanaland, into the language of which country he translated the Bible. For half a century he laboured nobly in the wilds of the Dark Continent. Livingstone became his son-in-law.

Molière, Jean Baptiste

b. Paris, Jan. 15, 1622. d. Paris, Feb. 17, 1673.

Jean Baptiste Poquelin assumed the name by which he is known to all the world when he went upon the stage. This step in life he took after having studied under the Jesuits and read for the law. To the end of his days he devoted himself to writing plays and acting in them. He remains a colossal figure in French drama and poetry. To him the stage was always a lay pulpit; its aim not merely amusement, but reformation of manners by means of amusing spectacles. Ruskin shows how, living in the blindest period of the civilised world's history, in the most luxurious city, and the most corrupted Court of the time, he yet manifests through all his writings an exquisite natural wisdom, a capacity for the most simple enjoyment, a high sense of nobleness, honour, and purity; and that, in all he says of art and science, he has an unerring instinct for what is useful and sincere, and uses his whole power to defend it.

Moltke, Helmuth Karl Bernhard, Count von
b. Parchim, Germany, Oct. 26, 1800. d. Berlin, April 24, 1891.

He began his military studies in Denmark, and entered the Danish Army. Transferring his services to the army of Prussia, he devoted his energies to raising that army to first-class rank. He was the chief strategist in the war against Denmark, in the Austro-Prussian War, and the Franco-Prussian War, and, with Bismarck, helped to make Germany a nation. His friends knew him as "the Silent." He was among the most modest of men, and added to supreme genius for war the capacity for unweariedly taking pains.

Montaigne, Michel Eyquem de
b. near Bordeaux, France, Feb. 28, 1533. d. near Bordeaux, Sept. 13, 1592.

The father of the modern essay was trained as a boy in Spartan ways. He was liberally educated, but treated as if he were one of the poor. This was in order that he might realise and sympathise with the lot of the humblest. Some years were passed at Court, and some devoted to extensive travels in Europe. He returned to France unwillingly, to accept the office of Mayor of Bordeaux, and discharged the duties of the office while inditing his immortal essays. These had enormous influence on the great men of his own and later ages. He examined all questions in the spirit of the sceptic; but upon his deathbed he devoutly received the last rites of his Church.

Montesquieu, Charles de Secondat
b. near Bordeaux, Jan. 18, 1689. d. Paris, Feb. 10, 1755.

Proceeding from college to the study of law, he first claimed attention by his clever criticism of the France of his day. This gained him election to the French Academy. After a spell of travel he settled down to the work of his life, of which the outstanding productions were his examination into the causes of the greatness and decline of the Romans, and his great work on the Spirit of Laws. To the latter task he devoted fourteen years. Although it was placed on the Index, it passed through twenty-two editions in the course of a couple of years, and had an enormous influence on the spirit of the age. Always a victim of weak sight, he became totally blind towards the close of his life.

Moore, Thomas
b. Dublin, May 28, 1779. d. near Devizes, Wilts, Feb. 25, 1852.

The son of an Irish grocer, he became one of the most popular poets and satirists of his time. Appointed to a sinecure post in Bermuda, he selected as his deputy a man who eventually misappropriated £6,000, which sum Moore repaid. His publishers, with unbounded faith, promised him £3,000 for his "Lallah Rookh," then unwritten; and though he offered to release them from their bargain, in consequence of the bad times, they held to, and profited by it. He made a handsome income, but was always poor, in spite of the providence of a model wife. He wrote the biography of Byron, and in turn had his own works edited by one of England's Prime Ministers—Lord John Russell.

More, Sir Thomas
b. London, Feb. 6, 1478. d. London, July 6, 1535.

Educated, as his father had been, to the law, he at one time seriously thought of turning monk. Statecraft later claimed his attention, and he became successively member of Parliament, Ambassador, Speaker of the House of Commons, and, in succession to Wolsey, Chancellor. He defended the Papacy against Martin Luther, and opposed the attack of Henry VIII. on the Church and his projected divorce of Catherine. Declining to swear adherence to the Act which vested the succession in the issue of Anne Boleyn, he was arrested and beheaded. Most famous of all his works is his "Utopia," in which he outlines a model community where all share the labours and rewards of an ideal life.

Morland, George
b. London, June 26, 1763. d. London, Oct. 27, 1804.

The history of genius has few sadder pages than that on which is inscribed the life story of this great artist. He worked, not for love of his art, but solely to get money with which to gratify sordid passions. He died miserably in a sponging-house. One of the finest of his works is in the National Gallery, and every year his pictures are increasingly esteemed.

Morley, John
b. Blackburn, Lancs, Dec. 24, 1838.

His father, like his elder brother, was a surgeon. On going to Oxford, he seems to have cherished the notion of entering the Church. In later years his views became pronouncedly agnostic. His earlier career in London was a struggle for footing in literature. He did not scorn the humblest work, but what he did he did well. Since then he has edited the "Fortnightly Review," the "Pall Mall Gazette," and two notable series of books. His own contributions to literature have included biographies of Burke, Voltaire, Rousseau, and Gladstone. The latter is a noble monument to a great statesman, nobly done by a scholar and loving friend. He has twice acted as Secretary for Ireland, and, upon Sir Henry Campbell-Bannerman becoming Prime Minister, was appointed Secretary for India.

Morris, William
b. Walthamstow, Essex, March 24, 1834. d. London, Oct. 3, 1896.

Painting was his first love, but poetry next claimed him for her own. He wrote many beautiful original poems and some striking translations, and set forth his Socialistic ideals in fine, nervous prose. He and a few kindred souls established a manufactory of artistic wallpapers, stained glass, pottery, and other articles of domestic use. The scheme was fanciful, but it had a great effect in reforming the taste of the country.

Morse, Samuel Finley Breese
b. Charlestown, Mass., April 27, 1791. d. New York, April 2, 1872.

The son of a clergyman, he graduated at Yale, and visited England to study portraiture under West. His efforts in art were unsuccessful in his native land, but his scheme for the electric telegraph well justified his existence. He conceived the idea in 1832, but not until fifteen years had elapsed could he induce the Government to establish a trial line between Baltimore and Washington. There was a dispute as to priority of discovery between the partisans of Morse and Wheatstone, but Morse deserved the honours which crowned his closing years.

Mozart, Wolfgang Amadeus Chrysostom
b. Salzburg, Austria, Jan. 27, 1756. d. Vienna, Dec. 5, 1791.

The world has never produced a greater musical genius than Mozart, and never treated another so badly. When he was a tiny child, all Europe was wildly enthusiastic over his marvellous abilities as instrumentalist and composer. By the time he had reached the age of twenty he had learned all that there was to be learned about music, and had to his credit many compositions which still live. But it was not easy to repeat the successes of his childhood. His genius, now fully matured, expressed itself in an unparalleled flood of musical glories. To every form of music he contributed superb works—opera, mass, symphony, concerto, sonata, song. All this time he was fighting for a bare livelihood for himself and his young wife. The greatest master of music in the history of the world had to look to lessons for his bread. It was while his crowning work, "The Magic Flute," was being played that he received a mysterious order to compose a "Requiem." It was to be ready in a month. His breaking health sank under the manifold taxes to which he submitted himself. He declared that the work would be his own requiem, and it was. He died while still labouring at it. His death was one of the most pathetic in history. He was hurried into a pauper's grave, and to this day no man can say where his poor bones lie.

Murchison, Sir Roderick Impey
b. Tarradale, Ross-shire, Feb. 19, 1792. d. London, Oct. 22, 1871.

Trained in a military academy, he entered the Army and fought in the Peninsular War. Exchanging into another regiment, in order to see more active service he was disappointed, but had the good fortune to meet the lady who became his wife and inspired his whole life's work. His geological discoveries, especially his establishment of the Silurian System, made him famous. It was he who, observing the resemblance between the Ural Mountains and the Australian chains, first predicted the discovery of gold in Australia.

Murdock, William
b. Auchinleck, Ayrshire, Aug. 25, 1754. d. Birmingham, Nov. 15, 1839.

His father—who had been a gunner, but took up the trade of a millwright on returning to civil employment—meant the future inventor to follow his own trade. Luckily, the youth found employment with Boulton & Watt at Birmingham, and was given responsible work in Cornwall, where the firm had important machinery plant. Here Murdock invented various improvements for the steam-engine. His most important discovery, however, was the distillation of illuminating gas from coal, wood, and peat. He lighted up his master's premises with the new illuminant in 1803, some years after he had begun experiments at his own house. His fame is overshadowed by that of the great men he served, but he was a man of striking original powers.

Murillo, Bartolomé Estéban
b. Seville, Spain, Jan. 1, 1618. d. Seville, April 3, 1682.

Humbly born, he owed his instruction in art to an uncle. When twenty-two, he had the good fortune to gain an introduction to Velasquez, who gave him an introduction at Court, which served to secure him ample patronage. His work was nearly all of an intensely devotional character, expressive of his own pious devotion. He married a wealthy wife, and enjoyed great prosperity. His death was brought about by a fall from a scaffolding while he was painting in a church in Cadiz. Some two hundred of his works are in England.

Murray, John
b. Edinburgh, 1745. d. November 6, 1793.

He joined the Royal Marines when seventeen years of age, but, disgusted with the monotony of the life, retired on half-pay at twenty-three, and turned bookseller. From the little business which he set up grew the world-famous publishing house of John Murray. The prosperity of the business was established by his son, John Murray II. (b. Nov. 27, 1778; d. June 27, 1843)—the "Anak of publishers," as Byron called him. He it was who started the "Quarterly Review," and paid Byron £20,000 for his works.

Musset, Alfred de
b. Paris, Dec. 11, 1810. d. Paris, May 1, 1857.

After a brilliant college career, he made a name for himself in literature at twenty, and followed with poems, comedies, tragedies, and short stories. Some of his poetry is perfect, but his work was unequal—a fact attributable largely to his irregular life.

Nansen, Fridtjof
b. near Christiania, Norway, Oct. 10, 1861.

He studied at the Universities of Christiania and Naples, and celebrated his majority by making his first voyage into the Arctic. A second followed seven years later, when he and five comrades crossed Greenland from east to west. This nerved him for his greater effort, the famous voyage in the Fram, when, in a three years' expedition—during which he permitted his ship to be frozen in, and to drift with the set of the ice—he succeeded in getting nearer to the North Pole than anyone else had previously done. Upon his native Norway being separated from Sweden, he was appointed first Ambassador of the new Power to England.

Napier, John
b. Edinburgh, 1550. d. Edinburgh, April 4, 1617.

He was born when his father was less than seventeen years of age. Like his sire, he was keenly interested in scientific agriculture. In abstract science, however, lay his chief glory. His genius expressed itself in devising methods for lessening the labour of reckoning. His famous logarithms and the device known as "Napier's bones" were the concrete results of his genius by which he is best remembered. His discoveries were of vast importance to astronomy, navigation, surveying, and other pursuits involving complicated and elaborate calculations. His eldest son was ennobled.

Napoleon Bonaparte
b. Ajaccio, Corsica, Aug. 15, 1769. d. St. Helena, May 5, 1821.

He was the second son of Carlo Bonaparte, who was of noble but impoverished family. His military studies began at Brienne, and were continued at Paris; but actual experience began in his seventeenth year, when he obtained a lieutenancy in an artillery regiment. The disturbed state of the nation, and the urgent need for officers with talent, made his promotion rapid. After commanding the Siege of Toulon against the Royalists, he was made a general, when only twenty-four. In another three years he was the most famous general in Europe. He married Josephine, a wealthy widow of much influence in Paris, and immediately set out for Italy, where he defeated the Austrians and Piedmontese, and entered Milan. Returning to France with the bays of many victories, he next entered upon a campaign against the eastern dominions of Britain. He conquered Egypt and Syria, but met with a reverse at Acre, where the defence was assisted by the English. Recalled to France by disturbing news of political disruption and of the loss of the newly-gained Italian territory, he was elected First Consul for ten years. Then, crossing the Alps, he swept down on Italy, and inflicted crushing blows upon the Austrians, winning for France the whole of Northern Italy. Various treaties gave the continent temporary peace, and Napoleon took advantage of it to reorganise France by means of the Code Napoleon, the establishment of the University, the National Bank, the Legion of Honour, and by the sweeping away of abuses which the Revolution had left. These were fruitful days, but war soon broke out again. He made elaborate preparations for the invasion of England, and even had a medal struck to commemorate the triumph which he was never to achieve. The Battle of Trafalgar effectually settled the question of invasion. Thereupon he turned his armies to Germany, where the tremendous victories of Ulm and Austerlitz were gained, to be followed by the overthrow of Prussia at Jena. He had now become hereditary Emperor, and attained the zenith of his power. One of his brothers was King of Naples, another was King of Holland, and a third was King of Westphalia. He himself was crowned King of Italy, and he now set his brother Joseph on the Spanish throne. The people rose in revolt. Wellington landed in Portugal, and the Peninsular War was begun. Many troubles now gathered about him; but after further battles he concluded peace with Austria, and married the daughter of her Royal house, having previously divorced

Josephine. Meanwhile, the Continental system—by which the commerce of England was to be boycotted—was in force, and it was the failure of the Tsar strictly to enforce it which led to war with that country. Napoleon marched a vast army to Moscow, but the city was fired, and he had to retreat in the depth of a Russian winter, harassed all the way by an indomitable foe. He lost four-fifths of the army with which he had set out, and, the allied armies of his enemies closing in upon Paris, he was compelled to abdicate. For a few months he lived as King of the Island of Elba, but returned secretly to France, regained the throne, and began the hundred days which ended in his final overthrow at Waterloo. He was taken prisoner to St. Helena, and died there, after five and a half wretched years, of cancer. Napoleon was the incarnate spirit of war, but he was great as an administrator. That he was cruel, and false, and treacherous, and filled with inordinate vanity, which cost the lives of millions of his fellow-creatures, every student of his history is aware. But such a man is not to be judged by ordinary standards. As Lord Rosebery has said, Napoleon came from Corsica a little pagan, viewing the world as his oyster. He was reared in the life of camps and in the terrors of revolution. He was raised to rule a nation which, in the horrors of a great convulsion, had formally renounced and practically abjured Christianity. He had to fight for his own hand against the whole world. It was breathless work, which gave little time for reflection. Before he died he saw all that he had built at such a cost of blood swept away. Had he died Emperor of France, no man could have followed him. His death must have created a gulf in which the whole apparatus of his government would have disappeared.

Nasmyth, James

b. Edinburgh, Aug. 19, 1808. d. London, May 7, 1890.

The Nasmyths were a talented family—the father a gifted portrait painter, a brother a landscape artist. James Nasmyth was the mechanical genius of the family. In 1839 he was informed that a steamship could not be built because there was no forge in existence big enough to forge its paddle-crank. In half an hour Nasmyth sketched his famous steam-hammer. The contrivance was built from that hurriedly-drawn sketch. He afterwards invented the steam pile-driver. Astronomy was one of his favourite studies, and he wrote a volume on the moon, which is still reprinted.

Nebuchadnezzar

began to reign, Babylon, 604 B.C. d. Babylon, 562 B.C.

As a warrior, architect, engineer, and ruler, Nebuchadnezzar was supreme in his age. He inherited from Nabopolassar, his father, a mere provincial city in Babylon. He made the city the wonder of all the ages; his dominions he so enlarged that they extended from Persia to Egypt, from Cicilia to the Persian Gulf. He besieged Jerusalem, and twice carried away its king, and swept all but the very outcast of the people into captivity. The rebellion of the Jews he punished with atrocious cruelty. Zedekiah—whom he had placed on the throne, but who had risen against him—he condemned to gaze on the slaughter of his own children. Then he put out his eyes, and led him in chains to Babylon. When Daniel interpreted his dreams he worshipped him, and bade all his people worship no god but the God of Daniel. For seven years his mind was clouded; but, recovering, he seems to have forsaken idolatry. His empire decayed after he died as rapidly as he had built it.

Nelson, Horatio, Viscount

b. Burnham Thorpe, Norfolk, Sept. 29, 1758. d. Trafalgar, Oct. 21, 1805.

A son of the rectory, he was a weakly boy, who never seemed likely to make a sailor; but experiences in the West Indies, and an expedition to the Arctic Regions, proved his metal. He was a post-captain at twenty-one, serving in the American War. War with France having been declared, he served under Hood and Hotham, and greatly distinguished himself at the battle off Cape St. Vincent, where for an hour his ship withstood the whole Spanish van and captured two vessels. Promoted to the rank of rear-admiral, he was sent to intercept Napoleon's expedition to Egypt. This he failed to do, but he came up with the French fleet in Aboukir Bay. The French were anchored in superior numbers, and Nelson planned a daring and original stroke. The wind was blowing against the French fleet, and he sailed down and took the enemy's ships one at a time. He captured or sunk all save four, which escaped, to be taken by him not long afterwards. Nelson went to Naples a hero. He had married some years before, but now he met Lady Hamilton at the Court of Naples, and they entered into that liaison which stains his name. He remained at Naples in defiance of orders, and when he reached England there was a stormy interview with his wife, after which they parted, never to meet again. He was censured for his disobedience at Naples, but there was too much fighting for him to remain idle. He directed the attack on Copenhagen and the Danish fleet, where he won new honours in a fierce and bloody battle. The after events in his life were but preliminaries to the Battle of Trafalgar. The French and Spanish fleets were allied; unless these were crushed, Napoleon's army would surely invade England. There were many delays and wearisome searchings by Nelson for the missing fleet. At last it was brought to battle off Cape Trafalgar. Nelson signalled to his fleet, "England expects that every man will do his duty." He had twenty-seven ships, the French and Spaniards thirty-three. The enemy's fleet was annihilated. Nelson himself fell, shot by a Frenchman in the tops of the Redoutable; but he lived long enough to know that his victory was complete and his country saved. He was the greatest naval warrior the world has known. He had all the genius and all the patience and the bravery essential to his work. In private he was a simple, unaffected man. In one battle he had an eye destroyed; in another he lost an arm; but he was always wholly a hero in battle. The one blot upon his fame is his relations with Lady Hamilton—a beautiful adventuress, who had become the wife of Sir William Hamilton. For her he sacrificed his personal honour and reputation as a moral man.

Newcomen, Thomas

b, Dartmouth, Feb. 1663. d. London (?), 1729.

He was one of the obscure, industrious geniuses to whom we owe the application of steam as a motive power. He was either an ironmonger or a blacksmith. Possessed of an original and inquiring mind, he corresponded with Robert Hooke as to the investigations of Papin and the Marquis of Worcester upon the applicability of steam-power for the purpose of driving machinery. He found a kindred spirit in Savery, a mine manager of Cornwall, and a sympathetic friend in Cawley, a glazier. The former was another born inventor; Cawley seems to have advanced the capital which Newcomen first needed for his experiments. The outcome was a patent for the "atmospheric steam-engine." Its purpose was to pump water from mines. This was the first piece of mechanism in which steam was used with practical success. Hero, of Alexandria, born two thousand years before, had discovered the power of steam, and applied it in the form of what was practically a primitive steam-turbine. For two thousand years the secret lay hidden, if it can be said ever to have been mastered. Possibly Newcomen never heard of Hero. He, at any rate, was the next man after the Alexandrian genius successfully to carry out experiments with steam. But Newcomen turned his experiments to practical account, and all our triumphs with steam date from his successful efforts.

Newman, John Henry

b. London, February 21, 1801. d. Birmingham, August 11, 1890.

The son of a banker, whose affairs became involved before the future cardinal had completed his Oxford course, he gained an Oriel Fellowship and took Orders. He threw himself with eagerness into the "Tractarian Movement" at Oxford, which landed him, as it had landed others, in the Roman Catholic Church. In his new faith he worked humbly and with zeal, and became famous for his sermons and lectures and writings. He had a singularly charming literary style, and was a poet of high order. His "Lead, Kindly Light" is the most popular of all hymns; his "Dream of Gerontius" is a work of striking beauty. He was created a cardinal in 1879, thirty-four years after his secession from the Anglican Church. His brother, Francis William Newman, was an educationist of renown, and did not follow John Henry to Rome.

Newton, Sir Isaac

b. Woolsthorpe, Lincs, December 25, 1642. d. London, March 20, 1727.

His father was a small freehold farmer. He was only twenty-one when he took his B.A. at Cambridge, and recorded his discovery of fluxions. A year later the great law of universal gravitation dawned upon him, suggested to his mind by the fall of an apple. His efforts to explain the lunar and planetary motions were fruitless, owing to the absence of reliable data as to the size of the earth, and he had to put aside his work, and turn to the investigation into the nature of light and the construction of telescopes. His discoveries as to the latter led to the construction of the first reflecting telescope, which later workers were to bring to perfection. Picard produced his estimate of the size of the earth in 1670, and Newton was able to resume, at the point where he had desisted, his speculations on the law of gravitation. Fourteen years elapsed before his completed theory was given to the world. Newton sat in Parliament, became Master of the Mint, and reformed the coinage; recommended public encouragement for an invention to determine longitude, and was for twenty-four years President of the Royal Society. He has been called the priest of Nature. No one before him had ever so clearly unfolded the laws by which the material world is regulated. He was one of the humblest of men, and spoke of himself as a child in knowledge.

Nightingale, Florence

b. Florence, May 15, 1820.

Although born in Florence, she is of English parentage. When quite a young woman, she made a tour of European hospitals, and on the outbreak of the Crimean War volunteered to organise a nursing department at Scutari. The terrible condition of the wounded was vastly improved under her skilful and sympathetic direction, and her work was the beginning of complete reforms in Army hospital methods. A public testimonial took the form of a £50,000 gift to her. This sum she devoted to the formation of a properly-equipped training institution for nurses.

Otho I. or Otto the Great

b. 912. d. Memleben, Germany, May 7, 973.

Succeeding his father, Henry I., as King of the Germans, he extended his dominions in various directions, suppressed rebellious nobles, restored the institutions of Charlemagne, and implanted Christianity in Scandinavian and Slavonic lands.

, Sir Richard

er, July 20, 1804. d. London, December 18, 1892.

study in Edinburgh and at a London hospital, he determined to enter the Navy. While hoping for an opening, he was offered the post of assistant to the curator of the museum of the Royal College of Surgeons. Here was housed the great collection got together by John Hunter, and it became Owen's task to classify and catalogue it. So, quite by chance, he was led to devote himself to science, and to make a lasting reputation as one of the foremost of British comparative anatomists and palæontologists. His work, slow to be recognised in official circles by his own countrymen, was honoured by every scientific academy in Europe.

Owen, Robert

b. Newtown, Wales, May 14, 1771. d. Newtown, November 17, 1858.

The founder of Socialism in Britain was the son of poor parents, and from the position of shop-boy rose to that of factory manager, and then cotton millowner. He put his Socialism to practical test by experimental plans in Scotland, America, Ireland, and England. The scheme, though it attracted widespread attention, was not a success, and brought him to comparative poverty. Nevertheless, he was instrumental in bringing about the first factory legislation. He was the pioneer of the co-operative movement, and schools for infants had their origin in his experiments.

Paganini, Niccolo

b. Genoa, February 18, 1784. d. Nice, May 27, 1840.

The prince of violinists was the son of a street-porter, who scourged him to study while yet an infant. He was performing in public at nine, and at seventeen was a blasé man of the world—a gambler and spendthrift. Then he disappeared for four years from public life, emerging at the age of twenty-one, to win triumph upon triumph in all the capitals of Europe. Gaunt and repellent of appearance, playing the violin with demonic force and spirit, and with effects such as no other man had ever produced, he exercised upon his audiences an influence quite hypnotic. Serious people in polite society declared that he was animated by evil spirits, and that he was accompanied on the concert platform by a "familiar." He made a large fortune, but lost heavily over speculations.

Palestrina, Giovanni Pierluigi da

b. Palestrina, Italy, about 1524. d. Rome, February 2, 1594.

It was to Palestrina that the Council of Trent entrusted the reform of Church music. He was the first to combine the art with the science of music, to give beauty as well as technical correctness. His work marked a new epoch in music.

Paley, William

b. Peterborough, July 1743. d. Lincoln, May 25, 1805.

After a successful career at college, he held various benefices, but was remarkable more for his writings than his spoken sermons. His principal work was the well-known *"Evidences of Christianity."*

Palissy, Bernard

b. near Agen, France, about 1509. d. Paris, 1589.

Industrial inventor, philosopher, and scientist, Palissy was one of the heroes of his century. His long and undaunted struggles with poverty while trying to discover the secret of the enamel for china are of the classics of industral history. Imprisoned as a Huguenot, he was released to continue his public works, but was again thrown into the Bastille because of his religion, and died in that infamous prison.

Palladio, Andrea

b. Vicenza, Italy, November 30, 1518. d. Vicenza, August 19, 1580.

The author of the Palladian style of architecture was the creator of many noble works in Italy, and the founder of the modern school of Italian architecture. He wrote as well as he designed, and his great book on architecture was of inestimable assistance, among others, to Inigo Jones, the great English architect

b. Blois, France, August 22, 1647. d. London, 1712.

Regarded by the French as the inventor of the steam-engine and steam navigation, he certainly was one of the pioneers in these directions. He did apply steam for driving a piston, but he looked not to the expansive force of steam, but to atmospheric pressure for mechanical power. His idea was developed by Newcomen, Brindley, and Smeaton, and undoubtedly paved the way for work upon more correct lines. Papin did important work in association with Huygens and Boyle, and set convention at naught by fitting a paddle-wheel worked by hand into a vessel in which he essayed to cross the Channel. He died in poverty and obscurity.

Paracelsus

b. Switzerland, December 17, 1493. d. Salsburg, September 23, 1541.

Paracelsus was the self-conferred name of Theophrastus Bombastus von Hohenheim, son of a Swiss physician; he early studied alchemy and chemistry, and by practical experiments learned the properties of metals and minerals. He was a vain-glorious creature, but the courage with which he advocated his theories was of great importance in affording a new impetus to the development of pharmaceutical chemistry and in encouraging research and investigation. From his labours many new chemical compounds were discovered.

Park, Mungo

b. Selkirkshire, September 10, 1771. d. Africa, 1805.

At twenty years of age, after having studied medicine and surgery, he set sail for Sumatra in the East-Indiaman *Worcester*, on which he held the post of assistant-surgeon. This led to his employment by the African Association, in whose behalf he undertook to explore the course of the Niger. After many startling adventures he returned to civilisation, and, in an interesting volume, threw light on the interior of the Dark Continent. Thereafter he settled down to practise as a country surgeon in Scotland. The life, however, proved impossible to him, and he again undertook an expedition into the interior of Africa. Starting from Pisania, on the Gambia, he lost thirty-eight of his forty-five companions. The survivors were attacked by natives at Boussa, and perished with him.

Pascal, Blaise

b. Clermont-Ferrand, France, June 19, 1623. d. Paris, August 19, 1662.

His father, early persuaded of the talents of the boy, gave him an excellent education, but kept him from the study of mathematics, to which he particularly inclined. In spite of this deprivation Pascal became one of the greatest mathematicians of his age, and is said to have "reconstructed" geometry while still a boy. He wrote, before the completion of his sixteenth year, a treatise on "Conic Sections," which attracted the attention of Descartes; and before he was nineteen had invented a calculating machine to help his father in his work. His investigations in connection with the vacuum and hydraulics were of great importance. His literary productions were of two kinds--scientific and philosophic, moral and theological. His "Provincial Letters," a satire on the moral theology of the Jesuits, and "Thoughts" are for all time. They had an extraordinary effect in Europe at the time of their production, and are still treasured by every people into whose language they have been translated.

Pasteur, Louis

b. Dôle, France, December 27, 1822. d. St. Cloud, France, Sep. 28, 1895.

He was the son of a tanner, and when homesick and melancholy would say, "If I could only smell the tannery again I should be well." None of the early manifestations of genius which often foreshadow coming greatness was apparent in his case. His health was poor, and his mental faculties slow to develop. But he had industry and application, and, by working steadfastly at problems which had puzzled all the chemists and physicists of his time, made a discovery which at once placed him in a position of honour among contemporary scientists. This was the outcome of his work on tartrate crystals and "left-handed" tartrates, and led him on to his great discoveries in fermentation and the action of atmospheric organisms. He swept aside the chemical speculations as to spontaneous generation, and showed that wine and milk turn sour, and meat becomes putrid, from the effects of these atmospheric organisms. Exclude these, he said, and food and drink remain pure and sweet. It was not without the most delicate and intricate experiments that his point was proved. Once established, it effected a complete revolution in chemical and biological science. The way was prepared for Lord Lister and antiseptic surgery, and for a thousand-and-one applications of the discovery to commerce and food supply. By this time the tanner's son had established himself at the head of his calling. Many and severe tests were imposed upon him, but, thanks to his powers of patient research and quick and exact observation, he succeeded in all. He had never seen a silkworm until the silk-producers besought his aid in the extermination of a pest which was ruining their industry; but he stamped out the plague. He cured chicken cholera, which had been destroying 10 per cent. of the poultry of his country; and he reduced the mortality in anthrax from 10 to 1 per cent. These discoveries represented in money hundreds of millions of pounds. Even more important to the human race were his investigations as to the cause and cure of hydrophobia, which resulted in his finding a way of rendering dogs immune from the evil, and of curing human beings suffering from it.

Paul, St.

b, Tarsus, Cilicia. d. Rome, 64, A.D.

The son of Jewish parents, "a Hebrew of the Hebrews," he was named Saul, and put to the trade of a tent-maker. Going to Jerusalem, he studied under Gamaliel, who held a foremost place among the theologians of the city. Gamaliel was a broad-minded, tolerant man, but Paul imbibed only of his knowledge, not of his spirit, so that he became a great master of the law and traditions and precedents, and thoroughly acquainted with the Scriptures and current methods of interpretation. The future Apostle became prominent as a persecutor of the Jews, and was present at the stoning of Stephen. Then came his miraculous conversion, and his subsequent teaching and exposition of Christianity. He made missionary tours in Syria, Cyprus, Asia Minor, Macedonia, and elsewhere; was imprisoned and tried, appealed against his sentence, and was sent to Rome. There he was acquitted, so that he was able to resume his journeys, but, returning to Rome, suffered martyrdom under the brutal Nero. Avowedly the servant of Christianity, he was really its leader. For two centuries after his death his name was little regarded, though his work lived and flourished and extended. His position and labours became more fully recognised in the century of Ambrose, Athanasius, and Augustin, but it was reserved for later Christians to raise him to his right place in the rôle of priests and martyrs.

Paxton, Sir Joseph

b. near Woburn, Beds, August 3, 1801. d. Sydenham, June 8, 1865.

One of the best examples of the self-made man, Paxton began life as an ordinary working-gardener on the estate of the Duke of Devonshire, for whom he modelled the famous Chatsworth gardens and conservatories. He sent in for competition a rough design for a building for the Great Exhibition in Hyde Park, which gained the prize. He saw the building erected, and afterwards transferred to Sydenham, where it exists still as the world-famous Crystal Palace. Paxton's useful and admirable life was crowned by the publication of several valuable horticultural works. As an instance of his powers of observation, it may be noted that the excellence of his design for the Crystal Palace was its lightness and its grace of design. He adapted the idea from an aquatic plant on the Chatsworth estate.

Peabody, George

b. S. Danvers, Mass., February 18, 1795. d. London, November 4, 1869.

Starting on the lowest rung, he worked in various small shops as assistant to grocers, drapers, and storekeepers, until he had saved capital enough to become partner in a dry goods store. This was when he had attained the age of thirty-four. Eight years later he opened in London as a merchant banker. By unimpeachable methods he amassed a great fortune, and during his lifetime gave away one and a half millions for exploration, for education, and for the building of industrial homes in London. The Peabody buildings have been established out of the funds given by him for the purpose.

Peary, Robert Edwin

b. Cresson Springs, Penn., U.S.A., May 6, 1856.

The most persistent of Arctic explorers, he joined the American Navy in 1881, and from time to time has sought leave of absence to make "a dash for the Pole." He had done a good deal of survey and mapping work in silent lands and lonely waters, before the world at large heard of him, and thus prepared himself for the greater work with which his name was to become identified. In the expedition from which he returned in 1906 he got to within 200 miles of the Pole on the Greenland side, so eclipsing all existing records. The Abruzzi expedition went thirty miles nearer than Nansen's; Peary's got thirty miles beyond the point at which the Abruzzi expedition was driven back.

Peel, Sir Robert

b. near Bury, Lancs, February 5, 1788. d. London, July 2, 1850.

Consecrated to politics from his youth up, Peel was bidden by his father to aim no lower than the Premiership. "Bob, you dog, if you're not Prime Minister, I'll disinherit you!" his father used jestingly to say. But he was sworn to service with the wrong party. At heart a Whig, he was destined to lead, to break up, to reconstruct, and once more shatter the Conservatives. At twenty-four he was Chief Secretary for Ireland, and so hostile to Catholic claims for freedom that he was nicknamed "Orange Peel." Yet it fell to him, as Home Secretary, and Leader of the House of Commons, to propose to the House a Bill for Roman Catholic Emancipation, his earlier antipathy to which, he confessed, had been his sole reason for refusing to act with Canning. The Bill cost him his seat and broke up his party, though not at once. He carried several useful measures, of which his reform of the police force was the most conspicuous. As Leader of the Opposition during the next ten years he was brilliantly successful, and restored his party to power. On taking office as Prime Minister in 1841, he was supported by a Conservative party pledged to Protection, and it fell to him to destroy the system which he had been placed in power to maintain. He resigned, in order to allow Lord John Russell to sweep away the Corn Laws; but as Russell could not form a Government Peel returned, and himself abolished the taxes on food. His party revolted and defeated him, and he declared that he had done for all time with parties. His death, the result of an accident while riding, prevented his saying from being falsified. Although force of circumstances made him forsake principles to which he was pledged, the honesty and integrity of Peel are not to be impugned.

became Speaker of the House of Commons in 1884, and held that position until 1895, when he was created Viscount Peel.

Penn, William

b. London, October 14, 1644. d. Ruscombe, Berks, July 30, 1718.

His father, the redoubtable Sir William Penn, sent him to Oxford, where he came under the ban of the powers for Nonconformity. Penn travelled, and took military service, but was recalled to his earlier ideas by a chance meeting with a Quaker minister, under whose influence he developed into a bold speaker and writer, carrying the war for freedom of conscience from England into Germany. Twice his free expressions of opinion brought him to gaol; but his trial in 1670 marked an epoch in English public life, in that it established for all time the immunity of juries. In 1681 he obtained from the Crown, in lieu of his father's claim upon it, a grant of territory in America called, after the admiral, Pennsylvania. Here he settled a numerous body of his co-religionists with a famous charter. He planned the city of Philadelphia, and became governor as well as proprietor of the colony. After the accession of William III., Penn was wrongfully accused of treasonable adherence to the deposed James II. His troubles were not ended, in the New World or the Old. The Colonial Constitution had proved unworkable, and there was much discontent. The colony did eventually prosper, but Penn, returning to England, suffered financial embarrassment, and was actually an inmate for nine months of the debtors' prison—the Fleet. To the end his life was harassed by pecuniary and political troubles. Penn is one of the men whose characters and actions Macaulay has wrongly appraised. The influence which he had at Court was invariably exerted for the succour of his persecuted brethren.

Pericles

b. Athens, 5th century B.C. d. Athens, 429 B.C.

Born of distinguished parents, Pericles was for forty years the leading statesman in Athens. In his day she reached her highest point in splendour and power. He obliterated all trace of oligarchical institutions; he made Athens an empire state; he took tribute of maritime allies, and devoted part of the money to the adornment of Athens with those glories which made the memory of the city immortal. To him she owed the Parthenon, Erechtheum, the Propylæa, the Odeum, and numberless other noble buildings, as well as some of her finest classical sculptures. He died of fever, contracted when the war between Athens and Sparta was at its height. He was an able general and a famous orator, but did his beloved Athens irreparable injury by not foreseeing that personal government, nobly as it worked in his hands, must be ultimately ruinous to a nation.

Perkin, Sir William Henry

b. London, March 12, 1838.

Sent to the City of London School, the only institution of the character at the time where scientific subjects were taught, he became, at seventeen years of age, assistant to H. W. Hofman, the great chemist. When in his eighteenth year Perkin, at Hofman's instigation, was seeking to make artificial quinine, he obtained unexpected results. He had discovered the way to manufacture an aniline purple or mauve from coal-tar. The discovery was patented, and at eighteen years of age he was within sight of potential wealth inestimable. The process was worked by himself, his brother, and father, who soon made a vast fortune from it. From that laboratory experiment dates the gigantic industry in coal-tar products—

Peter the Great

b. Moscow, June 9, 1672. d. St. Petersburg, February 8, 1725.

At first he reigned jointly with his half-brother, the weak-minded Ivan, but at his death reigned alone. He Europeanised his army, and set about the creation of a navy and the provision of harbours, of which, at this time, Russia had but one—Archangel. He seized Azov, and then set forth to see what civilisation was doing for other peoples. He visited several countries, eventually reaching England. At Amsterdam, disguised as a labourer, he worked as a shipwright, and devoted his leisure to the study of science and philosophy. From England he carried back engineers, artificers, surgeons, artillerymen, and artisans to the number of 500. At home he encouraged literature, developed trade with other countries, organised a national Church, and founded St. Petersburg. He was engaged in many wars and internal rebellions during his reign, but he extended his dominions, and made Russia a civilised nation. A genius in creative ability, he was a savage in his wrath, an Asiatic in his pleasures. Allowing for his limitations, he fully deserves his title "Great," for he was one of the most remarkable men of any age.

Peter the Hermit

b. Amiens, France, about 1050. d. Huy, Belgium, July 7, 1115.

Though not a great man in the best sense of the term, Peter the Hermit was one of the most astonishing figures of his age. First a soldier in the service of the Counts of Boulogne, he abandoned wife and family and became a monk. Roused by stories of the sufferings of Christians in Palestine, he went throughout Europe preaching a crusade. Blessed by the Pope, Urban II., he traversed a great part of Europe, riding bareheaded and barefooted, carrying a cross. Everywhere his fiery eloquence caused him to be received as an inspired prophet. A great multitude followed him, clamouring to be led forthwith to the Holy Land. With Peter at their head, a mob of 40,000 enthusiasts set forth. They fought and slew and pillaged their way to Constantinople, and were practically exterminated by the Turks at Nicæa. The Crusade, led by Godfrey of Bouillon, was accompanied by Peter the Hermit, who, during the long siege of Antioch, was among those to lose heart and desert. He was carried back, to undergo a public reprimand. When at last Jerusalem was taken, the triumphant Crusaders fell at his feet and offered him thanks, as the original inspirer of their expedition. The life of Peter the Hermit is an amazing example of the power of one gifted enthusiast to inspire to lofty heroism practically the whole people of a continent.

Petrarch, Francesco de Parenzo

b. Arezzo, Italy, July 20, 1374. d. Arquà, Italy, July 18, 1374.

The same decree which banished Dante from Florence sent into exile the father of Petrarch, who settled at Arezzo, where the founder of the Classical Revival was born. From his earliest years Petrarch devoted himself to the study of literature, and in the days of his youth wrote the lovely lyrics which have maintained his fame undimmed for sixteen centuries. The death of his father left him without means, and he had to enter the Church. He never became a priest, but held various minor benefices, conferred by admirers of his genius. Of these there were many and powerful, and kings competed for the distinction of having him at their Courts. The "Laura" whom he immortalised he first met when he was twenty-three. She is supposed to have been the wife of Hugues de Sade, and to have been the mother of eleven children. Petrarch's passion for her was of the purest and loftiest order, as was that of Dante for his Beatrice. At thirty-five Petrarch was recognised as the first scholar and poet of his age, and was crowned laureate in Rome. His life for many years was passed at Courts and in the society of the most learned and cultured men in Europe. His literary output was prodigious, and—vain are our own judgments!—he deemed the work which he now did the work upon which his fame would rest. As a fact, it was forgotten or eclipsed in a later age, and is never read in our own. Petrarch lives for posterity in the exquisite poems of his youth.

Petrie, Sir William Matthew Flinders

b. Woolwich, June 3, 1853.

The grandson of Captain Flinders, the Australian explorer, he has made the buried past of Egypt the mission of his life. Tombs and temples have been made to tell the wonderful story of a civilisation and culture in the East, in comparison with which the ancient arts of Greece are modern. His discoveries have meant practically the rewriting of ancient history.

Petty, Sir William

b. Romsey, Hants, May 26, 1623. d. London, December 16, 1687.

He was the son of a small clothier, and, going to sea while a boy, was left, by sailors jealous of his attainments, with a broken leg upon the coast of France. Instead of striving to return home, he raised money by teaching English and navigation in France, and then entered himself at the Jesuit College at Caen, Normandy, where he received a good general education. Continuing his studies in Holland, he passed on to Paris, whither he was drawn by the fame of its scientists, and became associated with several notable men. Upon returning to England he was still very poor, but gained reputation by the invention of a copying machine and by sketching proposals for the formation of a scientific society. That society did eventually come into being on the lines which he had planned. It was the famous Royal Society, and he was one of its founders. With increasing reputation he was appointed a Fellow of Brasenose College, Professor of Anatomy and Music. Next he was appointed physician to the Army in Ireland, and surveyed the land forfeited to soldiers. He acquired considerable possessions, and founded important industries. His daughter married Thomas Fitzmaurice, Earl of Kerry, and from this marriage descend the Marquises of Lansdowne.

Phidias

b. Athens, about 490 B.C. d. Athens, about 432 B.C.

The greatest sculptor of antiquity had the good fortune to live when Pericles was bedecking Athens with beauty, and to receive commissions to execute the chief statues and to supervise all the similar work of the capital. He constructed the Propylæa and the Parthenon, and adorned them with stupendous figures, acclaimed by antiquity as the most impressive and beautiful ever produced by man. The glorious Elgin marbles, fragmentary remains of the Parthenon frieze, remain as some evidence of his masterly work. The enemies of Pericles, afraid openly to attack him, assailed him through his nearest friends, of whom Phidias was one. They charged him with appropriating gold intended for his wonderful statue of Zeus. He was able to prove his innocence of this, so they charged him with impiety, he having introduced a portrait of himself into the statue of the goddess. He is supposed to have died while in prison on this second charge.

Pindar

b. near Thebes, Greece, about 522 B.C. d. Argos, Greece, 443 B.C.

The most famous and popular lyric poet of his day, he is the only Greek poet of whose work any considerable portions remain to us. Those preserved are the four books of odes celebrating the victories won in the Olympian, Pythian, Nemean, and Isthmian games. They present a striking picture of the importance which the athletic contests of the age occupied in the minds of the cultured Greeks. Pindar wrote also hymns to the gods, pæans, lamentations for the dead, as well as odes to the victors in the games. Only the last survive entire. Pindar was a member of a talented family, members of which were renowned as masters of the flute.

Pitt, William

b. near Bromley, Kent, May 28, 1759. d. Putney, January 23, 1806.

The second son of the Earl of Chatham, who trained him from his earliest years to politics, the younger Pitt took naturally to statesmanship, and when he became Chancellor of the Exchequer at twenty-three, and Prime Minister at twenty-four, he entered upon his tremendous responsibilities with as much confidence as if he had been twice his age. For twenty years his power was unbroken, and he established for himself a position as one of the greatest statesmen in history. He enhanced the powers of the House of Commons as the representatives of the nation; he abolished sinecure offices, and stamped out corruption; he reformed the revenue methods of the country, and re-established its finances. For long he managed to keep peace with the Continent, but the French Revolution at last drove him to war. His greatest triumph was Nelson's Trafalgar victory. Pitt was now designated the "Saviour of Europe." His reply has become a classic: "Europe is not to be saved by any one man. England has saved herself by her exertions, and will, as I trust, save Europe by her exertions." A month later came news of Napoleon's wonderful victory at Austerlitz, and this proved Pitt's death-blow. He died less than two months later. Pitt was a great orator, a great financier—except when his personal interests were engaged—a born leader of men, but he had his weaknesses. He conferred titles with cynical indifference to the claims of the recipients; he permitted scandalous corruption in the deal by which the union of England and Ireland was effected; he abandoned Parliamentary reform and the abolition of the slave-trade when opposition came from Parliament, and cast aside Catholic emancipation when the King objected. In private life he was blameworthy for his hard drinking—a weakness of his era—and for the hopeless incompetence with which he permitted his affairs to drift into confusion. Otherwise, his character was singularly amiable and exemplary, and on his death-bed he found consolation in reflecting on "the innocence of his life."

Plato

b. Ægina, about 427 B.C. d. Athens, 347 B.C.

A disciple of Socrates, and the teacher of Aristotle, his teaching, with that of his master and pupil, has largely controlled the progress of speculative thought to the present day. In his youth he was a gymnast, a soldier, and a poet. He burned his poems upon coming under the influence of Socrates. After the death of the latter he travelled, and was seized and sold as a slave in Ægina, but was ransomed. Returning now to Athens, he started his Academic School. The academy was a grove. There, and in his own

bodying the results of his thinking in his written "Dialogues." He enjoyed a peaceful and prosperous old age, and died at a wedding feast. All the best of his philosophical writings have been preserved, together with many whose authorship is not clearly traceable to him. Plato is the greatest

is accounted as unapproached among mankind for the magnificent sweep of clear intellect, and the beauty and gorgeousness of poetic expression of his expositions.

Playfair, Lyon, Lord

b. Meerut, India, May 21, 1819. d. London, May 30, 1898.

He began his scientific career under the noted chemists, Graham and Liebig, and turned his knowledge to account in the practical application of science to commerce and the everyday affairs of life. He managed an important bleaching works, and was the one to suggest ways and means of developing a little stream of oil in Derbyshire which was to prove the parent of the paraffin and petroleum industries of the world. He was King Edward's master in practical chemistry; he served on many commissions dealing with the health and commodities of the nation; he performed inestimable service for the cause of education. For many years he sat in Parliament, and acted as Deputy Speaker. His last letter was to Mrs. Gladstone, sympathising with her upon the death of her husband, whose decease preceded his own by only nine days.

Plutarch

b. Chæronea, Greece, about 46 A.D. d. Greece, about 120 A.D.

The encyclopædist of antiquity was educated at Athens, but visited Rome, and lectured there on philosophy. The greater part of his days, however, were spent at Chæronea, his native place. There he wrote his discourses and his immortal "Lives." With the latter every student is familiar. They are biographies of warriors, statesmen, legislators, and heroes of ages preceding his own. They are precious documents, based on records which have long been lost.

Poe, Edgar Allan

b. Boston, Mass., January 19, 1809. d. Baltimore, October 7, 1849

This gloomy genius was left an orphan when three years of age, but was adopted by a wealthy and kind-hearted man whose generosity he ill requited. Educated in London and at the University of Virginia, he got into disgrace at the latter through dissipation and gambling, and was removed to his patron's counting-house. He absconded and enlisted, was bought out, and sent to a military academy, from which he was dismissed for neglect of duty. Thrown on his own resources, he wrote poems and criticisms and stories for newspapers and magazines, one of which he edited. His most famous story, "The Gold Bug," was written to win a £20 competition; his greatest poem, "The Raven," was written for a New York evening paper. He gave way periodically to gross intemperance, and was frequently in direst poverty. His wife died when his affairs were in a hopeless condition, and he attempted suicide. Recovering, he was about to marry a second time, when he had another outburst, and was picked up in a public street, sodden with drink and dying. He was a genius of a peculiar order, with all the infirmities of genius, and few of its redeeming qualities.

Polo, Marco

b. Venice, 1254. d. Venice, 1324.

One of the earliest and greatest of travellers, Marco Polo was only a boy when he set out with his father and uncle to China. The elder Polos had already wandered thither, had been handsomely received by Kublai Khan, the Emperor,

learned men from Europe to the Celestial Empire. When they set out two friars accompanied them, but soon turned back, and the three Polos went on alone, by Sivus, Mosul, Bagdad, and Ormuz, through Khorasan, up the Oxus to the Pamir

they were honoured guests at the Imperial Court. Marco was made an ambassador, and visited Cochin China, India, and elsewhere. Finally, the three returned, wealthy, to their native land, coming back by way of Sumatra, the Straits of Malacca, Ceylon, and Ormuz. During a battle between the Venetians and Genoese, Marco was taken prisoner and cast into gaol. His misfortune was a blessing to posterity, for he recounted his adventures to a fellow prisoner, who gave them to the world in the form of a book. That book did much to stimulate the love of travel, and was of great assistance to Columbus and other seekers after a sea-way to India.

Pope, Alexander

b. London, May 21, 1688. d. Twickenham, May 30, 1744.

His father, a linendraper, having become a convert to Roman Catholicism, Pope had no regular training in the public schools, but laboured with prodigious zeal privately to equip himself. His intense application to study while still a child ruined his health, and his sickly constitution undoubtedly gave that jaundiced bias to his mind by which he was throughout life affected. At twelve he had already begun to write poetry, and at fourteen produced his "Ode on Solitude," a surprising work for one so young. While he was still in his 'teens he was introduced by Wycherley into the society of the literary lions of the age—Addison, Steele, Swift, and Arbuthnot. "The Rape of the Lock," one of his finest productions, was published in his twenty-fourth year, and "Windsor Forest" in the year following. His translation of Homer began when he was twenty-four. The "Iliad" occupied him seven years, and brought him fame and fortune. The "Odyssey" occupied a further five years, and was not so successful, owing to his having entrusted parts of the work to hands less skilled than his own. "The Dunciad" was written while the "Odyssey" was in progress, but it was not published until 1728, so that between its completion and issue Pope might have time deliberately to sting into fury the victims of his lampoon, then represent their anger as having induced him to write it. This was characteristic of Pope, who was always planning and plotting to deceive posterity into a belief in and admiration for a spontaneity which he did not possess. The "Essay on Man," produced when he was forty-five, like two of his earlier works, abounds in lines and couplets which have passed into the habitual conversation of our lives. Pope was one of the most extraordinary geniuses produced by England. Soured by bodily infirmity, by perpetual animosities, and by ungratified vanity, he could stoop to the meanest, most stupid deceits, yet he was tender-hearted and loyal to the weak and suffering. He had inspiration, yet never passed a line or phrase until it had been refined and burnished into perfection. He laboured at his work with all his energy, yet desired the world to believe that it was dashed off in bursts of enthusiasm and sent in hot haste to the printers. The life story of the man does not inspire admiration; he is best studied in his works.

Preece, Sir William Henry

b. Carnarvon, February 15, 1834.

Though he inclined more to music than to science, it was in electricity and its many applications to practical affairs that he was destined to distinguish himself. He played an important part in the development of the telegraph in Britain and in the Colonies, and, as Consulting Engineer to the Post Office, was responsible for innumerable inventions of importance. He invented a system of wireless telegraphy ten years before that of Marconi was announced; he adapted electricity in many ingenious ways to the purposes of railway work—not only as to signals, but as a motive power—and has edited quite a library of the literature of the science to which he has devoted his days. He introduced the telephone and the phonograph into Britain, and gave us the first of wireless telephones.

Hickling

While he was studying at Harvard he was deprived, through an accident, of the sight of one of his eyes, but the calamity did not keep him from unremitting study to qualify himself for the task of the historian. He employed a reader, and devised a special apparatus to assist him in his work, and, though practically blind, he produced works of lasting fame on Spanish history, on Mexico, and on Peru. He was still toiling at his history of the reign of Philip II. when overtaken by death.

Priestley, Joseph

b. Leeds, March 13, 1733. d. Northumberland, Pa., February 6, 1804.

The son of a cloth-dresser, he was suc Dissenting minister, school teacher, and In the latter capacity he served Lord S whom he accompanied on a journey to the Continent. There he met Lavoisier and other great chemists, and communicated to them his discovery of oxygen. In their hands this discovery revolutionised chemistry. Disciples of Lavoisier claim for their master that he discovered oxygen and the composition of water independently of Priestley, but the Englishman's title to credit seems clear, though Lavoisier gave oxygen its name. Priestley had called it "dephlogisted air," believing the gas to be air deprived of the so-called phlogiston, in which he believed to the end. He made many other important discoveries, but left to others their correct interpretation. Cavendish laid the foundation of pneumatic chemistry, but Priestley so improved upon his apparatus as to be called the father of pneumatic chemistry. His religious views were generally regarded as heterodox, and towards the close of his career he emigrated to America, there to await the second coming of Christ.

Prior, Matthew

b. East Dorset, July 21, 1664. d. Wimpole, Cambs, September 18, 1721.

Left fatherless at an early age, he became bookkeeper to his uncle, a vintner, but was befriended by the Earl of Dorset, and enabled to study at Cambridge. Although he is best remembered by his literary productions, in which occur lyrics and epigrams of surpassing excellence, he filled many diplomatic and State offices, and succeeded Locke as Commissioner of Trade and Plantations. His politics brought him to grief, the ascendancy of his enemies leading to his impeachment and incarceration (1715-1717) in gaol.

Ptolemy

b. Alexandria, 2nd century, A.D. d. Alexandria, about 160 A.D.

Although Claudius Ptolemæus borrowed more from the works of Hipparchus than he acknowledged, he was the author of much important independent discovery in astronomy and optics. With the scanty data at his disposal he came to the conclusion that the earth is the centre of the universe, with the heavenly bodies revolving around it. His theories held good until the system of Copernicus upset them. As a geographer he filled an important place. His calculations were often erroneous, but, considering the meagre character of his information, they were remarkably good guesses. One respect in which he was at fault was in his estimate of the circumference of the globe. Columbus, basing his calculations on Ptolemy's works, supposed the distance from the western coast of America to the eastern coast of Asia to be one-third less than is actually the case, and in that belief was encouraged to attempt the voyage which led him to the discovery of America.

Purcell, Henry

b. London, 1658. d. Westminster, Nov. 21, 1695.

Admitted as a chorister of the Chapel Royal, he composed an ode, when only twelve years of age, on the King's birthday; and he was but seventeen when he gave to the world his notable opera, "Dido and Æneas." He wrote much fine church an

[illegible]

all predecessors in this country. His music is still popular, more than two centuries after his death.

Purchas, Samuel

b. Thaxted, Essex, 1577. d. London, September, 1626.

A clergyman, he compiled books of travel which possess the highest historical value. During the latter part of his career he was Rector of St. Martin's, Ludgate Hill.

Puschkin, Alexander Sergejevich

b. Moscow, May 26, 1799. d. St. Petersburg, January 29, 1837.

Puschkin was one of the greatest of Russian poets, the son of a woman of negro descent. Although his political views were far in advance of his age in Russia, he was repeatedly employed in the administrative work of the Government, but after a semi-exile he was dismissed and confined to his estate. He died of wounds sustained in a duel.

Pythagoras

b. Samos, Greece, about 580 B.C. d. Crotona, about 500 B.C.

He was a famous philosopher, and founder of the school of philosophy called after his name. He left no writings, our knowledge of his teachings and institutions depending on the traditions of his disciples.

Quincey, Thomas de

b. Manchester, August 15, 1785. d. Edinburgh, December 8, 1859.

This brilliant essayist and miscellaneous writer was the son of a wealthy linendraper, but, owing to his erratic conduct as a youth, had to undergo severe privations in London before going to Oxford University. Here he contracted the opium habit, and upon his weakness based his famous "Confessions of an English Opium-eater," which at once established his reputation. His many charming writings were contributed, for the most part, to magazines, and not published in book form until shortly before his death. He long shared the friendship in the Lakes of Coleridge and Wordsworth.

Racine, Jean Baptiste

b. La Ferté-Milon, France, December 21, 1639. d. Paris, April, 21, 1699.

The greatest of French tragic poets was left an orphan at an early age, but was carefully educated by his grandparents, and received into the best literary society of his age. His literary career began with the publication of odes, but his friendship with men like La Fontaine, Boileau, and Molière led him to devote himself to the drama. In this he achieved striking successes, until either successful rivalry or his conversion to religion turned him finally to poetry. As a poet he was even greater than as a dramatist, and bequeathed to posterity some of the most exquisite melody in words ever conceived by the mind of man.

Raikes, Robert

b. Gloucester, September 14, 1735. d. Gloucester, April 5, 1811.

Moved by compassion for the desperate lot of the children of the poor, he started a Sunday-school in Gloucester, at which they were taught to read and write and instructed in the Christian faith. The first of its kind ever established, it was a success from the outset, and became the parent of the entire Sunday-school movement. Raikes was a newspaper owner.

Raleigh, Sir Walter

b. near Sidmouth, Devon, 1552. d. London, October 29, 1618.

One of the towering figures of Elizabethan days, Raleigh had all the daring and imagination of the hero of romance. He was a brilliant and daring soldier, a dauntless explorer, a polished statesman and courtier, a distinguished scientist and author. After completing his education at Oxford, he served five years abroad as a volunteer in aid of the Huguenots, then took part in the expedition to America. He gained the favour of Elizabeth, who heaped riches and honours upon him. His attempt to colonise that portion of America to which she gave the name of Virginia cost Raleigh £40,000, and yielded to England at the outset tobacco and the potato. Raleigh was ever the foe of Spain, and had a brave part in the destruction of the Armada, and in many lesser engagements with the great Catholic nation in the Old World and the New. Threatened in the affections of Elizabeth by the handsome and gallant Essex, Raleigh repaired to Ireland, where the Queen had given him an estate of 40,000 acres. He was soon restored to favour by the Queen, who would have made Raleigh's career more glorious had she not so dotingly kept him at Court when he was planning greater enterprises. However, his favour ended when his intrigue with Bessy Throckmorton was discovered. Tales of the riches of Guiana drew Raleigh from retirement, and he set sail on an expedition of discovery, and published an account of his doings. With the accession of James I. Raleigh was accused of treason, and condemned to death. For long he was kept a prisoner, then was released, to go again to Guiana. His expedition failed, and upon his return he was re-arrested and executed.

Ramsay, Sir William

b. Glasgow, October 2, 1852.

One of the most distinguished of modern scientists, he was educated at Glasgow and Tübingen Universities, and, after a successful career as tutor and college principal, won renown by researches into the constituents of air. In conjunction with Lord Rayleigh, he discovered argon. Besides the discovery of helium, he has identified and measured the previously unknown elements in the air, which he has named neon, krypton, and xenon. Awarded the Nobel prize in chemistry in 1904, he has been honoured by practically all the most famous learned and scientific bodies of Europe.

Ranke, Leopold von

b. Wiehe, Germany, December 21, 1795. d. Berlin, May 23, 1886.

Educated at Leipsic, he held professional appointments at Berlin, became historiographer of Prussia, and wrote many notable volumes on history. His works are distinguished by their statesmanlike breadth of view, but they rather neglect the social side of national development.

Raphael (or Raffaello Sanzio)

b. Urbino, Italy, March 28, 1483. d. Rome, April 6, 1520.

The prince of painters was the son of a poet and painter, and from an early age began the study of art, under his father and Vite; then, after the death of the former, under Perugino. The latter he excelled, and, going to Florence at twenty-one, was ripe for the influence of Michael Angelo and Leonardo da Vinci. For four years he lived in this atmosphere of supreme art, and executed some of the noblest of his works. Invited to Rome by Pope Julius II., he spent there the last twelve years of his life, and in that time produced an amazing number of works. It was as if he foresaw that his years were to be few—he died at thirty-seven—and that he must labour with all haste. Hard as he worked, he never permitted any of his pictures to suffer from lack of due care. He erred, indeed, in the opposite direction, seeking to combine too many perfections, and falling short of his own best. He left an enormous number of paintings, portraits, studies, drawings, sketches, and studies. Besides this, he was a sculptor of high ability, and acted as master architect of St. Peter's at Rome, in addition to superintending the excavation of antiquities. A man of many friendships, to the end he was unspoiled by his success, and was said to be beloved not only by all men, but by the very brutes.

Ray, John

b. near Braintree, Essex, November 29, 1627.
d. near Braintree, January 17, 1705.

The son of a blacksmith, he became a Fellow of Trinity College, and devoted himself to natural history. His classification of plants was the foundation of the "natural system"; his zoological works were the basis of all modern zoology.

Rayleigh, John William Strutt, Lord

b. Witham, Essex, November 12, 1842.

At Cambridge he was the Senior Wrangler and Smith's Prizeman, and became, at thirty-seven, Professor of Experimental Physics there, and afterwards succeeded Tyndale as Professor of Natural Philosophy at the Royal Institution. His most popular work was the discovery, with Sir William Ramsay, of argon; but his labours in the whole field of science have been of the greatest importance in many directions. He has not hesitated to go again over ground broken by others, and the result has been that either he has said the final word upon the subjects, or opened up entirely new horizons of discovery.

Rembrandt, Hermanszoon van Rhyn

b. Leyden, Holland, July 15, 1607. d. Amsterdam, October 8, 1669.

His father was a prosperous miller, and he was afforded a good education, though his art was mainly self-developed. He showed much independence of convention and example, and went to Nature for his inspiration. His works became famous until disaster overtook him. His wife, who had brought him a fortune, died; then he became bankrupt, and saw all his treasures sold. His closing years were passed in poverty and wretchedness. He toiled incessantly, but his art had declined in popularity, and the creator of some of the noblest works in existence had to be buried at the public expense.

Rennie, John

b. East Lothian, June 7, 1761. d. London, October 4, 1821.

He began life as a millwright, but by great diligence became one of the foremost engineers of the age. The Southwark, Waterloo, and London bridges were built from his plans, while he designed the London Docks, the India Docks, and others in the provinces, as well as the dockyards at Portsmouth, Chatham, Sheerness, and Plymouth.

Reynolds, Sir Joshua

b. near Plymouth, July 16, 1723. d. London, February 23, 1792.

Educated by his father, a schoolmaster and clergyman, he afterwards studied painting in London and at Rome. Then he caught a chill, which rendered him deaf. Returning to London, he rapidly established a high reputation as a painter, and upon the formation of the Royal Academy became its first president. In the following year he began his famous "Discourses" to the students. Three years before his death his sight failed, and he was compelled to relinquish painting. His portraits placed him at the head of the English school of portrait-painting, in which he has never been surpassed. He enjoyed the friendship of the literary lions of his time, and founded the Literary Club, which had among its members Johnson, Garrick, Burke, Goldsmith, Boswell, and Sheridan.

Rhodes, Cecil John

b. Bishop-Stortford, July 5, 1853. d. near Cape Town, March 26, 1902.

A son of the rectory, [illegible] search of health to Natal, and remained, to make a fortune from the Kimberley diamond-mines. But, while he was making himself one of the richest men in the world, he was dreaming dreams of empire—of a stretch of country "all British" from the Cape to the Z[illegible] England, and took his B.A. and M.A. at Oxford University, and was for a time a law student. While South Africa was developing, he financed many undertakings which were making for progress, entered the Cape Parliament, and was hopeful enough of the future to decline the invitation of his friend, General Gordon, to accompany him to Khartoum. Foiled by the Cape Parliament in the attempt to take over a large part of Bechuanaland, he was more successful with the Imperial Government, by which he was appointed Deputy Commissioner for the new Protectorate. Events marched quickly now. He consolidated the various diamond-mining companies at Kimberley, became Premier of the Cape Parliament, and secured a charter for the British South Africa Company, whose territory is now known as Rhodesia. The Jameson Raid into the Transvaal, in 1896, checked his political career, but not his imperial projects. To the end he was actively engaged in furthering his scheme for making homes in South Africa for the British colonists. He died of heart disease, the complaint from which all his life he had suffered. His will is a notable document. It includes bequests to Oxford University, and provides scholarships for English-speaking students from various parts of the world.

Richardson, Samuel

b. Derbyshire, 1689. d. London, July 4, 1761.

The father of the English domestic novel was the son of a carpenter and joiner, and was apprenticed to a London printer. His proficiency with his pen in an age when penmanship was a rare art among the lower classes led to his frequent employment by young people desiring to correspond with their sweethearts and relatives. This practice gave him an insight into the ways and needs of humble life, and led to his publishing his first book—a volume for the instruction in letter-writing of the illiterate. The same didactic scheme prompted the writing of his novel "Pamela," which he designed "to cultivate the principles of religion and virtue in both sexes." The book had a remarkable vogue, and encouraged him to patient effort in the production of his masterpiece, "Clarissa Harlowe," which Johnson declared to be the first book in the world for its knowledge of the human heart.

Richelieu, Armand Jean Duplessis, Cardinal, Duc de

b. Poitou, France, September 5, 1585. d. Paris, December 4, 1642.

Born a son of the Grand Provost of France, he aspired to a military career, but upon his brother throwing up his bishopric to become a Carthusian, the younger Richelieu had to succeed him, and so did, when twenty-two. In 1614 the States General, which was not again to be convoked until 1789, assembled, with Richelieu as a deputy from Poitou. His support of the queen-mother, Mary de Medici, led to her appointing him as her grand almoner, and his political career had begun. He rose to the position of Secretary of State, but fell when she retired to Blois, and accompanied her thither. He succeeded in reconciling the queen and her son, Louis XIII., and was appointed Minister by the latter. Thenceforth Richelieu was virtually King of France. He crushed the plotting nobles, who were battening like birds of prey upon the country; he destroyed the political power of the Huguenots, struck heavy blows at Spain and Austria, and vastly extended French influence. A prince of schemers himself, he was constantly plotted against, and was seldom free from danger. Personal ambition had no part in his procedure. He sought to enhance the prestige of his country by strengthening the Crown. All constitutional government and all vestiges of local liberty were destroyed. He was merciless and implacable, but it was against the most powerful foes of his country that his blows were chiefly [illegible] He prepared the way for th[illegible]

Richter, Jean Paul Friedrich

b. Wunsiedel, Bavaria, March 21, 1763. d. Beyreuth, November 14, 1825.

A famous humorist, and one of the most gifted of German writers, he had a long and hard struggle with fortune before winning recognition. His first writings were a failure, and he had to earn his bread by teaching while writing works which were to make him one of the most famous men of his era. Success having once come to him, it stayed, and he was almost idolised by his generation.

Ridley, Nicholas
b. Haltwhistle, Northumberland, about 1500. d. Oxford, Oct. 16. 1555.

After studying at Cambridge and on the Continent, he became domestic chaplain to Cranmer and Henry VIII., Bishop of Rochester, and finally Bishop of London. An ardent advocate of the Reformation, he was arrested under Mary, and after a long imprisonment was, with Latimer, burned as an obstinate heretic.

in, Auguste
b. Paris, Nov., 1840.

Although receiving an artistic training, he had in early manhood to engage in menial labour for a livelihood, but became famous at once with the bust called "The Broken Nose," which was exhibited when the sculptor was only twenty-three. Like other great artists, he has not always had the critics on his side, but later years have brought him indisputably to the head of his profession.

Rodney, George Brydges, Lord
b. Walton-on-Thames, Feb. 19, 1719. d. London, May 24, 1792.

He served in the Seven Years War, gained a great victory over the Spaniards at Cape St. Vincent, captured Martinique, St. Lucia, and Grenada, and, by defeating the French at Havre, destroyed the flotilla by which it had been intended to invade England.

Romilly, Sir Samuel
b. London, March 1, 1757. d. London, Nov. 2, 1818.

The son of a watchmaker, he became a great lawyer, and attained to the position of Solicitor-General. He is famous for his untiring efforts to reform the criminal law of England, which, in his day, was a barbarous code, including capital punishment for comparatively trivial offences. When sixty-one he lost his wife, and was so distressed at her death that he took his own life.

Romney, George
b. Dalton, Lancs, Dec. 15 1734. d. Kendal, Nov. 15, 1802.

He joined his father in the workshop as a cabinet-maker, but showed unmistakable evidence of genius as an artist, and eventually became one of the most distinguished of English portrait-painters. The most famous of his works are his portraits of Lady Hamilton. His paintings have increased in value to thirty or more times the prices which he obtained.

Ronalds, Sir Francis
b. London, Feb. 1788. d. Battle, Aug. 8, 1873.

A London merchant's son, he early interested himself in mechanics and electricity, invented an electric telegraph, and established it, with eight miles of insulated wire, in his garden at Hammersmith. He offered to demonstrate his invention before the Admiralty, but was answered: "Telegraphs of any kind are now totally unnecessary, and no other than the one now in use will be adopted." The one then in use was the old semaphore. He bore his rebuff with much good-humour, bade "a cordial adieu" to electricity, and set himself to the invention of an instrument which has proved invaluable to meteorologists and physicists. Wheatstone and Cook afterwards developed the Ronalds telegraph, and had it publicly used twenty-one years after he had offered it to the Admiralty.

Rontgen, William Konrad von
b. Lennep, Germany, March 27, 1845.

He was trained in Holland and at Zürich, and began to teach at Würzburg and Strasburg. At the former place, while experimenting with a highly-exhausted vacuum tube on the conduction of electricity through gases, he discovered the famous X-rays, now called, in his honour, Röntgen rays. He has distinguished himself in other branches of science, but it is by this discovery that he is popularly known to the world.

Rosa, Salvator
b. nr. Naples, June 20, 1615. d. Rome, March 15, 1673.

Intended for the Church, he devoted himself to musical composition, but by frequenting the studio of his brother-in-law became imbued with a love of art, and adopted painting as a profession. After working for some time in obscurity, he attained fame with his picture, "Tityrus tortured by the Vulture"; and, removing to Rome, raised himself to independence and celebrity. He was gifted as poet and satirist, as well as musician and painter, and his writings are still read. In art he was distinguished by the gloomy grandeur and terrible magnificence of his pictures.

Salt, Sir Titus
b. Morley, Yorks, Sep. 20, 1803. d. Saltaire, Yorks, Dec. 29, 1876.

The son of a cloth manufacturer who turned farmer. Salt was brought up to the trade of a wool-stapler, and invented a process for turning to profit alpaca, a fabric which had previously defied all efforts to render it saleable. Salt accomplished with alpaca as great wonders as Lord Masham achieved with silk-waste, and founded the model manufacturing town of Saltaire for his works and workpeople.

Sand, George
b. Paris, July 2, 1804. d. Nohant, France, June 7, 1876.

"George Sand" was the assumed name of Amantine Lucile Aurore Dupin, Baroness Dudevant, novelist, playwright, and miscellaneous writer. Married at eighteen, she quitted her husband for the Bohemian literary life of Paris, where among her intimates were Jules Sandeau, Alfred de Musset, and Chopin.

Sappho
b. Mytilene (?), Asia Minor, 7th Century, B.C.

Just as "The Poet" served as sufficient description of Homer, so "The Poetess" was the description of Sappho, one of the greatest of Greek lyrists. Only two of her odes, and about 150 scattered, broken lines remain, but by ancient writers and modern she is proclaimed the only poet whose every word has a seal of absolute perfection and inimitable grace.

Sargent, John Singer
b. Florence, 1856.

The son of an American physician, he grew up in an artistic atmosphere, and, trained by Carolus Duran, has developed into one of the foremost portrait and genre painters of the age.

Saunderson, Nicholas
b. Thurlston, Yorks, Jan., 1682. d. Boxworth, Cambs. April 19, 1739.

Although blind from infancy, he became an accomplished scholar and famous as a lecturer at Cambridge University, whither he was taken as a poor student by a sympathetic friend.

Savonarola, Girolamo
b. Ferrara, Italy, Sep. 21, 1452. d. Florence, May 23, 1498.

First a Dominican monk and later prior of St. Mark's, Florence, he had enormous influence by his fearless denunciation of the vice and corruption in Church and State. He brought about a great religious revival and led to the overthrow of the Medici, but the lasting animosity of Pope Alexander VI., whom he had assailed, brought his arrest and barbarous execution.

Schule, Karl Wilhelm
b. Stralsund, Dec. 2, 1742. d. Koping, Sweden, May, 1786.

While serving as a chemist's apprentice, and afterwards as a pharmist, he made an unparalleled series of discoveries, in the course of which, independently of Priestley, he discovered oxygen and nitrogen. Among his many other discoveries were: Oxalic, tartaric, citric, lactic, and arsenic acids and their salts; baryta and the salts of barium; uric acid and the composition of prussic acid and Prussian blue.

Schiller, Johann, Christoph Friedrich von

b. Marbach, Germany, Nov. 10, 1759. d. Weimar, May 9, 1805.

The son of an army surgeon, he first tried the law, but turned to medicine, and entered the army as a surgeon. But the pen early claimed his affections, and at twenty-three he was in disgrace for a play of revolutionary tone. He fled from Stuttgart, and though afterwards his successes as dramatist and poet were second to those of no other man of his age, he and poverty were never for long strangers. Philosophy and poetry are admirably blended in his works. With Goethe he succeeded in elevating the German drama and in moulding and purifying the thought and language of a great people.

Schubert, Franz Peter

b. Vienna, Jan. 31, 1797. d. Vienna, Nov. 19, 1828.

The son of a musician, he early showed a genius for composition, but the times were not propitious, and the privations which he suffered during youth brought him to an early grave. He composed 500 songs, among which are some of the loveliest in existence, ten symphonies, six masses, several operas, cantatas and overtures, and a host of sonatas and other compositions.

Schumann, Robert

b. Zwickau, Saxony, June 8, 1810. d. near Bonn, Germany, July 29, 1856.

He did not take up the study of music until twenty-one years of age, but two years later he published his first important composition, and in the following year began his writings on music. His subsequent career was chequered. Beautiful compositions were followed by spells of madness, and he died in an asylum for the insane. His music is distinguished by freshness and originality, much piquancy in rhythm and wealth and resource in harmony.

Scipio, Publius Cornelius Africanus Major

b. 237 B.C. d. Campania, Italy, 183 B.C.

A soldier from his youth up, he gained great successes for the Roman arms, and caused the recall of Hannibal from his invasion of Italy to defend Carthage. Scipio inflicted upon him his only defeat, and ended the second Punic War.

Scott, Sir Walter

b Edinburgh, Aug. 15, 1771. d. Abbotsford, Sep. 21, 1832.

An early illness, though it left him lame for life, was a blessing in disguise, for he was given the run of an ample library, there to store his mind with reading which no ordinary boy would have attempted. Brought up to the law, as his father had been, he first became known by translations of German writings, following this with poems of his own. His original poems speedily brought him fame, and fearing that he might sacrifice this if he appeared as a novelist, he published the early volumes of the immortal "Waverley" novels anonymously, and stoutly denied the authorship when challenged. Not until twenty-five of them had appeared did he publicly admit their parentage. A secret partnership with the Ballantynes proved an inauspicious venture, and upon Constable taking over the business and failing, Scott became involved in a loss of £120,000, in addition to £30,000 private debt. His declining years were devoted to paying off this sum, and in the end, after his death, every creditor had his due. Not only did Scott write poems and novels and a vast number of miscellaneous articles; he edited large editions of Dryden and Swift, and wrote a nine-volume "Life of Napoleon." His baronetcy was conferred by George IV., of whom the Jacobite genius was, paradoxically enough, an ardent admirer.

Selden, John

b. Salvington, Sussex, Dec. 16, 1584. d. London, Nov. 30, 1654.

A poor boy, bred to the law, he became a successful lawyer, but found time for wide and profound study, and for the production of deeply-learned historical, antiquarian, and legal works. His resolute stand for liberty caused him to be imprisoned for nearly a year in the Tower, without, however, abating his zeal for the right. He helped to draw up the Petition of Right, but did not take part in the impeachment of Strafford or in Laud's prosecution, while he was opposed to the execution of Charles I.

Shaftesbury, Anthony Ashley Cooper, 7th Earl of

b. London, April 28, 1801. d. Folkestone, Oct. 1, 1885.

While still a schoolboy he determined to devote his life to ameliorating the condition of the poor. He helped to reform the law in its relation to the treatment of lunatics, for the prevention of the employment of boys as chimney-sweeps, and for the Factory and Workshop Regulation Acts. He was a devoted friend of the Ragged School movement, and was a foremost figure in all the social reforms effected during his lifetime.

Shakespeare, William

b. Stratford-on-Avon, Ap. 23 (?), 1564. d. Stratford-on-Avon, Ap. 23, 1616.

The greatest of dramatists and one of the most gifted of poets had for his father a fellmonger and glover, while his mother was a woman of some fortune. Comparatively little is known of his life. A reverse in the fortunes of his father compelled him to take service, with but scanty store of education, as apprentice to a butcher, while there is a tradition as to his being employed in the office of an attorney. Married, while a youth, to Anne Hathaway, he was the father of a daughter at nineteen, and a few years later quitted his native town, impelled, it is supposed, by a prosecution for deer-stealing. His early life in London is obscure, but it is supposed that at the outset he earned a livelihood by holding horses near the spot where he was to gain more or less renown as an actor in his own plays. The first of these, preceded by the poems "Venus and Adonis" and "Lucrece," was probably "Love's Labour's Lost," followed by the "Comedy of Errors," "Two Gentlemen of Verona," and "A Midsummer Night's Dream." Play followed play with amazing rapidity, the author's genius developing in new directions with each production. "The Merry Wives of Windsor" is said to have been hastily produced in compliance with Queen Elizabeth's command that he should exhibit Falstaff in love. Shakespeare was by this time a prosperous man. He wrote for the hour, not for posterity.

> "For gain, not glory, wing'd his roving flight,
> And grew immortal in his own despite."

His raw material for comedy and historical drama and tragedy he took from various sources—old plays, old chronicles, the writers of antiquity. "The Winter's Tale" dramatises a novel. He bought a residence at Stratford and another in London, and died at the former in his forty-ninth year. Seven years elapsed between his death and the appearance of the first collected edition of his works, and scholars to this day are not able to say quite where his pen ceased and others began. The mystery is little less perplexing than that by which the works of Homer are invested. But those works, wholly his, or touched here and there by the hand of a collaborator, remain the chief literary heritage of the Anglo-Saxon race, even if Landor spake not truly when he said, "Shakespeare is not our poet, but the world's!"

Shelley, Percy Bysshe
b. near Horsham, Sussex, Aug. 4, 1792. d. Spezzia Bay, Italy, July 8, 1822.

Expelled from Oxford University for an Atheistical pamphlet, Shelley, out of chivalrous desire to save from suicide the daughter of a coffeehouse-keeper, married her. He was nineteen, she was seventeen. They parted three years afterwards, and he went to Switzerland with Mary, daughter of William Godwin, whom, upon the suicide of his wife, he married. The second union

[illegible] his body, recovered eleven days later, was burned upon the shore in the presence of his friends Trelawny, Leigh Hunt, and Byron.

Sidney, Sir Philip
b. Penshurst, Kent, Nov. 29, 1554. d. Zutphen, Holland, Oct. 17, 1586.

Warrior, statesman, poet, he experienced the full force of a capricious queen's power to wound a subject, and met his death in an expedition against the Netherlands, undertaken for policy's sake at Elizabeth's behest. His literary masterpieces were unknown to the world at large during his lifetime, for, though celebrated in Court circles, they were not published until after his death. His writings have proved a well of inspiration at which many later poets have drunk deep; his career was a pattern to all who strive to live the life of a true gentleman.

Siemens, Ernst Werner
b. Leuthe, Germany, Dec. 13, 1816. d. Berlin, Dec. 6, 1892.

After fifteen years' service in the Prussian Army, he established works for carrying out many of the electrical inventions with which his fertile brain teemed.

Siemens, Sir William
b. Leuthe, Germany, April 4, 1823. d. London, Nov. 19, 1883.

The younger and more distinguished of the Siemens brothers came to England poor in pocket, but rich in scientific knowledge, and after many trials, established a great and successful business. Naturalised, he was the recipient of many distinctions for his inventions in metallurgy, and contributed works of great value to the scientific literature of the period. He and his brother generously helped the movement for the better education of aspirants to careers in science.

Simpson, Sir James Young
b. Bathgate, Scotland, June 7, 1811. d. Edinburgh, May 6, 1870.

The first man to introduce anæsthetics into British surgery was the son of a humble baker. He made many experiments before discovering the value of chloroform for his purpose, and fought a long fight against bigotry and prejudice before making his practice popular.

Smith, Adam
b. Kirkcaldy, June 5, 1723. d. Edinburgh, July 17, 1790.

After study at Glasgow and Oxford and filling professorial chairs at Edinburgh, he travelled as tutor to the Duke of Buccleuch, then settled down to studious retirement and the production of his famous works on political economy. Of these the "Wealth of Nations" remains still the economists' guide and source of inspiration.

Socrates
b. Athens, about 470 B.C. d. Athens, 399 B.C.

After following the calling of his father, that of a sculptor, Socrates gave himself up entirely to the study of philosophy, which he taught and expounded to such famous pupils as Plato, Xenophon, and Alcibiades. His life was one long campaign for truth and virtue. In his old age his enemies charged him with impiety and with corrupting the morals of the youth of Greece. He defended himself in a noble speech, but the verdict of partial judges going against him, he drank hemlock in his cell, surrounded by his disciples.

Sophocles
b. nr. Athens, 496 B.C. d. Athens, 405 B.C.

One of the three

Greece, he defeated Æschylus, his elder by thirty years, in a tragic competition when twenty-eight years of age, and reigned supreme until Euripides

world some of the masterpieces of human genius.

Speke, John Hanning
b. Ilminster, May 4, 1827. d. Bath, Sep. 15, 1864.

After service with the Indian Army, he explored the Equatorial lakes of Africa in company with Burton. While travelling alone he discovered the Victoria Nyanza, and in it the long-sought source of the Nile.

Spencer, Herbert
b. Derby, April 27, 1820. d. Dec. 8, 1903.

His father, a schoolmaster, intended him to follow the occupation of a railway-engineer, but Spencer threw up this calling for that of letters, and from early manhood began to develop the ideas which were eventually to issue in his System of Synthetic Philosophy. His writings have had a profound influence upon the thought of his own country, and an even greater effect upon foreign peoples, into whose languages they have been translated.

Spenser, Edmund
b. London, about 1552. d. London, Jan. 13, 1599.

Born of poor parents but good family, he proceeded from Merchant Taylors' School to Cambridge University. Winning the friendship of Sir Philip Sidney, to whom he dedicated his "Shepherd's Calendar," he was appointed, through Sidney's uncle, Lord Leicester, private secretary to Lord Grey de Wilton when the latter was sent to repress the rebellion in Ireland. Before crossing over, Spenser had begun his "Faerie Queen," and continued at his task in Ireland amid fierce fighting and plots culminating in the destruction of his own home there. Although he enjoyed great literary fame, his fortunes were of the most dismal character, and he died in London utterly destitute.

Spinoza, Benedict Baruch
b. Amsterdam, Nov. 24, 1632. d. The Hague, Feb. 21, 1677.

Excommunicated by the Jewish community, of which he was a member, he supported himself by grinding lenses, so that he might compose his works on philosophy and pantheism, which were destined to form the acknowledged basis of much of modern German philosophy.

Stanley, Sir Henry Morton
b. Denbigh, Wales, 1841. d. London, May 10, 1904.

His name was Rowlands, but on making his way from his poverty-stricken home to New Orleans, he adopted the name of an American Stanley, who befriended him. On growing up, he fought in the American Civil War, turned newspaper correspondent, and was sent on behalf of an American newspaper to the Abyssinian War. He so impressed his employer that later he was commissioned to head an expedition into Africa in search of Livingstone. This mission he accomplished, and afterwards made important explorations, and established for the King of the Belgians the Congo Free State. From another of his expeditions the British East Africa Company developed; while his final and not least notable journey through the Dark Continent was undertaken for the relief of Emin Pacha. Stanley married the skilful artist, Miss Dorothy Tennant, who survives him.

Steel, Sir Richard

b. Dublin, March 1672. d. nr. Carmarthen, Sep. 1, 1729.

immortal. His collaboration with Addison in the 'Tatler" and "Spectator" was most happy, though the two friends ultimately quarrelled.

Stephenson, George

b. nr. Newcastle, June 9, 1781. d. nr. Chesterfield, Aug. 12, 1848.

First a farm-hand, next fireman at a colliery, he devoted his pocket-money as a youth to learning to read and write and sum. His first notable invention was a safety lamp for miners. Next came his first steam-engine, rendered successful by his later invention of the steam-blast. Upon becoming engineer for the first railway, he constructed the famous "Rocket" locomotive. He attained to great prosperity, and was employed on many important schemes during the race for railways which followed. His son, ROBERT STEPHENSON (b. Oct. 16, 1803. d. Oct. 12, 1859), won independent renown by the construction of many famous railway and other bridges.

Stevenson, Robert Louis Balfour

b. Edinburgh, Nov. 13, 1850. d. Samoa, Dec. 3, 1894.

Intended for the law, he never practised, but travelled by strange methods, and turned his experiences to account in some of the most charming writings in the language. He was equally distinguished as essayist and author of fiction, while much of his verse is admirable.

Strabo

mtus, about 63 B.C. d. about 21 A.D.

Little is known of the greatest geographer of antiquity, except from the record of his travels. These embraced visits to Greece and Italy, Egypt, up the Nile, Africa, and Asia Minor. His work "surpasses all the other geographical writings of antiquity, both in grandeur of plan and in the abundance and variety of its materials." Many of his estimates of the size and configuration of the world were hopelessly wrong, but the performance was very wonderful, his scanty resources considered.

Sullivan, Sir Arthur Seymour

b. London, May 13, 1842. d. London, Nov. 22, 1900.

He began his musical career as a choir-boy, studied at Leipzig, and at twenty years of age had made his name as a composer. Cantatas and oratorios, tuneful songs, and hymn-tunes, now famous wherever religious music is heard, followed. His most famous achievements, however, were the delightful comic operas which he produced in collaboration with Sir F. S. Gilbert.

Swedenborg, Emanuel

b. Stockholm, Jan. 29, 1688. d. London, March 29, 1772.

Distinguished as a scholar and military engineer, he wrote several works on natural philosophy before he began to dream dreams and see visions and to expound the Christian faith as it appeared to him. The Swedenborgian Church was established sixteen years after his death.

Swift, Jonathan

b. Dublin, Nov. 30, 1667. d. Dublin, Oct. 19, 1745.

The British Rabelais was first a power in the Whig Press, and afterwards one of the most trenchant writers on the other side. In addition to minor incumbencies held earlier, he was Dean of St. Patrick's, Dublin, for over thirty years. Much of his time was spent in London society prior to this appointment, but it was while in Ireland that he wrote most of his famous satires. His latter days were clouded by periods of madness, upon

of the age, has become a children's classic.

Swinburne, Algernon Charles

b. London, April 5, 1837.

Son of an admiral, he quitted Oxford without a degree and travelled on the Continent, when he was the guest of Landor. His poems, which give him undisputed supremacy as a master of metrical invention, include some of the most exquisite lyrics in the language, while his prose writings are characterised by a vigour and charm of exceptional character. By common consent, he was the only poet worthy to succeed Tennyson as Poet Laureate.

Tacitus, Cornelius

b. Rome, about 52 A.D. d. Rome, about 117 A.D.

"The greatest man who has yet given himself to the recording of human affairs," as Froude describes him, was first famous as a legal orator. He married the daughter of Agricola, conqueror of Britain, and held offices under the State.

Tasman, Abel Janssen

b. Hoorn, Holland, about 1602. d. Batavia, Oct. 1659.

Despatched by Van Diemen, Governor of the Dutch East Indies, to seek "the great South Land," he discovered Tasmania (calling it Van Diemen's Land), New Zealand, part of the Friendly Islands, and ultimately the Bay of Carpentaria.

Tasso, Torquato

b. Sorrento, Italy, March 11, 1544. d. Rome, April 25, 1595.

Finding the pursuit of law and philosophy distasteful, he succeeded, by the production of a romantic poem, in persuading his father to let him follow his bent for letters. His noble epic, "Jerusalem Delivered," was followed by a mental breakdown. He imagined his rich and powerful friends to be his enemies, and had to undergo seven years' detention in a lunatic asylum. During his incarceration he wrote many noble verses and philosophical dialogues. Although released and able to continue his writings in freedom, he never wholly recovered, and died on being summoned to Rome to be crowned Poet Laureate.

Tennyson, Alfred Lord

b. Somersby, Lincs, Aug. 6, 1809. d. Aldworth, Sussex, Oct. 6, 1892.

One of a Lincolnshire rector's sons, of whom two besides himself were poets, Alfred Tennyson wrote verse as soon as he could write anything. He completed his education at Cambridge. The bulk of his loveliest lyrics were written before he passed his thirtieth year, and at forty-two he was promoted Poet Laureate, in succession to Wordsworth. In 1850 he published "In Memoriam," which, with the "Idylls of the King," constitute his noblest work. His poetical dramas, some of which were played in his own time, were of later date. His career ensured by a pension bestowed while he was yet young, his lot was happier far than that which usually falls to a great poet. He was created a baron when seventy-five.

Tesla, Nikola

b. Smiljan, Servia, 1857.

Educated with a view to devoting himself to mathematics and physics, he took up engineering, and has become one of the foremost inventors of electrical appliances.

Thackeray, William Makepeace

b. Calcutta, July 18, 1811. d. London, Dec. 24, 1863.

On his way home from India to England at St. Helena, he caught a glimpse of Napoleon. Educated at Charterhouse and Cambridge, he turned to art, but necessity compelled him to ply his pen for a livelihood. When he and Dickens were young, he asked to be allowed to illustrate "Pickwick," and Dickens refused his offer. Sustained success did not come to Thackeray until towards the end of "Vanity Fair," which was appearing serially. Then it turned completely in his favour. His domestic life was unhappy, his wife's mind giving way during the illness of one of their children.

Themistocles

b. about 525 B.C. d. about 459 B.C.

Famous as a general and statesman, he won for the Athenians the victory of Salamis.

Theocritus

b. Syracuse, 3rd Century B.C. d. Sicily (?), about 250 B.C.

He was the Greek poet of Nature and pastoral life, and his influence is to be traced in the work of many later classics.

Thucydides

b. Athens, about 471 B.C. d. about 401 B.C.

Warrior and scholar, he was condemned to death for his lack of success in the former capacity, but retired into exile and began his immortal work—the first of critical histories.

Titian

b. nr. Venice, about 1477. d. Venice, Aug. 27, 1576.

The chief of the Venetian school of painters and the greatest master of colour that the world has known, he worked for ninety years at his art, and died practically brush in hand.

Torricelli, Evangelista

b. Faenza, Italy, Oct. 15, 1608. d. Florence, Oct. 15, 1647.

His discoveries in relation to the gravity of the air resulted in the barometer, and his experiments with lenses gave us new and better telescopes and the microscope.

Tyndall, John

b. Leighlin Bridge, Ireland, Aug. 21, 1820. d. Haslemere, Surrey, Dec. 4, 1893.

Surveyor and engineer, he distinguished himself as a physicist and scientific author and lecturer.

Van Dyck, Sir Anthony

b. Antwerp, March 22, 1599. d. London, Dec. 9, 1641.

A pupil and asistant of Rubens, he specially distinguished himself by his portraits. His title was conferred by Charles I., by whom he was appointed painter to the English Court.

Velasquez, Diego Rodriquez de Silva y

b. Seville, June 6, 1599. d. Madrid, Aug. 6, 1660.

Velasquez was his mother's maiden name. His "Water Seller" made him famous, and he was taken to the Spanish Court, where he painted scores of works whose glories came as a revelation to later generations, but which in the meantime had remained little known in the gloomy royal galleries of Madrid.

Veronese, Paul

b. Verona, 1528. d. Venice, April 19, 1588.

His real surname was Caliari—Veronese refers to his birthplace. He was the last of the great Venetian painters.

Vespucci, Amerigo

b. Florence, March 9, 1451. d. Seville, Feb. 22, 1512.

The man whose Christian name the American Continent bears was sent by his employers to Spain, and fitted out one, if not two, of Columbus's expeditions. He claimed to have made four voyages to the New World, but there is no record of his actually having done so.

Virchow, Rudolf

b. Schivelbein, Germany, Oct. 13, 1821. d. Berlin, Sep. 5, 1902.

The son of a small shopkeeper, he became famous as a statesman, but infinitely more so as "the father of modern pathology." Among his many famous achievements was the establishing of what Lord Lister calls "the true and fertile doctrine that every morbid structure consists of cells which have been derived from pre-existing cells as a progeny." Of material results, the new Berlin, with its model sanitary system, water supply, and hospitals, is one of his monuments.

Virgil, Publius Virgilius Maro

b. Andes, Italy, Oct. 15, 70 B.C. d. Brundisium, Italy, Sep. 21, 19 B.C.

All his life an invalid, he devoted himself entirely to literary labour. He was the most painstaking of poets, and laboured incessantly at his task. His immortal Æneid he was unable to complete, and left instructions that, as the manuscript could not receive his finishing touches, it should be destroyed. Happily this order was disobeyed by the instructions of the Emperor Augustus.

Volta, Alessandro

b. Como, Italy, Feb. 18, 1745. d. Como, March 5, 1827.

Following up the investigations of Franklin and Galvani, he invented his Voltaic pile, the first instrument which artificially produced electricity, causing that science, with chemistry, to develop with astounding speed and certainty.

Voltaire

b. Paris, Nov. 21, 1694. d. Paris, May 30, 1778.

Born François de Marie Arouet, he assumed the style of Voltaire. His wit gained him admittance to the French Court, but his sharp tongue twice brought him into disgrace. He came to England and consorted with the leading literary spirits of the age, then returned to Paris. Here he got into hot water again, and went ultimately to the Court of Frederick the Great, from whom he parted on unfriendly terms three years later. He settled in Geneva until shortly before his death, when the excitement of a visit to Paris proved too much for him. His literary output was prodigious, his correspondence immense, his influence immeasurable. He had no reverence for good, but he had an unfailing eye for evil, and denounced it unsparingly wherever he found it. He helped to free Europe of the oppressive feudal bonds which bound it.

Wagner, Richard

b. Leipzig, May 22, 1813. d. Venice, Feb. 13, 1883.

He was a brilliant scholar as a boy, and before he was fourteen had translated a great part of Homer and written a tragedy. Weber and Beethoven inspired him to musical composition, but, in spite of his literary and musical gifts, he had a desperate struggle with fortune. It took him fifteen years to get a hearing for his "Faust" overture, and opera after opera was coldly received. He was often in great distress until Ludwig II. invited him to the Bavarian Court. A special theatre for his works was built at Bayreuth, and gradually his compositions grew in fame. He lived to see the triumph of his genius.

Wallace, Alfred Russel

b. Usk, Mon., Jan. 8, 1822.

Educated as a surveyor and architect, he gave his attention to natural history, explored, and, simultaneously with Darwin, formulated the theory of natural selection.

Walton, Isaac

b. Stafford, Aug. 9, 1593. d. Winchester, Dec. 15, 1683.

At one time a linendraper in London, he settled down to country life, and wrote his famous "Compleat Angler," which, with his classical volume of biographies, ranks as one of our most precious literary treasures.

Washington, George

b. Bridges Creek, Virginia, Feb. 22, 1732. d. Mount Vernon, Dec. 14, 1799

During the war in America between England and France he fought under the British flag, but in the Rebellion took arms for his native land. He handled his forces with supreme ability, and though it was an army ill-disciplined, ill-fed, and ill-equipped, he led it in the end to complete victory over the English troops. His compatriots would now have made him King, but he was as modest as he was noble, and though he accepted the position as head of the nation, it was only as the elected President of the United States.

Watt, James

b. Greenock, Jan. 19, 1736. d. nr. Birmingham, Aug. 19, 1819.

From the shop of an instrument-maker in London he graduated as mechanic and inventor. To his credit stands the practical steam-engine and steam condenser. With Boulton he established the famous works at Birmingham.

Wellington, Arthur Wellesley, Duke of

b. Dublin, April 29, 1769. d. Walmer Castle, Sep. 14, 1852.

He was the dull boy of the family, yet in his first military action showed genius. He had not much faith in a military career, and unsuccessfully sought civil employment. His chance came in India, where, in the course of eight years, he won great distinction as a leader of men and as an administrator. His supreme honours were not realised, however, until he took command in the Peninsula and drove the French out of Spain and captured Toulouse. For this feat he received £400,000 from Parliament, with honours in abundance from half the nations of Europe. Napoleon's escape from Elba and the subsequent battle of Waterloo took Wellington into the battlefield for the last time, and brought him further distinctions and rewards. Entering political life, he became Prime Minister, but was not in sympathy with popular aspirations, and on one anniversary of Waterloo was besieged by a mob in his own house.

Wells, Henry George

b. Bromley, Kent, Sep. 21, 1866.

The son of a professional cricketer, he was apprenticed to a linendraper, but by perseverance emancipated himself, and became schoolmaster's assistant. A course of study at the Royal College of Science brought him under the influence of Huxley, by whose aid he was able to take first-class honours with his B.Sc. degree. A career as a scientist was prohibited by a breakdown in health. He found his true vocation, however, in letters, in which he was destined to play an important part as a gifted and original writer upon social reform. He is equally impressed by the stupidity of the race and by its immense possibilities.

Wheatstone, Sir Charles

b. Gloucester, Feb. 1802. d. Paris, Oct. 19, 1875.

With W. F. Cooke he invented the instrument out of which has grown the electric telegraph system of the United Kingdom.

Wesley, John

b. Epworth, Lincs, June 17 (o. s.), 1703. d. London, March 2, 1791

"The Ignatius Loyola of the English Church" distinguished himself as a scholar at Oxford University, and had been curate to his father and a Church missionary in Georgia before entering upon the work in Britain which gave the world a new and mighty religious denomination—the Wesleyan Methodists. No man ever lived a fuller life. Wesley's itineraries of over 250,000 miles, the dangers he experienced, the vast literary labours he accomplished, the wonderful organisation he built up, constitute one of the great romances of modern biography. He distributed vast sums in charity, and, with his brother Charles, wrote a number of hymns still in general use.

White, Gilbert

b. Selborne, Hants, July 18, 1720. d. Selborne, June 26, 1793.

"White, of Selborne," was a fellow of Oriel College, Oxford, but became curate of his native Selborne. There he indulged his love of natural history and antiquarian interest, and wrote his immortal work on his observations. The book, a classic beyond price, has done more than any other work in the language to inculcate a love and knowledge of nature.

Whitefield, George

b. Gloucester, Dec. 16, 1714. d. Boston, Sep. 30, 1770.

While at Oxford he was caught by the wave of religious enthusiasm which the Wesleys had started, and accompanied John Wesley on his mission to Georgia. Upon his return he was admitted to Orders, but his burning eloquence and liberal views caused the pulpits of the Church to be closed against him. Thereafter his life was devoted to mission work, in which he had marvellous success. Although there were points of doctrine upon which he and Wesley differed, Whitefield was a very potent factor in the foundation of Methodism. He made seven expeditions on mission work to America, and died there.

Whitney, Eli

b. Westborough, Mass., Dec. 8, 1765. d. New Haven, Conn., Jan. 8, 1825.

In days when the cotton had to be slowly separated from the seed by hand, he gave years of his life to the invention of the cotton-gin. At last he succeeded, but unscrupulous rivals broke into his premises, stole his invention, and made copies of it before he could patent it. The invention, which added hundreds of millions of pounds to the wealth of America, brought him a £10,000 grant from the Government, which sum, with all his profits, was swallowed up in law suits undertaken to protect his interests. He afterwards realised a fortune as a manufacturer of firearms.

Wilberforce, William

b. Hull, Aug. 24, 1759. d. London, July 29, 1833.

Closely associated with Pitt, though an independent politician, he began as a young man his campaign for the abolition of the slave trade and for the emancipation of its victims. By many of his contemporaries he was deemed a fanatic, but his devotion to the righteous cause he had made his own was crowned with victory after a nineteen years' struggle. The Emancipation Bill, however, was not passed until a month after his death.

Wilkie, Sir David

b. Cults, Fifeshire, Nov. 18, 1785. d. off Gibraltar, June 1. 1841.

He painted before he could write, and though scantily furnished with means, made himself one of the most famous genre painters of his age.

William I., The Conqueror

b. Falaise, Normandy, 1027 or 1028. d. nr. Rouen, Sep. 9, 1087.

His father was Robert III., Duke of Normandy, his mother a tanner's daughter. Although not lawfully entitled to the crown of Normandy, the nobles made him successor to his father. Edward the Confessor, his cousin, promised him the English Crown. Harold pledged himself to help William to gain it; but, at the death of Edward, was himself crowned. William defeated him at Hastings, and was crowned on December 25, 1066. The Conqueror was a born statesman and warrior. He ruthlessly repressed rebellion, he committed many cruel acts of tyranny, but he made England and the English nation, and historians rank him with Alexander the Great, Constantine, and Charlemagne.

William III.

b. The Hague, Nov. 4, 1650. d. London, March 8, 1702.

The son of William II., Stadtholder of the United Netherlands, he was the grandson, through his mother, of Charles I., and married the elder daughter of James II. When the misconduct of the latter caused the English people to turn him from the Throne, William was brought over and crowned King. He carried out many striking reforms, among which was the making absolute of the will of the people, through Parliament, the establishment of our modern system of national finance, control of the Army by Parliament, and liberty of the Press. This he accomplished in the face of many difficulties, and in spite of many attempts upon his life by Stuart adherents.

Wolsey, Thomas, Cardinal

b. Ipswich, 1471. d. Leicester, Nov. 29, 1530.

His father, a grazier and wool merchant, had him educated at Oxford University, and at thirty-five Wolsey had become a royal chaplain. During the next five years he became indispensable to Henry VIII., who found him a powerful ally in peace and war, and made him Lord Chancellor. Thwarted in his designs upon the Papacy, Wolsey aided Henry in the dissolution of the monasteries, but fell from favour when he failed to secure the King's divorce from Catherine of Arragon, and was deprived of his offices. Restored to the Archbishopric of York, he was still obnoxious to lords and commons for his unjust taxation of the nation, and the wanton insolence with which he had behaved. He was now called upon to take his trial for high treason, but died on the way to London. Although a man of many and grave faults, he did much for education, and history has shown that his own ambitions were coincident with the interest of his country as he conceived it.

Wordsworth, William

b. Cockermouth, April 7, 1770. d. Rydal Mount, April 23, 1850.

After completing his education at Cambridge, he travelled on the Continent, and became imbued with Republican sentiments, which afterwards underwent considerable modification. His friendship with Coleridge determined his career as a poet, and a legacy of £900 from a friend made that career possible. His means were further enhanced by an office as distributor of stamps, while with the Poet Laureateship came, of course, the customary pension. Although he travelled now and again to the Continent and to Scotland, his life was passed almost wholly amid the glories of the Lake Country. Wordsworth's influence upon the poetry of the country was second to none.

Wren, Sir Christopher

b. East Knoyle, Wilts, Oct. 20, 1632. d. Hampton Court, Feb. 25, 1723.

The greatest of English architects was a singularly gifted man, and was first notable in helping to perfect the barometer and as a professor of astronomy. The Great Fire of London gave him his opportunity as an architect. He rebuilt St. Paul's Cathedral, and fifty of our noblest churches, and designed a London of noble thoroughfares and magnificent quays. Unfortunately there was not available money enough to carry out the scheme, but many buildings in and about London bear witness to his genius.

Wycliffe, John

b. nr. Richmond, Yorks, about 1324. d. Lutterworth, L'tshire, Dec. 31, 1384.

A distinguished scholar of Oxford, where he became Master of Balliol College, he discharged ecclesiastical offices with those of ambassador. Opposed to the corrupt and scandalous system in the Roman Catholic Church of the time, he boldly addressed the people in pamphlets written in English. Previously all writings for public perusal had been in Latin. He also, with assistance, translated the Bible into English, and to his life's end fearlessly carried on his campaign for the worship of God unfettered by enforced confessions to priests, penances, and indulgences.

Xavier, St. Francis

b. Xavier, Navarre, April 7, 1506. d. San-Chian, Canton, Dec. 22, 1552.

"The Apostle of the Indies" was associated with Loyola in establishing the Society of Jesus, and laboured with phenomenal success as a missioner in the Portuguese colonies in the East.

Xenophon

b. Athens, about 430 B.C. d. Corinth, 354 B.C.

A disciple of Socrates, whose memory he defended in a masterly work, he took part in the expedition of Cyrus the Younger against King Artaxerxes Mnemon. After the death of Cyrus, Xenophon succeeded to the command of the 10,000 Greeks, and led them on their celebrated retreat, through 1,500 miles of hostile country, to the sea. As a historian and essayist Xenophon occupies a foremost place.

Ximenes, Cardinal

b. Torrelaguna, Spain, 1436 d. Roa, Spain, Nov. 8, 1517.

Although as Grand Inquisitor he put to death over 2,500 persons in the sacred name of religion, Ximenes was one of the noblest spirits of his age. His virtues made him a cardinal and Regent of Spain. He governed at eighty years of age with astounding energy and success, broke the feudal spirit of the lawless nobles, restored lands wrested from the Crown, reformed finances, and created educational institutions on a lavish scale. During the time of his might and influence he observed the austerities of the cloister, always wearing under his robes the coarse frock of the Franciscan monk.

Zol, Emile

b. Paris, April 2, 1840. d. Paris, Sep. 29, 1902.

His father, a poor engineer, bequeathed to him nothing but energy and imagination, and Zola's early years were a period of terrible poverty. He succeeded at last in obtaining a situation as clerk which enabled him to live until he had c[illegible] [illegible] with his pen into public attention as a new force in literature. His novels are books [illegible] tremendous power, but many of them picture [illegible] detail the most detestable features [illegible] of lives; they idealise bestiality. H[illegible] heroic part in the rehabilit[illegible] of [illegible] Dreyfus.
